“It is forbidden to show them mercy, as it was said, ‘nor show mercy unto them’ (Deut. 7:2). Hence, if one sees one of them who worships idols
perishing or drowning, one is not to save him. . . . Hence you learn that it is forbidden to heal idolaters even for a fee. But if one is afraid of them or apprehends that refusal might cause ill will, medical treatment may be given for a fee but not gratuitously. . . . The foregoing rules apply to the time when the people of Israel live exiled among the nations, or when the Gentiles’ power is predominant. But when Israel is predominant over the nations of the world, we are forbidden to permit a gentile who is an idolator to dwell among us. He must not enter our land, even as a temporary resident; or even as a traveler, journeying with merchandise from place to place, until he has undertaken to keep the seven precepts which the Noachides were commanded to observe (*Hilkhot Avodah Zara*, ch. 10:8)."

Philo the Jew also records that attempts were planned to bribe Helicon, but that he could not be bribed, and to control Caligula through Macro, who was close friends with Flaccus of Alexandria—at that time friendly to the Jews of Alexandria; and Philo records conversations that must either have been the product of his imagination, or the result of the corrupt use of agents within the Roman government. It appears that the schemes and conspiracies alleged in Philo’s writings did not occur, but that he and others were the ones attempting to exert their influence in Rome and sought to maintain a privileged status at the expense of others. Philo relentlessly smears Caligula and Gentile peoples. The ancient slanders against Caligula are actually quite similar to the life history of Mausolus, whose tomb was one of the seven wonders of the ancient world. It was an Old Testament habit for Jews to defame all other peoples and to plagiarize their beliefs and their historical stories.

Philo threatens that a Jewish God will punish all who contradict the wishes of the Jews and sees no hypocrisy in his demand that all people on Earth obey Jewish law, lest there be civil war instigated by Jews; while the Jews refused to obey the laws of Rome. Philo wrote, quoting Caligula,

“‘If any people in the bordering countries, with the exception of the metropolis itself, wishing to erect altars or temples, nay, images of statues, in honour of me and of my family are hindered from doing so, I charge you at once to punish those who attempt to hinder them, or else to bring them before the tribunal.’ (335) Now this was nothing else but a beginning of seditions and civil wars, and an indirect way of annulling the gift which he appeared to be granting. For some men, more out of a desire of mortifying the Jews than from any feelings of loyalty towards Gaius, were inclined to fill the whole country with erections of one kind or another. But they who beheld the violation of their national customs practised before their eyes were resolved above all things not to endure such an injury unresistingly.”

Great enmity existed between the Egyptians, Greeks and Jews of Alexandria; in part because the Jews maintained themselves as a privileged and segregated class. As often happens in places of great wealth discrepancy and wealth condensation, Egyptians and Greeks looted Jewish estates in their quest for social justice.
According to Philo, Flaccus reduced the two Jewish sectors of the city into one smaller parcel and quarantined the Jews in it. According to Josephus, three ambassadors of Alexandria called upon the Emperor. One of the ambassadors, Apion, criticized the Jews. Another ambassador was Philo the Jew, who was the brother of the wealthiest man in the world, Alexander Lysimachus. Philo’s own accounts, however, reveal that Josephus misrepresented the history. Though it appears that Philo was himself a liar, and Josephus simply corrupted Philo’s fantasies. There is, however, redeeming value in analyzing their accounts, which exhibit Jewish double standards and duplicity in the ancient world.

There were, in Philo’s accounts, two meetings of the embassies of Jewish Alexandria with Caligula (Gaius or Caius). Philo the Jew, who attended both meetings, makes no mention of Apion. Whereas Philo himself stated that the Emperor treated him cordially at the first meeting,

“For it appeared good to present to Gaius a memorial, containing a summary of what we had suffered, and of the way in which we considered that we deserved to be treated; (179) and this memorial was nearly an abridgment of a longer petition which we had sent to him a short time before, by the hand of king Agrippa; for he, by chance, was staying for a short time in the city, while on his way into Syria to take possession of the kingdom which had been given to him; (180) but we, without being aware of it, were deceiving ourselves, for before also we had done the same, when we originally began to set sail, thinking that as we were going before a judge we should meet with justice; but he was in reality an irreconcilable enemy to us, attracting us, as far as appearance went, with favourable looks and cheerful address; (181) for, receiving us favourably at first, in the plains on the banks of the Tiber (for he happened to be walking about in his mother’s garden), he conversed with us formally, and waved his right hand to us in a protecting manner, giving us significant tokens of his good will, and having sent to us the secretary, whose duty it was to attend to the embassies that arrived, Obulus by name, he said, ‘I myself will listen to what you have to say at the first favourable opportunity.’

So that all those who stood around congratulated us as if we had already carried our point, and so did all those of our own people, who are influenced by superficial appearances. (182) But I myself, who was accounted to be possessed of superior prudence, both on account of my age and my education, and general information, was less sanguine in respect of the matters at which the others were so greatly delighted. ‘For why,’ said I, after pondering the matter deeply in my own heart, ‘why, when there have been such numbers of ambassadors, who have come, one may almost say, from every corner of the globe, did he say on that occasion that he would hear what we had to say, and no one else? What could have been his meaning? for he was not ignorant that we were Jews, who would have been quite content at not being treated worse than the others; (183) but to expect to be looked upon as worthy to receive especial privileges and precedence, by a master
who was of a different nation and a young man and an absolute monarch, would have seemed like insanity. But it would seem that he was showing civility to the whole district of the Alexandrians, to which he was thus giving a privilege, when promising to give his decision speedily; unless, indeed, disregarding the character of a fair and impartial hearer, he was intending to be a fellow suitor with our adversaries and an enemy of ours, instead of behaving like a judge."

Josephus misrepresented the story in his *Antiquities of the Jews*, Book 18, Chapter 8, and stated that the Emperor, angered by what Apion (a person Josephus wished to defame) had allegedly told him, refused to hear Philo the Jew, and only then ordered that a statue of Caligula be erected in the Temple. Josephus wrote,

“CHAPTER VIII.

Embassy of the Jews to Caius—Caius sends Petronius into Syria to make war against the Jews.

There was now a tumult arisen at Alexandria, between the Jewish inhabitants and the Greeks; and three ambassadors were chosen out of each party that were at variance, who came to Caius. Now one of these ambassadors from the people of Alexandria was Apion, (29) who uttered many blasphemies against the Jews; and, among other things that he said, he charged them with neglecting the honors that belonged to Caesar; for that while all who were subject to the Roman empire built altars and temples to Caius, and in other regards universally received him as they received the gods, these Jews alone thought it a dishonorable thing for them to erect statues in honor of him, as well as to swear by his name. Many of these severe things were said by Apion, by which he hoped to provoke Caius to anger at the Jews, as he was likely to be. But Philo, the principal of the Jewish embassage, a man eminent on all accounts, brother to Alexander the alabarch, (30) and one not unskillful in philosophy, was ready to betake himself to make his defense against those accusations; but Caius prohibited him, and bid him begone; he was also in such a rage, that it openly appeared he was about to do them some very great mischief. So Philo being thus affronted, went out, and said to those Jews who were about him, that they should be of good courage, since Caius’s words indeed showed anger at them, but in reality had already set God against himself.

Hereupon Caius, taking it very heinously that he should be thus despised by the Jews alone, sent Petronius to be president of Syria, and successor in the government to Vitellius, and gave him order to make an invasion into Judea, with a great body of troops; and if they would admit of his statue willingly, to erect it in the temple of God; but if they were obstinate, to conquer them by war, and then to do it. Accordingly, Petronius took the government of Syria, and made haste to obey Caesar’s epistle. He got
together as great a number of auxiliaries as he possibly could, and took with him two legions of the Roman army, and came to Ptolemais, and there wintered, as intending to set about the war in the spring. He also wrote word to Caius what he had resolved to do, who commended him for his alacrity, and ordered him to go on, and to make war with them, in case they would not obey his commands. But there came many ten thousands of the Jews to Petronius, to Ptolemais, to offer their petitions to him, that he would not compel them to transgress and violate the law of their forefathers; ‘but if,’ said they, ‘thou art entirely resolved to bring this statue, and erect it, do thou first kill us, and then do what thou hast resolved on; for while we are alive we cannot permit such things as are forbidden us to be done by the authority of our legislator, and by our forefathers’ determination that such prohibitions are instances of virtue.’ But Petronius was angry at them, and said, ‘If indeed I were myself emperor, and were at liberty to follow my own inclination, and then had designed to act thus, these your words would be justly spoken to me; but now Caesar hath sent to me, I am under the necessity of being subservient to his decrees, because a disobedience to them will bring upon me inevitable destruction.’ Then the Jews replied, ‘Since, therefore, thou art so disposed, O Petronius! that thou wilt not disobey Caius’s epistles, neither will we transgress the commands of our law; and as we depend upon the excellency of our laws, and, by the labors of our ancestors, have continued hitherto without suffering them to be transgressed, we dare not by any means suffer ourselves to be so timorous as to transgress those laws out of the fear of death, which God hath determined are for our advantage; and if we fall into misfortunes, we will bear them, in order to preserve our laws, as knowing that those who expose themselves to dangers have good hope of escaping them, because God will stand on our side, when, out of regard to him, we undergo afflictions, and sustain the uncertain turns of fortune. But if we should submit to thee, we should be greatly reproached for our cowardice, as thereby showing ourselves ready to transgress our law; and we should incur the great anger of God also, who, even thyself being judge, is superior to Caius.’

When Petronius saw by their words that their determination was hard to be removed, and that, without a war, he should not be able to be subservient to Caius in the dedication of his statue, and that there must be a great deal of bloodshed, he took his friends, and the servants that were about him, and hastened to Tiberias, as wanting to know in what posture the affairs of the Jews were; and many ten thousands of the Jews met Petronius again, when he was come to Tiberias. These thought they must run a mighty hazard if they should have a war with the Romans, but judged that the transgression of the law was of much greater consequence, and made supplication to him, that he would by no means reduce them to such distresses, nor defile their city with the dedication of the statue. Then Petronius said to them, ‘Will you then make war with Caesar, without considering his great preparations for war, and your own weakness?’ They replied, ‘We will not by any means make war with
him, but still we will die before we see our laws transgressed.' So they threw themselves down upon their faces, and stretched out their throats, and said they were ready to be slain; and this they did for forty days together, and in the mean time left off the tilling of their ground, and that while the season of the year required them to sow it. (31) Thus they continued firm in their resolution, and proposed to themselves to die willingly, rather than to see the dedication of the statue.

When matters were in this state, Aristobulus, king Agrippa’s brother, and Heleias the Great, and the other principal men of that family with them, went in unto Petronius, and besought him, that since he saw the resolution of the multitude, he would not make any alteration, and thereby drive them to despair; but would write to Caius, that the Jews had an insuperable aversion to the reception of the statue, and how they continued with him, and left of the tillage off their ground: that they were not willing to go to war with him, because they were not able to do it, but were ready to die with pleasure, rather than suffer their laws to be transgressed: and how, upon the land’s continuing unsown, robberies would grow up, on the inability they would be under of paying their tributes; and that Caius might be thereby moved to pity, and not order any barbarous action to be done to them, nor think of destroying the nation: that he continues inflexible in his former opinion to bring a war upon them, he may then set about it himself. And thus did Aristobulus, and the rest with him, supplicate Petronius. So Petronius, (32) partly on account of the pressing instances which Aristobulus and the rest with him made, and because of the great consequence of what they desired, and the earnestness wherewith they made their supplication,—partly on account of the firmness of the opposition made by the Jews, which he saw, while he thought it a terrible thing for him to be such a slave to the madness of Caius, as to slay so many ten thousand men, only because of their religious disposition towards God, and after that to pass his life in expectation of punishment; Petronius, I say, thought it much better to send to Caius, and to let him know how intolerable it was to him to bear the anger he might have against him for not serving him sooner, in obedience to his epistle, for that perhaps he might persuade him; and that if this mad resolution continued, he might then begin the war against them; nay, that in case he should turn his hatred against himself, it was fit for virtuous persons even to die for the sake of such vast multitudes of men. Accordingly, he determined to hearken to the petitioners in this matter.

He then called the Jews together to Tiberias, who came many ten thousands in number; he also placed that army he now had with him opposite to them; but did not discover his own meaning, but the commands of the emperor, and told them that his wrath would, without delay, be executed on such as had the courage to disobey what he had commanded, and this immediately; and that it was fit for him, who had obtained so great a dignity by his grant, not to contradict him in any thing: — ‘yet,’ said he, ‘I do not think it just to have such a regard to my own safety and honor, as to refuse
to sacrifice them for your preservation, who are so many in number, and
deal to preserve the regard that is due to your law; which as it hath come
down to you from your forefathers, so do you esteem it worthy of your
utmost contention to preserve it: nor, with the supreme assistance and power
of God, will I be so hardy as to suffer your temple to fall into contempt by
the means of the imperial authority. I will, therefore, send to Caius, and let
him know what your resolutions are, and will assist your suit as far as I am
able, that you may not be exposed to suffer on account of the honest designs
you have proposed to yourselves; and may God be your assistant, for his
authority is beyond all the contrivance and power of men; and may he
procure you the preservation of your ancient laws, and may not he be
deprived, though without your consent, of his accustomed honors. But if
Caius be irritated, and turn the violence of his rage upon me, I will rather
undergo all that danger and that affection that may come either on my body
or my soul, than see so many of you to perish, while you are acting in so
excellent a manner. Do you, therefore, every one of you, go your way about
your own occupations, and fall to the cultivation of your ground; I will
myself send to Rome, and will not refuse to serve you in all things, both by
myself and by my friends."

When Petronius had said this, and had dismissed rite assembly of the
Jews, he desired the principal of them to take care of their husbandry, and to
speak kindly to the people, and encourage them to have good hope of their
affairs. Thus did he readily bring the multitude to be cheerful again. And now
did God show his presence to Petronius, and signify to him that he would
afford him his assistance in his whole design; for he had no sooner finished
the speech that he made to the Jews, but God sent down great showers of
rain, contrary to human expectation; (33) for that day was a clear day, and
gave no sign, by the appearance of the sky, of any rain; nay, the whole year
had been subject to a great drought, and made men despair of any water from
above, even when at any time they saw the heavens overcast with clouds;
insomuch that when such a great quantity of rain came, and that in an
unusual manner, and without any other expectation of it, the Jews hoped that
Petronius would by no means fail in his petition for them. But as to
Petronius, he was mightily surprised when he perceived that God evidently
took care of the Jews, and gave very plain signs of his appearance, and this
to such a degree, that those that were in earnest much inclined to the contrary
had no power left to contradict it. This was also among those other
particulars which he wrote to Caius, which all tended to dissuade him, and
by all means to entreat him not to make so many ten thousands of these men
go distracted; whom, if he should slay, (for without war they would by no
means suffer the laws of their worship to be set aside,) he would lose the
revenue they paid him, and would be publicly cursed by them for all future
ages. Moreover, that God, who was their Governor, had shown his power
most evidently on their account, and that such a power of his as left no room
for doubt about it. And this was the business that Petronius was now engaged
in.

But King Agrippa, who now lived at Rome, was more and more in the favor of Caius; and when he had once made him a supper, and was careful to exceed all others, both in expenses and in such preparations as might contribute most to his pleasure; nay, it was so far from the ability of others, that Caius himself could never equal, much less exceed it (such care had he taken beforehand to exceed all men, and particularly to make all agreeable to Caesar); hereupon Caius admired his understanding and magnificence, that he should force himself to do all to please him, even beyond such expenses as he could bear, and was desirous not to be behind Agrippa in that generosity which he exerted in order to please him. So Caius, when he had drunk wine plentifully, and was merrier than ordinary, said thus during the feast, when Agrippa had drunk to him: ‘I knew before now how great a respect thou hast had for me, and how great kindness thou hast shown me, though with those hazards to thyself, which thou underwast under Tiberius on that account; nor hast thou omitted any thing to show thy goodwill towards us, even beyond thy ability; whence it would be a base thing for me to be conquered by thy affection. I am therefore desirous to make thee amends for every thing in which I have been formerly deficient; for all that I have bestowed on thee, that may be called my gifts, is but little. Everything that may contribute to thy happiness shall be at thy service, and that cheerfully, and so far as my ability will reach.’ (34) And this was what Caius said to Agrippa, thinking he would ask for some large country, or the revenues of certain cities. But although he had prepared beforehand what he would ask, yet had he not discovered his intentions, but made this answer to Caius immediately: That it was not out of any expectation of gain that he formerly paid his respects to him, contrary to the commands of Tiberius, nor did he now do any thing relating to him out of regard to his own advantage, and in order to receive any thing from him; that the gifts he had already bestowed upon him were great, and beyond the hopes of even a craving man; for although they may be beneath thy power, [who art the donor,] yet are they greater than my inclination and dignity, who am the receiver. And as Caius was astonished at Agrippa’s inclinations, and still the more pressed him to make his request for somewhat which he might gratify him with, Agrippa replied, ‘Since thou, O my lord! declarest such is thy readiness to grant, that I am worthy of thy gifts, I will ask nothing relating to my own felicity; for what thou hast already bestowed on me has made me excel therein; but I desire somewhat which may make thee glorious for piety, and render the Divinity assistant to thy designs, and may be for an honor to me among those that inquire about it, as showing that I never once fail of obtaining what I desire of thee; for my petition is this, that thou wilt no longer think of the dedication of that statue which thou hast ordered to be set up in the Jewish temple by Petronius.’

And thus did Agrippa venture to cast the die upon this occasion, so great was the affair in his opinion, and in reality, though he knew how dangerous
Nazism is Zionism 1461

a thing it was so to speak; for had not Caius approved of it, it had tended to no less than the loss of his life. So Caius, who was mightily taken with Agrippa’s oblibging behavior, and on other accounts thinking it a dishonorable thing to be guilty of falsehood before so many witnesses, in points wherein he had with such alacrity forced Agrippa to become a petitioner, and that it would look as if he had already repented of what he had said, and because he greatly admired Agrippa’s virtue, in not desiring him at all to augment his own dominions, either with larger revenues, or other authority, but took care of the public tranquillity, of the laws, and of the Divinity itself, he granted him what he had requested. He also wrote thus to Petronius, commending him for his assembling his army, and then consulting him about these affairs. ‘If therefore,’ said he, ‘thou hast already erected my statue, let it stand; but if thou hast not yet dedicated it, do not trouble thyself further about it, but dismiss thy army, go back, and take care of those affairs which I sent thee about at first, for I have now no occasion for the erection of that statue. This I have granted as a favor to Agrippa, a man whom I honor so very greatly, that I am not able to contradict what he would have, or what he desired me to do for him.’ And this was what Caius wrote to Petronius, which was before he received his letter, informing him that the Jews were very ready to revolt about the statue, and that they seemed resolved to threaten war against the Romans, and nothing else. When therefore Caius was much displeased that any attempt should be made against his government as he was a slave to base and vicious actions on all occasions, and had no regard to what was virtuous and honorable, and against whomsoever he resolved to show his anger, and that for any cause whatsoever, he suffered not himself to be restrained by any admonition, but thought the indulging his anger to be a real pleasure, he wrote thus to Petronius: ‘Seeing thou esteemest the presents made thee by the Jews to be of greater value than my commands, and art grown insolent enough to be subservient to their pleasure, I charge thee to become thy own judge, and to consider what thou art to do, now thou art under my displeasure; for I will make thee an example to the present and to all future ages, that they may not dare to contradict the commands of their emperor.’

This was the epistle which Caius wrote to Petronius; but Petronius did not receive it while Caius was alive, that ship which carried it sailing so slow, that other letters came to Petronius before this, by which he understood that Caius was dead; for God would not forget the dangers Petronius had undertaken on account of the Jews, and of his own honor. But when he had taken Caius away, out of his indignation of what he had so insolently attempted in assuming to himself divine worship, both Rome and all that dominion conspired with Petronius, especially those that were of the senatorian order, to give Caius his due reward, because he had been unmercifully severe to them; for he died not long after he had written to Petronius that epistle which threatened him with death. But as for the occasion of his death, and the nature of the plot against him, I shall relate
them in the progress of this narration. Now that epistle which informed Petronius of Caius’s death came first, and a little afterward came that which commanded him to kill himself with his own hands. Whereupon he rejoiced at this coincidence as to the death of Caius, and admired God’s providence, who, without the least delay, and immediately, gave him a reward for the regard he had to the temple, and the assistance he afforded the Jews for avoiding the dangers they were in. And by this means Petronius escaped that danger of death, which he could not foresee.”

Note the Greek-like fairytale nature of Josephus’ religious story, with its superstitious threats by God, its miracles and omens, its morals, its cunning heroes and villains, and its fatalistic resolution through divine wisdom making all right in the world, demonstrating the power of the Jewish God and the blessings received by those who obeyed His will, and the fall of those who disobeyed it through fatal hubris.

According to Josephus’ spurious account, after being refused an audience with the Emperor, Philo the Jew then slandered the Emperor and threatened him, declaring that God would exact vengeance upon him. In his alleged anger, the Emperor ordered that Publius Petronius be made president of Syria and sent him to Judea with Roman armies to erect a statue of the Emperor in the Temple, demanding that the Jews worship Caligula as god.

However, Philo the Jew, quoting another, informs us that Caligula had already issued his order that his image appear in the Temple in the form of statue before meeting with the ambassadors, the first time,

“And he with difficulty, sobbing aloud, and in a broken voice, spoke as follows: ‘Our temple is destroyed! Gaius has ordered a colossal statue of himself to be erected in the holy of holies, having his own name inscribed upon it with the title of Jupiter!’”

Josephus’ account contradicts Philo the Jew’s own account, that it was the Jews’ destruction of a shrine to Caligula in Jamnia that provoked Caligula to retaliate by demanding that they place a statue of him in the Temple. In addition, whereas Philo accuses Helicon of putting thoughts into Caligula’s head, Josephus changes the story to blame Apion—the same Josephus who made such a show of declaring his honesty and virtue as a historian, while defaming the Greeks, in his work *Against Apion*—in which Josephus recklessly defames Apion and the Egyptians with still more shrill lies. Of course, the fact that Josephus’ account is dishonest does not render Philo’s account accurate, though it is certainly more plausible.

The entire story appears to be a canard meant to artificially fulfil prophecies and may simply be a repetition of the story of Antiochus Epiphanes, who was also said to be mad, and who also desecrated the Temple with a statue of a foreign god, and who had pigs sacrificed at the alter of the Temple which he converted to the worship of Zeus. Antiochus Epiphanes was said to be the first of a line of what Christians call the “anti-Christ”; and Jews fear that another anti-Messiah will rise in Syria, which
Nazism is Zionism 1463

may well explain why the Neo-Conservative Jews in America are pushing America towards war with Syria, another obvious reason being their desire for a greater Israel from the Nile to the Euphrates, and perhaps most ominously Isaiah 17:1 states, “The burden of Damascus. Behold, Damascus is taken away from being a city, and it shall be a ruinous heap.”

Some doubt whether the Temple actually was at the site of the Dome of the Rock and the Al Aqsa Mosque. The Roman Emperor Hadrian built a temple of Jupiter on the site claimed for the Jewish Temple, and the remains which are extant today of an ancient temple may be the remains of Hadrian’s temple to Jupiter. The supposed first Temple of Solomon probably never existed. The Samaritans placed Solomon’s Temple at Mount Gerizim (John 4:20). Some hold that the Temple was at the Gihon Spring, which made a better location for a temple, given that it had a spring available to wash away the blood from sacrifices.

According to Josephus, the Jews declared that they would die before they would see the Temple defiled. In his story, the Jews lay with their throats bare for forty nights aware that war with the Romans was futile and declared that they should be killed before their laws were defiled and their Temple desecrated—an account that is false on its face. According to Josephus, Publius Petronius, speaking as if a monotheistic Jew himself (Philo implies that Petronius, Augustus and Julia Augusta were Jewish converts), declared that he could not commit such an injustice against a people behaving so nobly and called upon the “power of God” to help him persuade the Emperor to change his mind. This speech is a figment of Josephus’ imagination. According to Josephus, Petronius sent out a letter informing Caligula that he would rather die himself than follow such an unfair order. This, too, is a figment of Josephus’ imagination. The letter instead attempted to persuade Caligula that it would be impractical to place the statue in the Temple before the crops were harvested and gave other justifications for delay.

In Philo’s account, it was the Jewish King Agrippa who courted death, not the Roman Petronius. Philo reproduced Agrippa’s supposed words,

“O master, that your Agrippa may not be driven wholly to forsake life; for I shall appear (if you do not do so) to have been released from bondage, not for the purpose of being saved, but for that of being made to perish in a more conspicuous manner. [***] command me at once to be put out of the way. For what advantage would it be to me to live, who place my whole hopes of safety and happiness in your friendship and favour?”

Not only did Petronius not offer to commit suicide, Philo tells us that he planned to run away to Alexandria,

“[Petronius] himself was intending, as is said, to sail to Alexandria in Egypt[.]”

During this period of civil disobedience, the Jews could not attend to their occupations and so could not pay tribute to the Romans, and, should the Romans...
murder them, could never increase the wealth of Rome. While a sit-down strike may have occurred, it did not occur in the fashion of Josephus’ fancy. The Jewish King Herod Agrippa was closely associated with, and literally indebted to, Alexander Lysimachus, Philo the Jew’s wealthy brother, and to Caligula who had made him King.

According to Josephus, Herod Agrippa tricked Caligula, his friend and supporter. King Herod Agrippa, who oppressed the first followers of Christ (Acts 12) and ruled over the lands of Judea—intervened on behalf of the Jews by getting Caligula drunk and flattering him, compelling Caligula to offer Agrippa, the man he had made King, such graces in return, lest he appear less noble than Agrippa. According to Josephus’ accounts, when Caligula asked Agrippa what it is that he might desire, Agrippa asked Caligula to free the Jews from the requirement of erecting a statue to the worship of Caligula in the Temple. Caligula allegedly agreed.

In the meanwhile, according to Josephus’ fictional account, Publius Petronius’ letter reached Caligula, who ordered that Publius Petronius must follow through on his pledge to kill himself before committing such an injustice against so many good people. Amazingly, Caligula was assassinated by Cassius Chaerea of the Praetorian Guard before his letter reached Publius Petronius, and so slow was the ship dispatched to deliver his order to Publius Petronius, that news of Caligula’s assassination reached Publius Petronius before Caligula’s letter, and both Publius Petronius and the sanctity of the Temple were spared by divine providence. This story of guile is a fabrication meant to save Agrippa’s honor, the honor of the Temple and of the Jewish people; while concomitantly smearing the Romans and threatening all with the power of the Jewish God.

We must be on guard against the ethnic bias shown by “historians” like Josephus, who fantasize and distort in order to embellish their image and the image of their people, while smearing others. (It would be inappropriate and cumbersome to name all of the discrepancies between Josephus’ and Philo’s story in this place.) Max Born and Philipp Frank lied about events in the early 1920’s in much the same way Josephus lied about the history of Caligula—in order to protect the image of their humiliated saint and to smear those who opposed Einstein with deliberate lies. Jewish tribalism has many ill effects and the dishonesty of no small number of Jewish historians is one of them.

Contrary to the accounts of Josephus, Philo the Jew stated that Agrippa coincidently called upon Caligula and had no knowledge of the unfolding events. Caligula communicated to Agrippa that something was terribly wrong by staring through him, and then informed Agrippa of his plan to place a statue of himself in the Temple, at which point Agrippa went into shock and passed out. When he had somewhat recovered—with the help of drugs—Agrippa wrote a long and passionate letter to Caligula, pleading with him to not defile the Temple. Caligula appeared to relent somewhat and wrote to Petronius. However, Philo makes clear that this was a delaying tactic by Caligula, one made after Petronius’ deceitful delaying tactics. Caligula constructed an even greater statue in Rome than that which he had ordered Petronius, governor of Syria, to construct in Sidon. In this way, Caligula was able to install the statue in the Temple before the Jews could in any way organize to obstruct
him. He had used their tactics against them and outwitted them. Philo wrote,

“What advantage, then, was gained? some one will say; for even when they were quiet, Gaius was not quiet; but he had already repented of the favour which he had showed to Agrippa, and had re-kindled the desires which he had entertained a little while before; for he commanded another statue to be made, of colossal size, of brass gilt over, in Rome, no longer moving the one which had been made in Sidon, in order that the people might not be excited by its being moved, but that while they remained in a state of tranquillity and felt released from their suspicions, it might in a period of peace be suddenly brought to the country in a ship, and be suddenly erected without the multitude being aware of what was going on.

XLIII. (338) And he was intending to do this while on his voyage along the coast during the period which he had allotted for his sojourn in Egypt. For an indescribable desire occupied his mind to see Alexandria, to which he was eager to go with all imaginable haste, and when he had arrived there he intended to remain a considerable time, urging that the deification about which he was so anxious, might easily be originated and carried to a great height in that city above all others, and then that it would be a model to all other cities of the adoration to which he was entitled, inasmuch as it was the greatest of all the cities of the east, and built in the finest situation in the world. For all inferior men and nations are eager to imitate great men and great states.”

Though Josephus would have us believe that the sanctity of the Temple was preserved through the wit and cunning of Agrippa, the humanity of Petronius who had converted to Judaism, and the will of God; Philo the Jew informs us that all the synagogues in the world were violated with statues of Caligula, and the Temple, the holy of holies, was indeed made a temple to Caligula, and that Philo the Jew and all the ambassadors of the Jews recanted and worshiped Caligula as the god Jupiter,

“So great therefore was his inequality of temper towards every one, and most especially towards the nation of the Jews to which he was most bitterly hostile, and accordingly beginning in Alexandria he took from them all their synagogues there, and in the other cities, and filled them all with images and statues of his own form; for not caring about any other erection of any kind, he set up his own statue everywhere by main force; and the great temple in the holy city, which was left untouched to the last, having been thought worthy of all possible respect and preservation, he altered and transformed into a temple of his own, that he might call it the temple of the new Jupiter, the illustrious Gaius. [***] We have now related in a concise and summary manner the cause of the hatred of Gaius to the whole nation of the Jews; we must now proceed to make our palinode to Gaius.”

The fact that Philo the Jew’s account differs from Josephus’ account does not
mean that either man told the truth. Josephus, however, has been discredited and his story is false on its face, with its physical impossibilities. Philo was a participant in the events. Artifacts from the period confirm Philo’s story to the extent that Jewish religious artifacts and temple carvings from the period bear images of Roman gods.

It would be very interesting to discover that Jews, or Jewish Christians, not the Romans, were the ones to destroy the Jewish Temple, which had been desecrated by the statue, the idol, of a foreign god. Such an event would be in keeping with the story of Christ and would explain the dispersal of the Jews as their self-fulfillment of Judaic prophetic myth. The Jews were bound by God to destroy any and all idolatrous temples in Jerusalem, and if Philo’s story is true, the Jews were duty bound to ruin the formerly Jewish Temple and all others like it. It would be like them to blame this on the Romans and use the hatred of the Romans as a means to preserve what was left of the unity of their disintegrating nation.

Caligula was not the only Roman Emperor who has been smeared by historians in order to preserve Jewish honor. Nero has been blamed for the burning of Rome, which was more likely carried out by Jews, who resented being forced to worship Roman gods and the Emperor of Rome, and who resented the Roman occupation. Though it is claimed that Nero blamed the Christians for the fire in order to deflect suspicions that he had set it, others have claimed that Nero’s Jewish wife Poppæa urged him to blame the Christians in order to protect the Jews from retaliation against them, and is so doing not only burned Rome, but also put to death many Gentiles who had the audacity to pretend to be Jews. The murders of the Christians often took the form of human sacrifices. Nero is said to have killed Poppæa by kicking her in the stomach while pregnant, which is perhaps symbolic of an attempted abortion. Their first child died as an infant and was declared a deity, almost as if the child were a sacrifice.

The intercession of Poppæa into Roman-Jewish relations is interesting on another point. She allegedly persuaded Nero to allow the Jews to shield the Temple from the Romans’ view, so that religious sacrifices could be made in complete privacy. Jews were often accused of human sacrifice and the Old Testament repeatedly mentions Jews sacrificing their children by “passing them through the fire”. One bone of contention among more modern Jews who debated Zionism and the reconstruction of the Temple was whether or not the sacrifices of animals should be resumed. Among racist Jews, Gentiles have long been considered animals. Judaism has long called on Gentiles to sacrifice themselves in the name of God in wars fought on Israel’s behalf. Esau was destined to soldier for Jacob.

Idolatry was nothing new to the Jews. Solomon was an idolater who supposedly constructed the Temple with magic, employing both demons and angels to build it. This is an instance of Jewish Dualism, the belief that ultimate power can only be attained by the use of both good and evil forces, both of which stem from God. Posidonius and Apollonius Molo charged the Jews with worshipping the head of an ass. When Moses came down from Mount Sinai with the Commandments, he found his brother Aaron and their people worshiping a Golden Calf they had made from golden earrings molten in a pot (Exodus 32). Some believe that Jewish sects to this day worship the Golden Calf, which is symbolic of wealth accumulation, and in
some minds, of the “Beast” Baal. The Hebrews called God “Baal” and Jacob called God “El”, who was Baal’s father. The Frankists openly advocated the deliberate practice of evil, accused fellow Jews of using Christian blood in their rituals, and taught their followers to, “acquire wealth even in deceitful and crooked ways.”

Ancient Jews kept secrets hidden behind the screen of the Temple in the Holy of Holies. The Temple had a secret area where only the High Priest was allowed to enter and it contained the Ark of the Covenant. The Ark was covered in gold, and embellished with golden rings, which facilitated movement and which might have been symbolic of the Golden Calf and of the earrings used to make it. Might the Ark have contained the Golden Calf? Aaron, who had introduced the worship of the Golden Calf, was the first High Priest. The cover of the Ark had two Cherubim on it, which were forbidden by the very Commandments it was said to house:

“3 Thou shalt have no other gods before me. 4 Thou shalt not make unto thee any graven image, or any likeness of any thing that is in heaven above, or that is in the earth beneath, or that is in the water under the earth: 5 Thou shalt not bow down thyself to them, nor serve them: for I the LORD thy God am a jealous God, visiting the iniquity of the fathers upon the children unto the third and fourth generation of them that hate me;”—Exodus 20:3-5

Solomon’s Temple contained Solomon’s Molten Sea—a giant pot perhaps symbolizing the smelting pot used to melt the gold Aaron used to cast the Golden Calf. The Molten Sea sat upon twelve oxen, three facing each of the four points of the compass, or the winds (I Kings 7:23-26. II Chronicles 4:2-5, 15) of Baal. God commanded that golden offerings be made to the Ark (I Samuel 6:8). Solomon’s Temple was filled with carved Cherubim covered in Gold. The oracle and its giant Cherubim were covered in gold (I Kings 6). The forbidden images of angels might well have been erected in reverence of the fallen angels said to have bred with human females and to have introduced evil to the world (Genesis 6:1-5. I Enoch) and may have reflected the tradition of Dualism present in the story of Adam and Eve, Cain and Abel, and Jacob and Esau.
The New Testament ascribes Satanic aspects to some Jews. *John* 8:44-45 states,

“Ye are of your father the devil, and the lusts of your father ye will do. He was a murderer from the beginning, and abode not in the truth, because there is no truth in him. When he speaketh a lie, he speaketh of his own: for he is a liar, and the father of it. And because I tell you the truth, ye believe me not.”

*Revelation* 2:9:

“I know thy works, and tribulation, and poverty, (but thou art rich) and I know the blasphemy of them which say they are Jews, and are not, but are the synagogue of Satan.”

*Revelation* 3:9:

“Behold, I will make them of the synagogue of Satan, which say they are Jews, and are not, but do lie; behold, I will make them to come and worship before thy feet, and to know that I have loved thee.”

*John* 7:1 tells that,

“After these things Jesus walked in Galilee: for he would not walk in Jewry, because the Jews sought to kill him.”

Caligula did unto the Jews as the Jews did unto others. Ancient Jews were religious zealots blind to their own arrogance and hypocrisy. Philo the Jew’s family, in collusion with Agrippa and Claudius, murdered Caligula. Philo must have been deeply gratified to have served up this revenge upon Caligula—if any of these events actually took place. Philo the Jew and Josephus went to great lengths to defame Caligula, and their characterizations have prevailed through history. There is, though, another side to the story. Jews hypocritically demanded religious freedom and religious tolerance from others, but forbid others from practicing their religions, from worshiping their gods and idols, from building their temples of perishable materials, in any districts predominantly inhabited by Jews. Alexandrian Jews were resented for their control of markets, tax collecting and corruption, as well as their segregationist religion and nationalism, and the Roman Emperor was not so disliked as they were in the nations—in fact, Caligula was loved and they were often hated. Philo the Jew decries the civil wars he alleges Caligula caused, but only hints at the social injustice and rampant corruption in those cities which prompted revolts against Jews, and Philo admits that the worship of Caligula was only a pretext for attempts to obtain social justice. Philo betrays the religious arrogance and bigotry of the Alexandrian Jews. Quoting Caligula, Philo wrote,
“If any people in the bordering countries, with the exception of the metropolis itself, wishing to erect altars or temples, nay, images of statues, in honour of me and of my family are hindered from doing so, I charge you at once to punish those who attempt to hinder them, or else to bring them before the tribunal.’ (335) Now this was nothing else but a beginning of seditions and civil wars, and an indirect way of annulling the gift which he appeared to be granting. For some men, more out of a desire of mortifying the Jews than from any feelings of loyalty towards Gaius, were inclined to fill the whole country with erections of one kind or another. But they who beheld the violation of their national customs practised before their eyes were resolved above all things not to endure such an injury unresistingly. [***] What is this that you say? Do you, who are a man, seek to take to yourself the air and the heaven, not being content with the vast multitude of continents, and islands, and nations, and countries of which you enjoy the sovereignty? And do you not think any one of the gods who are worshipped in that city or by our people worthy of any country or city or even of any small precinct which may have been consecrated to them in old time, and dedicated to them with oracles and sacred hymns, and are you intending to deprive them of that, that in all the vast circumference of the world there may be no visible trace or memorial to be found of any honour or pious worship paid to the true real living God? (348) Truly you are suggesting fine hopes to the race of mankind; are you ignorant that you are opening the fountains of evils of every kind, making innovations, and committing acts of audacious impiety such as it is wicked to do and even to think of? [***] For if he were to give us up to our enemies, what other city could enjoy tranquillity? What city would there be in which the citizens would not attack the Jews living in it? What synagogue would be left uninjured? What state would not overturn every principle of justice in respect of those of their countrymen who arrayed themselves in opposition to the national laws and customs of the Jews? They will be overthrown, they will be shipwrecked, they will be sent to the bottom, with all the particular laws of the nation, and those too which are common to all and in accordance with the principles of justice recognized in every city.”

And wealthy Philo betrays another of his motives, one less noble than the preservation of the honor of his religion and that of his nation, which he eventually betrayed,

“For [Caligula’s] designs were prepared against all those in authority and all those possessed of riches, and especially against those in Rome and those in the rest of Italy, by whom such quantities of gold and silver had been treasured up that even if all the riches of all the rest of the habitable world had been collected together from its most distant borders, it would have been found to be very inferior in amount. On this account he began, he, this hater of the citizens, this devourer of the people, this pestilence, this destructive
evil, began to banish all the seeds of peace from his country, as if he were expelling evil from holy ground [***] Is it fitting now to compare with these oracles of Apollo the ill-omened warning of Gaius, by means of which poverty, and dishonor, and banishment, and death were given premature notice of to all those who were in power and authority in any part of the world?"  

After Caligula was assassinated, Claudius took the throne—with the assistance, one might even say, at the insistence of King Agrippa—and exacted vengeance upon the enemies of the Jews. Claudius was intimate friends with Philo the Jew’s brother, Alexander Lysimachus, long before the assassination took place. Alexander Lysimachus was also steward to Claudius’ mother Antonia. Caligula had imprisoned Alexander Lysimachus. Claudius set Alexander Lysimachus free. Claudius executed the assassins of Caligula, made Agrippa, the Great Herod’s grandson, not only King of Judea, but also of Samaria, and Claudius issued an edict in two forms, as repayment to the Jews who had given him the throne,

“Now about this time there was a sedition between the Jews and the Greeks, at the city of Alexandria; for when Caius was dead, the nation of the Jews, which had been very much mortified under the reign of Caius, and reduced to very great distress by the people of Alexandria, recovered itself, and immediately took up their arms to fight for themselves. So Claudius sent an order to the president of Egypt to quiet that tumult; he also sent an edict, at the requests of King Agrippa and King Herod, both to Alexandria and to Syria, whose contents were as follows: ‘Tiberius Claudius Caesar Augustus Germanicus, high priest, and tribune of the people, ordains thus: Since I am assured that the Jews of Alexandria, called Alexandrians, have been joint inhabitants in the earliest times with the Alexandrians, and have obtained from their kings equal privileges with them, as is evident by the public records that are in their possession, and the edicts themselves; and that after Alexandria had been subjected to our empire by Augustus, their rights and privileges have been preserved by those presidents who have at divers times been sent thither; and that no dispute had been raised about those rights and privileges, even when Aquila was governor of Alexandria; and that when the Jewish ethnarch was dead, Augustus did not prohibit the making such ethnarchs, as willing that all men should be so subject [to the Romans] as to continue in the observation of their own customs, and not be forced to transgress the ancient rules of their own country religion; but that, in the time of Caius, the Alexandrians became insolent towards the Jews that were among them, which Caius, out of his great madness and want of understanding, reduced the nation of the Jews very low, because they would not transgress the religious worship of their country, and call him a god: I will therefore that the nation of the Jews be not deprived of their rights and privileges, on account of the madness of Caius; but that those rights and privileges which they formerly enjoyed be preserved to them, and that they
may continue in their own customs. And I charge both parties to take very great care that no troubles may arise after the promulgation of this edict.’

And such were the contents of this edict on behalf of the Jews that was sent to Alexandria. But the edict that was sent into the other parts of the habitable earth was this which follows: ‘Tiberius Claudius Caesar Augustus Germanicus, high priest, tribune of the people, chosen consul the second time, ordains thus: Upon the petition of King Agrippa and King Herod, who are persons very dear to me, that I would grant the same rights and privileges should be preserved to the Jews which are in all the Roman empire, which I have granted to those of Alexandria, I very willingly comply therewith; and this grant I make not only for the sake of the petitioners, but as judging those Jews for whom I have been petitioned worthy of such a favor, on account of their fidelity and friendship to the Romans. I think it also very just that no Grecian city should be deprived of such rights and privileges, since they were preserved to them under the great Augustus. It will therefore be fit to permit the Jews, who are in all the world under us, to keep their ancient customs without being hindered so to do. And I do charge them also to use this my kindness to them with moderation, and not to show a contempt of the superstitious observances of other nations, but to keep their own laws only. And I will that this decree of mine be engraved on tables by the magistrates of the cities, and colonies, and municipal places, both those within Italy and those without it, both kings and governors, by the means of the ambassadors, and to have them exposed to the public for full 30 days, in such a place whence it may plainly be read from the ground.’

This edict continued a long tradition of governmental edicts which granted Jews special privileges and which ensured religious tolerance towards Jews, while granting the Jews the privilege of being intolerant. Ancient Jews did not accord the peoples they had vanquished religious freedom and were intolerant even of their neighbors’ religious beliefs, which they forbade and sought to completely destroy. The book of *Ezra*, Chapter 6, provides an example both of the special privileges allegedly accorded to ancient Jews, and of the hatred of ancient Jews against the “heathens”, as well as the use of the Jewish God as a superstitious granter of gifts to those who sponsor the Jews—the gods of various peoples were often used as a threat to curse or to bless enemies or friends in the ancient world, a mythology which continues today (Zionists curried, and curry, favor for their cause among Christians by promising them uninhibited access to the holy sites and the fulfilment of religious prophecy). Note also the use of the wealth of other nations for the construction of the Temple, and the hypocrisy lying in the fact that a monument to Caligula was destroyed by a people who demanded religious tolerance for themselves. It must be borne in mind that the accounts of *Ezra* may be fabrications as may the alleged “roll”:

“No Darius the king made a decree, and search was made in the house of the rolls, where the treasures were laid up in Babylon. 2 And there was found
at Achmetha, in the palace that is in the province of the Medes, a roll, and therein was a record thus written: 3 In the first year of Cyrus the king, the same Cyrus the king made a decree concerning the house of God at Jerusalem, Let the house be builded, the place where they offered sacrifices, and let the foundations thereof be strongly laid; the height thereof threescore cubits, and the breadth thereof threescore cubits; 4 With three rows of great stones, and a row of new timber: and let the expenses be given out of the king’s house: 5 And also let the golden and silver vessels of the house of God, which Nebuchadnezzar took forth out of the temple which is at Jerusalem, and brought unto Babylon, be restored, and brought again unto the temple which is at Jerusalem, every one to his place, and place them in the house of God. 6 Now therefore, Tatnai, governor beyond the river, Shethar-boznai, and your companions the Apharsachites, which are beyond the river, be ye far from thence: 7 Let the work of this house of God alone; let the governor of the Jews and the elders of the Jews build this house of God in his place. 8 Moreover I make a decree what ye shall do to the elders of these Jews for the building of this house of God: that of the king’s goods, even of the tribute beyond the river, forthwith expenses be given unto these men, that they be not hindered. 9 And that which they have need of, both young bullocks, and rams, and lambs, for the burnt offerings of the God of heaven, wheat, salt, wine, and oil, according to the appointment of the priests which are at Jerusalem, let it be given them day by day without fail: 10 That they may offer sacrifices of sweet savors unto the God of heaven, and pray for the life of the king, and of his sons. 11 Also I have made a decree, that whosoever shall alter this word, let timber be pulled down from his house, and being set up, let him be hanged thereon; and let his house be made a dunghill for this. 12 And the God that hath caused his name to dwell there destroy all kings and people, that shall put to their hand to alter and to destroy this house of God which is at Jerusalem. I Darius have made a decree; let it be done with speed. 13 ¶ Then Tatnai, governor on this side the river, Shethar-boznai, and their companions, according to that which Darius the king had sent, so they did speedily. 14 And the elders of the Jews builded, and they prospered through the prophesying of Haggai the prophet and Zechariah the son of Iddo. And they builded, and finished it, according to the commandment of the God of Israel, and according to the commandment of Cyrus, and Darius, and Artaxerxes king of Persia. 15 And this house was finished on the third day of the month Adar, which was in the sixth year of the reign of Darius the king. 16 ¶ And the children of Israel, the priests, and the Levites, and the rest of the children of the captivity, kept the dedication of this house of God with joy, 17 And offered at the dedication of this house of God a hundred bullocks, two hundred rams, four hundred lambs; and for a sin offering for all Israel, twelve he goats, according to the number of the tribes of Israel. 18 And they set the priests in their divisions, and the Levites in their courses, for the service of God, which is at Jerusalem; as it is written in the book of Moses. 19 ¶ And the children of the captivity kept the passover
upon the fourteenth day of the first month. 20 For the priests and the Levites were purified together, all of them were pure, and killed the passover for all the children of the captivity, and for their brethren the priests, and for themselves. 21 And the children of Israel, which were come again out of captivity, and all such as had separated themselves unto them from the filthiness of the heathen of the land, to seek the LORD God of Israel, did eat, 22 And kept the feast of unleavened bread seven days with joy: for the LORD had made them joyful, and turned the heart of the king of Assyria unto them, to strengthen their hands in the work of the house of God, the God of Israel.”

Alexander Lysimachus was the wealthiest man in the world. He decorated the Temple with gold. Alexander Lysimachus’ son, Philo the Jew’s nephew, Marcus Julius Alexander married Agrippa’s daughter Bernice. Ironically, Alexander Lysimachus’ other son, Tiberius Julius Alexander, allegedly abandoned Judaism, became procurator of Judea and prefect of Egypt and took part in the attacks on Jerusalem. The facts tend to indicate that the family of Philo the Jew, the wealthiest family in the world, assassinated Caligula in the defense of the Temple, Jewish law and the Jews of Alexandria—truly speaking, also in defense of their wealth and privilege, and to free Alexander Lysimachus. Then the Jews did what they were bound to do by their religion.

Josephus’ story of Publius Petronius is implausible, and it is far more likely that Caligula never intended to withdraw his order that a statue of him be placed in the Temple, and that Claudius and Philo the Jew’s family conspired to murder him. Claudius attained the throne, and Philo the Jew received the edict favoring the Jews, the freedom of his brother, and corrupt influence in the Roman government, which enabled him to maintain a privileged status for the Jews of the ancient world—though this was short-lived.

Philo the Jew, also known as Philo of Alexandria, is most famous for Helenizing the Jewish faith with mystical writings on the Pentateuch, a Helenization carried out in earnest in Alexandria, with, among other things the translation of the Torah into Greek in the Septuagint with Heraclitean and Platonic language and overtones. Many ancients claimed that the Old Testament itself was a plagiarized fabrication by the Judeans, who had no known authentic ancient history of their own and instead cobbled one together circa 500-450 BC, copying the beliefs of the Egyptians, Greeks and others.

In the 1870's, Julius Wellhausen set out to prove the contention that the Old Testament was of comparatively recent origin and that the Pentateuch had multiple authors. He established that the Old Testament signifies the creation of the new religion of Judaism and not the history of Israel. His work was popular and well-received.

7.5 All the Best Zionists are Anti-Semites

The worst enemy of the common Jew has always been the Zionist.
In 1932, Einstein stated, referring to the “deplorably high development of nationalism everywhere”—his own rabid Zionism excepted,

“The introduction of compulsory service is therefore, to my mind, the prime cause of the moral collapse of the white race, which seriously threatens not merely the survival of our civilization but our very existence. This curse, along with great social blessings, started with the French Revolution, and before long dragged all the other nations in its train.”1526

Einstein complained to Lorentz on 12 January 1920 that even well-educated persons fell victim to “the illiberal nationalistic standpoint.” Einstein called “Nationalism” an “ugly name”. Einstein’s Zionist hypocrisy did not go unnoticed. He was asked why he stood firmly against Gentile nationalism, while making Zionist nationalism his primary purpose in life. According to Thüring, the Jüdische Presse reported on 29 May 1929,

This clearly elucidates Einstein’s nationalistic perspective, which mirrored the Nazis’ nationalistic perspective. The Nazis simply pursued the same false reasoning as Einstein and asserted that their right arm was infected with Einstein’s self-described foreign and disloyal nationalists. Einstein agreed with the Nazis and saw them as the salvation of the Jews.

Therein lies the potential danger of Einstein’s segregationism. Segregationist nationalism is bound to lead to genocidal nationalism. Einstein’s tacit premise that citizenry and nationhood be based on ancient territory, ethnicity, race and religion—on Blut und Boden, instead of the sovereignty of a group of living persons in a territory, whether homogenous or heterogeneous in its ethnicities and religions, was racist bigotry—commonly held bigotry, but bigotry nonetheless. Einstein’s Zionist nationalism, which was no different from Nazi nationalism, would disconnect Jews around the world from the nations in which they were citizens. His racist nationalism definitely did not conform with his internationalist views, which were premised upon a community of nations, which implies a human family. In addition, Einstein voluntarily amputated his right arm, though he pretended that his self-inflicted wound was a congenital defect. Einstein was born a German, not a Palestinian. But Einstein’s hypocrisy, his system of double standards, his desire that
the Gentiles be consumed in wars and that the Jews reestablish a State and rule the world, were nothing new. They were Judaism.

Einstein was an advocate of world government and a segregated “Jewish State”. While this seemed a contradiction to many, including many Jews, especially many secular Jews, Einstein was merely expressing his loyalty to Jewish Messianic myth. Given Einstein’s racist Zionism, it is clear that Einstein wished for a day when Jews would rule a world devoid of Gentile government and that they would be segregated from, and reign over, the “Goyim”, to use Einstein’s term. “Internationalism” was a code word for a world devoid of Gentile government—a Jewish Messianic prophecy. “Zionism” was a code word for Jewish supremacy reigning over the world from Jerusalem in the Jewish Nation. Einstein’s “Internationalism” and Einstein’s “Zionism” need no reconciliation, they are one in the same objective—Judaism. Rather those who are confused by Einstein’s apparent contradictions need only read the Hebrew Bible, where the Jewish prophets tell the Jews to reconstruct the Jewish State and at the same time destroy all the Gentile governments of the world.

After World War II had ended, Einstein’s friend Peter A. Bucky also questioned the apparent contradiction in Einstein’s political philosophy. Bucky asked Einstein how he reconciled his Zionism with his anti-Nationalism. As a good racist Zionist Jew was wont to do, Einstein exploited modern anti-Semitism to legitimize racist Jewish Nationalism which is at least 2,500 years old,

“I think that [nationalism] is justified in this special case because the world has forced the Jews to entrench themselves with the continued existence of anti-Semitism.”

Einstein felt that Jews owed anti-Semites a great debt of appreciation for forcing Jews to “entrench themselves”. He must also have known that the Zionists created the Nazis to force reluctant assimilating Jews to Palestine. Einstein dreaded a world without anti-Semitism, without segregation and without segregated racist Jews like himself. The incentive for Jews to create anti-Semitism is clear. There is abundant evidence that leading Jews have again and again down through history created and sponsored anti-Semitism. In the racist Zionist’s view, racist segregationist Judaism and the Jewish tribe cannot continue to exist without manufacturing anti-Semitism to keep them alive.

Given that the vast majority of German Jews during Einstein’s lifetime vehemently opposed his bigotry, it is especially odd that Einstein was so unenlightened and so racist. His own children were assimilated Jews, and he hated them for it. Whereas most German Jews considered the racism of Zionist Eastern Jews primitive and uncivilized, Einstein considered assimilation uncivilized and inhuman, because Einstein believed that European Gentiles were sub-human and incapable of civilization. His Zionist sponsors created wars for, among other things, the purpose of discrediting Gentile government. Einstein owed his fame to Zionists, who used him to publicize their cause. Einstein was more loyal to the Zionists’ racism, than he was to his own children. Racism buttered Einstein’s bread, his children wanted eat it, though he wouldn’t let them—they were sub-human. Fellow
Jewish racists kept Einstein in the spotlight and shielded him from criticism.

Einstein, himself, echoed and endorsed the views of the anti-Semites in an interview in which he again revealed himself to be a racist and a segregationist. Zionists intentionally provoked and sought to inspire anti-Semitism, and anti-Semites welcomed the openly racist positions of the Zionists. Einstein went along with the crowd of prominent political Zionists who openly stated that anti-Semitism is welcomed, encouraged and useful to the Zionists. They based their myth on Spinoza’s declaration that emancipation leads to assimilation and that the Jews only exist in modern times because glorious anti-Semitism kept them segregated.

Prominent Zionist and author of the *Encyclopaedia Judaica; das Judentum in Geschichte und Gegenwart*, Jakob Klatzkin stated in 1925,

"The national viewpoint taught us to understand the true nature of antisemitism, and this understanding widens the horizons of our national outlook. [***] In the age of enlightenment antisemitism was included among the phenomena that are likely to disappear along with other forms of prejudice and iniquity. The antisemites, so the rule stated, were the laggard elements in the march of progress. Hence, our fate is dependent on the advance of human culture, and its victory is our victory. [***] In the period of Zionism, we learned that antisemitism was a psychic-social phenomenon that derives from our existence as a nation within a nation. Hence, it cannot change, until we attain our national end. But if Zionism had fully understood its own implications, it would have arrived, not merely as a psychosociological explanation of this phenomenon, but also as a justification of it. It is right to protest against its crude expressions, but we are unjust to it and distort its nature so long as we do not recognize that essentially it is a defense of the integrity of a nation, in whose throat we are stuck, neither to be swallowed nor to be expelled. [***] And when we are unjust to this phenomenon, we are unfair to our own people. If we do not admit the rightfulness of antisemitism, we deny the rightfulness of our own nationalism. If our people is deserving and willing to live its own national life, then it is an alien body thrust into the nations among whom it lives, an alien body that insists on its own distinctive identity, reducing the domain of their life. It is right, therefore, that they should fight against us for their national integrity. [***] Know this, that it is a good sign for us that the nations of the world combat us. It is proof that our national image is not yet utterly blurred, our alienism is still felt. If the war against us should cease or be weakened, it would indicate that our image has become indistinct and our alienism softened. We shall not obtain equality of rights anywhere save at the price of an explicit or implied declaration that we are no longer a national body, but part of the body of the host-nation; or that we are willing to assimilate and become part of it. [***] Instead of establishing societies for defense against the antisemites, who want to reduce our rights, we should establish societies for defense against our friends who desire to defend our rights. [***] When Moses came to redeem the children of Israel, their leaders
said to him, ‘You have made our odor evil in the eyes of Pharaoh and in the
eyes of his servants, giving them a sword with which to kill us.’
Nevertheless, Moses persisted in worsening the situation of the people, and
he saved them.”

Klaus J. Herrmann has collected a great deal of evidence related to Zionist racism
in his presentation, “Historical Perspectives on Political Zionism and Antisemitism”,
Organization for the Elimination of All Forms of Racial Discrimination, Tripoli,
(1977), pp. 197-210. At page 197, Herrmann states, [quoting Constantin Brunner,
Der Judenhass und die Juden, Berlin, (1918), p. 112; and Ernst Ludwig Pinner,
“Meine Abkehr vom Zionismus”, Los vom Zionismus, J. Kauffmann, Frankfurt,
(1928), pp. 32-33; and referencing Houston Stewart Chamberlain, Die Grundlagen
des neunzehnten Jahrhunderts, F. A. Bruckmann, München, (1899), English
translation by John Lees, Foundations of the Nineteenth Century, John Lane, New
York, (1910)—see: F. Kahn, “H. St. Chamberlain (Eine Charakteristik)”, Jüdische
Rundschau, Volume 25, Nummer 63/64, (10 September 1920), pp. 499-500, for a
contemporary view of the impact on Jews of Chamberlain’s much-read book. His
book was popular among Zionists and the English translation of it received a long
500-501.]

“Jews,’ wrote Brunner, ‘have been taken in by the racial theories of the
Jew-haters;’ and he accused the Zionists of having taken as their teacher the
notorious racist and forger of scholarly documentation Houston Stewart
Chamberlain, whose ‘confused nonsense revelations’ had been
‘restammered’ in a Zionist book on the subject of race. ‘How could Germans
of Jewish background begin to talk of a Jewish nation, and to fashion of the
worst calumny the dream of their greatest nonsense!’

One of Brunner’s disciples, Ernst Ludwig Pinner, who had been a Zionist
earlier, bitterly accused the Zionists of having
taken up Europe’s newest nonsense, namely racial theory as the justification
of national emotion. Racial arrogance and racial hate poison national
emotion, as did previously religious arrogance and religious hatred. Today
it is race which is exalted as the banner in whose name everything is
justified.

Pinner also designated the Zionists as ‘Jews infected by the sickness of racial
insanity . . . because, similar to the Jew-haters, they drew political
consequences out of race-consciousness.’ Pinner did absolve Zionists of
‘preaching arrogance and hatred;’ whether or not he would have done so in
later years remains open to conjecture.”

At pages 204-205, Klaus J. Herrmann quotes the Zionist ideologist Jakob

“[I applaud] the contribution of our enemies in the continuance of Jewry in eastern Europe. [***] We ought to be thankful to our oppressors that they closed the gates of assimilation to us and took care that our people were concentrated and not dispersed, segregatedly united and not diffusely mixed [***] One ought to investigate in the West and note the great share which antisemitism had in the continuance of Jewry and in all the emotions and movements of our national rebirth. [***] Truly our enemies have done much for the strengthening of Judaism in the diaspora. [***] Experience teaches that the liberals have understood better than the antisemites how to destroy us as a nation. [***] We are, in a word, naturally foreigners; we are an alien nation in your midst and we want to remain one.”

“Man vergegenwärtige sich, wie groß der Anteil unserer Feinde am Fortbestand des Judentums im Osten ist. [. . .] Wir müßten beinahe unseren Bedrängern dankbar sein, wenn sie die Tore der Assimilation vor uns schlossen und dafür Sorge trugen, daß unsere Volksmassen konzentriert und nicht zerstreut, abgesondert geeint und nicht zerklüftet vermischt werden[. . .] Man untersuche es im Westen, welchen hohen Anteil der Antisemitismus am Fortbestand des Judentums und an all den Regungen und Bewegungen unserer nationalen Wiedergeburt hat. [. . .] Wahrlich, unsere Feinde haben viel zur Stärkung des Judentums in der Diaspora beigetragen. [. . .] Und die Erfahrung lehrt, daß die Liberalen es besser als die Antisemiten verstanden haben, uns als Volk zu vernichten. [. . .] Wir sind schlechthin Wesensfremde, sind — wir müssen es immer wiederholen — ein Fremdvolk in eurer Mitte und wollen es auch bleiben.”

Some Jews, and some critics of the Jews, have for thousands of years asserted that Jews always form a separate state within the nations they inhabit. This they attribute to the Jewish religion, with its one God to rule over all—Jews being the chosen people who will one day receive the Messiah who will assist them in ruling the world after all other nations are destroyed, which fatalistic belief system inspires the nationalism many Jews have expressed in the Diaspora.

When Zionists like Herzl, Klatzkin and Rabbi Meir Bar-Ilan, who stated in 1922,

“We have no ‘church’ that is not also concerned with matters of state, just as we have no state which is not also concerned with ‘church’ matters—in Jewish life these are not two separate spheres.”

confirmed that these ancient religious, nationalistic and political aspirations were current in modern Europe, where Jews had been emancipated, it caused many to view Jews not only with suspicion, but with contempt, most especially so because
radical revolutionary organizations were often led by, and populated with, Jews in disproportionate numbers to Gentiles. Many leading figures warned the public that the Bolshevik Jews were seeking world domination. They wanted to end the immigration of Eastern European Jews to Germany, and to expel Eastern European Jews from Germany. The Bolshevik Jews had already conducted successful, though short-lived, revolutions in German territory. Many of the Jews emigrating to Germany from the East were the descendants of the Frankists, who had pledged themselves to destroy the Gentile nations by means of deception and revolution. Frankist Jews were often crypto-Jews who hid their Jewish ethnicity in order to deceive Christians who might not otherwise trust them, to place the blame for their actions on other peoples so as to cause an unjust hatred towards those innocent peoples, and to prevent a backlash against Jews for the vile actions Jews were taking against other peoples. The Talmud teaches the Jews that they can sin against others with immunity if they hide the fact that they are Jewish such that Jews will not be attacked in retaliation. *Moed Katan* 17a states,

“R’ IL’AI SAYS: [***] IF A PERSON SEES THAT HIS evil INCLINATION IS OVERWHELMING HIM, [***] HE SHOULD GO TO A PLACE WHERE THEY DO NOT RECOGNIZE HIM [***] AND CLOTHE HIMSELF IN BLACK AND WRAP HIMSELF IN BLACK, [***] AND HE SHOULD DO WHAT HIS HEART DESIRES, [***] AND HE SHOULD NOT DESECRATE THE NAME OF HEAVEN OPENLY.”

An alternative translation:

“For R. Il’ai says, If one sees that his [evil] yezer is gaining sway over him, let him go away where he is not known; let him put on sordid clothes, don a sordid wrap and do the sordid deed that his heart desires rather than profane the name of Heaven openly.”

Albert Einstein stated in the *Berliner Tageblatt* on 30 December 1919,

“It is quite likely that there are Bolshevist agents in Germany, but they undoubtedly hold foreign passports, have at their disposal ample funds and cannot be seized by any administrative measures. The big profiteers among the Eastern European Jews have certainly, long ago, taken precautions to elude arrest by officials. The only [Jews] affected would be those poor and unfortunate ones, who in recent months made their way to Germany under inhumane privations, in order to look for work here.”

Albert Einstein was himself a racist; and, therefore, a hypocrite when criticizing the racism of others. John Stachel wrote,

“While he lived in Germany, however, Einstein seems to have accepted the then-prevalent racist mode of thought, often invoking such concepts as ‘race’
and ‘instinct,’ and the idea that the Jews form a race.”

On 8 July 1901, Einstein wrote to Winteler,

“There is no exaggeration in what you said about the German professors. I have got to know another sad specimen of this kind — one of the foremost physicists of Germany.”

Einstein wrote to Besso sometime after 1 January 1914,

“A free, unprejudiced look is not at all characteristic of the (adult) Germans (blinders!).”

After the war Einstein and some of his friends alluded to much earlier conversations with Einstein where he had correctly predicted the eventual outcome of the war. In his diaries, Romain Rolland recorded his conversations with Einstein in Switzerland at their meeting of 16 September 1915,

“What I hear from [Einstein] is not exactly encouraging, for it shows the impossibility of arriving at a lasting peace with Germany without first totally crushing it. Einstein says the situation looks to him far less favorable than a few months back. The victories over Russia have reawakened German arrogance and appetite. The word ‘greedy’ seems to Einstein best to characterize Germany. [***] Einstein does not expect any renewal of Germany out of itself; it lacks the energy for it, and the boldness for initiative. He hopes for a victory of the Allies, which would smash the power of Prussia and the dynasty. . . . Einstein and Zangger dream of a divided Germany—on the one side Southern Germany and Austria, on the other side Prussia. [***] We speak of the deliberate blindness and the lack of psychology in the Germans.”

Einstein’s dreams during the First World War remind one of the “Carthaginian Peace” of the Henry Morgenthau, Jr. plan for the destruction of Germany following the Second World War. Morgenthau worked with Lord Cherwell (Frederick Alexander Lindemann), Churchill’s friend and advisor, who planned to bomb German civilian populations into submission. Lindemann studied under Einstein’s friend, Walther Nernst, who worked with Fritz Haber, a Jewish developer of poisonous gas. James Bacque argues that the Allies, under the direction of General Eisenhower, starved hundreds of thousands, if not millions of German prisoners of war to death. Dwight David Eisenhower was called “the terrible Swedish-Jew” in his yearbook for West Point, The 1915 Howitzer, West Point, New York, (1915), p. 80. He was also called “Ike”, as in. . . Eisenhower? The Soviets also abused countless German POW’s after the Second World War.

Einstein often spoke in genocidal and racist terms against Germany, and for the Jews and England, and he betrayed Germany before, during and after the war.
Einstein wrote to Paul Ehrenfest on 22 March 1919,

“[The Allied Powers] whose victory during the war I had felt would be by far the lesser evil are now proving to be only slightly the lesser evil. [***] I get most joy from the emergence of the Jewish state in Palestine. It does seem to me that our kinfolk really are more sympathetic (at least less brutal) than these horrid Europeans. Perhaps things can only improve if only the Chinese are left, who refer to all Europeans with the collective noun ‘bandits.’”

While responsible people were trying to preserve some sanity in the turbulent period following World War I, Zionists like Albert Einstein sought to validate and encourage the racism of anti-Semites. The Dreyfus Affair taught them that anti-Semitism had a powerful effect to unite Jews around the world. The Zionists were afraid that the “Jewish race” was disappearing through assimilation. They wanted to use anti-Semitism to force the segregation of Jews from Gentiles and to unite Jews, and thereby preserve the “Jewish race”. They hoped that if they put a Hitler into power—as Zionists had done in the past, they could use him to herd up the Jews and force the Jews into Palestine against their will. This would also help the Zionists to inspire distrust and contempt for Gentile government, while giving the Zionists the moral high-ground in international affairs, despite the fact that the Zionists were secretly behind the atrocities. Theodor Herzl wrote in his book *The Jewish State*,

“Oppression and persecution cannot exterminate us. No nation on earth has survived such struggles and sufferings as we have gone through. Jew-baiting has merely stripped off our weaklings; the strong among us were invariably true to their race when persecution broke out against them. This attitude was most clearly apparent in the period immediately following the emancipation of the Jews. Later on, those who rose to a higher degree of intelligence and to a better worldly position lost their communal feeling to a very great extent. Wherever our political well-being has lasted for any length of time, we have assimilated with our surroundings. I think this is not discreditable. Hence, the statesman who would wish to see a Jewish strain in his nation would have to provide for the duration of our political well-being; and even Bismarck could not do that. [***] The Governments of all countries scourged by Anti-Semitism will serve their own interests in assisting us to obtain the sovereignty we want. [***] Great exertions will not be necessary to spur on the movement. Anti-Semites provide the requisite impetus. They need only do what they did before, and then they will create a love of emigration where it did not previously exist, and strengthen it where it existed before. [***] I imagine that Governments will, either voluntarily or under pressure from the Anti-Semites, pay certain attention to this scheme; and they may perhaps actually receive it here and there with a sympathy which they will also show to the Society of Jews.”

Albert Einstein wrote to Max Born on 9 November 1919, and encouraged anti-
Semitism and advocated segregationism (one must wonder what rôle Albert’s increasing racism played in his divorce from Mileva Marić—a Gentile Serb),

“Antisemitism must be seen as a real thing, based on true hereditary qualities, even if for us Jews it is often unpleasant. I could well imagine that I myself would choose a Jew as my companion, given the choice. On the other hand I would consider it reasonable for the Jews themselves to collect the money to support Jewish research workers outside the universities and to provide them with teaching opportunities.”\(^{1546}\)

In 1933, the Zionists publicly declared their allegiance to the Nazis. They wrote in the *Jüdische Rundschau* on 13 June 1933,

“Zionism recognizes the existence of the Jewish question and wants to solve it in a generous and constructive manner. For this purpose, it wants to enlist the aid of all peoples; those who are friendly to the Jews as well as those who are hostile to them, since according to its conception, this is not a question of sentimentality, but one dealing with a real problem in whose solution all peoples are interested.”\(^{1547}\)

On 21 June 1933, the Zionists issued a declaration of their position with respect to the Nazi régime, in which they expressed a belief in the legitimacy of the Nazis’ racist belief system and condemned the anti-Fascist forces.\(^{1548}\)

Michele Besso wrote that it might have been Albert Einstein’s racism and bigotry which caused him to separate from his first wife Mileva Marić in 1914. Besso wrote to Einstein on 17 January 1928,

“[. . .] perhaps it is due in part to me, with my defense of Judaism and the Jewish family, that your family life took the turn that it did, and that I had to bring Mileva from Berlin to Zurich[.]”\(^{1549}\)

The hypocrisy of racist Zionists often manifested itself in this way. Many had “intermarried”. Racist Zionist Moses Hess was married to a Christian Gentile prostitute named Sybille Pritsch.

Einstein may have been effected by his mother’s early racist opposition to his relationship with Marić. Another factor in the Einsteins’ divorce was, of course, Albert’s incestuous relationship with his cousin Else Einstein, and his desire to bed her daughters, as well as his general promiscuity. Albert Einstein opposed his sister Maja’s marriage to Gentile Paul Winteler on racist grounds, and Albert thought they should divorce. Albert Einstein wrote to Michele Besso on 12 December 1919, “No mixed marriages are any good (Anna says: oh!)”\(^{1550}\) Besso, himself, was married to a Gentile, Anna Besso-Winteler. Denis Brian wrote,

“When asked what he thought of Jews marrying non-Jews, which, of course, had been the case with him and Mileva, [Albert Einstein] replied with a
laugh, ‘It’s dangerous, but then all marriages are dangerous.’”

On 3 April 1920, Einstein wrote, criticizing assimilationist Jews,

“And this is precisely what he does not want to reveal in his confession. He talks about religious faith instead of tribal affiliation, of ‘Mosaic’ instead of ‘Jewish’ because the latter term, which is much more familiar to him, would emphasize affiliation to his tribe.”

Albert Einstein often referred to Jews as “tribesmen” and Jewry as the “tribe”. Fellow German Jew Fritz Haber was outraged at Albert Einstein’s racist treachery and disloyalty. Einstein confirmed that he was disloyal and a racist, and was obligated,

“[. . .] to step in for my persecuted and morally depressed fellow tribesmen, as far as this lies within my power[.]”

After declaring that Jewish children segregate due to natural forces and that they are “different from other children”, not due to religion or tradition, but due to genetic features and “heritage”, Einstein continued his 3 April 1920 statement,

“With adults it is quite similar as with children. Due to race and temperament as well as traditions (which are only to a small extent of religious origin) they form a community more or less separate from non-Jews. [***] It is this basic community of race and tradition that I have in mind when I speak of ‘Jewish nationality.’ In my opinion, aversion to Jews is simply based upon the fact that Jews and non-Jews are different. [***] Where feelings are sufficiently vivid there is no shortage of reasons; and the feeling of aversion toward people of a foreign race with whom one has, more or less, to share daily life will emerge by necessity.”

Einstein made similar comments in a document dated sometime “after 3 April 1920”. Einstein was in agreement with Philipp Lenard that a “Jewish heritage” could be seen in intellectual works published by Jews. Einstein stated,

“The psychological root of anti-Semitism lies in the fact that the Jews are a group of people unto themselves. Their Jewishness is visible in their physical appearance, and one notices their Jewish heritage in their intellectual works, and one can sense that there are among them deep connections in their disposition and numerous possibilities of communicating that are based on the same way of thinking and of feeling. The Jewish child is already aware of these differences as soon as it starts school. Jewish children feel the resentment that grows out of an instinctive suspicion of their strangeness that naturally is often met with a closing of the ranks. [***] Jews are the target of instinctive resentment because they are of a different tribe than the
In a draft letter of 3 April 1920, Einstein wrote that children are conscious of “racial characteristics” and that this alleged “racial” gulf between children results in conflicts, which instill a sense of foreignness in the persecuted child. Einstein wrote,

Einstein’s racism was perhaps a defense mechanism to depersonalize the attacks he faced as a child and to counter the hurt with a sense of communal love, and communal hatred. Like Adolf Stoecker before him, Albert Einstein advocated the segregation of Jewish students. Peter A. Bucky quoted Albert Einstein,

“I think that Jewish students should have their own student societies. [***] One way that it won’t be solved is for Jewish people to take on Christian fashions and manners. [***] In this way, it is entirely possible to be a civilized person, a good citizen, and at the same time be a faithful Jew who loves his race and honors his fathers.”

Einstein stated,

“We must be conscious of our alien race and draw the logical conclusions from it. [***] We must have our own students’ societies and adopt an attitude of courteous but consistent reserve to the Gentiles. [***] It is possible to be [***] a faithful Jew who loves his race and honours his fathers.”

On 5 April 1920, Einstein repeated what he had heard from his political Zionist friends, who believed that anti-Semitism was necessary to the preservation of the “Jewish race”,

“Anti-Semitism will be a psychological phenomenon as long as Jews come in contact with non-Jews—what harm can there be in that? Perhaps it is due to anti-Semitism that we survive as a race: at least that is what I believe.”

and,

“I am neither a German citizen, nor is there in me anything that can be described as ‘Jewish faith.’ But I am happy to belong to the Jewish people, even though I don’t regard them as the Chosen People. Why don’t we just let the Goy keep his anti-Semitism, while we preserve our love for the likes of
This letter was published in the *Israelitisches Wochenblatt für die Schweiz*, on 24 September 1920, on page 10. It became famous and was widely discussed in newspapers and was used as a political issue. Einstein’s racism had already become a weapon for critics of the Jews to wield against German Jews loyal to the Fatherland. Einstein ridiculed the *Central-Verein deutscher Staatsbürger jüdischen Glaubens*, an organization that combated anti-Semitism and vigorously defended and celebrated Jews, because Einstein sought to promote anti-Semitism and because Einstein believed that being “Jewish” was a racial, not a religious, condition. Einstein knew quite well that the letter had been published. The *C. V.* contacted him about it and published a statement regarding it in their periodical *Im deutschen Reich* in March of 1921,

On 24 May 1931, the *Sunday Express* of London published an interview it claimed it had had with Einstein while he was visiting Oxford. The interview contained inflammatory statements similar to those published in the *Israelitisches Wochenblatt für die Schweiz* on 24 September 1920. These statements were repeated in several German language newspapers across Europe together with scathing editorial indictments of Einstein. Einstein claimed that no interview had taken place.
and the quotations were taken from a letter he had written eleven years prior. Einstein stated in a letter to Michael Traub of 22 August 1931 that this letter had never been published, though it had been published and Einstein knew quite well that it had been published.

Einstein accused the *Central-Verein deutscher Staatsbürger jüdischen Glaubens e. V.* of instigating the “forgery”. The *C.V.* denied that it was behind the publication in the *Sunday Express* and invited Einstein to respond in their official organ the *Central-Verein Zeitung*. Einstein took the opportunity and stated, “Es wurden mir schon wiederholt Auszüge aus einem Artikel der „Sunday Express“ zugesandt, aus denen ich ersehe, daß es sich um eine glatte Fälschung handelt. Ich habe in Oxford überhaupt kein einziges Zeitungsinterview gegeben. Der Inhalt ist eine böswillige Entstellung eines vor elf Jahren geschriebenen, nicht für die Öffentlichkeit bestimmten Briefes.” He affirmed in 1931 that he had made the statements and did not repudiate them.

In 1932, Einstein stated, referring to the “deplorably high development of nationalism everywhere”—his own rabid Zionism excepted,

“The introduction of compulsory service is therefore, to my mind, the prime cause of the moral collapse of the white race, which seriously threatens not merely the survival of our civilization but our very existence. This curse, along with great social blessings, started with the French Revolution, and before long dragged all the other nations in its train.”

Einstein had a reputation as a rabid anti-assimilationist, which is to say that Einstein was a rabid racist segregationist. On 15 March 1921, Kurt Blumenfeld wrote to Chaim Weizmann,

“Einstein [***] is interested in our cause most strongly because of his revulsion from assimilatory Jewry.”

Einstein stated in 1921,

“To deny the Jew’s nationality in the Diaspora is, indeed, deplorable. If one adopts the point of view of confining Jewish ethnical nationalism to Palestine, then one, to all intents and purposes, denies the existence of a Jewish people. In that case one should have the courage to carry through, in the quickest and most complete manner, entire assimilation. We live in a time of intense and perhaps exaggerated nationalism. But my Zionism does not exclude in me cosmopolitan views. I believe in the actuality of Jewish nationality, and I believe that every Jew has duties towards his coreligionists. [***] [T]he principal point is that Zionism must tend to strengthen the dignity and self-respect of the Jews in the Diaspora. I have always been annoyed by the undignified assimilationist cravings and strivings which I have observed in so many of my friends.”
In 1921, Einstein declared, referring to Eastern European Jews,

“These men and women retain a healthy national feeling; it has not yet been destroyed by the process of atomisation and dispersion.”

Einstein wrote in the Jüdische Rundschau, on 21 June 1921, on pages 351-352,

“This phenomenon [i.e. Anti-Semitism] in Germany is due to several causes. Partly it originates in the fact that the Jews there exercise an influence over the intellectual life of the German people altogether out of proportion to their number. While, in my opinion, the economic position of the German Jews is very much overrated, the influence of Jews on the Press, in literature, and in science in Germany is very marked, as must be apparent to even the most superficial observer. This accounts for the fact that there are many anti-Semites there who are not really anti-Semitic in the sense of being Jew-haters, and who are honest in their arguments. They regard Jews as of a nationality different from the German, and therefore are alarmed at the increasing Jewish influence on their national entity. [**] But in Germany the judgement of my theory depended on the party politics of the Press[**].

Einstein also stated,

“The way I see it, the fact of the Jews’ racial peculiarity will necessarily influence their social relations with non-Jews. The conclusions which—in my opinion—the Jews should draw is to become more aware of their peculiarity in their social way of life and to recognize their own cultural contributions. First of all, they would have to show a certain noble reservedness and not be so eager to mix socially—of which others want little or nothing. On the other hand, anti-Semitism in Germany also has consequences that, from a Jewish point of view, should be welcomed. I believe German Jewry owes its continued existence to anti-Semitism.”

Nazi Zionist Joseph Goebbels, sounding very much like political Zionist Albert Einstein, was quoted in The New York Times, on 29 September 1933, on page 10,

“It must be remembered the Jews of Germany were exercising at that time a decisive influence on the whole intellectual life; that they were absolute and unlimited masters of the press, literature, the theatre and the motion pictures, and in large cities such as Berlin, 75 percent of the members of the medical and legal professions were Jews; that they made public opinion, exercised a decisive influence on the Stock Exchange and were the rulers of Parliament and its parties.”

On 1 July 1921, Einstein was quoted in the Jüdische Rundschau on page 371,
“Let us take brief look at the development of German Jews over the last hundred years. With few exceptions, one hundred years ago our forefathers still lived in the Ghetto. They were poor and separated from the Gentiles by a wall of religious tradition, secular lifestyles and statutory confinement and were confined in their spiritual development to their own literature, only relatively weakly influenced by the forceful progress which intellectual life in Europe had undergone in the Renaissance. However, these little noticed, modestly living people had one thing over us: Every one of them belonged with all his heart to a community, into which he was incorporated, in which he felt a worthwhile member, in which nothing was asked of him which conflicted with his normal processes of thought. Our forefathers of that era were pretty pathetic both bodily and spiritually, but—in social relations—in an enviable state of mental equilibrium. Then came emancipation. It offered undreamt of opportunities for advancement. The isolated individual quickly found their way into the upper financial and social circles of society. They eagerly absorbed the great achievements of art and science which the Occidentals had created. They contributed to the development with passionate affection, and themselves made contributions of lasting value. They thereby took on the lifestyle of the Gentile world, turning away from their religious and social traditions in growing masses—took on Gentile customs, manners and mentality. It appeared as if they were being completely dissolved into the numerically superior, politically and culturally better organized host peoples, such that no trace of them would be left after a few generations. The complete eradication of the Jewish nationality in Middle and Western Europe appeared to be inevitable. However, it didn’t turn out that way. It appears that racially distinct nations have instincts which work against interbreeding. The adaptation of the Jews to the European peoples among whom they have lived in language, customs and indeed even partially in religious practices was unable to eliminate all feelings of foreignness which exist between Jews and their European host peoples. In short, this spontaneous feeling of foreignness is ultimately due to a loss of energy. For this reason, not even well-meant arguments can eradicate it. Nationalities do not want to be mixed together, rather they want to go their own separate ways. A state of peace can only be achieved by mutual tolerance and respect.”

Einstein stated that Jews should not participate in the German Government,

“I regretted the fact that [Rathenau] became a Minister. In view of the attitude which large numbers of the educated classes in Germany assume towards the Jews, I have always thought that their natural conduct in public should be one of proud reserve.”

Einstein merely parroted the Zionist Party line. Werner E. Mosse wrote,
“While the leaders of the CV saw it as their special duty to represent the interests of the German Jews in the active political struggle, Zionism stood for... systematic Jewish non-participation in German public life. It rejected as a matter of principle any participation in the struggle led by the CV.”

In 1925, Einstein wrote in the official Zionist organ *Jüdische Rundschau*,

> “By study of their past, by a better understanding of the spirit [Geist] that accords with their race, they must learn to know anew the mission that they are capable of fulfilling. [***] What one must be thankful to Zionism for is the fact that it is the only movement that has given many Jews a justified pride, that it has once again given a despairing race the necessary faith, if I may so express myself, given new flesh to an exhausted people.”

On 12 October 1929, Albert Einstein wrote to the *Manchester Guardian*,

> “In the re-establishment of the Jewish nation in the ancient home of the race, where Jewish spiritual values could again be developed in a Jewish atmosphere, the most enlightened representatives of Jewish individuality see the essential preliminary to the regeneration of the race and the setting free of its spiritual creativeness.”

Einstein’s public racism eventually waned, but he continued to publicly express his segregationist philosophy in the same terms as anti-Semites, as well as his belief that Jews “thrived on” and owed their “continued existence” to anti-Semitism.

Einstein stated in December of 1930 to an American audience,

> “There is something indefinable which holds the Jews together. Race does not make much for solidarity. Here in America you have many races, and yet you have the solidarity. Race is not the cause of the Jews’ solidarity, nor is their religion. It is something else—which is indefinable.”

Einstein’s confusing public statement perhaps resulted from his desire to promote multi-culturalism in America, which had the benefit of freeing up Jewish immigration to the United States. Einstein was also likely parroting, or trying to parrot, a fellow anti-assimilationist political Zionist whose pamphlet was well known in America, Solomon Schechter and his *Zionism: A Statement*, Federation of American Zionists, New York, (1906), in which Schechter states, among other things, “Zionism is an ideal, and as such is indefinable.”

Einstein stated in 1938,

> “JUST WHAT IS A JEW?

The formation of groups has an invigorating effect in all spheres of human striving, perhaps mostly due to the struggle between the convictions and aims represented by the different groups. The Jews, too, form such a
group with a definite character of its own, and anti-Semitism is nothing but the antagonistic attitude produced in the non-Jews by the Jewish group. This is a normal social reaction. But for the political abuse resulting from it, it might never have been designated by a special name.

What are the characteristics of the Jewish group? What, in the first place, is a Jew? There are no quick answers to this question. The most obvious answer would be the following: A Jew is a person professing the Jewish faith. The superficial character of this answer is easily recognized by means of a simple parallel. Let us ask the question: What is a snail? An answer similar in kind to the one given above might be: A snail is an animal inhabiting a snail shell. This answer is not altogether incorrect; nor, to be sure, is it exhaustive; for the snail shell happens to be but one of the material products of the snail. Similarly, the Jewish faith is but one of the characteristic products of the Jewish community. It is, furthermore, known that a snail can shed its shell without thereby ceasing to be a snail. The Jew who abandons his faith (in the formal sense of the word) is in a similar position. He remains a Jew.

Perhaps even more than on its own tradition, the Jewish group has thrived on oppression and on the antagonism it has forever met in the world. Here undoubtedly lies one of the main reasons for its continued existence through so many thousands of years. Albert Einstein was parroting racist political Zionist leader Theodor Herzl, who wrote in his book The Jewish State,

“Oppression and persecution cannot exterminate us. No nation on earth has survived such struggles and sufferings as we have gone through. Jew-baiting has merely stripped off our weaklings; the strong among us were invariably true to their race when persecution broke out against them. This attitude was most clearly apparent in the period immediately following the emancipation of the Jews. Later on, those who rose to a higher degree of intelligence and to a better worldly position lost their communal feeling to a very great extent. Wherever our political well-being has lasted for any length of time, we have assimilated with our surroundings. I think this is not discreditable. Hence, the statesman who would wish to see a Jewish strain in his nation would have to provide for the duration of our political well-being; and even Bismarck could not do that. [***] The Governments of all countries scourged by Anti-Semitism will serve their own interests in assisting us to obtain the sovereignty we want. [***] Great exertions will not be necessary to spur on the movement. Anti-Semites provide the requisite impetus. They need only do what they did before, and then they will create a love of emigration where it did not previously exist, and strengthen it where it existed before. [***] I
imagine that Governments will, either voluntarily or under pressure from the Anti-Semites, pay certain attention to this scheme; and they may perhaps actually receive it here and there with a sympathy which they will also show to the Society of Jews.”

Einstein’s statements and those of other like-minded racist Zionists threw fuel on the fire and were reflective of the spirit and tone enunciated in Protocols of the Learned Elders of Zion, Number 9, which states (no matter who wrote it),

“Nowadays, if any States raise a protest against us, it is only pro forma at our discretion, and by our direction, for their anti-Semitism is indispensable to us, for the management of our lesser brethren.”

Many Zionist leaders espoused racist nationalism, which made them the darlings of the Nazis, the Nazis they had put into power. Joachim Prinz wrote, among other things, a racist polemic against assimilation in his book published in Germany in the Hitler-era, Wir Juden of 1934,

In dem Bekenntnis des Juden zu seiner eigenen Nation, in seiner Gewißheit, in sich sein eigenes Blut zu tragen, seine eigene Vergangenheit und seine eigene Art — wird er erst beginnen, die Distanz vor den Erlebnissen der anderen Nationen zu wahren, die notwendig ist, um ein ehrliches Miteinander und eine anständige Nachbarhaft zu halten. In dem Augenblick, in dem dieses Bekenntnis zur jüdischen Nationalität die Mehrheit der Judenheit ergreift, beginnt die erste ehrliche Aussprache zwischen Juden und Nichtjuden.”

Prinz wrote of the supposed suicide of the emancipated Jews through assimilation in liberal states, and he despised liberalism. His goal was to preserve the alleged purity of the Jewish race in a Jewish nation, i.e. the expulsion of the Jews to a new territory which allowed the Zionists to enforce racial segregation. Prinz wrote,
The brochure of the baptized Jew Karl Marx on the Jewish question is an anti-Jewish pamphlet and an autobiographical entry in the chapter of Jewish self-hatred.

Die Broschüre des getauften Juden Karl Marx über die Judenfrage ist ein antijüdisches Pamphlet und ein autobiographischer Beitrag zum Kapitel des jüdischen Selbsthasses.1584

Prinz was not alone in his condemnation of Karl Marx’s anti-Semitism.1585 Hitler and Prinz had much in common. Lenni Brenner documents Prinz’ and the Zionists’ kinship with the Nazis’ nationalistic and racial views in his book Zionism in the Age of the Dictators.1586

Dietrich Bronder and Hennecke Kardel1587 state that the top leadership of the Nazi Party and the orchestrators of the “final solution” were of Jewish descent, including Adolf Hitler,1588 Adolf Eichmann, Reinhard Heydrich, Rudolf Hess (member of the Thule-Gesellschaft, an organization Zionists created to promote anti-Semitism in order to force Jews to accept Zionism), Dietrich Eckart (member of the Thule-Gesellschaft), Alfred Rosenberg (member of the Thule-Gesellschaft), Julius Streicher (member of the Thule-Gesellschaft), Joseph Goebbels, and Hans Frank (member of the Thule-Gesellschaft). Dietrich Bronder wrote in 1964, “Aus den eigenen Untersuchungen des Verfassers über die führenden Nationalsozialisten sei hier nur mitgeteilt, daß sich unter 4000 Männern der Reichsführung 120 Ausländer von Geburt befanden, viele mit einem oder zwei Elternteilen ausländischer Herkunft und ein Prozent sogar jüdischer Abkunft — also im Sinne der NS-Rassengesetze „untragbar“.

a) So rechnen zu den Auslandsgeborenen:
Reichsminister und Führerstellvertreter Rudolf Heß (Ägypten);
Reichsminister Darré (Argentinien); Gauleiter und Staatssekretär E. W. Bohle und der Reichskommissar Herzog von Sachsen-Coburg (England);
Generaloberst Lühr (Jugoslawien); General der Waffen-SS Phleps (Rumänien); Reichsärzteteilnehmer und Staatssekretär Dr. Conti und der Berliner Oberbürgermeister Lippert (Schweiz); NSKK-Obergruppenführer G. Wagner (Frankreich); sowie aus Rußland: Reichsminister und Reichsleiter Alfred Rosenberg und die NS-Reichshauptamtsleiter Brockhausen, Dr. von Renteln und Schickedanz, Reichsminister Backe, Präsident Dr. Neubert, Staatsrat Dr. Freiherr von Freytag-Loringhoven und Bischof J. Beermann.

b) Darüber hinaus stammten von einem oder beiden ausländischen Elternteilen (u. v. a.):

c) Selbst jüdischer Abkunft bzw. mit jüdischen Familien verwandt waren:
der Führer und Reichskanzler Adolf Hitler; seine Stellvertreter, die Reichsminister Rudolf Heß und Reichsmarschall Hermann Göring; die
Reichsleiter der NSDAP Gregor Strasser, Dr. Josef Goebbels, Alfred Rosenberg, Hans Frank und Heinrich Himmler; die Reichsminister von Ribbentrop (der mit dem berühmten Zionisten Chaim Weizmann, dem 1952 verstorbenen ersten Staatsoberhaupt von Israel, einst Brüderschaft getrunken hatte) und von Keudell; die Gauleiter Globocznik (der Judenvernichter), Jordan und Wilhelm Kube; die hohen SS-Führer und z. T. in der Judenvernichtung tätigen Reinhard Heydrich, Erich von dem Bach-Zelewski und von Keudell II; die Bankiers und alten Förderer Hitlers vor 1933 Ritter von Stauff (Vizepräsident des NS-Reichstages) und von Stein; der Generalfeldmarschall und Staatssekretär Milch, der Unterstaatssekretär Gaß; die Physiker und Alt-Pg.’s Philipp von Lenard und Abraham Esau; die Uralt-Pg.’s Hanffstaengel (NS-Auslandspresschef) und Prof. Haushofer (s. S. 190).”

Inferences can be drawn that these crypto-Jewish Nazi leaders were either motivated by self-hatred, or they were front men under the control of Herzlian political Zionists. Both may have been true of the genocidal Nazi Party leaders. Bryan Mark Rigg estimates the total number of Jewish soldiers and sailors in the Nazi military perhaps ranged upwards to 150,000.\textsuperscript{1590}

Many Zionists hated themselves and Jews in general and defamed Jews in their literature, especially the relatively impoverished and uneducated Jews of the East, whom the Zionists tried to bribe into migrating to Palestine, though they only largely succeeded in capturing ne’er-do-wells. Herzl considered himself to be a sleazy ultra-Jew in the most pejorative sense of which he could conceive to use the term “Jew”. Herzl justified himself by generalizing his character flaws as if they were a racial “Jewish” trait. He hated the masses of poor Jews from the East and the rich Jews of the West, who wanted to assimilate.

In 1845, \textit{The North American Review} wrote of the snobbish class hatred common among Jews, the inter-Jewish racism which has long plagued Jews, and the various dogmatic Jewish sects hatefully at odds with one another (note the misogyny and dogmatic indoctrination of Jews, which continues to this day,\textsuperscript{1591} and which manifests itself in, among other things, virulent Jewish censorship of others),

“As the Jews were ancienly divided into several religious sects,—the Pharisees, the Sadducees, the Essenes,—so we find them distinguished at the present day. Their chief modern denominations, some of which represent the more ancient, are the Caraites, the Zabathaites, the Chasidim, the Rabbinists, or Talmudists, and the Reformed Jews. The Samaritans

\textit{Footnote}: Mixed descendants of a remnant of the ten tribes left in their own land, and of the Assyrians colonized among them. 2 Kings, xvii. 24, &c. In Christ’s time they had a temple on Mount Gerizim, which they held more sacred than Mount Zion and its temple. They receive only the Pentateuch, and perhaps the Books of Joshua and Judges, which are found among them; but confidently wait for the Messiah, and observe the Mosaic laws more
strictly than even the Jews. Wolff found fifty families of them at the foot of Gerizim, and they have also been met with in other parts of Palestine and in Egypt.

are not to be classed among them, though akin to them in many respects. The main point of difference between most of these sects, though not the only one, respects the Talmud. The Talmud—a word that means doctrine—is a voluminous work of two parts,—the Mishna, that is the second law, and the Gemara, or completion. The former, consisting of a divine interpretation of the written law, say the Talmudists, was given to Moses at the same time with that delivered on Mount Sinai, together with rules for its exegesis, all to be orally handed down; and by him it was made known to the whole people, and specially committed to his successors. These traditions were collected in the Mishna, a work ascribed to Judah Hannasi,—the Holy, as he is usually called,—about the middle of the second century. Many glosses upon this text soon accumulated, which the Rabbi Jochanan, about the year 230, threw together in the form of a perpetual commentary upon it, entitled the Gemara; and this, with the Mishna, is called the Jerusalem Talmud; though sometimes the Mishna, and sometimes the Gemara alone, is, by synecdoche, called the Talmud. About a century later, Ashi and Abhina, distinguished Babylonian rabbins, compiled a much larger collection of opinions, which, with the Mishna, is styled the Babylonian Talmud, a work held in much higher esteem than the other, and generally understood when the Talmud, without further specification, is mentioned. It has commonly been published in twelve large folios. The other is comprised in a single folio. The Talmud has been justly described as 'containing things frivolous and superstitious, impieties and blasphemies, absurdities and fables.' As an example of all these in one,—God is represented as having contracted impurity by the burial of Moses, and as washing in fire to cleanse himself. These traditions, many of them the same by which, in Christ’s time, the Jews ‘made the commandment of God of none effect,’ since then, in accumulated instances, have been used to destroy the force of the Old Testament Scriptures; which, indeed, Rabbinists consider of very little importance.

Rabbinism is the Catholic faith, from which all these sects are, in modern phrase, dissenters. It is the lineal descendant of Pharisaism, and distinguished by its blind adherence to the Talmud. The estimation in which strict Rabbinists hold this book is unbounded. ‘He that has learned the Scripture, and not the Mishna,’ says the Gemara, ‘is a blockhead.’ Isaac, a distinguished rabbi, says, ‘Do not imagine that the written law is the foundation of our religion, which is really founded on the oral law.’ The Rabbinical doctrine is, ‘The Bible is like water, the Mishna like wine, and the Gemara like spiced wine.’ Some even say, that ‘to study the Bible is but a waste of time.’ For strict Rabbinism, a melancholy compound of superstition and fanaticism, we must look to Poland, Russia, Hungary, and Palestine, of which we speak,
in describing the system. In those countries, the Rabbinists, or Talmudists, discountenance as profane all other study than that of the Bible and Talmud, but are very careful to educate their sons in their religious lore. The Talmud forbids teaching females more than their appropriate domestic arts. ‘Whoever instructs his daughter in the Bible is as if he instructed her in abominations.’ But it is a disgrace, if boys are not taught to read the Hebrew Bible. The rich provide teachers for their own children, and either permit the poorer to share this provision, or aid them in obtaining masters. So honorable is the office of teacher made, that a bare support is enough generally to secure a competent one. The ordinary method of instruction is very simple. The child, when four years old, is taught the Hebrew letters, and then to pronounce words, the meaning of which he afterwards learns from his tutor; and thus proceeds, without grammar or dictionary, until he can translate the Pentateuch with tolerable ease. Then he begins at Genesis to study exegetically, surrendering his mind, however, entirely to the guidance of some Jewish commentator; and, from first to last, never forming an independent judgment, but implicitly following tradition, and of course never detecting its gross perversions of the Bible. Some stop short of this commentary, with which others conclude their education; while others still, whose parents can afford it, especially if they display quickness in study and fondness for it, pass on to the Talmud,—first the Mishna, then the Gemara, each with its rabbinical commentaries. As an evidence of the ardor sometimes manifested in these studies, and of complete devotion to them, we are told, that a traveller, some years ago, met three young educated rabbins, who ‘were born and lived to manhood in the middle of Poland, and yet knew not one word of its language.’ A Jewish youth, distinguished for proficiency in Talmudical learning, is anxiously sought in marriage for the daughters of wealthy parents; who look not only at the certain honor of such an alliance, but also at the chance, thus increased, of the Messiah’s coming in their line. On the other hand, the Talmud designates by the name of ‘people of the land,’ equivalent to peasantry, those educated in the Bible alone, or not at all; and represents them as an inferior class, fit only for servile labor, with whom others may not intermarry; applying Deut. xxvii. 21,—‘Cursed be he that lieth with any manner of beast.’ Indeed, the Talmud authorizes every species of oppression towards such, giving them the hope of heaven only if they submit. The Jewish ‘peasant’ is a servant of servants, ground down by those who have learned, by being oppressed, the art of oppression. In Russia and Poland, where the Jews collect the government taxes among themselves, the rabbins make the peasantry pay nearly the whole. This class, too, where the Jews regulate the conscription, must furnish all the soldiers required.

Some other characteristics of the strict Rabbinists may be briefly noticed. They are the lowest of the Jews in point of morals, and this is sufficiently accounted for by the gross immorality of many Talmudical precepts. On the great yearly Day of Atonement, complete absolution from all past sins is pronounced, and from all religious vows, bonds, and oaths taken since the
The Manufacture and Sale of St. Einstein

last preceding, and until the next, atonement. This latter absolution, contained in a prayer denominated *col nidre*, being supposed by Christians to extend to all oaths and obligations, civil as well as religious, which the Jews deny, has caused them much trouble in some parts of Europe. The Talmud teaches, moreover, that no respect is due to a Gentile’s, or an unlearned Jew’s, rights of property; and it accumulates other abominable doctrines, too numerous, and some of them too vile, to mention. Indeed, the modern Rabbinical Jews are generally, in practice, superior to the precepts of the Talmud. They believe in a purgatory, and pray for the souls of the dead; they hold that all Hebrews will rise in the Holy Land, those dying elsewhere rolling painfully under ground until they reach that soil; and that ‘all Israel hath part in eternal life.’ The dead buried in the Holy Land are expected to be the first to rise in the Messiah’s day; and so strong has been the desire of burial there, that in the seventeenth century large quantities of Jewish bones were yearly sent thither to be interred. Ship-loads of this melancholy freight might often be seen at Joppa. They believe that a council properly constituted is infallible, and practically, by their implicit confidence in the Talmud, they make the ancient rabbins their ‘fathers.’ They place a high estimate on the merits of good works, especially those of a ceremonial kind. Thus, though the reading of the Bible is considered hardly a good act, and even as a positive waste of time, the act of taking out the Pentateuch from its depository in the synagogue, and the duty of standing on the left side of the reader, and of closing and removing the roll after service, are considered highly meritorious, and the privilege of performing them is often sold to the highest bidder. A pilgrimage to the Holy Land, much more to pass one’s life there, is a superlative merit. They place great confidence in the supererogatory merits of their ancient saints, especially of Abraham, Isaac, and Jacob, for the males, and of Sarah, Rebekah, and Leah, for females. They have daily morning and evening prayer in the synagogue; and all the prayers for public and private devotion are prescribed, and in Hebrew; for the Talmud affirms, that the angels who receive them understand no other language. Women, servants, and children under twelve years of age, are not required to observe the hours of prayer. The Jews of the Holy Land are, perhaps, singular in praying to saints, and honoring and even worshipping relics. They never approach the supposed stones of the temple, some of which are much worn by kissing, without removing their shoes. Every spot where a saint is supposed to be buried is a place of prayer and pilgrimage. The Talmudists do not allow women to attend the synagogue, until they are married; and then, in Poland, Russia, and the East, they occupy a separate apartment.

Public worship among the Talmudical Jews is, for the most part, where the civil power has not interfered, very irreverent and disorderly. A missionary at Beyroot saw comfits thrown among the people in the synagogue, when particular portions of the service were read, *to show the sweetness of the law!* and the audience—some of the adults, and all the boys—tumbling over one another in the scramble for them on the floor. The
Talmud declares, that, in observing the feast of Purim, ‘Every man must get so drunk, that he cannot distinguish between the phrases, Blessed be Mordecai, and Cursed be Haman.’ While the Talmud imposes many burdensome ceremonies in addition to the Mosaic institutions, it also furnishes multiplied expediens for lighten the latter; and a fertile ingenuity, newly exercised for each emergency, or perpetuated in legendary rules, has extended the dispensation to every desirable point. Stephens, in his travels in the Holy Land, lodged with a Jew, who would not suffer a lamp, lighted the day before, to be extinguished on the Sabbath; but ‘described an admirable contrivance he had invented for reconciling appetite with duty;—an oven, heated the night before to such a degree, that the process of cooking was continued during the night, and the dishes were ready when wanted on the Sabbath.’ Yet even the Talmudical Jews are generally superior in morals to their Christian neighbours, especially in the point of female purity. No wonder they hate the New Testament, reading it only through the profligate and intolerant conduct of their persecutors.

Hospitality and alms-giving to their brethren are sacred duties among all the Jews. A large majority of those in Palestine are paupers, and, for their support, contributions, averaging fourteen thousand dollars a year, are made in different parts of Europe, deposited at Amsterdam, and thence transmitted to Beyroot. Jerusalem, Hebron, Tiberias, and Saphet are holy cities in Jewish esteem, and in all the Italian synagogues money-boxes are kept, marked, ‘For Jerusalem,’ ‘For Saphet,’ &c. The largest collections are in Amsterdam. Leghorn sends about four thousand dollars. But the poor unlearned Jews of Palestine are greatly oppressed by the rabbins, and generally defrauded, wholly or in part, of their share in these charities. When the Hebrew quarter at Smyrna was destroyed by fire, in 1841, Mr. Rothschild, of Vienna, gave 20,000 francs for the sufferers. He and his brothers have lately offered 100,000 francs for founding a Jewish hospital at Jerusalem. Sir Moses Montefiori, during his late visit to Palestine, contributed munificently to the wants of his poor brethren there.”

Lenni Brenner cites numerous examples of defamations against Jews by the Jewish Zionists Maurice Samuel, Ben Frommer, Micah Yosef Berdichevsky, Yosef Chaim Brenner and Aaron David Gordon. One could add Theodor Herzl’s, Berl Katzenelson’s and Vladimir Jabotinsky’s names to the list. Mussolini called Jabotinsky a “Jewish Fascist” and David Ben-Gurion found Adolf Hitler’s writings reminiscent of Jabotinsky’s. Lenni Brenner wrote, quoting Chaim Greenberg,

“In March 1942 Chaim Greenberg, then the editor of New York’s Labour Zionist organ, Jewish Frontier, painfully admitted that, indeed, there had been:

a time when it used to be fashionable for Zionist speakers (including
the writer) to declare from the platform that ‘To be a good Zionist one must be somewhat of an anti-Semite’. . . To this day Labor Zionist circles are under the influence of the idea that the Return to Zion involved a process of purification from our economic uncleanliness. Whosoever doesn’t engage in so-called ‘productive’ manual labor is believed to be a sinner against Israel and against mankind.”

Martin Luther accused the Jews of not sharing the societal burden of manual labor. The ancients also made such accusations against the Jews. Zionists like Theodor Herzl emphasized that Jews must engage in manual labor in their proposed segregated society, so that their gene pool would not be corrupted by foreign laborers, and Herzl stressed his assertions that the poor Jews of Galicia and Eastern Europe were well accustomed to manual labor. Echoing the charges of anti-Semites, Herzl and other Zionists publicly accused the Jews of being “parasites”—to use their term—and the Zionists wanted Jews to take up farming and manual labor allegedly so as to cease to be “parasites”. They had other ulterior motives. Racists, and there was no one more racist than the Zionists, had long argued that conquered peoples exacted a vengeance of the vanquished by outbreeding, and by overwhelming the cultures of nations which used them as slave labor. The Zionists wanted to avoid any such occurrence by using exclusively Jewish labor in the “Jewish Homeland”. They also wanted to strengthen their gene pool, which they believed had been weakened by the ghetto system and urbanization. In addition, in the early 1920’s, some, like Lord Sydenham, complained that the Zionists were exporting Jews of poor character from the East to Palestine, people who were not fit for, nor skilled in, the farmwork that was needed in Palestine. Beyond this, Jewish laws forbids non-Jews to live in Jerusalem, even in Greater Israel, and the racist Jews needed a Jewish slave labor force of Eastern European Jews to build them a new nation without violating Jewish law.

Indeed, one of the first objectives of the Jewish Bolshevists was to train Eastern European Jews to farm and perform the trades. A. Borisow wrote in The Jewish Chronicle on 22 September 1922 on page 16,

“Nep and the Jews.
A New Element in Soviet Russia.

BY A. BORISOW.

A new persecutor has arisen to plague our long-suffering Russian Jewry in the form of the New Economic Policy, familiarly known in Russia as the ‘Nep.’

Most people will look up in surprise when they hear me describe the ‘Nep,’ the far-famed and much-heralded New Economic Policy of the Soviet Government, as a persecutor. For does not ‘Nep’ mean the renunciation of the Communist illusions, liberation from the bureaucratic Soviet institutions,
the reintroduction of trade into the country, the circulation of money, the
right of possession of land and factories? All that is surely a blessing to the
Jewish population, mainly an urban and commercial element, and yet I
stigmatise it as a persecutor!

Still I repeat that the ‘Nep’ in Russia is a persecutor of the Jews. During
the whole of the last two years the Jews have not suffered economically so
much as they have during the few months since the introduction of the ‘Nep.’
It is not for nothing that the Jews translate the initials of the ‘Nep’ as the
‘Nestchastnaja’ (‘luckless’) Economic Policy.

What is it that the ‘Nep’ has brought us?

To begin with, it has reduced the number of officials. Many of the Soviet
institutions have been closed down. In most of the others, 50 to 60 per cent.
of the staff has been dismissed. Viewed on its merits, this is most welcome.
It will mean a decrease in the heavy taxation which went to keep all these
officials. But for the Jewish population it is a terrible blow. It is no secret that
the Soviet institutions, especially in the cities, were staffed almost entirely
by Jews. About three-quarters of the total number of officials were Jews.
Tens of thousands of Jewish intellectuals and semi-intellectuals, lawyers,
journalists and doctors, managed to earn a crust of bread in the service of the
Soviet institutions. They formed the majority of the lettered population. Now
they are dismissed, driven out into the streets, condemned to unemployment
and to starvation. That is the first blessing which the ‘Nep’ has brought to the
Jews.

Trade in Russia has again become free. People are allowed to exchange
commodities, to buy and sell. As that was the usual occupation of the
majority of the Jews in pre-war Russia, it should be an excellent thing for the
Jews. There is no need now to fear that the ‘Cheka’ will come down on the
traders and have them shot for speculation.

But what is the result?

The reintroduction of trade has meant the annihilation of everything that
has been done to foster productive work among the Jews. During the four
years of Communism in Russia, the foundations of the old economic order
were undermined.

With fire and sword the Communists wiped out every trace of trading in
the country. They put a stop to what they called ‘speculation.’ The ‘Cheka’
drove our *Luftmenschen* by the fear of death into productive work. No one
imagined there would ever be a return to the old conditions. Lest they died
of hunger, they were compelled to adapt themselves to the new conditions.
They learned some kind of handicraft, or they took to agriculture. Productive
co-operatives sprang up in the towns. The younger generation, especially,
took to establishing agricultural co-operatives. Thousands of young men and
women joined the *Hechaluz*, joined together in a rigid discipline in order to
take up agriculture as their life work. The Jewish population, under
compulsion, became if not proletarianised, in the sense of becoming a factory
population, at least labourised—engaged in direct labour. They did
productive work instead of engaging in barter.

And now the ‘Nep’ has come, and stamped out all these hopeful signs, put a stop to all this new endeavour which has meant so much adaptation and hard work. It has killed the co-operatives, and the Hechaluz groups. People have left their handicrafts, their agricultural work, and they have again started their small trading—not only those who were traders in the pre-Revolution period, but also people who had never before in their lives had anything to do with commerce or barter. Men who were intellectuals, lawyers, writers, Government officials, have hailed the ‘Nep’ as the liberator. People who had grown tired of hungering, who had sold their last garment in order to get a dry crust of bread, who could no longer stand being herded together, ten of them in an unheated cellar, have become drunk with the lust of making money. Hundreds of millions of roubles, they heard, could be made by engaging in trade. So they went into trade. They are ‘Nepping.’

It would be ridiculous to blame anyone for that. All we can do is to deplore it. But we must regret that the forced and unwilling, yet nevertheless healthy work of transition of a large part of the Jewish population to productive work has been brought to nothing.

If the ‘Nep’ at least provided the people with the means of livelihood, if those who have thrown away their handicraft and their agriculture, in order to engage in trade improved their economic position, there would be some sort of justification even for the loss.

Business in Russia to-day is conducted by the million. The slightest transaction involves tens of millions. Where are the people to obtain these huge initial sums with which to start their businesses? Nobody had any money. Most of those who have started in business have sold their effects down to their very last plate or spoon in order to get some sort of a starting capital. They buy up goods for several tens of millions and they sell them again at some hundreds per cent. profit. Splendid, it seems at first sight. But in the interval which the transaction takes to complete, the rate of exchange has generally fallen to such an extent that the total sum realised buys less than the original sum had purchased. Sixty million roubles, for example, to-day buy about as much as 20 to 25 millions bought a short while ago. Nominally, the ‘Nep’ man has become richer. Actually, he has become poorer.

There is an anecdote in circulation among these ‘Nep’ people which will serve as an apt illustration.

Somebody bought in the Urals five waggon-loads of nails, brought them to Moscow and sold them at a tremendous profit. He went back again to the Urals, but this time he was unable to get more than three waggon-loads of nails for his money. He came back to Moscow, sold them again at an immense profit, and went back to the Urals. This time he managed to buy no more than one waggon-load of nails. And so it went on and on, until at last he went to the Urals with a simply colossal sum, but all he could get for it was just one nail. So he took that nail and hitched a rope to it and hanged
himself.

It is not difficult to earn money, but to become rich or even to make a decent livelihood is impossible, especially with the State shearing the ‘Nep’ people unmercifully. They are taxed to an enormous extent. And it is not to be wondered at that hundreds and thousands of Jews who at first petitioned for permits to become ‘Neppists’ are now returning their permits to the Government asking to be released from the honour of being among the builders of the New Economic Policy.

But it is not easy to give it up. When the shopkeepers in Homel, staggering under their heavy taxation, declared a sort of strike, refusing to open their shops and engage in business, they were denounced as counter-revolutionaries, and one of the leaders of the ‘Yewsekzie,’ the notorious Merejin, published two inflammatory articles in the ‘Emess’ denouncing the ‘first attack by the Jewish bourgeoisie against the Soviet Government,’ and demanding that they should be punished as traitors.

Naturally, not all the ‘Nep’ people go through the same kind of thing. As always, there are exceptions, and there are individuals who have made fortunes, especially in Moscow, which is to-day the greatest, perhaps the only trading centre in Russia. It is to Moscow that the Jews are flocking from every part of the country. Till recently things were not so bad in Minsk, where people managed to do well on contraband trade with Poland. But now there is a Customs office at the railway station in Minsk; all goods are thoroughly examined, and permission to bring goods back into Russia is given only to those who agree to smuggle illegal Communist literature into Poland.

Things are somewhat better for those families who have children over the age of twelve, able to travel round the villages, buy up goods and bring them home to their parents to sell. To have several grown-up children to-day in Russia means to be a rich man. Each child is a bread-winner. So from their earliest days children are being brought up to trade. Speculation is again becoming the forte of the Jews. All education is neglected, in order to train the children to become good business people. Of ideals it is better to say nothing at all.

But the most fortunate under the ‘Nep’ are those families who have been down with typhus. That is an exceptional bit of luck. These people have no fear of again contracting the disease, so they travel about along the railway lines, and bring goods to their homes. There are very few others who will venture to set foot in a train, for the compartments are generally the homes of lice and contagion. They are consequently becoming monopolists. People who want to have things done for them in distant parts usually have to employ these typhus people, who get a good proportion of the profits.

A few individuals become rich, speculating in diamonds and in the exchange rate. The overwhelming majority, however, scuttle about the place like poisoned rats, buying and selling, working sixteen hours in the day, thinking of nothing in the world except their little businesses, and at the end
of it all they have gained hardly anything.
Economically, ‘Nep’ has brought nothing but demoralisation into the life of Russian Jewry.

The moral degeneration is appalling. The mentality of the few new rich is disgusting. Everything is to their view concentrated within their little business transactions. The hunger for profits is stronger than anything else in the world, more potent than social or intellectual interests, for which there is no room left in their minds. A ‘Nep’ man who has really done well will never give anything away unless he is given a place of honour on some committee or other. The rule of the day in Jewish life in Russia is that ‘he who has the money gets the honey.’ The few new rich ‘Nep’ people are the rulers of Jewish life. The old social order has been broken up. The former communal workers have emigrated or have become the poorest of the poor. New people have taken their place.

The story of the ‘Nep’ is not finished yet. We will not venture to prophesy what it may bring to Russian Jewry in the future. But there is no doubt about what it is to-day. It is a persecution. It is not a New Economic Policy, but, as they say a ‘luckless’ economic policy.”

In an age of Social Darwinism, the Zionists promoted the idea that only young and strong Jews should emigrate to Palestine and that they alone should avoid death at the hands of the Nazis. The infamous stories of the selection process of the SS, whereby healthy Jews of childbearing age were selected to survive, while others were selected to die, was, if true, most likely a Zionist directive meant to undoe the supposed genetic damage of the ghettoes. The Nazis were also infamous for forcing Jews to perform strenuous manual labor, literally working the old and the weak to death. This practice fulfilled several Zionist objectives—killing off the old and the weak—training Jews to do the dirty work that would be needed to be done in Palestine—fulfilling Jacob’s Biblical rôle as an agrarian—and ensuring that the Holy Land would become predominantly Jewish, almost exclusively Jewish, which is also a Biblical goal and one the racist Israelis are still attempting to achieve today. The Nazis devoted a great deal attention to identification of “Jewish racial traits”.

While the Zionist Nazis favored Zionist Jews and helped to usher them out of Nazi occupied lands, the Zionist Nazis targeted assimilatory Jewry and Orthodox Jewry, who were largely opposed to Zionism. The Zionists hoped to persuade both assimilated Jews and Orthodox Jews to violate their sensibilities and the Talmud and emigrate to Palestine en masse after the Second World War. The Zionists viciously punished these assimilated and Orthodox Jews who had opposed the Zionists after the First World War. The following article appeared in The Jewish Chronicle on 11 April 1919 on page 10,

“Jewish Factions in the Polish Parliament.

When the leaders of the Jewish factions in Poland rose in Parliament to explain the Jewish policy and demands in the new State, there was only one
Nazism is Zionism 1503

note of agreement struck by them, namely, the loyalty of the Jews to Poland and their goodwill towards the State. Otherwise, a sharp conflict of opinions manifested itself between the Jewish Nationalists (the Zionists and the People’s Party) and the Orthodox Group (to which the Assimilation Party also leans on Jewish National questions). The former demanded national minority rights for the Jews, whereas the latter claimed equal rights only. Rabbi Perlmutter, on behalf of the Orthodox Party (speaking in the House without uncovering), declared that he desired to see a great Poland sweeping to the sea. M. Prilutzky, on behalf of the Jewish Nationalists, claimed National rights for the Jews, including special schools and the right to employ Yiddish in Courts of Justice and in State documents. He had a very hostile reception, members shouting at him: ‘Let America grant such demands first, and we shall follow.’

Rabbi Halpern replied to M. Prilutzky that the Orthodox Party, which, as he believed, formed the preponderating group of Jews in Poland, only demanded equal rights. He stated that the Jews loved Poland, and that they believed the declarations of the Polish Party leaders that the Jews would get equal rights. He expressed the fear that the Nationalists would impair the relations between the Poles and the Jews.”

Many Jews were aware of the fact that the Zionists were sponsoring anti-Semitism and that Zionists agreed with the precepts of anti-Semitism—were themselves anti-Semites. Some Zionists loudly protested against this truth. On 3 September 1897 on page 12, an article in The Jewish Chronicle paraphrased Dr. Birnbaum’s statement at the First Zionist Congress,

“Dr. Birnbaum mentioned that it had often been contended that Zionism was but a reaction against anti-Semitism. It had not been denied that the growth of Zionism coincided with that of anti-Semitism, and, therefore, the conclusion was arrived at that the former only existed at the mercy of the latter. This was a complete mistake. It should be remembered that every movement has its causes and impetus. Through the former it obtained its pioneers, and through the latter its troops. Zionism could proudly say of itself that all who stood at its head had either long left the anti-Semitic impetus behind them, or that from the beginning their belief originated in the anomaly of the existence of a Jewish people. The want of a land of their own caused this anomaly to be the greater. There was a sentimental feeling in favour of Palestine, but sentiment would not suffice because the land whither they would go did not need special attraction; any country in which their distress would cease would be attractive; what they required was a land which would be able to keep them once they were there, till the grand process of converting them from a mercantile people into a people devoted to all callings, especially agriculture, had been completed, and they would no longer hanker after the flesh pots of Egypt [Exodus 16:3]. Palestine was the only country able to accomplish this. The second reason in favour of
Palestine was the benefits that would be conferred not on Jews alone, but on mankind in general. A Jewish people in Palestine would not alone be the medium between the social-ethical and political-aesthetic elements of Europeism, but also the long-sought medium between the East and the West. No people is so apt for this as the Jews with their inherited Oriental qualities and their acquired European character. No country is so fitted to be the territorial medium as Palestine, with its proximity to Europe and to the Suez Canal, and as being the inevitable station on the railway to India. Fears had been expressed for the future of the Holy Sepulchre if Jews became the masters of Palestine, but by making the Christian holy places extra-territorial the difficulty would be overcome and all fears would be dissipated.”

Much of what Birnbaum stated echoed the sophistry contained in Theodor Herzl’s book *The Jewish State*. If the Zionists were genuinely interested in the best interests of humanity, they would have propped up the Turkish Empire, instead of trying to tear it down. It was the Turkish Empire which had the potential to fulfill the roles the Zionist European Jews artificially claimed as their own. The Zionists knew that a large Jewish presence in Palestine would have the exact opposite effect of what they claimed. Instead of bringing peace to the region, it would inflame the Moslems and Catholics against the Jews and against one another. The Zionists tossed out the bait that the Suez Canal was of vital interest to European trade, and then falsely asserted that a Jewish presence would secure that interest, when in fact the Jews knew quite well that a Jewish presence would jeopardize European interests by instigating religious conflict. There was nothing that prevented the British and the French from maintaining productive relations with Moslems, other than Jewish Messianic designs.

The Jews did not want to secure the Suez for the sake of the Europeans, rather the Jews wanted the Northern European and British Protestants to secure Palestine for the Jews and protect them from the Catholics and the Muhammadans who would be inflamed by a Jewish colonization of their Holy Lands and shrines. Jewish intolerance of other religions remains a threat today, when Jewish Israelis attack Christians in Bethlehem, violate international law in Jerusalem, and seek to destroy the militaries and societies in Moslem countries, so that the Moslems will have no means with which to fight back when the Jews and Dispensationalist Christians destroy the Dome of the Rock and Al Aqsa Mosque and build a Jewish Temple in their place. The Israelis are also using the military of the United States to take over the territory of Greater Israel, which they know will eventually pass into their hands.

Beginning in the late 1800’s, Jewish Zionists heavily promoted anti-Semitism and anti-Semites. Crypto-Jews founded and led anti-Jewish societies, which were financed with Jewish bankers’ money. The most prominent Nazis were crypto-Jewish Frankists—Zionist propagandists in anti-Semite’s clothing, *agents provocateur*, including Alfred Rosenberg, who took his political ideology from Houston Stewart Chamberlain, Liebenfels and List. Theodor Herzl took his racist political ideology from Eugen Karl Dühring, making Dühring an influence on both Herzlian Zionist racist mythology and Nazi racist mythology. Before Dühring was
the Jewish racist Zionist Moses Hess, who created National Socialist racism. Dietrich Eckart proposed that a demagogue should lead the Germans to drive out the Jews—long a Zionist objective.

In 1909, Zionist Max Nordau presented a character profile for the successful revolutionary that fit Hitler, Lenin and Stalin. Nordau, though born and raised in Austro-Hungary, called himself a German, parroted the Übermensch philosophy, ridiculed Judaism and Christianity, copied the Germanic Hegelian dialectic, then called the modern world and those philosophers he was copying “degenerate”—a favorite word of Lombroso, who was Jewish, and the Nazis. Disraeli, Nordau and Zollschan promoted the alleged superiority of the “blonde Nordic race” in order to promote the segregation of their own “Jewish race”. They asserted that the German and the Jew were superior races to the Slav and the Negro.

Cesare Lombroso, who was Jewish, advocated the extermination of alleged criminal phenotypes. His theories later became the model for the Nazis’ gassing of political opponents, criminals, the insane and the infirm. Jewish Zionist Max Nordau was in many senses the archetype Nazi. Many Nazis and anti-Semites were of Jewish origin. Both the Zionists and the Nazis loathed the Slavic “race” and brought about its downfall in modern times. They also attempted to wipe out the blonde “race” of Nordics they pretended to admire.

The Old Testament is filled with stories of Jews massacring other Jews and of human sacrifice. The Old Testament and the Talmud instruct pious Jews to kill Jews who abandon Judaism, especially those who sincerely convert to other religions, as well as heathen priests. While addressing the justifications given by religious Zionist terrorists for Yigal Amir’s murder of Yitzhak Rabin, Jessica Stern wrote in her book *Terror in the Name of God: Why Religious Militants Kill*:

> “According to the halakah, the rulings of Din Mosser and Din Rodef apply to those Jews who have committed the most despicable crime imaginable—the betrayal of their fellow Jews. The punishment of the Mosser—a person who hands over sacred Jewish property to the gentile—as well as that of the Rodef—a person who murders or facilitates the murder of Jews—shall be death. Since the execution of the Mosser or the Rodef is aimed at saving the lives of other Jews, there is no need for a trial.”

The political Zionists considered non-Zionist Jews to be traitors and they believed assimilation would lead to the death of the mythical “Jewish race”. Moses Hess wrote,

> “The most touching point about these Hebrew prayers is, that they are really an expression of the collective Jewish spirit; they do not plead for the individual, but for the entire Jewish race. The pious Jew is above all a Jewish patriot. The ‘new’ Jew, who denies the existence of the Jewish nationality, is not only a deserter in the religious sense, but is also a traitor to his people, his race and even to his family. If it were true that Jewish emancipation in exile is incompatible with Jewish nationality, then it were the duty of the
Jews to sacrifice the former for the sake of the latter. This point, however, may need a more elaborate explanation, but that the Jew must be above all a Jewish patriot, needs no proof to those who have received a Jewish education. Jewish patriotism is not a cloudy Germanic abstraction, which dissolves itself in discussions about being and appearance, realism and idealism, but a true, natural feeling, the tangibility and simplicity of which require no demonstration, nor can it be disposed of by a demonstration to the contrary."

Anti-Semitism was very useful to both the Communists and the Zionists. Politically active anti-Semitic demagogues like Lueger, Ahlwardt, Treitschke and Stoecker had numerous Jewish connections, as did Adolf Hitler—some even had Jewish blood, as did Hitler. Anselm von Rothschild stated that Stoecker was an apostate Jew. The Rothschilds wanted desperately to buy Palestine and establish a Jewish state there, with a Rothschild sitting as king of the world, but the Rothschilds lacked broad Jewish support. The political Zionists later concluded that they could only obtain Jewish support in a climate of advanced anti-Semitism. The Chicago Tribune, on 12 December 1881 on page 6, reprinted a letter from Rothschild to Stoecker:

"BARON ROTHSCHILD.

The Letter Written by Him in Defense of the Jews.

Baron Anselm von Rothschild, of Vienna, wrote the annexed letter to Hof-Prediger Stoecker, of Berlin, the instigator of the anti-Semitic agitation in Germany:

VIE NNA, November, 1881.—To the Court Preacher Stoecker—Sir: If I am correctly informed, your physician once advised you to take plenty of exercise, and since then you have been almost constantly employed in anti-Semitic movements. This matter really concerns me very little, for, thank God, Austria has not yet advanced so far on the path of intelligence and refinement as to possess a ‘Judenhetze,’ such as the cultivated city of Berlin can boast of. But still I should like to call the attention of your reverence to certain grave errors which have crept into your speech recently delivered in the German Parliament.

You said in that address, ‘Behind me stand the millions.’ You are mistaken: the millions stand behind me, and if you doubt this you are respectfully invited to visit my counting-house, where ample proofs shall be given you. You contend that ‘the Jewish usurers have ruined all classes of people.’ Now, pray tell me, my dear Court-Preacher, who goes to the Jewish usurer? Is it not those whose credit is exhausted? And if their fellow-men will not trust them any longer, are they not already ruined before they seek their last resort—the Jewish usurer? This is only another of many cases where the Jew is made the scapegoat for the offenses of his neighbors. [A Gentile, or Gentile government, could be easily forced to seek loans from a Jewish usurer through the agitation of the Jewish press for war, or an infinite
number of other corrupt means—as evinced by the Jewish financiers’ destruction of Russia.]

You say further that the Jews, out of all proportion to their numbers, assisted by talent and capital, exercise a mighty influence in the community. I am really surprised that this should surprise you. As if talent had not, from time immemorial, held the sceptre. Would you rather that this world should be ruled by fools than by wise men? And as far as the disproportion of our numbers is concerned we Jews cannot help but feel highly flattered if we possess more talent than our Gentile countrymen. And as for our power as capitalists this is the result of our business genius and our economy. Why do not the Christians imitate us? Do we hinder them from earning money or from saving it? [The answer to this question is obviously yes. Jewish power, wealth and influence in the press result from Jewish racism and Jewish tribalism, and the Cabalist and Talmudic doctrines which encourage Jews to take advantage of Christian integrity in order to exploit Christians. Rich Jews promoted honesty and decentralized power among the Gentiles, while promoting dishonesty and tribalism among their own. This gave the Jews an advantage, which could only be overcome by the Gentiles’ sinking to the debased level of the foe, or expelling it. Rothschild’s racist arrogance is ample proof of the fact, and if the Gentiles had truly leveled the playing field by sinking to Rothschild’s level, they would have quickly crushed the Jews.]

‘The Jews should be more modest,’ you say. It is true that modesty is a most desirable virtue, suited alike to Jew and Gentile, but as Goethe has it, ‘Only scoundrels are modest.’ Now, among the Jews there are so few scoundrels, and then really it is much easier for a Court Preacher to be modest than for a Jew. If a Court Preacher displays that commendable virtue, his flock will bow before him and exclaim, ‘So mighty and yet so modest.’ Let a Jew be modest and he is kicked and spurned, and the mob say, ‘Serves him right.’ [The reality is that the rich Jews concentrated their wealth and shared it with neither Gentile nor poor Jew. This concentration of wealth gave the Jews enormous power and the resentment this corrupt and undemocratic warmongering power caused was directed at poor Jews, often through the machinations of rich Jews, who sought to keep their poor brethren segregated.]

You aver that the Jew in Lessing’s ‘Nathan’ is no Jew at all, but a Christian. With the same right I might say the Court Preacher Stoecker is no Christian, but an apostate Jew who has banded himself with some barbarous relics of the Middle Ages to prosecute a miserable anti-Semitic agitation. But I will not say this, as I would not desire to so grossly insult my co-religionists. [It is highly interesting that Rothschild called Stoecker an apostate Jew.]

Your friend Bachem is of the opinion that the people are backing him. I will admit that there is a people in his wake, but as a German philosopher once said: ‘There are enough wretches in the world to back any bad cause.’ Your friend also indulges in the crushing accusation that the Jews are grain
speculators. Now, do you know who was the first speculator in grain? None other than Jew, Joseph, in Egypt, although at that time there was no Court Preacher to discover any crime in his action, and the people were grateful to him. [The Egyptian people were not grateful to Joseph, who brought them into slavery (Genesis 47).]

In one of your discourses you once exclaimed: ‘Look at Herr von Bleichroeder. He has more money than all the evangelical preachers put together.’ Now, I am sure that Herr von Bleichroeder has never said: ‘Look at Court Preacher Stoecker. He earns more money by a single sermon than a hundred Jewish firms do in a whole year.’

In conclusion, if you will not admit that the Jews have any good qualities, you will at least not envy them for the little money they may possess. If in spite of their wealth they cannot prevent, in the year of 1881, the formation of an agitation against them, what would become of them if they had no money? It is true the Jews put some value on wealth, and I must say that I would rather be a rich Jew than a poor Christian. But then, are there not poor Christians who would rather be rich Jews? Even you, most reverent sir, might, perhaps, be willing to change positions with me (and I flatter myself that you would not make so bad a bargain). For myself, I can only say that if I were not Rothschild, I should still be very far from wishing myself the Court Preacher Stoecker. Very respectfully, A. von Rothschild.”

Under the heading “Foreign Articles”, the following statement appeared in Niles’ Weekly Register, Volume 17, Number 427, (13 November 1819), p. 169,

“Mr. Rothschild, the great London banker, indignant at the persecution of his Jewish brethren in Germany, has refused to take bills upon any of the cities in which they are persecuted; and great embarrassments to trade have been experienced in consequence of his determination. It is intimated that the persecution of the Jews is in part owing to the fact, that Mr. Rothschild and his brethren were among the chief of those who furnished the ‘legitimates,’ with money to forge chains for the people of Europe.”

There would not have been agitations against the Jews, if the Jews in the press had not attacked Christianity and if the Jewish financiers had not attacked Europe with perpetual war throughout the Nineteenth Century. That “little money” in the hands of the Rothschilds alone amounted to some, or one might say “sum” $3,400,000,000.00, acquired through deceitful and inhuman means. It is interesting, though not at all unusual, that Stoecker was a Jew and was behind the anti-Jewish agitation. The same could be said of Goebbels, Streicher, Heydrich, Frank, etc., and, no doubt, Rothschild.

The outspoken Mayor of Vienna Karl Lueger proclaimed that he decided who was, and who was not, a Jew, meaning that he could protect those Jews who helped him—those Jews who put him in power in order to spread anti-Semitism. He had Jewish backers and was an agent for their agenda. Anti-Semite Hermann Ahlwardt
advocated the segregation of Jews in the Reichstag in 1895. The segregation of Jews was a Zionist objective. Ahlwardt spoke in anti-assimilationist terms Theodor Herzl would soon use in his book *The Jewish State*. Adolf Stoecker also raised his voice to advocate segregation in the schools, as did racist Zionist Albert Einstein. The dogma of segregation had both Zionist and anti-Semitic origins—for example racist Zionist Moses Hess’ *Rom und Jerusalem: die letzte Nationalitätsfrage* of 1862 and anti-Semite Eugen Karl Dühring’s *Die Judenfrage als Racen-, Sitten- und Culturfrage: mit einer weltgeschichtlichen Antwort* of 1881. Hermann Ahlwardt stated to the Reichstag in 1895,

“A Jew who was born in Germany does not thereby become a German; he is still a Jew. Therefore it is imperative that we realize that Jewish racial characteristics differ so greatly from ours that a common life of Jews and Germans under the same law is quite impossible because the Germans will perish.”

Jewish Zionist Bernard Lazare wrote in 1894,

> “Everything is tending to bring about such a consummation. Such is the irony of things that antisemitism which everywhere is the creed of the conservative class, of those who accuse the Jews of having worked hand in hand with the Jacobins of 1789 and the Liberals and Revolutionists of the nineteenth century, this very antisemitism is acting, in fact, as an ally of the Revolution. Drumont in France, Pattai in Hungary, Stoecker and von Boeckel in Germany are co-operating with the very demagogues and revolutionists whom they believe they are attacking. This antisemitic movement, in its origin reactionary, has become transformed and is acting now for the advantage of the revolutionary cause. Antisemitism stirs up the middle class, the small tradesmen, and sometimes the peasant, against the Jewish capitalist, but in doing so it gently leads them toward Socialism, prepares them for anarchy, infuses in them a hatred for all capitalists, and, more than that, for capital in the abstract. And thus, unconsciously, antisemitism is working its own ruin, for it carries in itself the germ of destruction. Such, then, is the probable fate of modern antisemitism. I have tried to show how it may be traced back to the ancient hatred against the Jews; how it persisted after the emancipation of the Jews, how it has grown and what are its manifestations. In every way I am led to believe that it must ultimately perish, and that it will perish for the various reasons which I have indicated, because the Jew is undergoing a process of change; because religious, political, social, and economic conditions are likewise changing; but above all, because antisemitism is one of the last, though most long lived, manifestations of that old spirit of reaction and narrow conservatism, which is vainly attempting to arrest the onward movement of the Revolution.”

Dietrich Eckart promoted Adolf Hitler as a viable anti-Semitic demagogue,
The Manufacture and Sale of St. Einstein

though many thought that Hitler appeared to be a Jewish actor or comedian spoofing an anti-Semitic demagogue, and they laughed at him. Eckart said,

“The best would be a worker who knows how to talk. . . . He doesn’t need much brains, politics is the stupidest business in the world, and every marketwoman in Munich knows more than the people in Weimar. I’d rather have a vain monkey who can give the Reds a juicy answer, and doesn’t run away when people begin swinging table legs, than a dozen learned professors. He must be a bachelor, then we’ll get the women.”

In 1934, Jacob R. Marcus incorrectly predicted that Nazis would not carry the Holocaust, because so many of its prominent leaders were, by Nazism’s own standards, “sub-human”,

“The present National Socialist government is too shrewd, in spite of its racial commitments, to lend itself to such extravaganzas. It wants no Brahmanic caste-system in which even the shadow of a low caste Hindu is a pollution. It knows that any attempt toward racial eugenics along purely Nordic lines would disrupt present day Germany with its half-dozen racial strains. Nordicization, if it were literally true to itself, would mean the exclusion from the German state of the following non-Nordic types: the late Paul von Hindenburg; Streicher, the rabid anti-Semitic Nuremberg journalist; Ley, the head of the National Socialist Labor Front; Goebbels, Minister of National Enlightenment and Propaganda; and finally, Hitler, himself. Here is a racial analysis of Hitler made in 1929 by the racial-hygienist, Professor von Gruber, then President of the Bavarian Academy of Sciences and a member of the racially-minded Pan-American Association:

‘For the first time I saw Hitler at close range. Face and head of poor race, mongrel, low slanting forehead, ugly nose, broad cheek bones, small eyes, dark hair. A short brushlike mustache, no broader than the nose, gives the face a defiant touch. The facial expression is not that of a man who has complete control of himself but of one who is aroused to frenzy. Repeated twitching of the facial muscles. When through, expression of contented self-reliance.’ (Essener Volkswacht, Nov. 9, 1929.)

The exposure of the active involvement of Zionists with the Nazi hierarchy—even as instigators of the entire Nazi movement—is shocking, but one is reminded of the willingness of some Jewish religious fanatics to commit suicide and to submit to genocide in order to preserve the integrity of the holy land and of the “race” of the “chosen”. Racists like the Jewish Zionist Meir Kahane thrived on conflict. Kahane asked Jews to rejoice at the United Nations Resolution which acknowledged that Zionism is a form of racism. He hoped that it would lead to strife between Gentiles and Jews, because he believed that this would ultimately lead to the destruction of the Gentile world, as Jewish prophecy foretold. Kahane hoped that the entire world would turn against Israel, and falsely tied all Jews to Israel, in the
Nazism is Zionism 1511

hopes that Jews would be humiliated and then the Gentiles would be destroyed by God, in the form of Zionist subversion. Kahane succinctly wrote, inter alia,

“The banding together by the nations of the world against Israel is the guarantee that their time of destruction is near and the final redemption of the Jew at hand.” 1615

Jessica Stern, in her book Terror in the Name of God: Why Religious Militants Kill, writes of Jews who are willing,

“to risk a world war in pursuit of religious redemption for the Jewish people.” 30 1616

Baruch Kimmerling wrote,

“At the center of this culture of death is the remembrance of martyrs—Jews who, in Zionist ideology, had to die so that the state might be born. [***] A triumphal creed shadowed by death, Zionism transformed the catastrophes of Jewish history into nationalist fables of redemption.” 1617

Though Kahane has been rejected by the vast majority of Jews, and by the majority of Israelis, his message is in keeping with Judaism. Kahanism has a romantic allure to some Jews of a promise of community and common enemy. That battles with their better natures and Kahanism threatens to become a broad movement if not checked and exposed again and again as the hateful mythology that it is. This lust for persecution and martyrdom in order to bring death upon the enemies of the Jews, real or imagined enemies, is an ancient tradition for Jews. It is clearly advocated in the writings of Philo the Jew and Josephus, as well as those of Theodor Herzl. Philo the Jew vilified the Egyptians and Caligula with lies—as did Josephus with even more outrageous lies. Josephus fabricated the myth of Masada. These legendary lies are ingrained in the psyches of those who see these lies as their history and who have a “Masada Complex” of imagined persecution and martyrdom. 1618 Many modern Jews have created an unhealthy culture of death and persecution around the Holocaust—some say the Holocaust has become a new religion. 1619

In the book of Numbers, Chapter 25, Jews were commanded by God to commit genocide against Jews who had assimilated. According to the Gospel of John 11:47-53, Caiaphas chose to execute Jesus in order to preserve the nation of the Jews and to gather back its supposedly chosen people:

“47 Then gathered the chief priests and the Pharisees a council, and said, What do we? for this man doeth many miracles. 48 If we let him thus alone, all men will believe on him: and the Romans shall come and take away both our place and nation. 49 And one of them, named Caiaphas, being the high priest that same year, said unto them, Ye know nothing at all, 50 Nor
consider that it is expedient for us, that one man should die for the people, and that the whole nation perish not. 51 And this spake he not of himself: but being high priest that year, he prophesied that Jesus should die for that nation; 52 And not for that nation only, but that also he should gather together in one the children of God that were scattered abroad. 53 Then from that day forth they took counsel together for to put him to death.”

The book of Matthew 1:21-23 states that “Jesus”—the Jew—was meant to rescue the Jewish Nation,

“21 And she shall bring forth a son, and thou shalt call his name JESUS: for he shall save his people from their sins. 22 Now all this was done, that it might be fulfilled which was spoken of the Lord by the prophet, saying, 23 Behold, a virgin shall be with child, and shall bring forth a son, and they shall call his name Emmanuel, which being interpreted is, God with us.”

If the New Testament is a fiction in part, or in whole, it is a fabrication that fixes blame for the destruction of the Temple and of Jerusalem on Jesus—from the Jewish point of view, instead of on the corruption of some leading Jews against the Roman government and the murder of Caligula for defiling the Temple. It also makes Jesus a means by which to preserve and consolidate the Jewish nation—a human sacrifice. If the New Testament is authentic, then Jesus’ murder was a ploy, which enabled Jewish leaders to secure the unity of their people. In either event, the founding of Christianity—the story of the crucifixion of Christ—was a nationalistic attempt to unite the Jews of the world through human sacrifice—an alleged unity that some Jews have since sought and continue to seek at all costs to the themselves and without any regard for the rights and interests of others, both selflessly and selfishly willing to lead the world into an apocalyptic war in order to preserve their nationalistic vision.

At this critical time when humanity faces many important decisions and should be planning for the future of the survival of the human race, the tiny and insignificant country of Israel with a population of only six million receives grossly disproportionate attention on the world stage, draining off resources and time that the other six-and-one-half-billion human beings cannot afford to spare. Humanity would be better served to devote its resources to more important problems and simply impose an equitable solution to the problems in the Middle East with overwhelming force, or overwhelming disinterest. Though it seems the racist Jews will never rest until they have murdered off the Gentiles in way or another.

Early Christians inherited their love of martyrdom from the Jews and mostly were Jews. Ancient writers assert that ancient Jews believed that death by martyrdom was a certain means to immortality. One is further reminded of the countless failed attempts to form a Jewish nation and the desperation of the Zionists to find a means to achieve their ends because they believed the “Jewish race” was on the verge of extinction. The political Zionists embraced anti-Semitism as that meanest of means.

It is a fact that the Nazis in their writings and in their speeches promoted the
Nazism is Zionism

Zionists, and that the Zionists in their writings and in their speeches promoted anti-Semitism and the Nazis. It is also a fact that the Zionists advocated the racist position that Jews cannot and should not assimilate and were a foreign, disloyal, and combative nation within Germany.

This common interest between Nazis and Zionists includes financial collusion between Zionists and anti-Semites—the type of financial collusion Herzl advocated in his book *The Jewish State*. Herzl, who exhibited a psychopathic personality, held the majority of the Jews in low regard, and was eager to “sacrifice” them for his cause. His philosophical descendants were even more inhumane. Of course, the guilt of the Zionists who fomented the political climate which precipitated the Holocaust in no way abrogates the guilt of the many Germans and Europeans who participated in murdering millions of innocent men, women and children in the Holocaust and the Second World War. It serves as a warning to us all of the power held by those who mold public opinion and the possibilities for good or evil that control over that force holds. It is presently in the hands of the Zionists and has been for centuries.

7.5.1 Nazism is a Stalking Horse for Zionism and Communism

Adolf Hitler was a former Bolshevik with connections to members of the *Thule-Gesellschaft*—a subversive organization founded by crypto-Jewish Zionists on the Illuminati model to foment an anti-Semitic revolution that would force the Jews out of Europe and into Palestine. Hitler was filmed marching in the funeral procession of Jewish Communist Kurt Eisner, who led a short-lived Soviet Republic in Munich at the end of the First World War. Hitler was a Bolshevik and a Zionist with many strong ties to the Jewish community. He surrounded himself with Jews and crypto-Jews throughout his life.

To many of his contemporaries, Hitler appeared to be a Jewish actor, comically spoofing a ranting anti-Semitic demagogue. Many of Hitler’s contemporaries knew that Hitler was a Red subversive who was trying to weasel his way into power through Jew-baiting, and pretending to fight Bolshevism, in order to convert Germany into a Zionist Bolshevist nation led by crypto-Jews. This was a common Communist tactic. At the same time, American Jewish Communists were also Jew-baiting and trying to attract a following through the use of anti-Semitic propaganda in an effort to use anti-Jewish prejudice as a means to fulfill Jewish prophecy and put Jews in power around the world. This was an old Frankist trick. One could even say that Christianity served the same purpose.

The Soviet Union tried to subvert Moslem nations with anti-Israeli positions meant to lure Moslem nations into turning Communist and to make it appear that Israel was a necessary ally to the United States and Western Europe. If the Moslem nations had gone Communist, Israel, which itself had a Communist Party, would then have had complete control over those nations, which undoubtedly would have been ruled by crypto-Jews or Jewish agents. In a short period of time, the Moslem faith would have been proscribed, and the Moslems, even in the oil rich nations, would have found themselves completely ruined and in abject poverty. The current President of Iran is serving Israel’s interests by making anti-Israeli statements which
serve as a spurious pretext for war. The Israelis have placed crypto-Jews and Jewish agents in power throughout the Middle East and have organized anti-Israeli terrorist organizations so as to provide Israel with pretexts to attack and dehumanize Moslems.

The Nazi Party’s platform of “The 25 Points” published on 24 February 1920 was so obviously Bolshevistic, that Adolf Hitler had to apologize for it on 13 April 1928 in order to appease the German Capitalists who had sponsored Hitler believing he would fight Bolshevism and fatten their pockets with profitable wars against the Bolsheviks,

“Oh April 13th, 1928, Adolf Hitler made the following declaration:

It is necessary to reply to the false interpretation on the part of our opponents of Point 17 of the Programme of the N.S.D.A.P.

Since the N. S. D. A. P. admits the principle of private property, it is obvious that the expression ‘confiscation without compensation’ merely refers to possible legal powers to confiscate, if necessary, land illegally acquired, or not administered in accordance with national welfare. It is directed in accordance with national welfare. It is directed in the first instance against the Jewish companies which speculate in land.

Munich, April 13th, 1928.

(signed) Adolf Hitler.”

The Nazis wanted to eliminate class differences, abolish personal property and make businesses communal.

Nazism was in many respects quite Marxist. When the NSDAP began, many in the Freikorps believed that Adolf Hitler was a Communist and that the Nazis were “Reds”. The term “NAZI” comes from the party’s name, Nationalsozialistische Deutsche Arbeiterpartei, or “National Socialist German Worker’s Party”; which sounded very much like the older Communist parties Allgemeiner Deutscher Arbeiter-Verein, or “Universal German Worker’s Union”; and Sozialdemokratische Arbeiterpartei, or “Social Democrat Worker’s Party”. Ernst Röhm, Chief of the SA, was very liberal minded and sought support from Communists. Gregor Strasser was another Communist Nazi. When Hitler made it very clear that he would protect the interests of the wealthy capitalists who supported him financially, while stating that he reserved the right to confiscate land for the State, it confused many Socialists who weren’t sure whether Hitler embraced Socialism or Capitalism. Though the Nazis sought to distance themselves from Bolshevism, their propaganda of revolution and worker’s rights was often directly copied from Bolshevik propaganda.

Indeed, archival footage shows that Hitler marched with a detachment from his regiment in the funeral procession of the Jewish Communist Kurt Eisner in February of 1919. Eisner was shot after the Bavarian Revolution in November, 1918. Hitler’s group wore both red and black armbands to sponsor Socialism and to mourn the death of a Socialist revolutionary. Soon thereafter, Bolshevists established a Soviet Republic in Bavaria, and Adolf Hitler became a spokesman for the Soviet Counsel. After the Bolshevik Revolution was suppressed, Hitler began to work for
the Right as an anti-Bolshevist and an anti-Jewish propagandist. But he soon showed
his true colors as a devoted Communist Red working towards a controlled opposition
when he turned the rightist party to the left and converted the DAP into the NSDAP.
In the Bolshevik totalitarian tradition, Hitler eventually destroyed all political parties
but his. Like other crypto-Jewish Bolshevik tyrants, he wanted a thoroughly
homogenous State with only one political party, Socialism.

Hermann Rauschning, who was himself at one time a powerful Nazi leader,
写了 several books in the late 1930's and early 1940's, which alleged that many
Nazis were essentially Bolshevik revolutionaries and that Hitler was in many
respects seen by them as a Marxist revolutionary. Rauschning knew in advance
that Hitler would turn on Russia. Rauschning, who made it clear that he believed
Hitler hated Bolshevists, stated in 1939,

“There has been from the beginning in the National Socialist Party a group
favoring close alliance with Soviet Russia. [***] It insisted upon the need to
create this continental line as the foundation for a new world order — not
through war, but through an alliance with Russia. After all, the advocates of
this scheme said, it mattered little whether the vast empire was National
Socialist or Bolshevik. The differences were, in their opinion, of no
importance as against the larger world-revolutionary tasks of rational
economic planning, of creating the new social order, and a ‘just’
redistribution of the world’s wealth. It was not of such paramount
importance, in the end, whether Germans or Russians would come out on top
in this close symbiosis of Germany and Russia. What really mattered was the
finish of the democratic order, free economy, and capitalism. Though he did
not accept these ideas, Hitler never rejected them.”

Though he was considered highly credible for many years, several researchers
have discredited Rauschning’s claim to have had numerous conversations with
Hitler, and he is today disregarded as a historical witness to Hitler’s personality.
Regardless of these facts and allegations, many of Rauschning’s general predictions
came true and he was a witness to, and a member of, the inner circles of the Nazi
hierarchy. His statements with respect to the redder tones of Nazism are verified by
the actions and beliefs of Ernst Röhm and the fact that many sincere Socialists
became uneasy and began to leave the Party in the 1930's when it became clear that
Capitalism was still king. Adolf Hitler was more devoted to Zionism than to
Communism. He was put into power to create a “Jewish State” and for those who put
him in power, Communism was a transitory means to achieve that end.

The seemingly paradoxical accusation, that both Capitalism and Marxism are
ultimately centralized Jewish movements, can be explained in many ways. It is
usually dismissed as paranoia sponsored by The Protocols of the Learned Elders of
Zion, which presents a plan to pit Liberals against Conservatives, in order to weaken
and confuse both groups, and in order to control all government from behind the
scenes without detection and regardless of which political persuasion is in power at
any particular time in any given place. Jewish financiers had sponsored an arms build
up in opposing empires, which led to the First World War, through their control of news media by direct ownership, tribal loyalty and with advertising dollars. Their media control gave them control over public opinion and control over politicians. Jewish financiers funded the Bolshevik Revolution in Russia in order to free the Jews there from the Pale of Settlement and to seize the reins of power in Russia and rob the nation of its vast wealth. The artificial struggle between Capitalists and Communists weakened peoples and states and left them vulnerable to Jewish exploitation and totalitarian control. The constant war resulting from the battles of Capitalism and Communism suppressed the masses, weakened the nations in preparation for world revolution, and enriched the Jewish arms dealers and bankers.

A large branch of the Nazis, primarily under the leadership of Ernst Röhm, were in greater sympathy with the Communists than the Zionists. The industrialists who sponsored Hitler were vehemently anti-Communist Capitalists. Hitler was more of a Zionist than a Communist. He knew that the primary goal of Communism was to destroy Gentile society. Hitler’s primary goal was the establishment of the “Jewish State”. Like many top Bolshevik dictators, he did not care about the working class.

The Zionists hated the Capitalism that enabled and sponsored Jewish assimilation and the Zionists hated the anti-nationalistic Communism which led to “Red Assimilation”. This is why Bolshevism morphed into Nazism, which destroyed both assimilationist Capitalism and assimilationist Communism. Zionist Berl Katzenelson stated,

“[...they enjoy emancipation purchased through assimilation in capitalistic France and communistic Russia[...]]”

Racist political Zionist Theodor Herzl stated in his book *The Jewish State*,

“When we sink, we become a revolutionary proletariat, the subordinate officers of the revolutionary party; when we rise, there rises also our terrible power of the purse. [***] Again, people will say that I am furnishing the Anti-Semites with weapons. Why so? Because I admit the truth? Because I do not maintain that there are none but excellent men amongst us? Again, people will say that I am showing our enemies the way to injure us. This I absolutely dispute. My proposal could only be carried out with the free consent of a majority of Jews. Individuals or even powerful bodies of Jews might be attacked, but Governments will take no action against the collective nation. The equal rights of Jews before the law cannot be withdrawn where they have once been conceded; for the first attempt at withdrawal would immediately drive all Jews rich and poor alike, into the ranks of the revolutionary party. The first official violation of Jewish liberties invariably brings about economic crisis. Therefore no weapons can be effectually used against us, because these cut the hands that wield them.”

The Nazis’ attacks on Jews aided the Zionists’ agenda of forcing rich assimilationist Jews towards Zionism, and punishing them for their opposition to it,
Nazism is Zionism

as was accomplished by brutal Nazi persecution; while concurrently eliminating the
sanctuary that Marxist nations afforded liberated Jews; as was accomplished by the
Nazi invasion of the Soviet Union—these being major objectives of both Theodor
Herzl and Chaim Weizmann, as evinced in Herzl’s diaries1628 and Weizmann’s
autobiography.1629 Hitler’s strategies in some ways copied those of Napoleon and in
some ways were opposites of those of Napoleon. Both Napoleon and Hitler were
Zionists who seemingly irrationally attacked Russia in order in part to force, or to
enable, Jews to move to Palestine. Both had Zionist allies and both fit the Zionist
mold of a dictator. Napoleon sought to fulfill the Zionist dream of the Jews with
philo-Semitism. After Napoleon failed, Hitler sought to fulfill the Zionist dream of
the Jews with anti-Semitism, and succeeded.

In an article in 1943 in which he acknowledged that the First World War freed
the Jews of central and eastern Europe then led to rabid anti-Semitism, and in which
he acknowledged that the Zionists had allies in the newspapers of New York and in
American Presidents from “Wilson down”, Zionist Rabbi Abba Hillel Silver
emphasized the importance of America to Zionism and called for “American Israel”
to unite behind Zionism. Hillel also recognized the repeated Zionist connections
between revolutions, emancipation, assimilation, anti-Semitism and world war,

“The story of Jewish emancipation in Europe from the day after the French
Revolution to the day before the Nazi revolution is the story of political
positions captured in the face of stubborn and sullen opposition, which left
our emancipated minority in each country encamped within an unbeaten and
unreconciled opposition, so that at the slightest provocation, as soon as things
got out of order, the opposition returned to the attack and inflicted grievous
wounds. And in our day, stirred by the political and economic struggles
which have torn nations apart, this never-failing, never-reconciled opposition
swept over the Jewish political and economic positions in Europe and
completely demolished them. There is a stout black cord which connects the
era of Fichte in Germany with its feral cry of ‘hep, hep,’ and the era of Hitler
with its cry of ‘Jude verrecke.’ The Damascus affair of 1840 links up with
the widespread reaction after the Revolution of 1848—the Mortara affair of
Italy; the Christian Socialist Movement in the era of Bismarck; the Tisza-
Eszlar affair in Hungary; the revival of blood accusations in Bohemia; the
pogroms in the eighties in Russia; La France Juive and the Dreyfus affair in
France; the pogroms of 1903; the Ukrainian blood baths after the last war,
and the human slaughter houses of Poland in this war.”1630

Some political Zionists wanted to unite the Jews of the world, gather them
together and forcibly expel them to Palestine, punishing those who had abandoned
Israel with death as was prophesied in the Old Testament. German Bolshevnik
movements were often led by Eastern European Jews. Anti-Bolshevik movements
were also led by Eastern European Bolshevik Jews, who wanted a controlled
opposition they could use to sponsor revolutions which would ultimately place them
in power in fulfillment of Jewish Messianic prophecy. This controlled opposition
became known as “The Trust”. They followed the example of “Judas”—the “Jew”, who placed “Jesus”—the “Jew” on the throne of the Messiah by betraying him and fulfilling the Old Testament Jewish prophecy, which saved the Jewish Nation (Zechariah 11:12. Matthew 27:9).

The Jewish bankers may well have been inspired by the story of Judas the “Jew” and Jesus the “Jew” to betray the Jews of Europe into a Holocaust of the Jewish bankers’ design, and in so doing to have fulfilled Jewish prophecy. Note that the story of Jesus and Judas is suspiciously similar to the story of Julius Cæsar and Brutus—the story of a man who would be king and his friend turned betrayer who caused his murder and so saved the nation. Note further that the parallel between Judas and Brutus was captured in the story of Dante’s Inferno, and that John Wilkes Booth, the Jewish actor who assassinated President Lincoln perhaps at the behest of the Jewish bankers, likened himself to Brutus.

Eastern European Jews were the most ardent political Zionists. The Bolsheviks were among the most dogmatic thinkers, the most ruthless and undemocratic tyrants the world has ever known; and, like the Nazis, they had no compunctions about forcing people into acts they would not voluntarily commit. Both the Nazis and the Bolsheviks outlawed all rival political parties in territories under their control. Their rigid dogmatism and totalitarianism were typically Judaic, as were their terror tactics and genocides meant to segregate Jews.

Throughout its existence, the Nazi regime preached revolution by the working class. Like many totalitarian Socialist regimes, National Socialism punished free thought and banned all political parties other than National Socialism. While preaching the superiority of the “Nordic race”, it subverted the intellectual growth of Northern Europe and promoted Gleichschaltung and the Ermächtigungsgesetz, which enslaved and degraded the German People in the same way Stalin enslaved the Soviets. This resulted in the degradation of German culture and the growth of the decadent mythologies of Germanenorden.

Hitler attacked German and European society in the exact way he alleged that Jews sought to undermine it. In the name of rescuing Europe from Jewish Bolshevism, Hitler immediately destroyed the intellectual classes who opposed him or who even had the potential to oppose him. It was obvious that Hitler was an agent of the Bolsheviks and the Zionists, and was accomplishing their goals. Jewish leadership yet again used anti-Semitism as means to put Jewish agents into power who would ruin Gentile nations and segregate Jews.

The hypocrisy of Hitler’s attacks on Jews versus his own assumption of dictatorial powers was apparent in an interview he gave to Anne O’Hare McCormick which was published in The New York Times on 10 July 1933. As early as 8 April 1933, in the “Topics of the Times” Section of The New York Times on page 12, the following statement appeared,

“...Hitler’s chief enemy, over whose prostrate body he has ridden to victory, is ‘Marxism.’ But Marxism and Hitlerism are really brothers. They are both the offspring of the Absolute of Hegelian dialectic. Karl Marx, riding the theory of materialistic determinism to death, and Hitler, setting out to
reconstruct Christianity on a purely Aryan basis, are equally good illustrations of what the German mind is likely to do when it gets hold of a formula.”

The commonality of the oppression of both Bolshevist and Nazi Socialist dictatorships, and the common totalitarianism, was so obvious to so many that Goebbels protested loudly that Nazism was not Bolshevism—despite the fact that it was. In response to the comparison of Hitlerism to Stalinism in the *London Times*, Goebbels gave a speech in 1935, “Communism with the Mask Off”, in which he stated, *inter alia*,

“In the beginning of August, this year, one of the most authoritative English newspapers published a leading article entitled ‘Two Dictatorships’, in which a naive and misdirected attempt was made to place before the readers of the paper certain alleged similarities between Russian Bolshevism and German National Socialism. This article gave rise to an extraordinary amount of heated discussion in international centres, which was only another proof of the fact that an astonishing misconception exists among the most prominent West European circles as to the danger which communism presents to the life of the individual and of the nation. Such people still cling to their opinion in face of the terrible and devastating experiences of the past eighteen years in Russia.

The author of the article stated that the two symbols which are to-day opposed to one another, namely that of Bolshevism and National Socialism, stand for regimes which ‘in essential structure are similar and in many of their laws—their buttresses—are identical. The similarity is moreover increasing’. He went on to say:

‘In both countries are the same censorships on art, literature, and of course the Press, the same war on the intelligentsia, the attack on religion, and the massed display of arms, whether in the Red Square or the Tempelhofer Feld.’

‘The strange and terrible thing is’, he declared, ‘that two nations, once so widely different, should have been schooled and driven into patterns so drably similar.”

“A particularly vehement and outspoken speech was delivered on this occasion by the Reich Minister of Propaganda, Dr. Goebbels, who is the most fertile orator in new Germany, a master of the art of polemics and endowed with a rare gift for irony, and whose persuasive eloquence played a decisive part in the development of the party, especially in Berlin. In the speech in question Dr. Goebbels cited an article in a leading London
newspaper which pointed out a certain analogy between the Russian and German systems. With the help of extensive statistical and other material, Dr. Goebbels showed that the author of the article had not taken the trouble to study the fundamental and essential principles either of National Socialism or of Bolshevism; and that he was consequently not qualified to appreciate the differences which separate them.”

In 1938, Nesta Helen Webster stated that Fascism and Bolshevism were commonly considered to be the same thing, in Chapter 4, “Bolshevism and Fascism”, of her book, Germany and England, Boswell, London, (1938). She tried to convince her readers that Nazism was not Bolshevism, in spite of the obvious parallels.

Adolf Hitler was Time Magazine’s “Man of the Year” for 1938. The article on Hitler in the 2 January 1939 issue of Time stated,

“The Fascintern, with Hitler in the driver’s seat, with Mussolini, Franco and the Japanese military cabal riding behind, emerged in 1938 as an international, revolutionary movement. Rant as he might against the machinations of international Communism and international Jewry, or rave as he would that he was just a Pan-German trying to get all the Germans back in one nation, Führer Hitler had himself become the world’s No. 1 International Revolutionist—so much so that if the oft-predicted struggle between Fascism and Communism now takes place it will be only because two revolutionist dictators, Hitler and Stalin, are too big to let each other live in the same world. [***] Most cruel joke of all, however, has been played by Hitler & Co. on those German capitalists and small businessmen who once backed National Socialism as a means of saving Germany’s bourgeois economic structure from radicalism. [***] Hard-pressed for food-stuffs as well as funds, the Nazi regime has taken over large estates and in many instances collectivized agriculture, a procedure fundamentally similar to Russian Communism.”

One of the major mistakes Germany had made in the First World War was to make it easy for England to enter the war. Many have asserted that Goebbels and Hitler thought that England would stay out of the approaching second war as long as England believed that Germany would safeguard Western Europe from Bolshevism. In fact, it did not matter whether England entered the war, or not. Stalin and Hitler would not rest until Eastern Europe came under Bolshevist control. Most of the world’s Jews lived in Eastern Europe.

It worried Nazi leadership when they learned that the British public had discovered that Nazism was a twin bother to Bolshevism. German Jewish bankers and German industrialists had financed the Nazis and the Bolshevik Revolution in Russia. Some German industrialists were duped into sponsoring the attack on the Soviets, because they were glad to learn that the Nazis would attack the anti-Capitalistic Bolsheviks (whom the German industrialist had helped to put into power—they were then also the dupes of Jewish bankers, who promised them
Nazism is Zionism  

victory over Pan-Slavism and unlimited access to Russia’s vast wealth—the German industrialists did not know that the Bolsheviks would mass murder 30 million Gentiles in the first six years of their reign). They believed that perpetual war would make them rich beyond their wildest dreams.

Gentile German industrialists had become increasingly concerned by the Bolshevik Nazis, who were planning to nationalize industry. In order to dispel their fears, Hitler arrested and murdered the most outspoken Communists in the Nazi Party including Ernst Röhm and Gregor Strasser in the infamous “night of the long knives” on 30 June 1934 and 1 July 1934. After Hitler slaughtered the most obvious Bolsheviks in the Nazi Party, and concurrently killed off any potential rivals less inclined to Zionism than himself, coal magnate Emil Kirdorf reassured his fellow industrialists that Hitler was their man. Some say Emil Kirdorf was half Jewish. He had long financed and promoted Adolf Hitler and even promoted Hitler’s little book to his industrialist friends: A. Hitler, Der Weg zum Wiederaufstieg, H. Bruckmann, München, (1927).

The Nazis used both the threat of Bolshevism and the alleged need for Lebensraum as pretexts to attack Poland and then the Soviets in order to destroy Eastern Europe and ready it for a Communist takeover, and to attack the defenseless Jewish families who lived in the East and segregate them, then, it was planned, force them into a “Jewish State”. The Zionist Winston Churchill had issued the same carrot and stick threats at the same time. Churchill helped Zionist Adolf Hitler to turn Eastern Europe into a Communist bloc and to create the State of Israel—all of this vast destruction, communization and the ruin of Gentile nations and peoples, took place in the name of protecting the world from Jewish Bolshevism.

In 1932, Goebbels combined Bolshevist propaganda with anti-Semitic propaganda and misrepresented Marxism in order to mask his advocacy of its ideals. Goebbels adopted Socialism while presenting it as nationalistic racism, as opposed to international communism, which the Nazis attributed to “Jews” 1636 However, this was exactly what racist Zionist Communist National Socialist Moses Hess had proposed in the mid-Nineteenth Century. In addition, the Nazis called for world revolution as loudly as had Trotsky.

When the Nazis strengthened their hand, the Nazi propaganda, which had initially declared that Nazism differed from Bolshevism in that it was limited to a German revolution, became international, or multinational, and declared itself to be on a “world mission” to stamp out “international Bolshevism”. Russian Bolshevism had criminalized anti-Semitism on pain of death, which political Zionists feared would cause the extinction of the “Jewish race” in the East through assimilation. On this point, as with so many others, the Zionists and Nazis supported one another. Santoro continued on page 60,

“This last argument put forward by Dr. Goebbels reveals one of the main reasons of the hostility to Bolshevism manifested by the new Germany—namely, the predominance in the development of the Bolshevist creed of Jewish elements similar to those which National Socialism considers to have been the chief cause of all the evils that befell Germany after the
World War, and which have now been completely eliminated from German public life. Hitler combats Russian Bolshevism for the same motive which dictated his hostility to Marxism in Germany, which was likewise dominated by Jewish influence.

From an international point of view it is interesting to note that for the first time an allusion was made in the speech of Dr. Goebbels to the ‘world mission’ of Hitler as champion in the struggle against Bolshevism outside the German frontiers. ‘If’ (said Dr. Goebbels) ‘Germany which has been redeemed and united in the spirit of National Socialism takes the lead, at the head of all those groups which are animated by a similar spirit, in this struggle against international Bolshevism, she is convinced that over and above her national aims she has a world mission to fulfil, on the successful issue of which the fate of all civilised nations will depend.’”

The Bolsheviks were always nihilistic. They wanted to tear down society. They did not care whether Hitler won, or Stalin won, because in either event the revolution won, which is to say humanity lost. Hitler and Stalin initially had a pact which troubled unaware Jewish Communists in America, but under this pact which brought peace, they could not impart the destruction to Europe both men sought. When the time was right, they started the war the Jews had been planning for centuries.

7.5.2 Hitler and Goebbels Reveal Their True Motives at War’s End

Joseph Goebbels, who was called the “little rabbi” in school, revealed himself as a Bolshevik yet again at the end of the war when the Nazis and Bolsheviks had crushed the spirit of Eastern Europe and readied it for a Communist takeover. Goebbels rejoiced in Hitler’s “Nero Order”, which called for the destruction of Germany, for the destruction of “the last so-called achievements of the bourgeois nineteenth century”.1637

Hitler issued the “Nero Order” on 19 March 1945 and demanded the destruction of German infrastructure, industry, etc. in the hopes that the German People would be annihilated—which was his Bolshevik and Zionist goal from the very beginning. Goebbels stated,

“If the Führer were to meet an honourable death in Berlin, with Europe falling to the Bolsheviks, within five years at the latest, the Führer would become a legendary personality and National Socialism mythic, because he would have been sanctified by this greatest and last act, and all the human frailties which today people criticise him for would be wiped away at one stroke.”1638

One might conclude that Goebbels believed that Hitler would be revealed as a Bolshevik who had conquered Europe for the world revolution the Nazis had been preaching in a chorus with the Bolsheviks from the beginnings of the Nazi movement. One might alternatively conclude that Goebbels believed that Hitler
would be seen as a hero because he had opposed the Bolsheviks, who would certainly impose terror on a conquered Europe. An eyewitness account of some of Goebbels’ last words provides us with a means to determine his intentions—to determine that he was as an agent provocateur for the Bolsheviks—and the Zionists,

“the German people deserved the fate that awaited them. . . . [Goebbels] remarked cynically that the German people had after all chosen this fate themselves. ‘In the referendum on Germany’s quitting the League of Nations they chose in a free vote to reject a policy of subordination and in favour of a bold gamble. Well, the gamble hadn’t come off. . . . Yes, that may surprise some people, including my colleagues. But have no illusions. I never compelled anybody to work for me, just as we didn’t compel the German people. They themselves gave us the job to do. Why did you work with me? Now, you’ll have your little throat cut.’ Striding towards the door, [Goebbels] turned round once more and shouted: ‘but the earth will shake as we leave the scene.’”

Goebbels murdered his wife and children at the end of the war. He was never close to them. He preferred dark-haired Jewish women to his “Aryan” wife.

In the last days of the war on 16 April 1945, Hitler proclaimed,

“For the last time the Jewish-Bolshevik deadly foe has come forth with his masses to attack. He is seeking to destroy Germany and to exterminate our people. Many of you soldiers from the East already know yourselves what fate threatens above all German women and children. While the elderly, menfolk and children will be murdered, women and girls will be degraded into barrack-room whores. The rest will be marched off to Siberia.”

The best means Hitler had to ensure that the Bolsheviks would impose this horrible fate on the Germans was for the Nazis to continue to fight the Soviets and to resist any attempts at a negotiated peace that would end the destruction of Germany and it secure its borders from a Soviet takeover. Nazi leaders Rudolf Hess and Heinrich Himmler sought peace at the beginning, and at the end of the war, and both were silenced by the British. Goebbels relished the fact that the crimes the Nazis committed against the Jews would mean that the Germans would have to fight to the very end and consume themselves.

Hitler continued the war in the knowledge and the hopes that his failure to seek peace terms would lead to the destruction of Germany and the extermination of the German People, and note that he knew that the war was killing off the best of the German’s genetic stock,

“If the war is to be lost, the nation will also perish. This fate is inevitable. There is no need to consider the basis of a most primitive existence any longer. On the contrary it is better to destroy even that, and to destroy it ourselves. The nation will have proved itself the weaker and the future will
belong exclusively to the stronger Eastern nation. Those who remain alive after the battles are over are in any case only inferior persons, since the best have fallen.”

Hitler stated,

“That is the decision. To save everything here, and only here, and to deploy the last man, that is our duty.”

Hitler, who had once stated that Oliver Cromwell was his hero—Oliver Cromwell who had emancipated the Jews and welcomed them to England—Cromwell the Puritan revolutionary who had declared the Pope in Rome to be the anti-Christ—this Adolf Hitler likened himself to Napoleon, the revolutionary who had emancipated the Jews of Europe—Napoleon who had fought to take Palestine for the Jews—Napoleon who had suicidally attacked Russia in order to emancipate its Jews and bring them to Palestine—Adolf Hitler iterated the nihilistic Bolshevistic mantra:

“I have been Europe’s last hope. She proved incapable of refashioning herself by means of voluntary reforms. She showed herself impervious to charm and persuasion. To take her I had to use violence.

Europe can be built only on a foundation of ruins. Not material ruins, but ruins of vested interests and economic coalitions, of mental rigidity and narrow-mindedness. Europe must be refashioned in the common interest of all and without regard for individuals. Napoleon understood this perfectly.

I, better than anyone else, can well imagine the torments suffered by Napoleon, longing, as he was, for the triumph of peace and yet compelled to continue waging war, without ceasing, and without seeing any prospect of ceasing—and still persisting in the hope eternal of at last achieving peace.”

Like Napoleon, Hitler was viewed by his subjects as a messiah.

Hennecke Kardel entertained the possibility of links between Jewish self-hatred among the Nazi hierarchy, Nazism, Bolshevism, Zionism and Jewish financing in his book *Adolf Hitler, Begründer Israels*, Verlag Marva, Genf, (1974); English translation *Adolf Hitler: Founder of Israel*, Modjeskis’ Society Dedicated to Preservation of Cultures, San Diego, (1997). Though it is often claimed that Hitler and other Nazi leaders who were of mixed Jewish descent, or in some instances pure Jewish descent, were self-hating Jews; it is more likely that they hated the “Aryans” far more, their eternal enemy Esau, whom they did so much to destroy.

Zionist racist Moses Hess stated in 1862 that the only obstacle to the success of Zionism was the reluctance of cultured Jews to accept their fate and move to Palestine. Hess forecast the Nazi régime in 1862, established most of its tenets, and predicted that the assimilatory aspirations of cultured Jews would “be shattered only by a blow from without,” a blow that would “close their ephemeral existence”. Hess concluded his racist Zionist treatise *Rome and Jerusalem* with the apocalyptic
Nazism is Zionism

forecast:

“In contradistinction to orthodoxy, which cannot be destroyed by an external force without at the same time endangering the embryo of Jewish Nationalism that slumbers within it, the hard covering that surrounds the hearts of our cultured Jews will be shattered only by a blow from without, one that world events are already preparing; and which will probably fall in the near future. The old frame-work of European Society, battered so often by the storms of revolution, is cracking and groaning on all sides. It can no longer stand a storm. Those who stand between revolution and reaction, the mediators, who have an appointed purpose to push modern Society on its path of progress, will after society becomes strong and progressive, be swallowed up by it. The nurses of progress, who would undertake to teach the Creator himself wisdom, prudence and economy; those carriers of culture, the saviors of Society, the speculators in politics, philosophy and religion, will not survive the last storm. And along with the other nurses of progress our Jewish reformers will also close their ephemeral existence. On the other hand, the Jewish people, along with other historical nations will, after this last catastrophe, the approach of which is attested by unmistakable signs of the times, receive its full rights as a people.

‘Remember the days of old,  
Consider the years of many generations;  
Ask thy father and he will tell thee,  
Thy elders and they will inform thee,  
When the Most High divided to the nations their inheritance,  
When he separated the sons of Adam,  
He set the bounds of the peoples  
According to the number of the Children of Israel.’[Footnote: Deut. xxxii, 7-8.]

Just as after the last catastrophe of organic life, when the historical races came into the world’s arena, there came their division into tribes, and the position and rôle of the latter was determined, so after the last catastrophe in social life, when the spirit of humanity shall have reached its maturity, will our people, with the other historical people, find its legitimate place in universal history.”

When the pressure from without of Nazism failed to persuade the cultured Jews of Europe to move to Palestine, Hitler set out to fulfill his promise of 1939,

“If international finance Jewry in and outside Europe succeeds in plunging the peoples into another world war, then the end result will not be the Bolshevization of the earth and the consequent victory of Jewry but the
annihilation of the Jewish race in Europe.\footnote{1646}

“Wenn es dem internationalen Finanzjudentum in und außerhalb Europas gelingen sollte, die Völker noch einmal in einen Weltkrieg zu stürzen, dann wird das Ergebnis nicht der Sieg des Judentums sein, sondern die Vernichtung der jüdischen Rasse in Europa!”\footnote{1647}

The Jewish Nazi tyrant of Poland, Dr. Hans Frank, stated at a Cabinet Session on 16 December 1941,

“As far as the Jews are concerned, I want to tell you quite frankly, that they must be done away with in one way or another. The Fuehrer said once: should united Jewry again succeed in provoking a world war, the blood of not only the nations which have been forced into the war by them, will be shed, but the Jew will have found his end in Europe.”\footnote{1648}

Did the crypto-Jewish Zionists Adolf Hitler and Hans Frank mean that they would exterminate the Jews of Europe in death camps, or did they mean that they would deport the Jews of Europe to Palestine as a final solution to the Jewish question? Frank was a long-term Zionist who wanted to segregate the Jews in Polish concentration camps and then ship them to Palestine—not to say that he did not intend to kill off a large percentage of his brethren in the process. In the fall of 1933 in Nuremberg on Reichsparteitag, Frank stated that his goal was to secure a “Jewish State”,

“Unbeschadet unseres Willens, uns mit den Juden auseinanderzusetzen, ist die Sicherheit und das Leben der Juden in Deutschland staatlich, reichsamtlich und juristisch nicht gefährdet. Die Judenfrage ist rechtlich nur dadurch zu lösen, dass man an die Frage eines jüdischen Staates herangeht.”\footnote{1649}

The Zionists had always viewed wealthy Jewish assimilationists as their arch-enemy in their struggle to force Jews to Palestine against their will. Hitler’s last testament states, among other things,

“But I left no doubt about the fact that if the peoples of Europe were again to be treated as so many packages of shares by these international money and finance conspirators, then the people who bear the real guilt for this murderous struggle would also have to answer for it: the Jews! It also left no doubt that this time we would not permit millions of European children of Aryan descent to die of hunger, or millions of grown-up men to suffer death, or hundreds of thousands of women and children to be burned and bombed to death in the cities, without the real culprit suffering his due punishment, though in a more humane way.”\footnote{1650}
Hitler was put into power by political Zionists to create an anti-Semitic Bolshevist revolution in Europe that would destroy the intellectual class, all forms of Monarchy and would place the working class proletariat in the hands of absolute Jewish rule, in achievement of the Messianic vision of racist Zionists like Moses Hess and Theodor Herzl. Since it was the goal of political Zionists to eliminate the sanctuary that Marxism afforded Jews, Hitler preached anti-Semitism while concurrently preaching “World Revolution”, i.e. thinly veiled Bolshevism. Among Adolf Hitler’s first anti-Semitic statements after leaving Bolshevism to become an anti-Semitic propagandist was his assertion that the fight against Bolshevism meant the extirpation of the Jews—which was also a goal of the political Zionists. Hitler later inexplicably attacked the Soviet State in which Jews were becoming assimilated. Hitler attempted to create an anti-Semitic Bolshevist tyranny in Europe and to found a Jewish State to provide a homeland for forcibly expelled Jews. Liebenfels, Rosenberg and the other architects of Nazi ideology had always sponsored Zionism as a right of expelled Jews, in full agreement with Theodor Herzl’s prescriptions for a final resolution to the Jewish question.

Why did not the Russian Bolsheviks do to the Jews what the Nazis later would, if Jewish leadership controlled both movements? There are several reasons. While some Zionists predicted that assimilation would take place after the revolution emancipated the Jews, there were also many Zionists who hoped that the Russian People were too anti-Semitic and the Jews were of Russia were too racist and tribalistic for assimilation to occur in the East. Another reason is that the Zionists hoped to found a “Jewish State” soon after the war and they wanted to maintain Russia as a source of wealth and power and leverage against the Moslems of the Middle East, or, alternatively, they wanted to found a “Jewish State” in formerly Soviet territory. Yet another reason is that there were far greater numbers of Jews in Russia than in Germany, and the Bolshevik Revolution in Russia would not as easily have succeeded with a Nazi-style party platform, which, given the Jewish propaganda of the time, would not have appeared to have differed greatly from the Czar’s platform as depicted in the press. There are several other more obvious reasons.

The Nazis eventually and inevitably lost their perpetual war of revolution on the world. Hitler’s posthumously published sequel to his Mein Kampf, which sequel was written in 1928, asserted that “eternal war” was a doomed proposition. He must have known that his completely unnecessary declarations of war against the United States and the Soviet Union were suicidal to the German Nation. He knew the history of the First World War. It seems that he was either a complete fool, or was bent on destroying Germany, Communizing Europe and founding a “Jewish State” at the expense of the World. Given that Hitler’s régime so exactly fulfilled Jewish Messianic prophecy, and given that Hitler had so many relations with Zionists, and further given that Jews who sought to fulfill those Jewish Messianic prophecies put Adolf Hitler into power, the “coincidences” are too many and too unlikely to have been the products of chance.

7.5.3 Zionists and Communists Delight in Massive Human Sacrifices to the
Jewish Messianic Cause

The Second World War ended in 1945 with Albert Einstein’s 1915 vision of a divided and destroyed Germany made real. Communism was infinitely stronger than before the war and it looked as if France, Greece, Italy, Germany and even England, in their weakened state, would succumb to it. Zionists used the Nazis’ crimes against Jews, which the Zionist Jews intentionally caused, to justify the formation of the State of Israel, and the theft of Palestine, and the perpetual vilification of the Moslems.

Since the ancient Diaspora, all previous attempts to found a State of Israel had failed and the outlook for Jews after the First World War was near total assimilation, and, in the racist minds of political Zionists, the consequent extermination of the “Jewish race”. They were, in fact, desperate enough to create the Nazis as a means achieve their ends and they believed Jewish Messianic prophecy fully justified their treachery.

In 1921, political Zionist Jakob Klatzkin stated,

“[I applaud] the contribution of our enemies in the continuance of Jewry in eastern Europe. [***] We ought to be thankful to our oppressors that they closed the gates of assimilation to us and took care that our people were concentrated and not dispersed, segregatedly united and not diffusely mixed [***] One ought to investigate in the West and note the great share which antisemitism had in the continuance of Jewry and in all the emotions and movements of our national rebirth. [***] Truly our enemies have done much for the strengthening of Judaism in the diaspora. [***] Experience teaches that the liberals have understood better than the antisemites how to destroy us as a nation. [***] We are, in a word, naturally foreigners; we are an alien nation in your midst and we want to remain one.”

In 1898, Nachman Syrkin wrote,

“Nonetheless, the enemy has always considered the Jews a nation, and they have always known themselves as such.”

In 1945, after the Zionist Nazi atrocities, Albert Einstein callously reminded the world of the Balfour Declaration and the Palestine Mandate in order to exploit the tragedy of the Holocaust the Zionists had deliberately caused. Einstein used the Holocaust to justify the fulfilment of his pre-Nazi political Zionist agenda. Einstein asserted that the Holocaust proved that the world thought of the Jews as a nation. Genocidal human sacrifice had long been a Judaic tradition, and in more recent times, Friedrich Engels made it clear that the Communists were comfortable with human sacrifices amounting to ten million lives lost in order to prepare the way for revolution and Communist world dominance. In 1887, Frederick Engels knew that the First World War was coming and that it would destroy the Empires of Europe and leave them ripe for revolution,
“No other war is now possible for Prussia-Germany than a world war, and indeed a world war of hitherto unimagined sweep and violence. Eight to ten million soldiers will mutually kill each other off, and in the process devour Europe barer than any swarm of locusts ever did. The desolation of the Thirty Years’ War compressed into three or four years and spread over the entire continent: famine, plague, general savagery, taking possession both of the armies and of the masses of the people, as a result of universal want; hopeless demoralization of our complex institutions of trade, industry and credit, ending in universal bankruptcy; collapse of the old states and their traditional statecraft, so that crowns will roll over the pavements by the dozens and no one be found to pick them up; absolute impossibility of foreseeing where this will end, or who will emerge victor from the general struggle. Only one result is absolutely sure: general exhaustion and the creation of the conditions for the final victory of the working class.”

In 1945, Einstein wrote, among other things,

“[The Jews’] status as a uniform political group is proved to be a fact by the behavior of their enemies. Hence in striving toward a stabilization of the international situation they should be considered as though they were a nation in the customary sense of the word. [***] In parts of Europe Jewish life will probably be impossible for years to come. In decades of hard work and voluntary financial aid the Jews have restored the soil of Palestine to fertility. All these sacrifices were made because of trust in the officially sanctioned promise given by the governments in question after the last war, namely that the Jewish people were to be given a secure home in their ancient Palestinian country. To put it mildly, the fulfillment of this promise has been but hesitant and partial. Now that the Jews—especially the Jews in Palestine—have in this war too rendered a valuable contribution, the promise must be forcibly called to mind. The demand must be put forward that Palestine, within the limits of its economic capacity, be thrown open to Jewish immigration. If supranational institutions are to win that confidence that must form the most important buttress for their endurance, then it must be shown above all that those who, trusting to these institutions, have made the heaviest sacrifices are not defrauded.”

Einstein’s statements prove that the human sacrifice of countless Jewish lives in the Zionist Holocaust had not changed the nationalistic racism of the political Zionists at all, but rather had strengthened their hand—in fulfillment of the Zionists’ expressed plans. The racist Zionists had no regrets over their mass murder of Jews and they rejoiced at their slaughter of Gentiles. In the 1890’s, Bernard Lazare iterated the Zionist mantra:

“It is because the Jews are a nation that anti-Semitism exists. [***] If the cause of anti-Semitism is the existence of the Jews as a nationality, its effect
is to make this nationality more tangible for the Jews, to make them more aware of the fact that they are a people."^{1657}

Albert Einstein told Peter A. Bucky that the Holocaust had the benefit of uniting “all the Jews in the world”:

“But the suffering had not been in vain, in Einstein’s view. He felt that the Jews who died in Hitler’s pogroms had strengthened the bond uniting all of the Jews in the world.”^{1658}

Einstein was simply repeating the Zionist party line, as expressed by Rabbi Abba Hillel Silver in 1943,

“Should not, I ask you fellow Jews, ought not, the incalculable and unspeakable suffering of our people and the oceans of blood which we have shed in this war and in all the wars of the centuries; should not the myriad martyrs of our people, as well as the magnificent heroism and the vast sacrifices of our brave soldier sons who are today fighting on all the battle fronts of the world—should not all this be compensated for finally and at long last with the re-establishment of a free Jewish Commonwealth?”^{1659}

Did it occur to no one that the world, including the Jews, would be far better off if racist Zionism and Jewish tribalism were eradicated, rather than further justified, as a result of yet another massive Jewish tragedy? What, other than Jewish racism, prevented a massive drive for assimilation world-wide after the Holocaust?

### 7.5.4 Einstein Lulls Jews into Complacency—The Zionist Trap

After the Second World War and the Holocaust were over, few Jews wanted to emigrate to Palestine, despite the racist Zionists’ best efforts to destroy their lives and make it impossible for them to live anywhere else. They had had enough of racist segregation. The Zionists then again employed corruption and the manipulation of public opinion to coerce Jews into moving to Palestine against their will and better natures.^{1660}

Einstein had long known that the Zionists would put a Hitler into power to attack European Jewry. Paul Ehrenfest made an interesting comment in an 8 February 1920 letter to Albert Einstein—a racist political Zionist who believed that anti-Semitism was the salvation of the Jews. Ehrenfest stated that the Zionists had commissioned a Hitler to save them from assimilation,

“Something quite discontinuous is about to happen in Europe now, isn’t that true?—And on this occasion a devil will surely come, on special commission to grab all Jews in Europe uniformly and synchronously by the scruff of the neck and give them a tremendous shake. Will the great miracle then happen that our prophets foresee, which will awaken and unite us all, orthodox and
Nazism is Zionism  1531

athists alike, to a new living faith?—Maybe you have already seen something of it, even just a hint? I can’t see it anywhere yet.”1661

Ehrenfest had earlier written to Einstein that an old and very influential Zionist Prof. Oppenheim had warned him that Zionists ought not to mix with secular Jews, who were not, in his view, Jews at all.1662 A sorry fate awaited secular Jews at the hands of the anti-Semites the Zionists had commissioned on special order. After stating that it was not in his nature to lie to the public with the dishonest Zionist propaganda claiming that Einstein was a “Jewish Newton”, Ehrenfest expressed doubts about acting immorally and wrote to Einstein on 9 December 1919,

“But God only knows, this old man may be right: maybe salvation of the masses can only be bought by the hardest sacrifice—sacrificing the last remnants of ‘purity.’ [Please don’t read this as elegant empty words!]—Well, maybe that’s how it is—but then my powers do not suffice.”1663

Disturbed that Jews were perpetually defining themselves by a persecution myth—this many years, decades, centuries, before the appearance of the Holocaust the Zionists themselves created—a myth which made their lives easier in that it gave them unfair advantages in society and unburdened them from an existential quest for Self: Ralph Philip Boas identified many of the circumstances in America in 1921, which led to the Holocaust in Europe, including Jewish racism, the Jewish love of manufactured martyrdom, the lack of a genuine raison d’être for Judaism in the Twentieth Century, and the need of a common enemy to prevent the Jews from extinction through assimilation—the glorification of the myth that Gentile kindness is the worst enemy of the Jews and that anti-Semitism is the Jews’ salvation from integration:

“Despite the fact that we are ceasing to persecute people who disagree with us in religion or politics, we only dimly realize that one of the greatest evils of persecution is the fact that it saves its victims the trouble of justifying themselves. Persecution begets martyrdom, a glory as lacking in reason as its progenitor. Whether Sir Roger Casement was right or not is now only an academic question; his execution, by enshrining him forever in the Pantheon of Irish martyrs, makes the heart rather than the mind his judge. So it is with the Jews. Jews have not troubled themselves to justify, on any rational ground, the tenacious fight of their race against the storms of nineteen centuries of persecution. The fight has been its own justification. Obviously, a race that has endured what theirs has withstood must have some glorious mission to perform; to define that mission would be an element of positive weakness, since their enemies would then have a chance to meet them on the ground of reason, where their peculiar virtues, tenacity, single-mindedness, and pliant heroism, would avail them nothing.

It is, therefore, a happy chance for the American Jew that his age-long persecution has either ended or has degenerated into petty social
discrimination. For he must now realize that the day has gone when he could justify himself by recalling his heroic miseries. In other days and other countries he faced only the problems of existence. New ideas and opportunities could not pass the walls of the ghetto; custom made adherence to old ceremonies and beliefs not only easy but imperative. The Sabbath was the one day on which the Jew could be a man instead of a thing; the recurrent holidays gave him his one outlet for the emotions rigidly suppressed in daily life; the study and analysis of the Law and the Talmud furnished the intellectual exercise that his eager mind was denied in the schools and the learned circles of the country which tolerated him. The very fact that he was confined within a pale, therefore, made it easy for him to keep his race a distinct entity.

But now, if he is unable to find a rational ground for his religious and racial unity, he will meet a foe more insidious than persecution—the gradual disintegration of race and religious consciousness within the faith. Ironically enough, what pales, pogroms, and ghettos could not accomplish, freedom promises to bring to pass. So the time has come when the Jew in America must decide what he is going to do with and for himself; his enemies can no longer save him the effort of decision.

What is true of Europe is true also of the United States: the Jew occupies a position the importance of which is out of all proportion to his numbers. Hence the problem of Judaism is of real interest in America, because the influence which the Jew can have upon social life and the current political and financial situation depends almost entirely upon his mode of life and manner of thought. What the Jew is going to do with this self-consciousness may, to Christians, seem of little moment. It is not of that loyal kind which moves men to blow up munition factories, or to plant bombs in steamships. For others, doubtless, its implications are not of great importance. For himself, however, they are everything. His self-consciousness colors his whole point of view. It is not a simple thing. It is compounded of many factors. It is both racial and religious; it makes him both hopeful and despondent; it gives cause both for pride and for a feeling of inferiority; it makes him clannish, and it makes him long for a wider field of acquaintance. Judaism is clannish. Jews undoubtedly hang together. The combination of persecution with its inevitable concomitant, self-justification, acts as a centripetal force in driving Jews upon themselves. Just as Jews have the almost grotesque notion that a man will make his philosophic and religious convictions ‘jibe’ with his birth, so they have the wholly grotesque notion that a man should choose his friends and his wife from the small group among whom he happens to be born, though later education and environment may move him a thousand miles away. The results of this clannishness are paradoxical. For instance, the average Jew is sure that the chief reason why Anti-Semitism is everywhere ready to show its ugly head, is jealousy of the splendid history and the extraordinary
business ability of the race. At the same time he subconsciously assumes the inferiority which has long been attributed to him, covering his feelings, however, by uncalled-for justification and bitter opposition to all criticism. It is torture to him, for example, that *The Merchant of Venice* should be read in the public schools. Who can blame him? For Shylock, although undoubtedly an exaggerated character, nevertheless makes concrete those qualities the portrayal of which hurts because it bears the sting of truth.

The development of committees ‘On Purity of the Press’ in Jewish societies, and the extraordinary wire-pulling over the Russian treaty and the Immigration bill, show to what lengths this consciousness can go. It is impossible for the Jew to be entirely at ease in the world. He is introspective and suspicious, often unhappy, always sure that, for good or ill, he is a marked man among men.

There are three attitudes which Jews in this country take toward their problem—a few as a result of having thought it through, the majority as a result of the forces of inertia, environment, or chance, forces of which they themselves are perhaps not aware. Some Jews attempt to get rid of their self-consciousness by separating from the group. They deliberately set out to convince themselves that there is no difference between them and other men, and that they can act and live in all respects like other American citizens. A second group find their fellow Jews entirely satisfactory. They are conscious of a difference between themselves and others, but, living as they do in large cities where the Jewish community numbers hundreds of thousands, they feel no need of association with non-Jews other than that which they get in business. They are rich, or at least well-to-do; they have all the comforts that money can buy; they occupy fine streets and build expensive synagogues. They are willing, not only to accept their group-consciousness, but to develop it to the fullest extent by means of societies and fraternal orders. In the third place, there is a small group of Jews keenly conscious of their race, who would like to make Judaism vital as a great religion and a great tradition. They differ from the second group in that they not only accept their individuality but try to justify it. It is not sufficient for them that there should be enough Jewish organizations and undertakings to make a respectable year-book: they are interested in showing why such organizations should exist. They not only *are* Jews, but they *want to be* Jews; they want to feel that Judaism really has a mission to fulfill and a message to carry to the questioning world.

The Jew who attempts to solve his problem by separating from his community must leave the great centres of Jewish life and go to some small town where he may make a fresh start. There he will find himself in an anomalous position. He will have neither the support that comes from rubbing elbows with one’s own kind, nor the mental and moral stiffening that comes from active opposition. He will be simply an odd fish, and as such will be subject, not to antagonism, but to curiosity. What cordiality he meets with is the cordiality of curiosity. He is a strange creature, similar—on a far lower
scale of interest—to a Chinese traveler or a Hindu student. He is engaged in conversation on the ‘Jewish problem,’ or Jewish customs and history, until he sickens with trading on the race-consciousness that he is striving to forget. With cruel kindliness his friends impress upon him that his Judaism ‘makes no difference,’ with the result that he finds himself anticipating every imminent friendship by a clear statement of his race, lest the friendship be built upon the sands of prejudice. His social relations must be above reproach. A hasty word, an ill-considered action, in other men to be put down to idiosyncracy, in him is attributed to his birth. Even when there exists the frankest and most open friendship, he is continually seeing difficulties. The fathers have eaten a sour grape and the children’s teeth are set on edge. The self-consciousness that he learned in youth reappears in maturity. Whether he will or no, a Jew he remains.

If he finds his situation intolerable he may, of course, utterly and completely deny his Jewish affiliation. He may consort with Christians, join a Christian church, marry a Christian wife, and tread under foot the old associations that will occasionally cast a disagreeable shadow across his life. Unfortunately for such a solution, a cloud still hangs about the idea of apostasy. Such a refuge seems to a man of honor despicable. It is a cowardly procedure, surely, to deny one’s birth and sail under false colors, the more so since, though it does no harm to others, it gains advantage for one’s self. Why should it be treason for a Jew to abandon his religion and forget his birth any more than for a Frenchman or a Swede to do so? Probably for the reason that no one cares whether a man was born in France or not, whereas in certain circles it makes a great deal of difference if a man was born in Jewry. Furthermore, Christians feel strongly that the Jew who forsakes the religion into which he was born, does so, not because his eyes have been opened upon the truth, but because he sees in apostasy definite material advantages. The Jew who would take this means of obtaining peace, therefore, would find himself cursed by an irrational idealism which can disturb while it cannot fortify and achieve.

If, however, he returns to some great centre of Jewish life and attempts to affiliate with his own people, he is in a perilous position. He is more than likely to meet with distrust where he seeks sympathy. Jews are so extremely sensitive to criticism and so keenly conscious of the social discrimination which they encounter from Christians, that they can hardly believe that a man who seems to have lived for several years on an equal footing with Christians has not either denied his birth, in which case he has been a traitor, or has not certain qualities of mind which, since they have been palatable to Christians, must be severely critical of Jews.

And, indeed, they have, perhaps, a measure of justice in their position. It is impossible for a Jew to live apart from his race for several years without looking upon his people with a new light. For one thing, distance has enabled him to focus. He has learned to sympathize more than a little with those hotel-keepers whose ban upon Jews is a terrible thorn in the flesh of the man
whose money ought to take him anywhere. He has come to see that the
clannishness of Jews serves only to intensify what social discrimination may
exist, and to make present in the imagination much that does not. He has
realized that persecution is not necessarily justification, and that because a
Jew was blackballed at a fashionable club does not prove that he was a man
of first-rate calibre. And finally, he has perceived that there is an arrogance
of endurance as well as an arrogance of persecution, and that for a man to be
continually assuming that people are taking the trouble to despise him for his
birth, is to postulate an importance that does not exist.

On the other hand, he has, because of his distance, idealized Judaism. In
his retirement he studied the history of his people; he thrilled with their
martyrdom; he marveled at their tenacity and their fortitude. He built up for
himself on the cobweb foundation of boyhood memories, visions of the
simple nobility of Jewish ritual and ceremonies, and vague ideals of an
inspiring religious faith. He may, perhaps, have met, far more frequently than
ill-will, a sentimental and unbalanced adulation of Jews. The cult of the new
is with us, and the history, the folk-lore, the literature, and the customs of
Judaism have, for many people who pride themselves on their social
liberality, the fascination of novelty. It is the easiest thing in the world for a
Jew to yield to this sentimental tolerance, and to view his people in a rosy
light.

It is, therefore, something of a shock to him when he reënters a great
Jewish community, for he finds that the great mass of American Jews have
sunk into a comfortable materialism. What persecution could not accomplish,
success in business has brought to pass. The innate qualities of the Jew could
not save him from the fate of the Christian who has become rich in a
hurry—grossness and self-conceit. That Jeshurun waxed fat and kicked is as
true now as it ever was, and there is little reason to expect that the race which
was hopelessly cankered by national prosperity in the days of Solomon can
escape a similar fate in the twentieth century. [***] The sad result is that in
prosperity the Jewish self-consciousness ceases to be religious and becomes
merely racial.

[***]
The number of immigrants, or children of immigrants, from countries where
for centuries they have been trained in an atmosphere of slavish cunning and
worship of money, who become rich, is almost incredible. In Russia, Galicia,
or Roumania, they cultivated a self-respect by rigid adherence to dignified
and beautiful customs; in America the florid exuberance of newly acquired
wealth cannot be dignified. Clannishness, exclusion from circles of good
taste and good breeding, the infiltration of the parvenu East-European Jews,
and imitation of the most obvious aspects of Americanism—its flamboyant
tasteless materialism—all combine to make the thoughtful Jew sadly
question what hope lies in the bulk of the Jews who live in the great
American cities.

[***]
[Zionism] is actuated by a spirit of helpfulness and by an ideal of racial unity. [***] Aided by persecution and poverty, [American Judaism] furnished admirable discipline to a race naturally stubborn and tenacious. Persecution, poverty, and discipline gone, what is left?—an indistinct monotheism joined to an ethical tradition never formulated into a system, and only vaguely defined. None of the great Jewish philosophers ever succeeded in establishing a Jewish creed; indeed, there was no need of one when common suffering wrought so effectual a bond. [***] At all events it must be remembered that, since the problem of Judaism comes from intense self-consciousness, persecution and sentimental tolerance are both bad for the Jew. The one saves him the trouble of seeking out his reason for existence; the other flatters him into a belief that there is no necessity for the search. If men will treat Jews like other people, instead of nourishing their age-long notions of peculiarity, they will make it easier for time to settle the Jewish problem as it settles all others.}*\(^{1664}\)

Kurt G. W. Ludecke wrote in 1937 of Moses Pinkeles, a. k. a. Trebitsch Lincoln, a. k. a. Arthur Trebitsch, a Jew who marched with anti-Semites in the streets of Berlin, scripted their statements, and who funded Adolf Hitler and paid for his Nazi purchase of the newspaper *Münchener Beobachter* from the Thule Society, which became the Nazi Party’s official organ the *Völkischer Beobachter*.

“Another encounter in Vienna lives in my memory as something even more extraordinary. Some one introduced me to Arthur Trebitsch, and I spent a whole evening with him. His name was somewhat known through his books, *Geist und Judentum* and *Deutscher Geist oder Judentum?*, but I for my part had never heard of him; so I found myself quite unprepared for the strange discussion which ensued.

Arthur Trebitsch was a peculiar and pathetic personality, a full-blooded Jew who was an apostate from his people and his religion; who uncompromisingly attacked the Jew and the Jewish spirit in his speeches and writings, yet could not enter into the Gentile world with which he strove to ally himself. Whether the attitude which turned his life into a tragedy sprang from his mind or his emotions, I cannot say. This was the first time I had talked at length with an intellectual and erudite Jew about the German-Jewish problem, and though even among Gentiles I was now discovering a widespread doubt of the Nazi program, I was amazed to find that Trebitsch still passionately endorsed it.

Trebitsch did not consider himself a Jew, either spiritually or physically, in spite of his two Jewish parents. Convinced that he was the result of a phenomenon which biologists call “mutation,” he presented himself as a Gentile. Seriously believing that he looked very much like Houston Stewart Chamberlain, the declared scientific enemy of the Jewish people, he produced as proof one of his pamphlets which showed their pictures facing each other. Looking at his eyes and fair hair, I had to agree that the
photographs bore a striking resemblance.

Never before had I considered the Jewish problem from the standpoint of the individual Jew who finds much to condemn in his own people and dares to say so. Trebitsch was an extreme case; yet some of his findings were sound. Discovering that his people were resentful of criticism, he had turned his coat—without finding it any warmer. My mind reverted at once to the two famous apostates, Spinoza and Uriel de Acosta, who were excommunicated from the synagogues, and I reflected that there is no more sorrowful destiny than that which overtakes those who alienate their own people without making friends elsewhere.

Trebitsch sought to convince me that he could be a valuable ally in the Nazi struggle. Intuition and reason told me to remain reserved. But it was distressing to witness the despair of this exhausted and high-strung man, who beyond question was sincere. Ostracized on one side and rejected on the other, he was indeed an outcast. The tragic overtones of our interview made a deep impression on me, and at the earliest moment I spoke about him at length with Rosenberg. Needless to say, there was no place for him in the Party.”

Douglas Reed wrote in 1938 of Moses Pinkeles, a.k.a. Ignatz (Ignatius) Trebitsch-Lincoln, a Jew who financed Hitler, and of Zionists who sponsored Hitler,

“Oblivion for a few years, and then came the Kapp Putsch in Germany, the first of the Nationalist conspiracies to overthrow the democratic liberal regime that was so kind to the Jews, and reinstate the big business men, big landlords, monarchists, militarists, in the seats of the mighty in Germany. Who was a leading figure in this short-lived seizure of power? Trebitsch Lincoln, now a German die-hard. Among the other sympathizers was a relatively unknown man, one Adolf Hitler. Trebitsch Lincoln on the side of the anti-Semites? Of course, he was a Christian. [***] If you doubt me, think of Trebitsch Lincoln leading the anti-Semites down the Wilhelmstrasse to the seat of power. But I can show you the modern counterpart of Trebitsch Lincoln, and I don’t mean those pro-Hitler Jews who were said by rumour to have marched round Berlin in the early Nazi days carrying a banner with the legend ‘Hinaus mit uns!’—‘Chuck us out!’”

Eustace Mullins, Ezra Pound’s authorized biographer, stated on Daryl Bradford Smith’s radio program The French Connection, that the German-Jewish bankers Warburg and Oppenheimer marched with the Nazis carrying signs that read “throw us out”.

Prominent Zionist and author of the Encyclopaedia Judaica; das Judentum in Geschichte und Gegenwart, Jakob Klatzkin stated in 1925,

“The national viewpoint taught us to understand the true nature of antisemitism, and this understanding widens the horizons of our national
outlook. [***] In the age of enlightenment antisemitism was included among the phenomena that are likely to disappear along with other forms of prejudice and iniquity. The antisemites, so the rule stated, were the laggard elements in the march of progress. Hence, our fate is dependent on the advance of human culture, and its victory is our victory. [***] In the period of Zionism, we learned that antisemitism was a psychic-social phenomenon that derives from our existence as a nation within a nation. Hence, it cannot change, until we attain our national end. But if Zionism had fully understood its own implications, it would have arrived, not merely as a psychosociological explanation of this phenomenon, but also as a justification of it. It is right to protest against its crude expressions, but we are unjust to it and distort its nature so long as we do not recognize that essentially it is a defense of the integrity of a nation, in whose throat we are stuck, neither to be swallowed nor to be expelled. [***] And when we are unjust to this phenomenon, we are unfair to our own people. If we do not admit the rightfulness of antisemitism, we deny the rightfulness of our own nationalism. If our people is deserving and willing to live its own national life, then it is an alien body thrust into the nations among whom it lives, an alien body that insists on its own distinctive identity, reducing the domain of their life. It is right, therefore, that they should fight against us for their national integrity. [***] Know this, that it is a good sign for us that the nations of the world combat us. It is proof that our national image is not yet utterly blurred, our alienism is still felt. If the war against us should cease or be weakened, it would indicate that our image has become indistinct and our alienism softened. We shall not obtain equality of rights anywhere save at the price of an explicit or implied declaration that we are no longer a national body, but part of the body of the host-nation; or that we are willing to assimilate and become part of it. [***] Instead of establishing societies for defense against the antisemites, who want to reduce our rights, we should establish societies for defense against our friends who desire to defend our rights. [***] When Moses came to redeem the children of Israel, their leaders said to him, ‘You have made our odor evil in the eyes of Pharaoh and in the eyes of his servants, giving them a sword with which to kill us.’ Nevertheless, Moses persisted in worsening the situation of the people, and he saved them.*1667

Who was the “devil” the political Zionists commissioned to shake up the Jews of Europe? When Hitler came to power, some Zionists asked all Jews to let him do as he wished. Some Zionists even hailed him as their savior.

Leon Simon wrote in the introduction to a collection of Einstein’s Zionist works, that emancipation posed a greater threat to the Jewish “race” than the problems of the unemancipated. Hitler soon thereafter unemancipated the Jews. Simon wrote in 1930, inter alia,

“THERE are two main ways of approach to Zionism. One starts from those
Nazism is Zionism

Jews who are made to suffer for being Jews, the other from the smaller number who are not. In the one case Zionism means the transfer of masses of Jews from countries in which they are obviously not wanted to a country which they might call their own; in the other case it means the re-creation in Palestine of a Hebraic type of life, which will be regarded by all Jews as the embodiment of their own distinctive outlook and ideals, and will thus help to counteract the inevitable tendency of the Jews, when they are not driven back on themselves by external restrictions, to lose their sense of being a separate people.

Of these two conceptions of Zionism, the former has the more direct and obvious appeal. The fact that masses of Jews are made to suffer for the crime of being Jews and wishing to remain Jews is too patent to call for demonstration; and, while it is true that in some countries Jewish disabilities have been removed so far as that can be done by statute, bitter experience engenders a sceptical attitude towards the idea that universal emancipation will provide a panacea for the Jew’s troubles. In the first place, the countries with the largest numbers of Jews are not all eager to admit them to full equality; and in the second place, even where equality has been accorded, dislike of the Jew often makes itself felt too strongly for his liking or comfort. Hence, from the point of view of a Jew who wishes to see his people better off in the world than it is to-day, or has been these many centuries, there is much to commend a scheme which sets out to cut at the root of the trouble by removing all the victims of anti-Semitism to a land of their own. By contrast with this perfectly simple and intelligible idea, the other conception of Zionism appears abstruse, almost other-worldly. The problem to which it offers a solution is one of which the existence, let alone the urgency, is not, readily realised by ordinary men and women. It requires no great exercise of thought or imagination to appreciate the unenviable position of the Jewish masses, or the desirability of transporting them to a safe home of refuge. It is less easy to recognise that the emancipated Jew presents, from the point of view of Jewish survival, at least as difficult a problem as the unemancipated; that the very removal of restrictions on the political and economic freedom of the Jews in this or that country creates conditions which are more inimical than persecution to the maintenance of whatever is worthily distinctive of the Jew as such; that the consequent disintegration of an ancient people, involving the disappearance of one of the world’s great cultures, is even more tragic than the material ills of the Jewish masses; and that the paramount need of the hour is a safe home of refuge for the Jewish spirit.

7.5.4.1 Depressions Make for Fertile Ground for Anti-Semitic Zionist Dictators

Hitler had little political success until the Great Depression hit the world. The Depression, together with immense funding from Jewish financiers and from industrialists, propelled Hitler to power in early 1933. Samuel Untermeyer called for
a boycott of Germany in 1933, and chastised Jewish bankers for financing Adolf Hitler and Nazism,

“Revolting as it is, it would be an interesting study in psychology to analyze the motives, other than fear and cowardice, that have prompted Jewish bankers to lend money to Germany as they are now doing. It is in part their money that is being used by the Hitler régime in its reckless, wicked campaign of propaganda to make the world anti-Semitic; with that money they have invaded Great Britain, the United States and other countries where they have established newspapers, subsidized agents and otherwise are spending untold millions in spreading their infamous creed.

The suggestion that they use that money toward paying the honest debts they have repudiated is answered only by contemptuous sneers and silence. Meantime the infamous campaign goes on unabated with ever increasing intensity to the everlasting disgrace of the Jewish bankers who are helping to finance it and of the weaklings who are doing nothing effective to check it.”

The political Zionists learned from the financial crisis of 1873, that a financial catastrophe would provide an opportunity to promote political anti-Semitism, which was their goal. At least as early as 1914, Ignatz Zollschan stated,

“In Germany, in the west European states, and in the United States of America, which enjoy a great economic and political prosperity, and, moreover, have no great percentage of Jewish population, the expropriation of the Jews cannot come into consideration. But should stagnation and depression take the place of prosperity, conditions similar to those in eastern Europe may be expected. In order to verify this statement, we need only cast our glance upon the so-called foundation-years in Germany, and upon the financial crisis in the year 1873. For it was then that birth was given to political anti-Semitism in Germany.”

In 1898, Communist Zionist Nachman Syrkin wrote that economic hardships resulted in increased anti-Semitism and the success of criminal anti-Semitic politicians.

### 7.5.4.2 Einstein a Subtle Hitler Apologist

When the “Hitlerites” showed their strength in the elections, political might paid for by Jewish financiers, Einstein and some other Zionist leaders told Jews not worry but to close ranks and unite. Of course, should Hitler lead the country into war, it would benefit bankers, investors, and factory owners. Hitler’s anti-Semitism benefitted the political Zionists. An article entitled “Fascists Walk Out of Berlin Council”, *The New York Times* on 19 September 1930 on page 9 quoted the *Jewish Telegraphic Agency*, which quoted Albert Einstein,
“There is no reason for despair,’ declared Professor Einstein, ‘for the Hitler vote is only a symptom, not necessarily of anti-Jewish hatred but of momentary resentment caused by economic misery and unemployment within the ranks of misguided German youth. I hope that the momentary fever and wave will rapidly fall.

‘During the more dangerous Dreyfus period almost the entire French nation was to be found in the anti-Semitic camp. I hope that as soon as the situation improves the German people will also find their road to clarity.”

Einstein acted as a Nazi apologist and tried to subvert any organized Jewish reaction to Hitler—he effectively promoted Hitler at a critical time in history. Many Jews in Germany failed to respond to Hitler’s victory with an organized reaction, in part because treacherous Jews like Albert Einstein led them to believe that Hitler would soon be unseated and that Nazism was an ephemeral malady they need not bother too much about.

At a time when anti-Zionist Jews were desperately trying to organize all Jews to fight against the Fascists, while many Zionists were encouraging the Fascists, Einstein wanted to remove Jews from Germany and was confused by his own racist hypocrisy. Following Hitler’s election victory in 1933, Albert Einstein commented, merely parroting the Zionist Party line,

“For the time being, I see the National Socialist movement as merely a product of the current economic crisis and the teething pains of the Republic. The solidarity of the Jews is for me an eternal commandment, but I feel a specific reaction to the election results would be entirely inappropriate.”

“Ich sehe in der nationalsozialistischen Bewegung einstweilen nur eine Folgeerscheinung der momentanen wirtschaftlichen Notlage und eine Kinder-Krankheit der Republik. Solidarität der Juden halte ich immer für geboten, aber eine besondere Reaktion auf das Wahlergebnis für ganz unzweckmässig.”

At the time Einstein made this cavalier statement, he knew that the Nazis were going to annihilate the Jews of Europe—as did Zionist Nazi apologist Ludwig Lewisohn, the dear friend, and the lover, of the famous Hitler-promoter George Sylvester Viereck. Albert Einstein wrote to Gustav Bucky on 15 July 1933,

“I really do believe that any action aimed at keeping Jews in Germany would have the effect of speeding up their annihilation.”

In 1933, Einstein told British Prime Minister (1923-1929, 1935-1937) Stanley Baldwin of Hitler’s plan for world conquest and that Hitler would perhaps cause a new world war. Baldwin, who was later criticized for not preparing England to face Germany, told Einstein that Great Britain had her allies. Einstein did take a firmer stand against the Nazis and against the Prussian Academy of Sciences in 1933 than
many Zionists, and was accused of public anti-Germanism by that Academy. In this exchange, Einstein fought for the rights of Jews to human dignity and the right to equality under the law. What Einstein meant by “annihilation” in 1933 is not necessarily clear. He may have meant the rooting out of Jews from Germany by cutting off their means of earning a living and forcing them to Palestine—as the Nazis and Zionists had planned, or he may have meant mass murder.

7.5.5 Einstein’s Seething Racist Hatred and Rabid Nationalism

The smear tactics of Zionists are well known. Einstein’s smear tactics gained him and his defenders an international reputation as agitators and reckless defamers. A “Biographical Sketch” issued to U. S. Army Intelligence sometime in 1940 stated,

“The origin of the case is that in Berlin, even in the political free and easy period of 1923 to 1929, the Einstein home was known as a Communist center and clearing house. Mrs. and Miss Einstein were always prominent at all extreme radical meetings and demonstrations. When the German police tried to bridge some of the extreme Communist activities, the Einstein villa at Wannsee was found to be the hiding place of Moscow envoys, etc. The Berlin conservative press at the time featured this, but the authorities were hesitant to take any action, as the more radical press immediately accused these reporters as being Anti-Semites.”

The historic record bears out the accusation that Einstein and his sponsors had the means and the will to smear innocents in their efforts to redirect public attention away from their own vile actions. It had become a habit for them, and they took every opportunity, no matter how unjustified, to raise the issue of race, paint themselves as victims of racist oppression, and often went so far as to accuse innocent persons of racism. The ridiculous extremes of this political maneuvering were manifest long before the Holocaust, and reached across the English Channel.

In 1919, hypocritical, racist, ethnocentric and insulting Einstein smeared all Germans, all English, and the reporter who had helped to promote him,

“A final comment. The description of me and my circumstances in The Times shows an amusing feat of imagination on the part of the writer. By an application of the theory of relativity to the taste of readers, today in Germany I am called a German man of science, and in England I am represented as a Swiss Jew. If I come to regarded as a bête noire, the descriptions will be reversed, and I shall become a Swiss Jew for the Germans and a German man of science for the English!”

Einstein, either directly, or through someone else, took his line from Bernard Lazare’s L’Antisémitisme: Son Histoire et Ses Causes of 1894,

“In general the Jews, even the revolutionaries, have kept the Jewish spirit,
and if they have given up religion and faith, they have nevertheless been formed, thanks to their ancestry and their education, by the influence of Jewish nationalism. This is true in a very special fashion of the Jewish revolutionaries who lived in the first half of this century. Heinrich Heine and Karl Marx are two typical examples. Heine is held to be German in France. In Germany he is accused of being French. He was above all a Jew.**

A couple of years after Einstein made his comment, in June of 1921, *The Jewish Chronicle* reported,

“The *Times* of Monday last, by the by, published an interview with Einstein. The interviewer gave minute personal descriptions of the remarkable scientist, and yet did not venture to suggest that he was a Jew. If (the *Jewish World* comments) he had been a Bolshevik or a reprehensible character of any kind, we doubt not the fact would have dawned upon the *Times* correspondent that he was a Jew, and would have found place in what he had to say. Strange how circumstances alter one’s point of view!”

Strange, indeed, that no matter what a *Times* correspondent said about Einstein; either Einstein, or some extremist among his supporters, would viciously smear that correspondent as a bigot, without any grounds whatsoever. And for what purpose? This appears to have been a habit for them, a pernicious habit and a divisive habit meant to perpetuate, intensify and generate hatred, fear and conflict—for political Zionist purposes.

Einstein’s ardent nationalism became so extreme, that it played into the hands of his political foes, and became an example for their generalizations. Max Nordau described the pernicious habits of racists, with no small measure of hypocrisy, in his address to the First Zionist Congress in 1897,

“No one has ever tried to justify these terrible accusations by facts. At most, now and then, an individual Jew, the scum of his race and of mankind, is triumphantly cited as an example, and contrary to all laws of logic, the example is made general. This tendency is psychologically correct. It is the practice of human intellect to invent for the prejudices, which sentiment has called forth, a cause seemingly reasonable. Probably wisdom has long been acquainted with this psychological law, and puts it in fairly expressive words: ‘If you have to drown a dog,’ says the proverb, ‘you must first declare him to be mad.’ All kinds of vices are falsely attributed to the Jews, because one wishes to convince himself that he has a right to detest them. But the pre-existing sentiment is the detestation of the Jews.”**

Einstein detested Germans throughout his life. He hated Germans long before the Nazi Party was formed. Einstein’s racist nationalism rivaled and perhaps even surpassed Physics in Einstein’s self-image, making him the ideological twin of the Nazis—one who wanted to exterminate the Germans—one who wanted to
exterminate all Gentile Europeans. He was described in the *Daily Graphic* as,

“A man of the most simple tastes, he lives in a lofty flat in Berlin. He is an indifferent linguist, and will lecture in German, but he has a passion for music, and beyond this his scientific pursuits and his work for Zionism comprise his sole interests.”\textsuperscript{1683}

While hiding from Arvid Reuterdahl’s challenge to a public debate,\textsuperscript{1684} Einstein announced through his secretary Salomon Ginzberg during his famous stay in America,

“I came here with one object—the promotion of the establishment of the Hebrew University in Jerusalem. [***] The great purpose of my mission to this country must not be overshadowed by my theory. I will be here a short time, and all of that time must be devoted to the great Palestine reconstruction project.”\textsuperscript{1685}

Einstein stated in an interview following his visit to America,

“I really went on behalf of the Jewish cause. Yes, I have placed my name and indeed myself in the service of the Zionist movement to make propaganda for Palestine, and the true purpose of the America trip was to collect money for a fund to establish a university in Jerusalem.”\textsuperscript{1686}

Nationalism became so consuming a personal passion for Einstein, that he took advantage of his fraudulently-based fame to promote the political cause. R. S. Shankland stated,

“About publicity Einstein told me that he had been given a publicity value which he did not earn. Since he had it he would use it if it would do good; otherwise not. [*Emphasis found in the original*]”\textsuperscript{1687}

His famous trip to America was not made to promote or celebrate the theory of relativity, but to promote his personal vision of nationalism and to raise money for this cause. Though this was absolutely his right, many found Einstein’s exploitation of his scientific fame for political purposes distasteful—to the point of being disgraceful.

As early as February of 1914, loyal German Jews publicly protested against anti-German Zionism. Albert Einstein was a virulently racist oddity among German Jews. German Jews knew quite well that the Zionists were planning to deliberately place all Jews in harm’s way and ruin Germany. *The New York Times* wrote on 8 February 1914, Section 3, page 3,

“PROTEST AGAINST ZIONISTS.”
German-Jewish Organizations Say
They Harm Jews and Fatherland.

Special Cable to The New York Times.
BERLIN, Feb. 7.—Several Jewish organizations of Germany have joined in a protest against what they call the ‘insidious German national Chauvinism,’ which is being carried on in the name of German Jews by German Zionists.

It is alleged that the Zionists are resorting to methods that must bring the whole Jewish cause into disrepute at home and abroad and sow seeds of discord between Christians and Jews in Germany itself.

The protest, which has taken the form of a strong public statement, addressed to the press of the country, urges that the mere matter of faith which separates German Jews from their fellow-citizens must not be exploited by overzealous co-religionists to the disadvantage of both Jews and the Fatherland.”

In 1930, some German Jews demanded that Albert Einstein stop using his scientific fame to promote racism, disloyalty and “interracial” strife. The New York Times reported on 7 December 1930 on page 11,

“The National German-Jewish Union, a small group of extreme nationalist and anti-Zionist Jews, protested against Professor Einstein using his world-fame as a scientist for ‘propagating Zionism.’”

After the Second World War, Jews again criticized Einstein for his nationalistic Zionism. Einstein responded,

“In my opinion condemning the Zionist movement as ‘nationalistic’ is unjustified. [***] Thus already our precarious situation forces us to stand together irrespective of our citizenship.”

Einstein parroted the Zionist dogma that ethnic, racial and religious unity among peoples of Jewish descent around the world constituted a sovereignty without physical borders, which should be organized around a community in Palestine, but which sovereign status should be intrinsic to anyone of Jewish descent anywhere in the world—since a Jewish dispersion had allegedly taken place two thousand years ago. Theodor Herzl stated that anti-Semitism was justified and that the only means to end it was segregation. Chaim Weizmann made it very clear that Zionism is not a form of self-defense against prejudice, but is instead an indefensible product of Jewish bigotry. Weizmann proclaimed,
“The sufferings of Russian Jewry never were the cause of Zionism. The fundamental cause of Zionism was, and is, the ineradicable national striving of Jewry to have a home of its own—a national center, a national home with a national Jewish life.”

German Jews around the world had largely assimilated into various nations and cultures and were often quite successful. They were leading and highly productive members of their societies. Eastern European Jews were often living in intolerable conditions and sought to emigrate to the West. They looked to their religious brethren in the West for help, but were often resented and rejected, because they clung to their ancient Jewish racism, and their desire to flee their neighbors and their call to other Jews in other countries was itself a manifestation of their racist tribalism.

Many German Jews feared that these clannish Easterners would inspire anti-Semitism and resented their presence. Weizmann feared that the Russian Revolution would put an end to Zionism, because it achieved the freedom of Russian Jews,

“At that time the whole world—and the Jews more than anyone else—had been thrilled by the overthrow of the czarist regime in Russia, and the establishment of the liberal Kerensky regime.”

Weizmann was a rabid anti-assimilationist. He wasn’t simply after social justice for Jews. Weizmann was after self-imposed segregation of the Jews.

The Zionists are the product of an ancient racist and genocidal religious mythology. This religious mythology is largely political and racist, and it affects even secular Jews, some of whom view it as the product of Jewish genes, and therefore of intrinsic value in defining Jews and their actions. The prophets need not have been inspired by God, for they were inspired by a yet more divine source, Jewish blood. The creation myth was turned on its head such that some secular Jews stated that the Jews created a fellow Jew, “God”, to express the urges of their “Jewish blood”—their “Jewish soul”. Those many secular Jews who rejected this racist viewpoint, also could not have helped but have been somewhat affected by the legacy of centuries of Jewish culture which had evolved in the continuing presence of religious Jewish racism.

The Hebrew Bible contains numerous stories of the segregation, punishment and genocide of assimilationist Jews by anti-assimilationist Jews. For example, Numbers, Chapter 25, states:

“And Israel abode in Shittim, and the people began to commit whoredom with the daughters of Moab. 2 And they called the people unto the sacrifices of their gods: and the people did eat, and bowed down to their gods. 3 And Israel joined himself unto Baal-peor: and the anger of the LORD was kindled against Israel. 4 And the LORD said unto Moses, Take all the heads of the people, and hang them up before the LORD against the sun, that the fierce
anger of the LORD may be turned away from Israel. 5 And Moses said unto the judges of Israel, Slay ye every one his men that were joined unto Baal-peor. 6 ¶ And, behold, one of the children of Israel came and brought unto his brethren a Midianitish woman in the sight of Moses, and in the sight of all the congregation of the children of Israel, who were weeping before the door of the tabernacle of the congregation. 7 And when Phinehas, the son of Eleazar, the son of Aaron the priest, saw it, he rose up from among the congregation, and took a javelin in his hand; 8 and he went after the man of Israel into the tent, and thrust both of them through, the man of Israel, and the woman through her belly. So the plague was stayed from the children of Israel. 9 And those that died in the plague were twenty and four thousand. 10 ¶ And the LORD spake unto Moses, saying, 11 Phinehas, the son of Eleazar, the son of Aaron the priest, hath turned my wrath away from the children of Israel, while he was zealous for my sake among them, that I consumed not the children of Israel in my jealousy. 12 Wherefore say, Behold, I give unto him my covenant of peace: 13 and he shall have it, and his seed after him, even the covenant of an everlasting priesthood; because he was zealous for his God, and made an atonement for the children of Israel. 14 Now the name of the Israelite that was slain, even that was slain with the Mid’i-anitish woman, was Zimri, the son of Salu, a prince of a chief house among the Simeonites. 15 And the name of the Midianitish woman that was slain was Cozbi, the daughter of Zur; he was head over a people, and of a chief house in Midian. 16 And the LORD spake unto Moses, saying, 17 Vex the Midianites, and smite them: for they vex you with their wiles, wherewith they have beguiled you in the matter of Peor, and in the matter of Cozbi, the daughter of a prince of Midian, their sister, which was slain in the day of the plague for Peor’s sake.”

Since many Zionists were atheists, or pretended to be atheists to assuage Christian and Moslem concerns, as well as secular and religious Jewish fears, and since Herzl and others had made Zionism a political question rather than a religious question, Zionism became strictly a matter of racist segregation.

There was a definite rift between Eastern European Jews and German Jews, who feared that the presence of these Easterners, especially when led by rabidly racist Zionists, would inspire and intensify anti-Semitism. Einstein and Weizmann wanted to force Western European Jews into sponsoring the emigration of Eastern European Jews—who appeared in Western Europe like peoples from another time—and who would make a suitable slave labor force for the Zionists. In turn, these highly racist Eastern European Jews resented the assimilationist Western Jews. Many of the Jews of Palestine also resented the Eastern European Jews for creating conflicts in Palestine, where Jews, Moslems and Christians had been living together in peace.

A racist unity among Jews had long been a goal of the political Zionists despite the resistance they encountered from Jews around the world. Max Nordau wrote, soon after the First Zionist Congress in Basel in August of 1897:
“Die Voraussetzung des politischen Zionismus ist, dass es ein jüdisches Volk gibt. Das gerade leugnen die Assimilationsjuden und die von ihnen besoldeten geistlosen, salbungsvoll schwatzenden Rabbiner.”

and,

Theodor Herzl wrote of the utility of using Eastern European Jewish peasants as a slave labor force in his book *The Jewish State* and in his diaries. The Zionist Nazis helped the political Zionists to train this slave labor force and to condition them to accept their fate. After the Holocaust, Chaim Weizmann tried to blame assimilatory Jews for the tragic events the Zionists deliberately caused,

“[Rathenau’s] attitude was, of course, all too typical of that of many assimilated German Jews; they seemed to have no idea that they were sitting on a volcano; they believed quite sincerely that such difficulties as admittedly existed for German Jews were purely temporary and transitory phenomena, primarily due to the influx of East European Jews, who did not fit into the framework of German life, and thus offered targets for anti-Semitic attacks.”
Joachim Prinz explored the issue in his book *Wir Juden*, Erich Reiss, Berlin, (1934), pp. 50-55. Albert Einstein wrote to Max Born on 22 March 1934 that the same impediments Western European Jews had placed against the immigration of Eastern European Jews during their migration to the West were now being instituted against German Jews by the Jews of America, France and England,

“It is particularly unfortunate that the satiated Jews of the countries which have hitherto been spared cling to the foolish hope that they can safeguard themselves by keeping quiet and making patriotic gestures, just as the German Jews used to do. For the same reason they sabotaged the granting of asylum to German Jews, just as the latter did to Jews from the East. This applies just as much in America as in France and England.”

Einstein’s personality interfered with his attempts to open up immigration for Eastern European Jews and his bigoted hatred worked against his cause. In the long run, Einstein’s racism and provocative statements proved horrifically counterproductive and deliberately aided anti-Semitic racists in their ascent to power in Europe, which might have been his goal all along. Einstein later avowed that the plan for the inhuman carnage of which many Europeans and European governments eventually proved capable under Zionist leadership, appeared in Hitler’s *Mein Kampf*, which was written in the 1920’s. He knew well what to expect.

Hitler’s mentor, Dietrich Eckart, who was a member the Zionists’ anti-Semitic propaganda school the *Thule-Gesellschaft*, exploited Jewish racism and anti-Germanism for propaganda purposes. Dietrich Eckart wrote, quoting Hitler, in Eckart’s *Der Bolschewismus von Moses bis Lenin: Zwiegespräch zwischen Adolf Hitler und mir,*

“‘Send me a box full of German soil, so that I can at least symbolically defile the accursed country,’ wrote the German Jew, Börne; [Notation: Ludwig Börne (alias Löb Baruch), *Briefe aus Paris* (Hamburg, 1832), I.] and Heinrich Heine sniffed out Germany’s future from a toilet bowl. [Notation: Heinrich (alias Chaim) Heine, *Deutschland, ein Wintermärchen* (1844).] The physicist, Einstein, whom the Jewish publicity agents celebrate as a second Kepler, explained he would have nothing to do with German nationalism. He considered ‘deceitful’ the custom of the Central Association of German Citizens of Jewish Faith [Notation: *Zentralverein deutscher Staatsbürger jüdischen Glaubens*. {Translator}] of concerning themselves only with the religious interests of the Jews and not with their racial community also. A rare bird? No, only one who believed his people already safely in control, and thus considered it no longer necessary to keep up pretenses. In the Central Association itself, the mask has already fallen. A Dr. Brünn frankly admitted there that the Jews could have no German national spirit. [Notation: Artur Brünn, *Im Deutschen Reich* (the periodical of the *Zentralverein*) 1913, No. 8.] We always mistake their unprincipled exertions to accommodate themselves to all and everyone for impulses of the heart. Whenever they see
an advantage to be gained by adopting a certain pose, they never hesitate, and
certainly wouldn’t let ethical considerations stand in their way. How many
Galician Jews have first become Germans, then Englishmen, and finally
Americans! And every time in the twinkling of an eye. With startling rapidity
they change their nationality back and forth, and wherever their feet touch,
there resounds either the ‘Watch on the Rhine,’ or the ‘Marseillaise,’ or
‘Yankee Doodle.’ Dr. Heim does not once question the fact that our
Warburgs, our Bleichroders, or our Mendelssohns are able to transfer their
patriotism as well as their residence of today to London or to New York on
the morrow. ‘On the sands of Brandenburg an Asiatic horde!’ Walther
Rathenau once blurted out about the Berlin Jews. [Notation: Walther
Rathenau, Berliner Kulturzentren, 1913. Rathenau was a Jewish war profiteer
in World War I and later a minister in the Weimar government. He was
executed by German patriots in 1922. [Translator} He forgot to add that the
same horde is on the Isar, the Elbe, the Main, the Thames, the Seine, the
Hudson, the Neva, and the Volga. And all of them with the same deceit
toward their neighbors.”

Should Albert Einstein be forgiven as an ethnocentric and racist victim of his
time and political affiliations, who defended “his people” from what appeared to him
to be a threat to their very existence—the dangers of assimilation and philo-
Semitism? Early on, Jews with far more sense than Einstein organized to defend
themselves from the fanatical and racist Zionists, knowing that the political games
of the racists on both sides of the “Jewish question” would result in tragedy and
trauma for the world’s Jews. Klaus J. Herrmann wrote,

“To counter the coalition of antisemites and Zionists, in 1912, within the
Association for Liberal Judaism, a number of distinguished leaders of
Germany’s Jewish communities decided to form an Anti-Zionist Committee.
This Committee [***] took on the task of ‘enlightening the German Jews on
and combating Zionism.”"1699

Paul Ehrenfest saw the harm racist and segregationist Zionist Jews were doing
to his fellow Jews.1700 Since all reasonable Jews knew the destruction that would
inevitably follow from Einstein’s ideology, Einstein should have known it, and
indeed he did know it. One outgrowth of these anti-Zionist organizations, which
formed to protect themselves, is Neturei Karta. Rabbi Moshe Shonfeld documented
the collaboration of the Zionists with the Nazis and the deliberate human sacrifice
of innocent Jews in order to establish the “Jewish State”.1701 Numerous other Jewish
authors have chastised Zionist Jews for their behavior towards other Jews during the
Holocaust.1702 Rabbi E. Schwartz published a statement on behalf of the American
Neturei Karta in The New York Times on 18 May 1993,

“To achieve the goal of statehood the Zionists have always deliberately
provoked anti-Semitism. [***] Their interest was not to save Jews, on the
contrary, more spilling of Jewish blood would strengthen their demand of the nations for the creation of their state.\textsuperscript{1703}

Albert Einstein, the “Person of the Century” who sought to promote and foment anti-Semitism wherever he went, stated in 1921,

“On the other hand, anti-Semitism in Germany also has consequences that, from a Jewish point of view, should be welcomed. I believe German Jewry owes its continued existence to anti-Semitism.”\textsuperscript{1704}

Contrast this with Nobel Peace Prize laureate Elie Wiesel’s statement in 1968,

“Every Jew, somewhere in his being, should set apart a zone of hate—healthy, virile hate—for what the German personifies and for what persists in the German. To do otherwise would be a betrayal of the dead.”\textsuperscript{1705}

Lieutenant General Rafael Eytan, outgoing Chief of Staff of the Israeli Army, stated on 12 April 1983,

“When we have settled the land, all the Arabs will be able to do about it will be to scurry around like drugged roaches in a bottle.”\textsuperscript{1706}

Wiesel has stressed his view that the Holocaust should be seen as a uniquely tragic event in History. However, this exclusivist view of Jewish History predates the Holocaust by at least a century, for example in a statement from 1845,

“The sufferings of the Jews—whether the ‘wringing out of the dregs of a cup of trembling’ from Jehovah, or not—have far exceeded all other experience, and the common measure of human endurance.”\textsuperscript{1707}

After the First World War Einstein and some of his friends alluded to much earlier conversations with Einstein where he had correctly predicted the eventual outcome of the war. In his diaries, Romain Rolland recorded his conversations with Einstein in Switzerland at their meeting of 16 September 1915,

“What I hear from [Einstein] is not exactly encouraging, for it shows the impossibility of arriving at a lasting peace with Germany without first totally crushing it. Einstein says the situation looks to him far less favorable than a few months back. The victories over Russia have reawakened German arrogance and appetite. The word ‘greedy’ seems to Einstein best to characterize Germany. [***] Einstein does not expect any renewal of Germany out of itself; it lacks the energy for it, and the boldness for initiative. He hopes for a victory of the Allies, which would smash the power of Prussia and the dynasty. . . . Einstein and Zangger dream of a divided Germany—on the one side Southern Germany and Austria, on the other side
Prussia. [***] We speak of the deliberate blindness and the lack of psychology in the Germans.**1708

Einstein’s dreams during the First World War remind one of the “Carthaginian Peace” of the Henry Morgenthau, Jr. plan for the destruction of Germany following the Second World War. Morgenthau worked with Lord Cherwell (Frederick Alexander Lindemann), Churchill’s friend and advisor, who planned to bomb German civilian populations into submission. Lindemann studied under Einstein’s friend, Walther Nernst, who worked with Fritz Haber, a Jewish developer of poisonous gas. James Bacque argues that the Allies, under the direction of General Eisenhower, starved hundreds of thousands, if not millions of German prisoners of war to death. Dwight David Eisenhower was called “the terrible Swedish-Jew” in his yearbook for West Point, *The 1915 Howitzer*, West Point, New York, (1915), p. 80. He was also called “Ike”, as in . . . Eisenhower? The Soviets also abused countless German POW’s after the Second World War.**1709

Einstein often spoke in genocidal and racist terms against Germany, and for the Jews and England, and he betrayed Germany before, during and after the First World War. Einstein wrote to Paul Ehrenfest on 22 March 1919,

“[The Allied Powers] whose victory during the war I had felt would be by far the lesser evil are now proving to be only slightly the lesser evil. [***] I get most joy from the emergence of the Jewish state in Palestine. It does seem to me that our kinfolk really are more sympathetic (at least less brutal) than these horrid Europeans. Perhaps things can only improve if only the Chinese are left, who refer to all Europeans with the collective noun ‘bandits.’”**1710

Einstein avowed *circa* 3 April 1920, that,

“If what anti-Semites claim were true, then indeed there would be nothing weaker, more wretched, and unfit for life, than the German people”.**1711

Einstein avowed that the anti-Semites’ beliefs were true. Therefore, Einstein must have believed at least as early as 1920 that the Germans ought to be exterminated. When discussing the meaning of life, Einstein spoke to Peter A. Bucky about persons and creatures who “[do] not deserve to be in our world” and are “hardly fit for life.”**1712 Einstein’s language is quite similar to the language of Hitler’s “T4” “Euthanasia-Programme”.

After siding with Germany’s enemies in the First World War—while living in Germany, and after intentionally provoking Germans into increased anti-Semitism, which he thought was good for Jews, and after defaming German Nobel Prize laureates in the international press to the point where they felt obliged to join Hitler’s cause, which cause eventually resulted in the genocide of Europe’s Jews; Einstein sponsored the production of genocidal weapons to mass murder Germans, whom he had hated all of his life, in the famous letter to President Roosevelt that Einstein signed urging Roosevelt to begin the development of atomic bombs. Einstein signed
this letter before the alleged mass murder of Jews had begun.\textsuperscript{1713}

Genocidal Einstein callously asserted that the use of atomic bombs on civilian populations was “morally justified”. I quote Einstein without delving into the question of who first bombed civilian centers,

“It should not be forgotten that the atomic bomb was made in this country as a preventive measure; it was to head off its use by the Germans, if they discovered it. The bombing of civilian centers was initiated by the Germans and adopted by the Japanese. To it the Allies responded in kind—as it turned out, with greater effectiveness—and they were morally justified in doing so.”\textsuperscript{1714}

Einstein advocated genocidal collective punishment,

“The Germans as an entire people are responsible for these mass murders and must be punished as a people if there is justice in the world and if the consciousness of collective responsibility in the nations is not to perish from the earth entirely.”\textsuperscript{1715}

and,

“It is possible either to destroy the German people or keep them suppressed; it is not possible to educate them to think and act along democratic lines in the foreseeable future.”\textsuperscript{1716}

Albrecht Fölsing has assembled a compilation of post-WW II quotations by Albert Einstein, which evince Einstein’s lifelong habit of stereotyping people based on their ethnicity. Einstein again expressed his hatred after the war—a temptation Max Born had resisted,

“With the Germans having murdered my Jewish brethren in Europe, I do not wish to have anything more to do with Germans, not even with a relatively harmless Academy. [***] The crimes of the Germans are really the most hideous that the history of the so-called civilized nations has to show. [***] [It was] evident that a proud Jew no longer wishes to be connected with any kind of German official event or institution. [***] After the mass murder committed by the Germans against my Jewish brethren I do not wish any publications of mine to appear in Germany.”\textsuperscript{1717}

Einstein wrote to Born on 15 September 1950 that his pathological hatred towards Germans predated the Nazi period,

“I have not changed my attitude to the Germans, which, by the way, dates not just from the Nazi period. All human beings are more or less the same from birth. The Germans, however, have a far more dangerous tradition than any
of the other so-called civilized nations. The present behavior of these other nations towards the Germans merely proves to me how little human beings learn even from their most painful experiences.”

and on learning that Born would return to Germany, Einstein wrote on 12 October 1953,

“If anyone can be held responsible for the fact that you are migrating back to the land of the mass-murderers of our kinsmen, it is certainly your adopted fatherland — universally notorious for its parsimony.”

Einstein wanted to carry out the extermination of the Germans he had been planning for many decades before the Holocaust. Einstein could not forgive the fact that other nations forgave the Germans and did not take the opportunity the Zionists had created for the complete extermination of the German People, the extermination of Amalek.

7.5.6 The Final Solution of the Jewish Question is Zionism, but the Final Solution of the German Question is Extermination

The generally accepted history of the Wannsee-Konferenz of 20 January 1942 holds that the Nazis first proposed the party policy of the genocidal extermination of Jews on this date. Lesser known today is the fact that a Jewish American named Theodor Newman Kaufman advocated the genocidal sterilization of all Germans as a “final solution” in 1941 in his book Germany Must Perish!, Argyle Press, Newark, New Jersey, (1941), for which an ad was posted in The New York Times on 1 March 1941 on page 13. Kaufman had called for the sterilization of all Americans in 1939.

Kaufman promoted his book by sending out small black cardboard coffins with a note inside which read, “Read GERMANY MUST PERISH! Tomorrow you will receive your copy,” to leading figures and persons in the media. This was followed by a copy of the book the next day. This book was briefly noted in “Latest Books Received”, The New York Times, (16 March 1941), Book Reviews Section, pp. 28-30, at 29; which simply states, “A plan for permanent peace among civilized nations.” Time Magazine, under the heading “A Modest Proposal”, described the odd book, the strange method by which Kaufman had promoted it, and the peculiar history of Theodor Newman Kaufman, who claimed to have known members of Winston Churchill’s family. In an interesting aside, Albert Einstein’s personal physician, Professor Janos Plesch, became Winston Churchill’s personal physician. Kaufman’s book advocating the genocide of Germans was known to most Germans. Germany Must Perish! was condemned in German publications, which alleged that President Roosevelt had sponsored it and had even written passages in it. The book, which proposed the genocide of the Germans, provoked attacks on Jews in Germany. To the Germans, Germany Must Perish! represented the climax of the generalized vilification of all Germans propagandized by enemies of Germany.
Nazism is Zionism  1555

in the First World War, like Émile Durkheim. At least as early as the 1860's, recalling the myth of Esau and Amalek, Zionist racist and National Socialist Moses Hess argued that the “German race” had a genetically programmed antagonism towards the “Jewish race”—the implication being that one must destroy the other in order to survive. Hess cushions his blows by mentioning enlightened Germans who have supposedly overcome their alleged genetic compulsions to destroy Jews, but his genocidal hatred of Germans is clear.

Hess was an interesting figure. He married a Christian prostitute. He wrote together with Marx, then criticized him. Hess created many of the elements of National Socialism that would eventually become the National Socialist German Worker’s Party, or “Nazi” Party.

With Kaufman’s *Germany Must Perish!* as evidence, the Nazis told the German public that the Americans, under the direction of Jews, planned to exterminate the “German race” if the Allies won the war. This life and death struggle between the “German race” and the “Jewish race” was foretold in Hess’ book of 1862, *Rom und Jerusalem: die letzte Nationalitätsfrage*, Eduard Wengler, Leipzig, (1862); English: *Rome and Jerusalem: A Study in Jewish Nationalism*, Bloch, New York, (1918).

Goebbels proclaimed that the inhumane crimes Germans had committed against Jews compelled Germany to fight to the very end, thereby maximizing German and Allied and European casualties and the destruction of Europe. At the end of the war, Hitler called for Germans to kill themselves, because they had proven themselves unworthy to live in the fight for survival. Some have alleged that Hitler was sent to destroy Germans, who many Jews had alleged were genetic or cultural enemies of Jews predisposed to destroy them. Hitler destroyed “Red Assimilationist” Jews in order to punish them and to shock American Jews into embracing Zionism.

Einstein’s genocidal statements hint at the proposed measures advocated in Kaufman’s book of 1941. Among other things, Kaufman wrote,

“A final solution: Let Germany be policed forever by an international armed force? Even if such a huge undertaking were feasible life itself would not have it so. As war begets war, suppression begets rebellion. Undreamed horrors would unfold. Thus we find that there is no middle course; no act of mediation, no compromise to be compounded, no political or economic sharing to be considered. There is, in fine, no other solution except one: That Germany must perish forever from this earth! [***] There remains then but one mode of ridding the world forever of Germanism — and that is to stem the source from which issue those war-lusted souls, by preventing the people of Germany from ever again reproducing their kind. This modern method, known to science as Eugenic Sterilization, is at once practical, humane and thorough. Sterilization has become a byword of science as the best means of ridding the human race of its misfits: the degenerate, the insane, the hereditary criminal. [***] The population of Germany, excluding conquered and annexed territories, is about 70,000,000, almost equally divided between male and female. To achieve the purpose of German extinction it would be
necessary to only sterilize some 48,000,000—a figure which excludes, because of their limited power to procreate, males over 60 years of age, and females over 45. [***] Reviewing the foregoing case of sterilization we find that several factors resulting from it firmly establish its advocacy. Firstly, no physical pain will be imposed upon the inhabitants of Germany through its application, a decidedly more humane treatment than they will have deserved. As a matter of fact it is not inconceivable that after Germany’s defeat, the long-suffering peoples of Europe may demand a far less humane revenge than that of mere sterilization. Secondly, execution of the plan would in no way disorganize the present population nor would it cause any sudden mass upheavals and dislocations The consequent gradual disappearance of the Germans from Europe will leave no more negative effect upon that continent than did the gradual disappearance of Indians upon this.”

Perhaps inspired by the accusations against Jews of poising the wells in the 1300's, some Jews unsuccessfully attempted revenge against the Germans for the Holocaust after the Second World War by poisoning the water supply of Germany. Tom Segev wrote in his book *The Seventh Million: The Israelis and the Holocaust*,

“Kovner therefore set six million German citizens as his goal. He thought in apocalyptic terms: revenge was a holy obligation that would redeem and purify the Jewish people. The group divided into cells, each with a commander. Their primary goal, Plan A, was ‘to poison as many Germans as possible.’ Plan B was to poison several thousand former SS men in the American army’s POW camps. Reichman succeeded in infiltrating some members of the group into the Hamburg and Nuremberg water companies. Kovner went to Palestine to bring the poison—and, he hoped, to receive the blessing of the Haganah.”

It is often alleged that a group of high ranking Nazi officials met at a conference in Wannsee and settled on a plan to exterminate the Jews of Europe in concentration camps. There is a purported transcript of this meeting. Some have disputed the authenticity of the minutes of the Wannsee-Konferenz. At any rate, the minutes of the Wannsee Conference do not contain any statements plotting the deliberate murder of the Jews or the extermination of all Jews. The “final solution of the Jewish question” proposed in the purported minutes of the Wannsee Conference was not murder or complete extermination; but was instead the deportation of Jews to the East in conformity with the wishes of the Zionist Jews.

Zionist Nazi propagandist Julius Streicher affirmed at the Nuremberg Trials that the Nuremberg Laws of 1935 were patterned after Jewish Law,

“Yes, I believe I had a part in it insofar as for years I have written that any further mixture of German blood with Jewish blood must be avoided. I have written such articles again and again; and in my articles I have repeatedly emphasized the fact that the Jews should serve as an example to every race,
for they created a racial law for themselves—the law of Moses, which says, ‘If you come into a foreign land you shall not take unto yourself foreign women.’ And that, Gentlemen, is of tremendous importance in judging the Nuremberg Laws. These laws of the Jews were taken as a model for these laws. When, after centuries, the Jewish lawgiver Ezra discovered that notwithstanding many Jews had married non-Jewish women, these marriages were dissolved. That was the beginning of Jewry which, because it introduced these racial laws, has survived throughout the centuries, while all other races and civilizations have perished.”

Dr. Marx asked Julius Streicher,

“Were you of the opinion that the 1935 legislation represented the final solution of the Jewish question by the State?”

Streicher responded that Zionism was the final solution of the Jewish question,

“With reservations, yes. I was convinced that if the Party program was carried out, the Jewish question would be solved. The Jews became German citizens in 1848. Their rights as citizens were taken from them by these laws. Sexual intercourse was prohibited. For me, this represented the solution of the Jewish problem in Germany. But I believed that another international solution would still be found, and that some day discussions would take place between the various states with regard to the demands made by Zionism. These demands aimed at a Jewish state.”

Nazi Secretary of State in the Interior Ministry Wilhelm Stuckart, who attended the Wannsee-Konferenz, was questioned by Robert M. W. Kempner at his Nuremberg trial and denied that the extermination of the Jews was discussed,

“No, I don’t believe that I am wrong in saying that there was no discussion of the final solution of the Jewish question, in the sense in which it is now understood.

KEMPNER: Heydrich related clearly, in your presence, what it was about?

STUCKART: That is absolutely out of the question—otherwise I would have known what it meant.”

Refer to the Nuremberg trial transcripts of 22 November 1945, where Stuckart was quoted as referring to the “final solution” in the late 1930's, as a political solution, some years before the Wannsee-Konferenz occurred, meaning the formation of a “Jewish State”. This quotation was cited prior to the first appearance of the purported “Protocols of the Wannsee Conference”. Again, some have called into questions the authenticity of these “Protocols”.
Though Eichmann stated that the “final solution” had always meant a Zionistic political solution to him, Eichmann alleged many years after the war that he had heard from third party sources that Hitler changed course in the middle of the war and planned to exterminate the Jews. David Irving has argued that Hitler never had any such plan.

Accusations that Hitler was out to exterminate the Jews predated the Holocaust by many years, and served the interests of the Zionists, just as the Holocaust served and serves the interests of the Zionists. The New York Times reported on 8 February 1923, on page 3, in an article entitled “SAYS FORD AIDS ROYALISTS. Auer Charges Financial Help to Bavarian Anti-Semites.”:

“It would be interesting to determine the exact German word Auer used, which had been translated as “exterminate”. Was it Ausrottung, or perhaps Vernichtung? There has been a dispute over the meaning of Hitler’s many statements against the Jews in the original German, which hinges on whether or not he meant to simply rid Germany of Jews by deporting them, or whether he was out to exterminate all Jews. At the time, Hitler was calling for the expulsion of Jews from Bavaria and from all German lands. The money scandal drew attention in the newspapers in Germany, but most attention was paid to the French connection. Hitler’s agent Kurt G. W. Ludecke failed in his attempts to solicit monies for the Nazis from Henry Ford.

The “Hamburg Resolutions of the German Social Reform Party” proclaimed in 1899,

“Adolf Hitler wrote in an article entitled “Staatsmänner oder Nationalverbrecher” in the Völkischer Beobachter, Volume 35, Number 22, (15 March 1921), p. 1-2, that the fight against Bolshevism in Russia entailed the rooting out (Ausrottung) of the Jews. On 30 January 1939 Hitler famously threatened before the Reichstag that if Jewish finance again led the world into war, it would not mean a victory for “world Jewry”, but “the annihilation [Vernichtung] of the Jewish race”,

“If international finance Jewry in and outside Europe succeeds in plunging
the peoples into another world war, then the end result will not be the Bolshevization of the earth and the consequent victory of Jewry but the annihilation of the Jewish race in Europe."\textsuperscript{1735}

“Wenn es dem internationalen Finanzjudentum in und außerhalb Europas gelingen sollte, die Völker noch einmal in einen Weltkrieg zu stürzen, dann wird das Ergebnis nicht der Sieg des Judentums sein, sondern die Vernichtung der jüdischen Rasse in Europa!”\textsuperscript{1736}

The Jewish Zionist Nazi tyrant of Poland, Dr. Hans Frank, stated at a Cabinet Session on 16 December 1941,

“As far as the Jews are concerned, I want to tell you quite frankly, that they must be done away with in one way or another. The Fuehrer said once: should united Jewry again succeed in provoking a world war, the blood of not only the nations which have been forced into the war by them, will be shed, but the Jew will have found his end in Europe”\textsuperscript{1737}

Did the crypto-Jewish Zionists Adolf Hitler and Hans Frank mean that they would exterminate the Jews of Europe in death camps, or did they mean that they would deport the Jews of Europe to Palestine as a final solution to the Jewish question? Frank was a long-term Zionist who wanted to segregate the Jews in Polish concentration camps and then ship them to Palestine—not to say that he did not intend to kill off a large percentage of his brethren in the process. In the fall of 1933 in Nuremberg on Reichsparteitag, Frank stated that his goal was to secure a “Jewish State”,

“Unbeschadet unseres Willens, uns mit den Juden auseinanderzusetzen, ist die Sicherheit und das Leben der Juden in Deutschland staatlich, reichsamtlich und juristisch nicht gefährdet. Die Judenfrage ist rechtlich nur dadurch zu lösen, dass man an die Frage eines jüdischen Staates herangeht.”\textsuperscript{1738}

The expression “final solution of the Jewish question (or: “problem”)” was a commonplace in the parlance of the Zionists long before the Wannsee Konferenz.\textsuperscript{1739} Jewish Zionist Nahum Sokolow wrote in the introduction of his History of Zionism of 1919,

“The progress of modern civilization has come to be regarded as a sort of ‘Messiah’ for the final solution of the Jewish problem.”\textsuperscript{1740}

Sokolow spoke in reference to the “Jewish mission” of reformed Jews under the influence of Moses Mendelssohn. The Zionists believed this “final solution of the Jewish problem” resulted in fatal assimilation, whereas the Zionists were pitching Palestine as the “final solution of the Jewish problem”. Many others believed that
assimilation was the only viable “final solution to the Jewish question”. 1741

Boris Brasol wrote in 1921,

“When the Zionist claim was first established, and Theodore Herzl, in 1897, came out with his specific program of a Jewish State, the world at large gave a sigh of relief as it was trusted that henceforth the Jews would have a country of their own where they would be able to develop freely and unhampered their racial peculiarities, their cultural traditions and their religious thought. Christian countries have been so accustomed to innumerable complaints made by the Jews of their oppression, of anti-Semitism breeding throughout the world, of pogroms ravaging the Jewish masses, that there was every reason to hope that the Jews would dash to Palestine, leaving those cruel Christians to their own destinies. What better scheme for a fair solution of the Jewish problem could be hoped for by both Gentiles and Jews?” 1742

The Zionists wrote in the official organ of the German Zionist Organization, Jüdische Rundshau, on 13 June 1933, shortly after Hitler assumed power,

“Zionism recognizes the existence of the Jewish question and wants to solve it in a generous and constructive manner. For this purpose, it wants to enlist the aid of all peoples; those who are friendly to the Jews as well as those who are hostile to them, since according to its conception, this is not a question of sentimentality, but one dealing with a real problem in whose solution all peoples are interested.” 1743

Jewish Zionist Joachim Prinz stated in 1937,

“Everyone in Germany knew that only the Zionists could responsibly represent the Jews in dealings with the Nazi government. We all felt sure that one day the government would arrange a round table conference with the Jews, at which—after the riots and atrocities of the revolution had passed—the new status of German Jewry could be considered. The government announced very solemnly that there was no country in the world which tried to solve the Jewish problem as seriously as did Germany. Solution of the Jewish question? It was our Zionist dream! We never denied the existence of the Jewish question! Dissimilation? It was our own appeal! . . . In a statement notable for its pride and dignity, we called for a conference.” 1744

In 1917, Jewish Zionist Elisha M. Friedman made several references to the “solution of the Jewish question”,

“Recent events have served to accentuate Zionism as an attempt at the solution of the Jewish question. [***] And only yesterday, as it were, Adolph
Lewinsohn, whose activities transcend creed, has likewise joined those that see in Zionism a solution to the Jewish question. [***] Insofar as it affords no relief to the assimilationist and intensifies the loyalty of the great mass of a dispersed people, the policy of partial assimilation defeats its own ends. It is purposeless. It has been tested out, as a solution of the Jewish question, and has proven an eloquent failure.”¹⁷⁴⁵

In 1914, Jewish Zionist Israel Zangwill made reference to the “solution of the Jewish Question”,

“But if the prospect of a territorial solution of the Jewish Question, whether in Palestine or in the New World appears remote, it must be admitted that the Jewish race, in abandoning before the legions of Rome the struggle for independent political existence, in favor of spiritual isolation and economic symbiosis, discovered the secret of immortality, if also of perpetual motion.”¹⁷⁴⁶

In 1898, an American Jewish Zionist, Richard Gottheil, proposed a Zionist “final solution of the Jewish question”. Gottheil feared the “extermination” of the Jewish race, not through violent genocide, but by “a final solution of the Jewish question” of “assimilation”. Gottheil proposed that Jews form a nation in Palestine in order to maintain the Jewish race. Note that Gottheil mentions “those Jews who are forced to go” to Palestine. Gottheil’s speech appeared in The World’s Best Orations, Volume 6, F. P. Kaiser, St. Louis, (1899), pp. 2294-2298:

“THE JEWS AS A RACE AND AS A NATION

(Peroration of the Address, ‹The Aims of Zionism,› Delivered in New York City, November 1st, 1898)

I KNOW that there are a great many of our people who look for a final solution of the Jewish question in what they call «assimilation.» The more the Jews assimilate themselves to their surroundings, they think, the more completely will the causes for anti-Jewish feeling cease to exist. But have you ever for a moment stopped to consider what assimilation means? It has very pertinently been pointed out that the use of the word is borrowed from the dictionary of physiology. But in physiology it is not the food which assimilates itself into the body. It is the body which assimilates the food. The Jew may wish to be assimilated; he may do all he will towards this end. But if the great mass in which he lives does not wish to assimilate him — what then? If demands are made upon the Jew which practically mean extermination, which practically mean his total effacement from among the nations of the globe and from among the religious forces of the world, — what answer will you give? And the demands made are practically of that nature.
I can imagine it possible for a people who are possessed of an active and aggressive charity which it expresses, not only in words, but also in deeds, to contain and live at peace with men of the most varied habits. But, unfortunately, such people do not exist; nations are swayed by feelings which are dictated solely by their own self-interests; and the Zionists in meeting this state of things, are the most practical as well as the most ideal of the Jews.

It is quite useless to tell the English workingman that his Jewish fellow-laborer from Russia has actually increased the riches of the United Kingdom; that he has created quite a new industry,—that of making ladies’ cloaks, for which formerly England sent £2,000,000 to the continent every year. He sees in him some one who is different to himself, and unfortunately successful, though different. And until that difference entirely ceases, whether of habit, of way, or of religious observance, he will look upon him and treat him as an enemy.

For the Jew has this especial disadvantage. There is no place where that which is distinctively Jewish in his manner or in his way of life is *à la mode*. We may well laugh at the Irishman’s brogue; but in Ireland, he knows, his brogue is at home. We may poke fun at the Frenchman as he shrugs his shoulders and speaks with every member of his body. The Frenchman feels that in France it is the proper thing so to do. Even the Turk will wear his fez, and feel little the worse for the occasional jibes with which the street boy may greet it. But this consciousness, this ennobling consciousness, is all denied to the Jew. What he does is nowhere *à la mode*; no, not even his features; and if he can disguise these by parting his hair in the middle or cutting his beard to a point, he feels he is on the road towards assimilation. He is even ready to use the term «Jewish» for what he considers uncouth and low.

For such as these amongst us, Zionism also has its message. It wishes to give back to the Jew that nobleness of spirit, that confidence in himself, that belief in his own powers which only perfect freedom can give. With a home of his own, he will no longer feel himself a pariah among the nations, he will nowhere hide his own peculiarities,—peculiarities to which he has a right as much as any one,—but will see that those peculiarities carry with them a message which will force for them the admiration of the world. He will feel that he belongs somewhere and not everywhere. He will try to be something and not everything. The great word which Zionism preaches is conciliation of conflicting aims, of conflicting lines of action; conciliation of Jew to Jew. It means conciliation of the non-Jewish world to the Jew as well. It wishes to heal old wounds; and by frankly confessing differences which do exist, however much we try to explain them away, to work out its own salvation upon its own ground, and from these to send forth its spiritual message to a conciliated world.

But, you will ask, if Zionism is able to find a permanent home in Palestine for those Jews who are forced to go there as well as those who wish to go, what is to become of us who have entered, to such a degree, into the
life around us, and who feel able to continue as we have begun? What is to be our relation to the new Jewish polity? I can only answer: Exactly the same as is the relation of people of other nationalities all the world over to their parent home. What becomes of the Englishman in every corner of the globe? What becomes of the German? Does the fact that the great mass of their people live in their own land prevent them from doing their whole duty towards the land in which they happen to live? Is the German-American considered less of an American because he cultivates the German language and is interested in the fate of his fellow-Germans at home? Is the Irish-American less of an American because he gathers money to help his struggling brethren in the Green Isle? Or are the Scandinavian-Americans less worthy of the title Americans, because they consider precious the bonds which bind them to the land of their birth, as well as those which bind them to the land of their adoption?

Nay! it would seem to me that just those who are so afraid that our action will be misinterpreted should be among the greatest helpers in the Zionist cause. For those who feel no racial and national communion with the life from which they have sprung should greet with joy the turning of Jewish immigration to some place other than the land in which they dwell. They must feel, for example, that a continual influx of Jews who are not Americans is a continual menace to the more or less complete absorption for which they are striving.

But I must not detain you much longer. Will you permit me to sum up for you the position which we Zionists take in the following statements: —

We believe that the Jews are something more than a purely religious body; that they are not only a race, but also a nation; though a nation without as yet two important requisites — a common home and a common language.

We believe that if an end is to be made to Jewish misery and to the exceptional position which the Jews occupy, — which is the primary cause of Jewish misery, — the Jewish nation must be placed once again in a home of its own.

We believe that such a national regeneration is the fulfillment of the hope which has been present to the Jew throughout his long and painful history.

We believe that only by means of such a national regeneration can the religious regeneration of the Jews take place, and they be put in a position to do that work in the religious world which Providence has appointed for them.

We believe that such a home can only naturally, and without violence to their whole past, be found in the land of their fathers — in Palestine.

We believe that such a return must have the guarantee of the great powers of the world in order to secure for the Jews a stable future.

And we hold that this does not mean that all Jews must return to Palestine.

This, ladies and gentlemen, is the Zionist program. Shall we be able to carry it through? I cannot believe that the Jewish people have been preserved throughout these centuries either for eternal misery or for total absorption at
this stage of the world’s history. I cannot think that our people have so far misunderstood their own purpose in life, as now to give the lie to their own past and to every hope which has animated their suffering body.

Bear with me but a few moments longer while I read the words which a Christian writer puts into the mouth of a Jew. «The effect of our separateness will not be completed and have its highest transformation, unless our race takes on again the character of a nationality. That is the fulfillment of the religious trust that molded them into a people, whose life has made half the inspiration of the world. . . . Revive the organic centre; let the unity of Israel which has made the growth and form of its religion be an outward reality. Looking toward a land and a polity, our dispersed people in all the ends of the earth may share the dignity of a national life which has a voice among the peoples of the East and the West — which will plant the wisdom and skill of our race so that it may be, as of old, a medium of transmission and understanding. Let that come to pass, and the living warmth will spread to the weak extremities of Israel. Let the central fire be kindled again, and the light will reach afar. The degraded and scorned of the race will learn to think of their sacred land, not as a place for saintly beggary to await death in loathsome idleness, but as a republic, where the Jewish spirit manifests itself in a new order founded on the old, purified, enriched by the experiences which our greatest sons have gathered from the life of the ages. A new Judea, poised between East and West — a covenant of reconciliation. The sons of Judah have to choose, that God may again choose them. The Messianic time is the time when Israel shall will the planting of the national ensign. The divine principle of our race is action, choice, resolved memory. Let us help to will our own better future of the world — not renounce our higher gift and say: «Let us be as if we were not among the populations,» but choose our full heritage, claim the brotherhood of our nation, and carry into it a new brotherhood with the nations of the Gentiles. The vision is there; it will be fulfilled.»

These are the words of the non-Jewish Zionist, George Eliot. We take hope, for has not that Jewish Zionist said: «We belong to a race that can do everything but fail.»”

On 22 August 1897, on page 12, in an article entitled, “Jews Against Zionism”, The New York Times wrote,

“Many of them thought that a purely philanthropic movement would always be but a palliative, and would never lead to a solution of the Jewish question.”

Like countless other Jewish Zionists, Theodor Herzl spoke of Zionism as the “solution of the Jewish question”. In fact the very title of Herzl’s seminal book makes the reference, Der Judenstaat; Versuch einer modernen Lösung der Judenfrage, M. Breitenstein, Leipzig, Wien, (1896). English translation: A Jewish

“This guard of honour would be the great symbol of the solution of the Jewish Question after eighteen centuries of Jewish suffering.”

In an article entitled “Zionist Congress in Basel”, The New York Times quoted Theodor Herzl, on 31 August 1897, on page 7,

“I think we shall find Palestine at our disposal sooner than we expected. Last year I went to Constantinople and had two long conferences with the Grand Vizier, to whom I pointed out that the key to the preservation of Turkey lay in the solution of the Jewish question.”

In his opening address to the First Zionist Congress, Herzl stated,

“Wir Zionisten wünschen zur Lösung der Judenfrage nicht etwa einen internationalen Verein, sondern die internationale Diskussion.”

Herzl’s statements were recorded in, “The Zionist Congress: Full Report of the Proceedings”, The Jewish Chronicle, (3 September 1897), pp. 10-15, at 11, 12 and 15,

“We Zionists desire for the solution of the Jewish Question. [***] But it is not the solution of the Jewish Question, and cannot be so in its present form. [***] The financial help which the Jews are able to offer to Turkey is not small, and would serve to put an end to many an evil from which the country is suffering. If a part of the Oriental question can be solved, together with the Jewish question, this surely is in the interest of all nations. [***] In this way we understand, we expect the solution of the Jewish Question. [***] On the day when the Jews again held the plough in Palestine, on that day would the Jewish Question be solved.”

In examining the history of expressed threats of genocide, it should be mentioned that long before Kaufman’s genocidal book Germany Must Perish! advocated the extermination of Gentile Germans, anti-Semite Eugen Karl Dühring implicitly advocated the genocide of Jews in the 1901 edition of his Die Judenfrage, Chapter 5, Sections 4-9, which concludes with the statement:

“Precisely this situation must however urge the determined component of better humanity only so much more to act in order to create communities and communal life whose principles extend over the earth and thereby also, obviously, do not leave any room for Hebrew life.”

Jörg Lanz-Liebenfels advocated the deportation and sterilization of “inferior
“He perceives then what commingling of individuals, what confluence of blood, has produced him, what round of begettings and births has called him forth. He senses in this immortality of the generations a community of blood, which he feels to be the antecedents of his I, its perseverance in the infinite past. To that is added the discovery, promoted by this awareness, that blood is a deep rooted nurturing force within individual man; that the deepest layers of our being are determined by blood; that our innermost thinking and our will are colored by it. Now he finds that the world around him is the world of imprints and influences, whereas blood is the realm of a substance capable of being imprinted and influenced, a substance absorbing and assimilating all into its own form. And he therefore senses that he belongs no longer to the community of those whose constant elements of experience he shares, but to the deeper-reaching community of those whose substance he shares. [***]

Whoever, faced with the choice between environment and substance, decides for substance will henceforth have to be a Jew truly from within, to live as a Jew with all the contradiction, all the tragedy, and all the future promise of his blood.”

Josef Ludwig Reimer published *Ein pangermanisches Deutschland. Versuch über die Konsequenzen der gegenwärtigen wissenschaftlichen Rassenbetrachtung für unsere politischen und religiösen Probleme*, F. Luckhardt, Berlin, Leipzig, (1905); which advocated dividing human beings into three categories with the rulers being blond-haired, blue-eyed supermen, who ruled the “mixed-race” and middle class, and the lowest grouping, the non-Germanics. The non-Germanics would be sterilized or prevented by law from bearing children. Extremist and violent Social Darwinism appeared in Germany in the Nineteenth Century in the writings of Friedrich von Hellwald, and Ernst Haeckel advocated Eugenics.

The “Eugenics” of Sir Francis Galton has a long and complex history dating back to the Greeks and includes such famous persons as Charles Darwin and Alexander Graham Bell. Prior to the Nazi regime, Eugenics was most enthusiastically promoted in the United States, where there was active governmental
interest in the field, and where Eugenics influenced legislation. It was also welcomed in England. The colonial powers sought scientific justification for their un-Christian treatment of their fellow human beings, as if inferior. America sought to limit the immigration and political power of the so-called “inferior races”. The Nazis instituted their “T4” “Euthanasie-Programme” in 1939.

German Jews had endured increasingly hostile agitations since the end of the First World War, and the Hitler regime enacted discriminatory laws against the Jews long before Kaufman’s book found its way into print, which segregationist laws had an ancient history in Europe and were endorsed by Heinrich Class under the nom de plume Daniel Frymann, Wenn ich der Kaiser wär: politische Wahrheiten und Notwendigkeiten, Dieterich, Leipzig, (1912); even before the First World War.

In naming the important historical incidents of genocidal propaganda and acts, it must also be mentioned that Biblical passages in the Old Testament and the New, as well as Talmudic writings, prophesied the genocide and enslavement of Gentiles and the ascent of a master race of Jews. Writing on Thomas Jefferson’s religious views, William D. Gould wrote,

“Jefferson praised the philosophers of antiquity for their insistence on the necessity of governing the passions, but found that they did not deal adequately with social duties. They taught well the obligation of being just in dealing with one’s neighbor or countryman, but felt under no constraint to cultivate a love for all mankind. Even the Jews in Jesus’ day, he believed, entertained many erroneous ideas concerning religion and morality. In addition to the fact that he felt that a number of their conceptions of God were incorrect, their ethics, in respect to other nations, were, he thought, decidedly antisocial.”

Jefferson criticized ancient philosophers and the ancient Jews in his Syllabus. He wrote, inter alia, in a letter to Dr. Benjamin Rush of 21 April 1803 responding to rumors that he was not a Christian,

“Syllabus of an Estimate of the Merit of the Doctrines of Jesus, Compared with Those of Others.

In a comparative view of the Ethics of the enlightened nations of antiquity, of the Jews and of Jesus, no notice should be taken of the corruptions of reason among the ancients, to wit, the idolatry and superstition of the vulgar, nor of the corruptions of Christianity by the learned among its professors.

Let a just view be taken of the moral principles inculcated by the most esteemed of the sects of ancient philosophy, or of their individuals; particularly Pythagoras, Socrates, Epicurus, Cicero, Epictetus, Seneca, Antoninus.

I. Philosophers. i. Their precepts related chiefly to ourselves, and the government of those passions which, unrestrained, would disturb our tranquility of mind.[Footnote: To explain, I will exhibit the heads of
Seneca’s and Cicero’s philosophical works, the most extensive of any we have received from the ancients. Of ten heads in Seneca, seven relate to ourselves, viz. de ira, consolatio, de tranquilitate, de constantia sapientis, de otio sapientis, de vita beata, de brevitate vitae; two relate to others, de clementia, de beneficis; and one relates to the government of the world, de providentia. Of eleven tracts of Cicero, five respect ourselves, viz. de finibus, Tusculana, academica, paraodoxa, de Senectute; one, de officiis, relates partly to ourselves, partly to others; one, de amicitia, relates to others; and four are on different subjects, to wit, de natura deorum, de divinatione, de fato, and sommium Scipionis.] In this branch of philosophy they were really great.

2. In developing our duties to others, they were short and defective. They embraced, indeed, the circles of kindred and friends, and inculcated patriotism, or the love of our country in the aggregate, as a primary obligation: towards our neighbors and countrymen they taught justice, but scarcely viewed them as within the circle of benevolence. Still less have they inculcated peace, charity and love to our fellow men, or embraced with benevolence the whole family of mankind.

II. Jews. 1. Their system was Deism; that is, the belief in one only God. But their ideas of him and of his attributes were degrading and injurious.

2. Their Ethics were not only imperfect, but often irreconcilable with the sound dictates of reason and morality, as they respect intercourse with those around us; and repulsive and anti-social, as respecting other nations. They needed reformation, therefore, in an eminent degree.”

Ancient Jewish myths enunciate a nationalistic and destructive racism by a master nation of Israel on a holy mission to mercifully subjugate the other nations of the world, supposedly pursuant to God’s will. For example, Deuteronomy, Chapter 7, states,

“When the LORD thy God shall bring thee into the land whither thou goest to possess it, and hath cast out many nations before thee, the Hittites, and the Girgashtites, and the Amorites, and the Canaanites, and the Perizzites, and the Hivites, and the Jebusites, seven nations greater and mightier than thou; 2 And when the LORD thy God shall deliver them before thee; thou shalt smite them, and utterly destroy them; thou shalt make no covenant with them, nor show mercy unto them: 3 Neither shalt thou make marriages with them; thy daughter thou shalt not give unto his son, nor his daughter shalt thou take unto thy son. 4 For they will turn away thy son from following me, that they may serve other gods: so will the anger of the LORD be kindled against you, and destroy thee suddenly. 5 But thus shall ye deal with them; ye shall destroy their altars, and break down their images, and cut down their groves, and burn their graven images with fire. 6 For thou art an holy people unto the
LORD thy God: the LORD thy God hath chosen thee to be a special people unto himself, above all people that are upon the face of the earth. 7 The LORD did not set his love upon you, nor choose you, because ye were more in number than any people; for ye were the fewest of all people: 8 But because the LORD loved you, and because he would keep the oath which he had sworn unto your fathers, hath the LORD brought you out with a mighty hand, and redeemed you out of the house of bondmen, from the hand of Pharaoh king of Egypt. 9 Know therefore that the LORD thy God, he is God, the faithful God, which keepeth covenant and mercy with them that love him and keep his commandments to a thousand generations; 10 And repayeth them that hate him to their face, to destroy them: he will not be slack to him that hateth him, he will repay him to his face. 11 Thou shalt therefore keep the commandments, and the statutes, and the judgments, which I command thee this day, to do them. 12 Wherefore it shall come to pass, if ye hearken to these judgments, and keep, and do them, that the LORD thy God shall keep unto thee the covenant and the mercy which he sware unto thy fathers: 13 And he will love thee, and bless thee, and multiply thee: he will also bless the fruit of thy womb, and the fruit of thy land, thy corn, and thy wine, and thine oil, the increase of thy kine, and the flocks of thy sheep, in the land which he sware unto thy fathers to give thee. 14 Thou shalt be blessed above all people: there shall not be male or female barren among you, or among your cattle. 15 And the LORD will take away from thee all sickness, and will put none of the evil diseases of Egypt, which thou knowest, upon thee; but will lay them upon all them that hate thee. 16 And thou shalt consume all the people which the LORD thy God shall deliver thee; thine eye shall have no pity upon them: neither shalt thou serve their gods; for that will be a snare unto thee. 17 If thou shalt say in thine heart, These nations are more than I; how can I dispossess them? 18 Thou shalt not be afraid of them: but shalt well remember what the LORD thy God did unto Pharaoh, and unto all Egypt; 19 The great temptations which thine eyes saw, and the signs, and the wonders, and the mighty hand, and the stretched out arm, whereby the LORD thy God brought thee out: so shall the LORD thy God do unto all the people of whom thou art afraid. 20 Moreover the LORD thy God will send the hornet among them, until they that are left, and hide themselves from thee, be destroyed. 21 Thou shalt not be affrighted at them: for the LORD thy God is among you, a mighty God and terrible. 22 And the LORD thy God will put out those nations before thee by little and little: thou mayest not consume them at once, lest the beasts of the field increase upon thee. 23 But the LORD thy God shall deliver them unto thee, and shall destroy them with a mighty destruction, until they be destroyed. 24 And he shall deliver their kings into thine hand, and thou shalt destroy their name from under heaven: there shall no man be able to stand before thee, until thou have destroyed them. 25 The graven images of their gods shall ye burn with fire: thou shalt not desire the silver or gold that is on them, nor take it unto thee, lest thou be snared therein: for it is an abomination to the LORD thy God. 26 Neither
shalt thou bring an abomination into thine house, lest thou be a cursed thing like it: but thou shalt utterly detest it, and thou shalt utterly abhor it; for it is a cursed thing."

Deuteronomy, Chapter 28, proclaims the punishment to befall the assimilated,

“And it shall come to pass, if thou shalt hearken diligently unto the voice of the LORD thy God, to observe and to do all his commandments which I command thee this day, that the LORD thy God will set thee on high above all nations of the earth: 2 And all these blessings shall come on thee, and overtake thee, if thou shalt hearken unto the voice of the LORD thy God. 3 Blessed shalt thou be in the city, and blessed shalt thou be in the field. 4 Blessed shall be the fruit of thy body, and the fruit of thy ground, and the fruit of thy cattle, the increase of thy kine, and the flocks of thy sheep. 5 Blessed shall be thy basket and thy store. 6 Blessed shalt thou be when thou comest in, and blessed shalt thou be when thou goest out. 7 The LORD shall cause thine enemies that rise up against thee to be smitten before thy face: they shall come out against thee one way, and flee before thee seven ways. 8 The LORD shall command the blessing upon thee in thy storehouses, and in all that thou settest thine hand unto; and he shall bless thee in the land which the LORD thy God giveth thee. 9 The LORD shall establish thee a holy people unto himself, as he hath sworn unto thee, if thou shalt keep the commandments of the LORD thy God, and walk in his ways. 10 And all people of the earth shall see that thou art called by the name of the LORD; and they shall be afraid of thee. 11 And the LORD shall make thee plenteous in goods, in the fruit of thy body, and in the fruit of thy land, in the land which the LORD sware unto thy fathers to give thee. 12 The LORD shall open unto thee his good treasure, the heaven to give the rain unto thy land in his season, and to bless all the work of thine hand: and thou shalt lend unto many nations, and thou shalt not borrow. 13 And the LORD shall make thee the head, and not the tail; and thou shalt be above only, and thou shalt not be beneath; if that thou hearken unto the commandments of the LORD thy God, which I command thee this day, to observe and to do them: 14 And thou shalt not go aside from any of the words which I command thee this day, to the right hand, or to the left, to go after other gods to serve them. 15 But it shall come to pass, if thou wilt not hearken unto the voice of the LORD thy God, to observe to do all his commandments and his statutes which I command thee this day; that all these curses shall come upon thee, and overtake thee:16 Cursed shalt thou be in the city, and cursed shalt thou be in the field. 17 Cursed shall be thy basket and thy store. 18 Cursed shall be the fruit of thy body, and the fruit of thy land, the increase of thy kine, and the flocks of thy sheep. 19 Cursed shalt thou be when thou comest in, and cursed shalt thou be when thou goest out. 20 The LORD shall send upon thee cursing, vexation, and rebuke, in all that thou settest thine hand unto for to do, until thou be destroyed, and until thou perish
Nazism is Zionism 1571

quickly; because of the wickedness of thy doings, whereby thou hast forsaken me. 21 The LORD shall make the pestilence cleave unto thee, until he have consumed thee from off the land, whither thou goest to possess it. 22 The LORD shall smite thee with a consumption, and with a fever, and with an inflammation, and with an extreme burning, and with the sword, and with blasting, and with mildew; and they shall pursue thee until thou perish. 23 And thy heaven that is over thy head shall be brass, and the earth that is under thee shall be iron. 24 The LORD shall make the rain of thy land powder and dust: from heaven shall it come down upon thee, until thou be destroyed. 25 The LORD shall cause thee to be smitten before thine enemies: thou shalt go out one way against them, and flee seven ways before them: and shalt be removed into all the kingdoms of the earth. 26 And thy carcase shall be meat unto all fowls of the air, and unto the beasts of the earth, and no man shall fray them away. 27 The LORD will smite thee with the botch of Egypt, and with the emerods, and with the scab, and with the itch, whereof thou canst not be healed. 28 The LORD shall smite thee with madness, and blindness, and astonishment of heart: 29 And thou shalt grope at noonday, as the blind gropeth in darkness, and thou shalt not prosper in thy ways: and thou shalt be only oppressed and spoiled evermore, and no man shall save thee. 30 Thou shalt betroth a wife, and another man shall lie with her: thou shalt build an house, and thou shalt not dwell therein: thou shalt plant a vineyard, and shalt not gather the grapes thereof. 31 Thine ox shall be slain before thine eyes, and thou shalt not eat thereof: thine ass shall be violently taken away from before thy face, and shall not be restored to thee: thy sheep shall be given unto thine enemies, and thou shalt have none to rescue them. 32 Thy sons and thy daughters shall be given unto another people, and thine eyes shall look, and fail with longing for them all the day long: and there shall be no might in thine hand. 33 The fruit of thy land, and all thy labours, shall be a nation which thou knowest not eat up; and thou shalt be only oppressed and crushed alway: 34 So that thou shalt be mad for the sight of thine eyes which thou shalt see. 35 The LORD shall smite thee in the knees, and in the legs, with a sore botch that cannot be healed, from the sole of thy foot unto the top of thy head. 36 The LORD shall bring thee, and thy king which thou shalt set over thee, unto a nation which neither thou nor thy fathers have known; and there shalt thou serve other gods, wood and stone. 37 And thou shalt become an astonishment, a proverb, and a byword, among all nations whither the LORD shall lead thee. 38 Thou shalt carry much seed out into the field, and shalt gather but little in; for the locust shall consume it. 39 Thou shalt plant vineyards, and dress them, but shalt neither drink of the wine, nor gather the grapes; for the worms shall eat them. 40 Thou shalt have olive trees throughout all thy coasts, but thou shalt not anoint thyself with the oil; for thine olive shall cast his fruit. 41 Thou shalt beget sons and daughters, but thou shalt not enjoy them; for they shall go into captivity. 42 All thy trees and fruit of thy land shall the locust consume. 43 The stranger that is within thee shall get up above thee very high; and thou shalt come
down very low. 44 He shall lend to thee, and thou shalt not lend to him: he shall be the head, and thou shalt be the tail. 45 Moreover all these curses shall come upon thee, and shall pursue thee, and overtake thee, till thou be destroyed; because thou hearkenedst not unto the voice of the LORD thy God, to keep his commandments and his statutes which he commanded thee: 46 And they shall be upon thee for a sign and for a wonder, and upon thy seed for ever. 47 Because thou servedst not the LORD thy God with joyfulness, and with gladness of heart, for the abundance of all things; 48 Therefore shalt thou serve thine enemies which the LORD shall send against thee, in hunger, and in thirst, and in nakedness, and in want of all things: and he shall put a yoke of iron upon thy neck, until he have destroyed thee. 49 The LORD shall bring a nation against thee from far, from the end of the earth, as swift as the eagle flieth; a nation whose tongue thou shalt not understand; 50 A nation of fierce countenance, which shall not regard the person of the old, nor show favour to the young: 51 And he shall eat the fruit of thy cattle, and the fruit of thy land, until thou be destroyed: which also shall not leave thee either corn, wine, or oil, or the increase of thy kine, or flocks of thy sheep, until he have destroyed thee. 52 And he shall besiege thee in all thy gates, until thy high and fenced walls come down, wherein thou trustedst, throughout all thy land: and he shall besiege thee in all thy gates throughout all thy land, which the LORD thy God hath given thee. 53 And thou shalt eat the fruit of thine own body, the flesh of thy sons and of thy daughters, which the LORD thy God hath given thee, in the siege, and in the straitness, wherewith thine enemies shall distress thee: 54 So that the man that is tender among you, and very delicate, his eye shall be evil toward his brother, and toward the wife of his bosom, and toward the remnant of his children which he shall leave: 55 So that he will not give to any of them of the flesh of his children whom he shall eat: because he hath nothing left him in the siege, and in the straitness, wherewith thine enemy shall distress thee in all thy gates. 56 The tender and delicate woman among you, which would not adventure to set the sole of her foot upon the ground for delicateness and tenderness, her eye shall be evil toward the husband of her bosom, and toward her son, and toward her daughter, 57 And toward her young one that cometh out from between her feet, and toward her children which she shall bear: for she shall eat them for want of all things secretly in the siege and straitness, wherewith thine enemy shall distress thee in thy gates. 58 If thou wilt not observe to do all the words of this law that are written in this book, that thou mayest fear this glorious and fearful name, THE LORD THY GOD; 59 Then the LORD will make thy plagues wonderful, and the plagues of thy seed, even great plagues, and of long continuance, and sore sicknesses, and of long continuance. 60 Moreover he will bring upon thee all the diseases of Egypt, which thou wast afraid of; and they shall cleave unto thee. 61 Also every sickness, and every plague, which is not written in the book of this law, them will the LORD bring upon thee, until thou be destroyed. 62 And ye shall be left few in number, whereas ye were as the stars of heaven for
multitude; because thou wouldest not obey the voice of the LORD thy God. 63 And it shall come to pass, that as the LORD rejoiced over you to do you good, and to multiply you; so the LORD will rejoice over you to destroy you, and to bring you to nought; and ye shall be plucked from off the land whither thou goest to possess it. 64 And the LORD shall scatter thee among all people, from the one end of the earth even unto the other; and there thou shalt serve other gods, which neither thou nor thy fathers have known, even wood and stone. 65 And among these nations shalt thou find no ease, neither shall the sole of thy foot have rest: but the LORD shall give thee there a trembling heart, and failing of eyes, and sorrow of mind: 66 And thy life shall hang in doubt before thee; and thou shalt fear day and night, and shalt have none assurance of thy life: 67 In the morning thou shalt say, Would God it were even! and at even thou shalt say, Would God it were morning! for the fear of thine heart wherewith thou shalt fear, and for the sight of thine eyes which thou shalt see. 68 And the LORD shall bring thee into Egypt again with ships, by the way whereof I spake unto thee, Thou shalt see it no more again: and there ye shall be sold unto your enemies for bondmen and bondwomen, and no man shall buy you.”

Isaiah, Chapter 34,

“Come near, ye nations, to hear; and hearken, ye people: let the earth hear, and all that is therein; the world, and all things that come forth of it. 2 For the indignation of the LORD is upon all nations, and his fury upon all their armies: he hath utterly destroyed them, he hath delivered them to the slaughter. 3 Their slain also shall be cast out, and their stink shall come up out of their carcases, and the mountains shall be melted with their blood. 4 And all the host of heaven shall be dissolved, and the heavens shall be rolled together as a scroll: and all their host shall fall down, as the leaf falleth off from the vine, and as a falling fig from the fig tree. 5 For my sword shall be bathed in heaven: behold, it shall come down upon Idumea, and upon the people of my curse, to judgment. 6 The sword of the LORD is filled with blood, it is made fat with fatness, and with the blood of lambs and goats, with the fat of the kidneys of rams: for the LORD hath a sacrifice in Bozrah, and a great slaughter in the land of Idumea. 7 And the unicorns shall come down with them, and the bullocks with the bulls; and their land shall be soaked with blood, and their dust made fat with fatness. 8 For it is the day of the LORD’S vengeance, and the year of recompenses for the controversy of Zion. 9 And the streams thereof shall be turned into pitch, and the dust thereof into brimstone, and the land thereof shall become burning pitch. 10 It shall not be quenched night nor day; the smoke thereof shall go up for ever: from generation to generation it shall lie waste; none shall pass through it for ever and ever. 11 But the cormorant and the bittern shall possess it; the owl also and the raven shall dwell in it: and he shall stretch out upon it the line of confusion, and the stones of emptiness. 12 They shall call the nobles
thereof to the kingdom, but none shall be there, and all her princes shall be nothing. 13 And thorns shall come up in her palaces, nettles and brambles in the fortresses thereof: and it shall be an habitation of dragons, and a court for owls. 14 The wild beasts of the desert shall also meet with the wild beasts of the island, and the satyr shall cry to his fellow; the screech owl also shall rest there, and find for herself a place of rest. 15 There shall the great owl make her nest, and lay, and hatch, and gather under her shadow: there shall the vultures also be gathered, every one with her mate. 16 Seek ye out of the book of the LORD, and read: no one of these shall fail, none shall want her mate: for my mouth it hath commanded, and his spirit it hath gathered them. 17 And he hath cast the lot for them, and his hand hath divided it unto them by line: they shall possess it for ever, from generation to generation shall they dwell therein.”

_Isaiah_, Chapter 60:12, 16,

“For the nation and kingdom that will not serve thee shall perish; yea, those nations shall be utterly wasted. [***] Thou shalt also suck the milk of the Gentiles, and shalt suck the breast of kings: and thou shalt know that I the LORD am thy Saviour and thy Redeemer, the mighty One of Jacob.”

_Isaiah_, Chapter 61,

“The spirit of the Lord GOD is upon me; because the LORD hath anointed me to preach good tidings unto the meek; he hath sent me to bind up the brokenhearted, to proclaim liberty to the captives, and the opening of the prison to them that are bound; 2 To proclaim the acceptable year of the LORD, and the day of vengeance of our God; to comfort all that mourn; 3 To appoint unto them that mourn in Zion, to give unto them beauty for ashes, the oil of joy for mourning, the garment of praise for the spirit of heaviness; that they might be called trees of righteousness, the planting of the LORD, that he might be glorified. 4 And they shall build the old wastes, they shall raise up the former desolations, and they shall repair the waste cities, the desolations of many generations. 5 And strangers shall stand and feed your flocks, and the sons of the alien shall be your plowmen and your vinedressers. 6 But ye shall be named the Priests of the LORD: men shall call you the Ministers of our God: ye shall eat the riches of the Gentiles, and in their glory shall ye boast yourselves. 7 For your shame ye shall have double; and for confusion they shall rejoice in their portion: therefore in their land they shall possess the double: everlasting joy shall be unto them. 8 For I the LORD love judgment, I hate robbery for burnt offering; and I will direct their work in truth, and I will make an everlasting covenant with them. 9 And their seed shall be known among the Gentiles, and their offspring among the people: all that see them shall acknowledge them, that they are the seed which the LORD hath blessed. 10 I will greatly rejoice in the LORD, my soul
shall be joyful in my God; for he hath clothed me with the garments of salvation, he hath covered me with the robe of righteousness, as a
bridegroom decketh himself with ornaments, and as a bride adorneth herself with her jewels. 11 For as the earth bringeth forth her bud, and as the garden causeth the things that are sown in it to spring forth; so the Lord GOD will cause righteousness and praise to spring forth before all the nations.”

The Nazis’ infamous Lebensborn program, the program to breed “Aryan” children for the Reich, was perhaps instead a means for racist Jews to interject Jewish blood into the German “race” so as to dilute the blood of Esau. This is pure speculation, but it is based upon the fact that the Jews viewed Germans as Esau, wanted to destroy or weaken Esau, had control over the Third Reich, and had numerous Jewish members in the SS who could have fathered these children.

After the war, many people began to notice that a large number of children in Israel were tall, blond and blue eyed. They could have passed for Swedes. The entire Holocaust may well have been a eugenics program for racist Jews to clean up their blood, which they believed had been damaged by the Ghetto system of Europe. Jewish prophecy and lore teaches that in the Messianic Era Jews will be tall, fair-skinned (radiant: Isaiah 60:5) and handsome.

The especially interesting thing about these tall, blond, blue-eyed children in Israel, is that many were allegedly orphans—orphans who believed that they were Gentiles and who were shocked when told that their parents had been Jewish. This has led some to conclude that Jews kidnapped Gentile children and brought them to Israel. This leads to speculation that after anointing their Messiah, racist Jews will use Gentile slaves to breed them children, so that they can populate the world with the children of breeding slaves and completely kill off Gentiles born and raised by Gentiles. They may plan to steal the children fathered and mothered by Gentiles, and they may plan to use Gentile woman as surrogate mothers to bear children of Jewish parents on a massive scale. This speculation is based on many Jewish writings, including, but not limited to, Isaiah, Chapter 49,

“Listen, O isles, unto me; and hearken, ye people, from far; The LORD hath called me from the womb; from the bowels of my mother hath he made mention of my name. 2 And he hath made my mouth like a sharp sword; in the shadow of his hand hath he hid me, and made me a polished shaft; in his quiver hath he hid me; 3 And said unto me, Thou art my servant, O Israel, in whom I will be glorified. 4 Then I said, I have laboured in vain, I have spent my strength for nought, and in vain: yet surely my judgment is with the LORD, and my work with my God. 5 And now, saith the LORD that formed me from the womb to be his servant, to bring Jacob again to him, Though Israel be not gathered, yet shall I be glorious in the eyes of the LORD, and my God shall be my strength. 6 And he said, It is a light thing that thou shouldest be my servant to raise up the tribes of Jacob, and to restore the preserved of Israel: I will also give thee for a light to the Gentiles, that thou mayest be my salvation unto the end of the earth. 7 Thus saith the LORD, the
Redeemer of Israel, and his Holy One, to him whom man despiseth, to him whom the nation abhorreth, to a servant of rulers, Kings shall see and arise, princes also shall worship, because of the LORD that is faithful, and the Holy One of Israel, and he shall choose thee. 8 Thus saith the LORD, In an acceptable time have I heard thee, and in a day of salvation have I helped thee: and I will preserve thee, and give thee for a covenant of the people, to establish the earth, to cause to inherit the desolate heritages; 9 That thou mayest say to the prisoners, Go forth; to them that are in darkness, Shew yourselves. They shall feed in the ways, and their pastures shall be in all high places. 10 They shall not hunger nor thirst; neither shall the heat nor sun smite them: for he that hath mercy on them shall lead them, even by the springs of water shall he guide them. 11 And I will make all my mountains a way, and my highways shall be exalted. 12 Behold, these shall come from far: and, lo, these from the north and from the west; and these from the land of Sinim. 13 Sing, O heavens; and be joyful, O earth; and break forth into singing, O mountains: for the LORD hath comforted his people, and will have mercy upon his afflicted. 14 But Zion said, The LORD hath forsaken me, and my Lord hath forgotten me. 15 Can a woman forget her sucking child, that she should not have compassion on the son of her womb? yea, they may forget, yet will I not forget thee. 16 Behold, I have graven thee upon the palms of my hands; thy walls are continually before me. 17 Thy children shall make haste; thy destroyers and they that made thee waste shall go forth of thee. 18 Lift up thine eyes round about, and behold: all these gather themselves together, and come to thee. As I live, saith the LORD, thou shalt surely clothe thee with them all, as with an ornament, and bind them on thee, as a bride doth. 19 For thy waste and thy desolate places, and the land of thy destruction, shall even now be too narrow by reason of the inhabitants, and they that swallowed thee up shall be far away. 20 The children which thou shalt have, after thou hast lost the other, shall say again in thine ears, The place is too strait for me: give place to me that I may dwell. 21 Then shalt thou say in thine heart, Who hath begotten me these, seeing I have lost my children, and am desolate, a captive, and removing to and fro? and who hath brought up these? Behold, I was left alone; these, where had they been? 22 Thus saith the Lord GOD, Behold, I will lift up mine hand to the Gentiles, and set up my standard to the people: and they shall bring thy sons in their arms, and thy daughters shall be carried upon their shoulders. 23 And kings shall be thy nursing fathers, and their queens thy nursing mothers: they shall bow down to thee with their face toward the earth, and lick up the dust of thy feet; and thou shalt know that I am the LORD: for they shall not be ashamed that wait for me. 24 Shall the prey be taken from the mighty, or the lawful captive delivered? 25 But thus saith the LORD, Even the captives of the mighty shall be taken away, and the prey of the terrible shall be delivered: for I will contend with him that contendeth with thee, and I will save thy children. 26 And I will feed them that oppress thee with their own flesh; and they shall be drunken with their own blood, as with sweet wine: and all flesh
shall know that I the LORD am thy Saviour and thy Redeemer, the mighty One of Jacob.”

Isaiah, Chapter 60:12, 16,

“For the nation and kingdom that will not serve thee shall perish; yea, those nations shall be utterly wasted. [***] Thou shalt also suck the milk of the Gentiles, and shalt suck the breast of kings: and thou shalt know that I the LORD am thy Saviour and thy Redeemer, the mighty One of Jacob.”

There are many instances in the Old Testament of the use of slaves taken from other nations to bear the ancestors of the Jews young, for example Abraham and Hagar. Isaiah 66 states, note that the “Lord” who is speaking is the voice of genocidal Jewish racism and absolute Jewish religious intolerance,

“1 Thus saith the LORD, The heaven is my throne, and the earth is my footstool: where is the house that ye build unto me? and where is the place of my rest? 2 For all those things hath mine hand made, and all those things have been, saith the LORD: but to this man will I look, even to him that is poor and of a contrite spirit, and trembleth at my word. 3 He that killeth an ox is as if he slew a man; he that sacrificeth a lamb, as if he cut off a dog’s neck; he that offereth an oblation, as if he offered swine’s blood; he that burneth incense, as if he blessed an idol. Yea, they have chosen their own ways, and their soul delighteth in their abominations. 4 I also will choose their delusions, and will bring their fears upon them; because when I called, none did answer; when I spake, they did not hear: but they did evil before mine eyes, and chose that in which I delighted not. 5¶ Hear the word of the LORD, ye that tremble at his word; Your brethren that hated you, that cast you out for my name’s sake, said, Let the LORD be glorified: but he shall appear to your joy, and they shall be ashamed. 6 A voice of noise from the city, a voice from the temple, a voice of the LORD that rendereth recompence to his enemies. 7 Before she travailed, she brought forth; before her pain came, she was delivered of a man child. 8 Who hath heard such a thing? who hath seen such things? Shall the earth be made to bring forth in one day? or shall a nation be born at once? for as soon as Zion travailed, she brought forth her children. 9 Shall I bring to the birth, and not cause to bring forth? saith the LORD: shall I cause to bring forth, and shut the womb? saith thy God. 10 Rejoice ye with Jerusalem, and be glad with her, and be glad with her, all ye that love her: rejoice for joy with her, all ye that mourn for her: 11 That ye may suck, and be satisfied with the breasts of her consolations; that ye may milk out, and be delighted with the abundance of her glory. 12 For thus saith the LORD, Behold, I will extend peace to her like a river, and the glory of the Gentiles like a flowing stream: then shall ye suck, ye shall be borne upon her sides, and be dallied upon her knees. 13 As one whom his mother comforteth, so will I comfort you; and ye shall be comforted in Jerusalem.
14 And when ye see this, your heart shall rejoice, and your bones shall flourish like an herb: and the hand of the Lord shall be known toward his servants, and his indignation toward his enemies. 15 For, behold, the Lord will come with fire, and with his chariots like a whirlwind, to render his anger with fury, and his rebuke with flames of fire. 16 For by fire and by his sword will the Lord plead with all flesh: and the slain of the Lord shall be many. 17 They that sanctify themselves, and purify themselves in the gardens behind one tree in the midst, eating swine’s flesh, and the abomination, and the mouse, shall be consumed together, saith the Lord. 18 For I know their works and their thoughts: it shall come, that I will gather all nations and tongues; and they shall come, and see my glory. 19 And I will set a sign among them, and I will send those that escape of them unto the nations, to Tarshish, Pul, and Lud, that draw the bow, to Tubal, and Javan, to the isles afar off, that have not heard my fame, neither have seen my glory; and they shall declare my glory among the Gentiles. 20 And they shall bring all your brethren for an offering unto the Lord out of all nations upon horses, and in chariots, and in litters, and upon mules, and upon swift beasts, to my holy mountain Jerusalem, saith the Lord, as the children of Israel bring an offering in a clean vessel into the house of the Lord. 21 And I will also take of them for priests and for Levites, saith the Lord. 22 For as the new heavens and the new earth, which I will make, shall remain before me, saith the Lord, so shall your seed and your name remain. 23 And it shall come to pass, that from one new moon to another, and from one sabbath to another, shall all flesh come to worship before me, saith the Lord. 24 And they shall go forth, and look upon the carcases of the men that have transgressed against me: for their worm shall not die, neither shall their fire be quenched; and they shall be an abhorring unto all flesh.”

7.6 The Carrot and the Stick

The violent Bolshevik revolution inspired great trepidation in the West. The *Morning Post* of London published numerous essays attacking Bolshevism and the *Protocols of the Learned Elders of Zion*, and asserting that Bolshevism signified proof of the genuineness of the *Protocols* and of the alleged alliance of the Freemasons and a vast Jewish conspiracy to rule the world. In England, Lord Northcliffe drew attention to the *Protocols* in his newspaper *The London Times* and called for an investigation of the Zionists. Henry Ford’s *The Dearborn Independent* did much the same thing in America and personally attacked many Jewish leaders in America. In Germany, Alfred Rosenberg and Adolf Hitler, among many others, focused public attention on the *Protocols*.

In *Genesis* 12:1-3 the Jews offer the world a carrot and a stick:

“Now the Lord had said unto Abram, Get thee out of thy country, and from thy kindred, and from thy father’s house, unto a land that I will shew thee: 2 And I will make of thee a great nation, and I will bless thee, and make thy
name great; and thou shalt be a blessing: 3 And I will bless them that bless thee, and curse him that curseth thee: and in thee shall all families of the earth be blessed.”

“Mentor” intimated in The Jewish Chronicle on 4 April 1919 on page 7, that Bolshevism was revenge on the Gentile nations for not allowing the Jews their own nation and for not willfully succumbing to the Jewish Messianic prophecy of a world government run by Jews,

“PEACE, WAR—
AND BOLSHEVISM.
By MENTOR.

WHAT is written here is pendent to what appeared in this column last week. As I intimated, I propose to revert to the subject then referred to.

BOLSHEVISM is at once the most serious menace to, and the best hope of, Civilisation. Paradoxical as this may sound, but a little thought will show it to be abundantly true. The menace of Bolshevism is manifest. It pulls down what, until now, it has shown itself unable efficiently to replace. In the name of freedom, it imposes galling slavery. In the name of humanity, it inflicts the direst evil upon the men, women, and children who come under its sway. It protests against class domination and itself imposes the domination of class wherever it can obtain power. It knows no bounds either in justice or in liberty. It murders, imprisons and tortures with the ruthlessness of an autocracy drunk with new-found authority. It is ruthless, relentless, all-engulfing. It falls upon the country it infects like a dire pestilence which casts people prone. It is a political disease, an economic infliction, a social disaster.

YET, none the less, in Bolshevism there lies, to-day, the hope of Humanity. For in essence, it is the revolt of peoples against the social state, against the evil; the iniquities—and the inequalities—that were crowned by the cataclysm of the War under which the world groaned for upwards of four years. It is a revolution against a social state which suffered Tsarism to exist in Russia and militarism in Prussia and which still allows, alas, so many a crying wrong in countries that plume themselves on their freedom and boast of their liberty. Bolshevism is the signal to mankind to halt in its social, political, and economic ways of old; to stay and examine them in the light of the sacrifice of the millions of youth who have gone down to darkness eternal, of the millions of treasure which war has wasted, and to ponder them in the light of the incalculable, ineffable burden which the years of struggle have placed upon Society, and, heaviest of all, upon the poor—in light of the war which was proof in all surety that the old order was doomed if civilisation was to survive. That Bolshevism broke out first in the
country most oppressed is nothing for wonder; it is merely natural. For centuries Russia had been the forcing ground of every infamy imposed by power and every wickedness done in the name of Government. That the creed has spread to a country whose national aspirations were for generations crushed, and where autocracy ruled, is nothing for wonder. Nor is the protest of Bolshevism merely a matter for Russia and Hungary, or a menace only to bayonet-ridden Germany. It is a challenge to the world—not least to the nations of freedom and liberty. It is a challenge to all the nations including the peoples who nourish liberty and freedom as precious principles, but who have passively allowed a state of affairs to grow and putrefy into the infamies of Russian Tsarism, the iniquity of Hungary, and the wickedness of German militarism; to the world that has suffered Society to fester into these and to break out into the prurient, gaping, sloughing, agonising tumour of such a war as that which is not ended, though it is suspended. And the fact that this protest has been made is the world’s best hope. It is a demand for another order of things, for a social state which will render humanity immune from the wickedness and such evil as resulted in the greatest war mankind has ever known. It asks for some guarantee against a system which dragged peoples innocent of any intention of killing, slaying, and slaughtering into the vortex of War—peacefully intentioned peoples who loathed and hated War (such as was England before that fateful day in August, 1914)—from which even the most innocent of belligerents, and even those who stood aside from the contest are suffering to-day; though none were wholly guiltless of it, because for generations all passively concurred in the system. If the world, as a result of the War, had received no such warning as Bolshevism, the evil would, in all probability have gone on, deepening in its wrong, becoming ever blacker. Bolshevism is a social fever which indicates a high blood temperature. It gives the warning of mischief that may be fatal. A wise doctor takes note of the fever and seeks to remove the cause. He does not call the fever ugly names or denounce it, nor is he so stupid as to confuse the patient’s consequent delirium with his normal condition, as so many are confusing the delirium of Bolshevism with the normal state of the countries in which it is finding vogue.

All such indications on the part of the body politic that there is a disease that must be removed, else the patient must go under, are as unpleasant, as inimical, as is the delirium of the fever-stricken patient distressing. The French Revolution drowned Paris in blood. Its excesses were far greater than anything that even the most malicious has attributed to Bolshevism. It instituted a Reign of Terror. It massacred Royalty. It condemned men and women day by day to the tumbril; so commonly indeed, that the men and women walking in the streets of Paris hardly looked round when some victim of the Jacobins was being taken to the Guillotine. Nothing and nobody was safe from the raging, tearing fever of the Revolution. For years it inflicted upon France a series of infamies, of torture, of horror, of bloodshed almost unparalleled in history. Yet, at the end of it all, and notwithstanding its
reaction in Napoleonism, a great English writer declared that there had been nothing greater and more glorious in all history than the French Revolution. By common consent what liberty, equality, and fraternity—liberty, equality, and fraternity which the French Revolution never gained, and which in seeking after it demeaned and disgraced—the rest of the world possesses today, it draws in large measure from the days in which France was bathed in the anarchy of revolt. That is because the motive-spring which set the French Revolution into being was an ideal for the betterment of mankind, a protest against the social, political and economic infamies which will for ever be associated with the régime of the Bourbons, a striving for a social state that would not allow unbridled luxury, lascivious prodigality, selfish extravagance, inhuman carelessness, to thrive in the Court and to go on side by side with poverty, hunger, a life of groaning and moaning in the alleys hard by. And, even now, while the terror of Bolshevism is in full swing, a writer in an English Daily paper is brought to declare, as one did the other day, that at root Bolshevism in ideal has nothing comparable to it since the teachings which Jesus of Nazareth gave to the world. The writer had, there is little doubt, recollected the parable of the rich man, torn with suffering in Hell, pleading to Lazarus, the beggar whose sores the dogs licked, resting in the bosom of Abraham in Heaven. It is the parable of the ideals of Bolshevism.

It is not difficult to see why a people which has managed to subsist through Tsardom, because of the religious ideals and ideas which it nourished throughout all its classes, and not least among its peasantry, has been attacked by the ideals of Bolshevism, and why, released from Tsardom, it has, pendulum-like, swung into the arms of Lenin, looking to the ideals of his creed, and not to its wickedness or its excesses. The same reason obtains for the number of Jews who are to be found in the Bolshevist ranks. The Jew is an idealist. He will give much for an ideal. He thirst for idealism as a goal of life. This may seem strange to those who associate the Jew with materialism. But the capacity of the Jew for idealism is such that he notoriously idealises even the material. The fact that there are so many of our people who have associated themselves with the ideals of Bolshevism, even although as Jews its excesses must be repugnant to them, has to be placed in conjunction with another fact. These men will be found for the most part unassociated with or dissociated from the Synagogue. In the ordinary way of speaking they are not observing Jews. Is it not patent that the Synagogue, having failed to attract them by its idealism, and no other ideal, not even a material ideal, having been provided for them—for they are not men of wealth and substance, such as are usually to be found among the bourgeoisie—they have ranged themselves on the side of Bolshevism, because here was no Jewish ideal to which these Jews could devote their sentiments and their energies? I cannot understand how people who for generations have, unprotesting, allowed the Jew, particularly in Eastern Europe, in Russia, to suffer pogroms, to be massacred and ill-treated, and tortured and murdered, and for two thousand
years have kept our people outside the ambit of the most potent source of
idealism that can appeal to men—that associated with National being—now
have the hypocrisy, the soulless impertinence, to complain that so many of
our people are Bolshevists! That Jews have been chosen to the extent they
have to take a leading part in the movement in Russia and in Hungary, is
merely because they are heavily endowed with intellectualism and capacity,
as compared with the rest of the population. But the world must not surprised
that the Jew, who is an idealist or nothing, has turned to the idealism of
Bolshevism, which a British writer has declared to be comparable to the
idealism preached by the founder of Christianity. It were surprising, really,
were it otherwise. You cannot keep a people out of their rightful place amid
the nations of the world, and then complain because they take the leading
part which their abilities entitle them to in the nations among whom you have
scattered them. The fact that a timorous millionaire afraid, and doubtless with
good cause, of Bolshevism, which he probably has never taken the trouble,
or perhaps has not the capacity to appreciate in full measure, places a ban of
religious excommunication upon those Jews who are Bolshevists, is a thing
for the gods to laugh at!

There is much in the fact of Bolshevism itself, in the fact that so many
Jews are Bolshevists, in the fact that the ideals of Bolshevism at many
points are consonant with the finest ideals of Judaism, some of which went
to form the basis of the best teachings of the founder of Christianity—these
are things which the thoughtful Jew will examine carefully. It is the
thoughtless one who looks upon Bolshevism only in the ugly repulsive
aspects which all social revolutions assume and which make it so hateful to
the freedom-loving Jew—when allowed to be free. It is the thoughtless one
that thus partially examines the greatest problem the modern world has been
set, and as his contribution to the solution dismisses it with some exclamation
made in obedient deference to his own social position, and to what for the
moment happens to be conventionally popular.”

Sir Winston Churchill offered the world a carrot and a stick on behalf of the
Zionist Jews in a statement published in the Illustrated Sunday Herald, on 8
February 1920, on page 5. Churchill threatens God’s wrath, in the form of
Bolshevism, on any nation that does not commit itself to the Zionist cause, and
promises God’s gifts to any nation which sponsors Zionism. It was an ancient Zionist
appeal to superstitious fear.

Churchill traveled to Palestine and was an outspoken champion of Zionism in the
British Government. Some argue that Churchill was also crypto-Jew, who had a
Jewish mother. Churchill aggressively spoke out on behalf of Zionism in June of
1921 before the House of Commons in an effort to justify the unfair appropriation
of the nation by a minority population of Jews.\footnote{\cite{1761}}

In 1948, when Israel became a nation-state, Churchill wrote to Chaim Weizmann,
“[what a fine moment it was] for an old ‘Zionist’ like me!”\footnote{Christopher Sykes
detailmuch of Churchill’s Zionist activities in his book Crossroads to Israel, where}
he states, “Mr Churchill had always been a Zionist, albeit of a very Gentile and unorthodox kind, since his days as Colonel Secretary.” Though Churchill’s newspaper article is today seen by many as anti-Semitic, it was written on behalf of the Zionists, who quickly seized upon the opportunity of its publication to point out that in their opinion the only option for all Jews is Zionism.

Where Churchill paints Jews in a bad light, it is done as a threat to Gentiles, not as an attack on Jews, and his arguments were planted in his head by his Zionist cohorts, as evinced by Chaim Weizmann’s speech in Jerusalem in January of 1920, as captured in an article, “Eine große Rede Weizmanns in Jerusalem Vor der Abreise aus Palästina”, *Jüdische Rundschau*, Volume 25, Number 4, (16 January 1920), p. 4, which stated, *inter alia,*

“Professor Weizmann emphatically declared that the beauty of the ideals of the Jewish renaissance was critical for the English Declaration. It is a misconception, that England made the proposal to us only out of self-interest. *Lloyd George* once said: I know the Palestinian front far better than the French, because I am well acquainted with every borough and every brook from the Bible. For the English, Palestine is above all else a Biblical issue. The English still believe in the Bible more than many classes of Jewry. Therefore, the idealistic reasons came first, and afterwards the material reasons were added. It was we who made it clear to the English political leaders that it was in England’s interest to unite with us to spread the wings of the British eagle out over Palestine. We did not achieve the Declaration by way of miracles, but rather through persistent propaganda, through constant demonstration of the vigor of our people. We told the people in charge: We are taking over Palestine whether you like it, or not. You can accelerate or delay our arrival, but it is better for you to help us, because if you don’t our constructive power will turn destructive and overthrow the entire world.”

es ist aber für Euch besser, uns mitzuhelfen, denn sonst wird sich unsere
aufbauende Kraft in eine zerstörende verwandeln, die die ganze Welt in
Gärung bringen wird.”

Though the Zionists dominated the proceedings of the Treaty of Versailles and
later dominated the proceedings of the League of Nations and the Palestine Mandate,
the masses of Jews did not want to go to Palestine. Since the Jewish masses failed
to heed the Zionists’ threats, Weizmann and his fellow Zionists brought world-wide
tumult upon the Gentiles, as well as the Jews, just as Chaim Weizmann had
promised.

Weizmann took his cue from Theodor Herzl, who strongly believed that anti-
Semitism was the best means to achieve a “Jewish State”. Herzl unwisely believed
that he could threaten the governments of the world with absolute impunity,

“The governments will give us their friendly assistance because we relieve
them of the danger of a revolution which would start with the Jews—and
stop who knows where!”

Herzl wrote in his book *The Jewish State*,

“When we sink, we become a revolutionary proletariat, the subordinate
officers of the revolutionary party; when we rise, there rises also our terrible
power of the purse. [***] Again, people will say that I am furnishing the
Anti-Semites with weapons. Why so? Because I admit the truth? Because I
do not maintain that there are none but excellent men amongst us? Again,
people will say that I am showing our enemies the way to injure us. This I
absolutely dispute. My proposal could only be carried out with the free
consent of a majority of Jews. Individuals or even powerful bodies of Jews
might be attacked, but Governments will take no action against the collective
nation. The equal rights of Jews before the law cannot be withdrawn where
they have once been conceded; for the first attempt at withdrawal would
immediately drive all Jews rich and poor alike, into the ranks of the
revolutionary party. The first official violation of Jewish liberties invariably
brings about economic crisis. Therefore no weapons can be effectually used
against us, because these cut the hands that wield them.”

Churchill’s Weizmannesque and Herzlian article of 8 February 1920, originally
published in the *Illustrated Sunday Herald*, on page 5, again issued the ancient threat
of *Genesis* 12:3 and offered the Goyim the carrot and the stick:

“**ZIONISM versus BOLSHEVISM.**
A STRUGGLE FOR THE SOUL OF THE JEWISH PEOPLE.
By the Rt. Hon. WINSTON S. CHURCHILL
Some people like Jews and some do not; but no thoughtful man can doubt the fact that they are beyond all question the most formidable and the most remarkable race which has ever appeared in the world.

Disraeli, the Jew Prime Minister of England, and Leader of the Conservative Party, who was always true to his race and proud of his origin, said on a well-known occasion: ‘The Lord deals with the nations as the nations deal with the Jews.’ Certainly when we look at the miserable state of Russia, where of all countries in the world the Jews were the most cruelly treated, and contrast it with the fortunes of our own country, which seems to have been so providentially preserved amid the awful perils of these times, we must admit that nothing that has since happened in the history of the world has falsified the truth of Disraeli’s confident assertion.

Good and Bad Jews.

The conflict between good and evil which proceeds unceasingly in the breast of man nowhere reaches such an intensity as in the Jewish race. The dual nature of mankind is nowhere more strongly or more terribly exemplified. We owe to the Jews in the Christian revelation a system of ethics which, even if it were entirely separated from the supernatural, would be incomparably the most precious possession of mankind, worth in fact the fruits of all other wisdom and learning put together. On that system and by that faith there has been built out of the wreck of the Roman Empire the whole of our existing civilisation.

And it may well be that this same astounding race may at the present time be in the actual process of producing another system of morals and philosophy, as malevolent as Christianity was benevolent, which, if not arrested, would shatter irretrievably all that Christianity has rendered possible. It would almost seem as if the gospel of Christ and the gospel of Antichrist were destined to originate among the same people; and that this mystic and mysterious race had been chosen for the supreme manifestations, both of the divine and the diabolical.

‘National’ Jews.

There can be no greater mistake than to attribute to each individual a recognisable share in the qualities which make up the national character. There are all sorts of men—good, bad and, for the most part, indifferent—in every country, and in every race. Nothing is more wrong than to deny to an individual, on account of race or origin, his right to be judged on his personal merits and conduct. In a people of peculiar genius like the Jews, contrasts are more vivid, the extremes are more widely separated, the resulting consequences are more decisive.

At the present fateful period there are three main lines of political conception among the Jews, two of which are helpful and hopeful in a very high degree to humanity, and the third absolutely destructive.

First there are the Jews who, dwelling in every country throughout the world, identify themselves with that country, enter into its national life, and, while adhering faithfully to their own religion, regard themselves as citizens
in the fullest sense of the State which has received them. Such a Jew living in England would say, 'I am an Englishman practising the Jewish faith.' This is a worthy conception, and useful in the highest degree. We in Great Britain well know that during the great struggle the influence of what may be called the ‘National Jews’ in many lands was cast preponderantly on the side of the Allies; and in our own Army Jewish soldiers have played a most distinguished part, some rising to the command of armies, others winning the Victoria Cross for valour.

The National Russian Jews, in spite of the disabilities under which they have suffered, have managed to play an honourable and useful part in the national life even of Russia. As bankers and industrialists they have strenuously promoted the development of Russia’s economic resources, and they were foremost in the creation of those remarkable organisations, the Russian Co-operative Societies. In politics their support has been given, for the most part, to liberal and progressive movements, and they have been among the staunchest upholders of friendship with France and Great Britain.

**International Jews.**

In violent opposition to all this sphere of Jewish effort rise the schemes of the International Jews. The adherents of this sinister confederacy are mostly men reared up among the unhappy populations of countries where Jews are persecuted on account of their race. Most, if not all, of them have forsaken the faith of their forefathers, and divorced from their minds all spiritual hopes of the next world. This movement among the Jews is not new. From the days of Spartacus-Weishaupt to those of Karl Marx, and down to Trotsky (Russia), Bela Kun (Hungary), Rosa Luxembour (Germany), and Emma Goldman (United States), this world-wide conspiracy for the overthrow of civilization and for the reconstitution of society on the basis of arrested development, of envious malevolence, and impossible equality, has been steadily growing. It played, as a modern writer, Mrs. Webster, has so ably shown, a definitely recognizable part in the tragedy of the French Revolution. It has been the mainspring of every subversive movement during the Nineteenth Century; and now at last this band of extraordinary personalities from the underworld of the great cities of Europe and America have gripped the Russian people by the hair of their heads and have become practically the undisputed masters of that enormous empire.

**Terrorist Jews.**

There is no need to exaggerate the part played in the creation of Bolshevism and in the actual bringing about of the Russian Revolution by these international and for the most part atheistical Jews. It is certainly a very great one; it probably outweighs all others. With the notable exception of Lenin, the majority of the leading figures are Jews. Moreover, the principal inspiration and driving power comes from the Jewish leaders. Thus, Tchitcherin, a pure Russian, is eclipsed by his nominal subordinate Litvinoff, and the influence of Russians like Bukharin or Lunacharski cannot be compared with the power of Trotsky, or of Zinovieff, the Dictator of the Red
Nazism is Zionism

Citadel (Petrograd), or of Krassin or Radek—all Jews. In the Soviet institutions the predominance of Jews is even more astonishing. And the prominent, if not indeed the principal, part in the system of terrorism applied by the Extraordinary Commissions for Combating Counter-Revolution has been taken by Jews, and in some notable cases by Jewesses. The same evil prominence was obtained by Jews in the brief period of terror during which Bela Kun ruled in Hungary. The same phenomenon has been presented in Germany (especially in Bavaria), so far as this madness has been allowed to prey upon the temporary prostration of the German people. Although in all these countries there are many non-Jews every whit as bad as the worst of the Jewish revolutionaries, the part played by the latter in proportion to their numbers in the population is astonishing.

‘Protector of the Jews.’

Needless to say, the most intense passions of revenge have been excited in the breasts of the Russian people. Wherever General Denikin’s authority could reach, protection was always accorded to the Jewish population, and strenuous efforts were made by his officers to prevent reprisals and to punish those guilty of them. So much was this the case that the Petlurist propaganda against General Denikin denounced him as the Protector of the Jews. The Misses Healy, nieces of Mr. Tim Healy, in relating their personal experiences in Kieff, have declared that to their knowledge on more than one occasion officers who committed offences against Jews were reduced to the ranks and sent out of the city to the front. But the hordes of brigands by whom the whole vast expanse of the Russian Empire is becoming infested do not hesitate to gratify their lust for blood and for revenge at the expense of the innocent Jewish population whenever an opportunity occurs. The brigand Makhno, the hordes of Petlura and of Gregorieff, who signalised their every success by the most brutal massacres, everywhere found among the half-stupefied, half-infuriated population an eager response to anti-Semitism in its worst and foulest forms.

The fact that in many cases Jewish interests and Jewish places of worship are excepted by the Bolsheviks from their universal hostility has tended more and more to associate the Jewish race in Russia with the villainies which are now being perpetrated. This is an injustice on millions of helpless people, most of whom are themselves sufferers from the revolutionary regime. It becomes, therefore, specially important to foster and develop any strongly-marked Jewish movement which leads directly away from these fatal associations. And it is here that Zionism has such a deep significance for the whole world at the present time.

A Home for the Jews.

Zionism offers the third sphere to the political conceptions of the Jewish race. In violent contrast to international communism, it presents to the Jew a national idea of a commanding character. It has fallen to the British Government, as the result of the conquest of Palestine, to have the opportunity and the responsibility of securing for the Jewish race all over the
world a home and a centre of national life. The statesmanship and historic sense of Mr. Balfour were prompt to seize this opportunity. Declarations have been made which have irrevocably decided the policy of Great Britain. The fiery energies of Dr. Weissmann, the leader, for practical purposes, of the Zionist project, backed by many of the most prominent British Jews, and supported by the full authority of Lord Allenby, are all directed to achieving the success of this inspiring movement.

Of course, Palestine is far too small to accommodate more than a fraction of the Jewish race, nor do the majority of national Jews wish to go there. But if, as may well happen, there should be created in our own lifetime by the banks of the Jordan a Jewish State under the protection of the British Crown, which might comprise three or four millions of Jews, an event would have occurred in the history of the world which would, from every point of view, be beneficial, and would be especially in harmony with the truest interests of the British Empire.

Zionism has already become a factor in the political convulsions of Russia, as a powerful competing influence in Bolshevik circles with the international communistic system. Nothing could be more significant than the fury with which Trotsky has attacked the Zionists generally, and Dr. Weissmann in particular. The cruel penetration of his mind leaves him in no doubt that his schemes of a world-wide communistic State under Jewish domination are directly thwarted and hindered by this new ideal, which directs the energies and the hopes of Jews in every land towards a simpler, a truer, and a far more attainable goal. The struggle which is now beginning between the Zionist and Bolshevik Jews is little less than a struggle for the soul of the Jewish people.

Duty of Loyal Jews.

It is particularly important in these circumstances that the national Jews in every country who are loyal to the land of their adoption should come forward on every occasion, as many of them in England have already done, and take a prominent part in every measure for combating the Bolshevik conspiracy. In this way they will be able to vindicate the honour of the Jewish name and make it clear to all the world that the Bolshevik movement is not a Jewish movement, but is repudiated vehemently by the great mass of the Jewish race.

But a negative resistance to Bolshevism in any field is not enough. Positive alternatives are needed in the moral as well as in the social sphere; and in building up with the utmost possible rapidity a Jewish national centre in Palestine which may become not only a refuge to the oppressed from the unhappy lands of Central Europe, but which will also be a symbol of Jewish unity and the temple of Jewish glory, a task is presented on which many blessings rest.”

The Zionists were playing a very dangerous game with the lives of millions of innocent Jews. Israel Cohen saw the dangers of the false association of Bolsheviks
with all Jews and wrote, *inter alia*, in *The Jewish Chronicle* of London, on 12 December 1919, on page 17,

**“THE ‘JEW-BOLSHEVIST’ LIE.**

**BY ISRAEL COHEN.**

The systematic attempts that are now being made to identify the Jews of Russia with the Bolshevists, to represent Bolshevism as a Jewish movement, and thus to hold up the entire Jewish people to obloquy and attack, are based solely upon the fact that a certain number of prominent Bolshevist Commissaries are of Jewish birth. Upon this fact, which has never been denied, have been built up all sorts of fantastic accusations, such as that the Jews wish to wreak revenge upon Russia for the persecutions under Tsardom, and that they aim at sweeping away Christian civilization so as to enthrone Judaism as the dominant faith throughout the world. How utterly absurd these calumnies are, and how grotesquely exaggerated are most of the stories of Jewish participation in Bolshevism can be proved by an unimpassioned examination of the ascertainable facts and figures.”

*See also:* Fritz Rodeck, “Judentum und Bolschewismus”, *Jüdische Zeitung*, Volume 14, Number 25, (3 September 1920), pp. 5-6.

While it was true that most Jews were not Bolsheviks—even in Russia, it is also true that many Jews in lands “liberated” by Bolsheviks welcomed and embraced the mass murderers and aggressively participated in the destruction of their Gentile neighbors’ lives. It is further true that the rise and spread of Bolshevism primarily occurred through Jewish communities around the world. It is yet further true that Bolshevism fulfilled Jewish Messianic prophecy, which was no coincidence. However, this does not mean that a majority of Jews have ever been Bolshevists, or even that a majority of Bolshevists have ever been Jews, but there is no doubt that Bolshevism was a Jewish movement meant to accomplish Jewish Messianic prophecies.

While leading Jews in the West decried Bolshevism when the connection to Jews became obvious, they did little to undo the damage Jewish financiers had done through Bolshevism to Russia and other nations. In fact, Jewish leadership instead continued to covertly perpetuate Bolshevism. Had Jewish leaders genuinely opposed Bolshevism, they would have organized and funded massive campaigns to stamp it out and to repair the damage done, and given their wealth and influence, they would have succeeded.

7.7 British Zionists, in Collaboration with Nazi Zionists, in Collaboration with Palestinian Zionists, Ensured that the Jews of Continental Europe Would Find No Sanctuary Before the War Ended

After the First World War, the Zionists had their Peace Conference and their League of Nations and their Palestine Mandate, but they lacked the broad support of the
Jewish People. They decided to bring on a Second World War, which would result in another Peace Conference; and, the second time around, they would torture the Jewish People into embracing Zionism.

“‘For only with Blood Shall We Get the land’

The Nazis began taking the Jews of Slovakia captive in March 1942. Rabbi Michael Dov-Ber Weissmandel, an Agudist, thought to employ the traditional weapon against anti-Semitism: bribes. He contacted Dieter Wisliceny, Eichmann’s representative, and told him that he was in touch with the leaders of world Jewry. Would Wisliceny take their money for the lives of Slovakian Jewry? Wisliceny agreed for 50,000 in dollars so long as it came from outside the country. The money was paid, but it was actually raised locally, and the surviving 30,000 Jews were spared until 1944 when they were captured in the aftermath of the furious but unsuccessful Slovak partisan revolt.

Weissmandel, who was a philosophy student at Oxford University, had volunteered on 1 September 1939 to return to Slovakia as the agent of the world Aguda. He became one of the outstanding Jewish figures during the Holocaust, for it was he who was the first to demand that the Allies bomb Auschwitz. Eventually he was captured, but he managed to saw his way out of a moving train with an emery wire; he jumped, broke his leg, survived and continued his work of rescuing Jews. Weissmandel’s powerful post-war book, *Min HaMaitzer* (From the Depths), written in Talmudic Hebrew, has unfortunately not been translated into English as yet. It is one of the most powerful indictments of Zionism and the Jewish establishment. It helps put Gruenbaum’s unwillingness to send money into occupied Europe into its proper perspective. Weissmandel realised: ‘the money is needed here – by us and not by them. For with money here, new ideas can be formulated.’

Weissmandel was thinking beyond just bribery. He realised immediately that with money it was possible to mobilise the Slovak partisans. However, the key question for him was whether any of the senior ranks in the SS or the Nazi regime could be bribed. Only if they were willing to deal with either Western Jewry or the Allies, could bribery have any serious impact. He saw the balance of the war shifting, with some Nazis still thinking they could win and hoping to use the Jews to put pressure on the Allies, but others beginning to fear future Allied retribution. His concern was simply that the Nazis should start to appreciate that live Jews were more useful than dead ones. His thinking is not to be confused with that of the Judenrat collaborators. He was not trying to save some Jews. He thought strictly in terms of negotiations on
a Europe-wide basis for all the Jews. He warned Hungarian Jewry in its turn: do not let them ghettoise you! Rebel, hide, make them drag the survivors there in chains! You go peacefully into a ghetto and you will go to Auschwitz! Weissmandel was careful never to allow himself to be manoeuvred by the Germans into demanding concessions from the Allies. Money from world Jewry was the only bait he dangled before them.

In November 1942, Wisliceny was approached again. How much money would be needed for all the European Jews to be saved? He went to Berlin, and in early 1943 word came down to Bratislava. For $2 million they could have all the Jews in Western Europe and the Balkans. Weissmandel sent a courier to Switzerland to try to get the money from the Jewish charities. Saly Mayer, a Zionist industrialist and the Joint Distribution Committee representative in Zurich, refused to give the Bratislavan ‘working group’ any money, even as an initial payment to test the proposition, because the ‘Joint’ would not break the American laws which prohibited sending money into enemy countries. Instead Mayer sent Weissmandel a calculated insult: ‘the letters that you have gathered from the Slovakian refugees in Poland are exaggerated tales for this is the way of the ‘Ost-Juden’ who are always demanding money’. 23

The courier who brought Mayer’s reply had another letter with him from Nathan Schwalb, the HeChalutz representative in Switzerland Weissmandel described the document:

There was another letter in the envelope, written in a strange foreign language and at first I could not decipher at all which language it was until I realised that this was Hebrew written in Roman letters, and written to Schwalb’s friends in Pressburg [Bratislava] . . . It is still before my eyes, as if I had reviewed it a hundred and one times. This was the content of the letter:

‘Since we have the opportunity of this courier, we are writing to the group that they must constantly have before them that in the end the Allies will win. After their victory they will divide the world again between the nations, as they did at the end of the first world war. Then they unveiled the plan for the first step and now, at the war’s end, we must do everything so that Eretz Yisroel will become the state of Israel, and important steps have already been taken in this direction. About the cries coming from your country, we should know that all the Allied nations are spilling much of their blood, and if we do not sacrifice any blood, by what right shall we merit coming before the bargaining table when they divide nations and lands at the war’s end? Therefore it is silly, even impudent, on our part to ask these nations who are spilling their blood to permit their money into enemy countries in order to protect our blood—for only with blood shall we get the land. But in respect to you, my friends, atem taylu, and for this purpose I am sending you money illegally with this
Rabbi Weissmandel pondered over the startling letter:

After I had accustomed myself to this strange writing, I trembled, understanding the meaning of the first words which were ‘only with blood shall we attain land’. But days and weeks went by, and I did not know the meaning of the last two words. Until I saw from something that happened that the words ‘atem taylu’ were from ‘tīyul’ [to walk] which was their special term for ‘rescue’. In other words: you, my fellow members, my 19 or 20 close friends, get out of Slovakia and save your lives and with the blood of the remainder—the blood of all the men, women, old and young and the sucklings—the land will belong to us. Therefore, in order to save their lives it is a crime to allow money into enemy territory—but to save you beloved friends, here is money obtained illegally.

It is understood that I do not have these letters, for they remained there and were destroyed with everything else that was lost.

Weissmandel assures us that Gisi Fleischman and the other dedicated Zionist rescue workers inside the working group were appalled by Schwalb’s letter, but it expressed the morbid thoughts of the worst elements of the WZO leadership. Zionism had come full turn: instead of Zionism being the hope of the Jews, their blood was to be the political salvation of Zionism.”

Zionist Anglican Chaplain to the British Embassy in Vienna, William Henry Hechler, published *The Restoration of the Jews to Palestine According to the Prophets* in 1884. He contacted racist Zionist Theodor Herzl as soon as he learned of Herzl’s book *Der Judenstaat*, in 1896. Hechler knew the Jewish Zionist Leon Pinsker. Queen Victoria requested that Hechler transmit a letter from her to the Sultan of Turkey asking him to allow Russian Jews to take asylum in Palestine, but the British embassy would not transmit the message.

Theodor Herzl changed paths from converting Jews to Christianity in order to end anti-Semitism, to converting anti-Semites to Zionism in order to end anti-Semitism. Herzl’s ungodly betrayal of the Jewish People ultimately led the Zionists to create and install the Nazi régime.

Like the prophet Isaiah, Hechler and Herzl envisioned Jerusalem as the new capital of the world. Herzl’s vision is revealed in his book *Almeinstadt*.

Like many Zionists, Hechler relished the fact that anti-Semitism encouraged Jews to embrace Zionism out of fear for their lives. Isaiah Friedman wrote,

“On 26 March 1896, Hechler wrote to [Frederick the Grand Duke of Baden] about Herzl’s project, noting with satisfaction that the antisemitic movement had made the Jews see that they were ‘Jews first and [only] secondly Germans, Englishmen, etc.’ It reawakened in them a longing to return ‘as a
nation to the Land of Promise... Palestine belongs to them by right.' Should Germany and England give their support and take the Jewish State, declared neutral, under their protection, the Return of the Jews would be a great blessing and would put an end to antisemitism, which was detrimental to the welfare of European nations. He also suggested that the issue be laid before the kaiser, the duke’s nephew.”

Hechler knew beforehand that the First World War would occur. He also knew beforehand that the Holocaust would occur. He took comfort in his knowledge of these events. Elias Newman wrote,

“To the German-Jewish philosopher Martin Buber, Hechler said in 1913: ‘Your fatherland will soon be given back to you. For a serious crisis will occur, whose deep meaning is the liberation of your Messianic Jerusalem from the yoke of the — nations... We are moving towards a world war...’ Shortly before his death [in 1931], he said this to the family of the Zionist leader Nahum Sokolov: ‘Part of European Jewry is going to be sacrificed for the resurrection of your biblical fatherland.’”

In the context Hechler’s foreknowledge of the Holocaust, Claude Duvernoy writes,

“Political, rational and ‘scientific’ anti-Semitism, born in Austria, spread all over Europe where the ground had been well prepared by centuries of bad Christian catechism. With Moscow opposing Zionism as a heretical movement and London already pursuing its policy of suffocation, one really could not see how this ferocious Nazi could fail in his plan for Jewish genocide. In closing Palestine to Jewish immigrants (which was done in 1939) London delivered up millions of European Jews to the ovens of the crematoria soon to come—without wishing this, of course. [***] As there was need of a first world war, to force the liberation of Jerusalem from the pagan yoke of the Turk, undoubtedly a second world conflict was inevitable to form a Jewish homeland through much suffering and blood, but he did not dare to think of it.”

After Hechler came David Ben-Gurion, who stated,

“The First World War brought us the Balfour Declaration. The Second ought to bring us the Jewish State.”

Before Hechler was Benjamin Disraeli. Soon after Queen Victoria ascended the throne in 1837, the campaign to “restore the Jews to Palestine” gained political support, which was driven by the Rothschild family in hopes that a Rothschild would ascend the throne in Jerusalem to become King of the Jews, a. k. a. the Messiah, and, therefore, King of the World. Victoria believed that she was descended from King
David and during her reign Rothschild and Disraeli were able to secure the Suez Canal for England as a means to expedite shipping to and from India, and as a means to tie England’s fate to the goal of forming a Jewish State in Palestine. Disraeli wrote in 1852,

“We have shown that the theological prejudice against the Jews has no foundation, historical or doctrinal; we have shown that the social prejudice, originating in the theological but sustained by superficial observations irrespective of religious prejudice, is still more unjust, and that no existing race is so much entitled to the esteem and gratitude of society as the Hebrew. It remains for us to notice the injurious consequences to European society of the course pursued by the communities of this race, and this view of the subject leads us to considerations which it would become existing statesmen to ponder.

The world has by this time discovered that it is impossible to destroy the Jews. The attempt to extirpate them has been made under the most favourable auspices and on the largest scale; the most considerable means that man could command have been pertinaciously applied to this object for the longest period of recorded time. Egyptian pharaohs, Assyrian kings, Roman emperors, Scandinavian crusaders, Gothic princes, and holy inquisitors, have alike devoted their energies to the fulfilment of this common purpose. Expatriation, exile, captivity, confiscation, torture on the most ingenious and massacre on the most extensive scale, a curious system of degrading customs and debasing laws which would have broken the heart of any other people, have been tried, and in vain. The Jews, after all this havoc, are probably more numerous at this date than they were during the reign of Solomon the wise, are found in all lands, and unfortunately prospering in most. All which proves, that it is in vain for man to attempt to baffle the inexorable law of nature which has decreed that a superior race shall never be destroyed or absorbed by an inferior.

But the influence of a great race will be felt; its greatness does not depend upon its numbers, otherwise the English would not have vanquished the Chinese, nor would the Aztecs have been overthrown by Cortez and a handful of Goths. That greatness results from its organisation, the consequences of which are shown in its energy and enterprise, in the strength of its will and the fertility of its brain. Let us observe what should be the influence of the Jews, and then ascertain how it is exercised. The Jewish race connects the modern populations with the early ages of the world, when the relations of the Creator with the created were more intimate than in these days, when angels visited the earth, and God himself even spoke with man. The Jews represent the Semitic principle; all that is spiritual in our nature. They are the trustees of tradition, and the conservators of the religious element. They are a living and the most striking evidence of the falsity of that pernicious doctrine of modern times, the natural equality of man. The particular equality of a particular race is a matter of municipal arrangement,
and depends entirely on political considerations and circumstances; but the natural equality of man now in vogue, and taking the form of cosmopolitan fraternity, is a principle which, were it possible to act on it, would deteriorate the great races and destroy all the genius of the world. What would be the consequences on the great Anglo-Saxon republic, for example, were its citizens to secede from their sound principle of reserve, and mingle with their negro and coloured populations? In the course of time they would become so deteriorated that their states would probably be reconquered and regained by the aborigines whom they have expelled, and who would then be their superiors. But though nature will never ultimately permit this theory of natural equality to be practised, the preaching of this dogma has already caused much mischief, and may occasion much more. The native tendency of the Jewish race, who are justly proud of their blood, is against the doctrine of the equality of man. They have also another characteristic, the faculty of acquisition. Although the European laws have endeavoured to prevent their obtaining property, they have nevertheless become remarkable for their accumulated wealth. Thus it will be seen that all the tendencies of the Jewish race are conservative. Their bias is to religion, property, and natural aristocracy; and it should be the interest of statesmen that this bias of a great race should be encouraged, and their energies and creative powers enlisted in the cause of existing society.

But existing society has chosen to persecute this race which should furnish its choice allies, and what have been the consequences?

They may be traced in the last outbreak of the destructive principle in Europe. An insurrection takes place against tradition and aristocracy, against religion and property. Destruction of the Semitic principle, extirpation of the Jewish religion, whether in the Mosaic or in the Christian form, the natural equality of man and the abrogation of property, are proclaimed by the secret societies who form provisional governments, and men of Jewish race are found at the head of every one of them. The people of God co-operate with atheists; the most skilful accumulators of property ally themselves with communists; the peculiar and chosen race touch the hand of all the scum and low castes of Europe! And all this because they wish to destroy that ungrateful Christendom which owes to them even its name, and whose tyranny they can no longer endure.

When the secret societies, in February 1848, surprised Europe, they were themselves surprised by the unexpected opportunity, and so little capable were they of seizing the occasion, that had it not been for the Jews, who of late years unfortunately have been connecting themselves with these unhallowed associations, imbecile as were the governments the uncalled for outbreak would not have ravaged Europe. But the fiery energy and the teeming resources of the children of Israel maintained for a long time the unnecessary and useless struggle. If the reader throws his eye over the provisional governments of Germany, and Italy, and even of France, formed at that period, he will recognise everywhere the Jewish element. Even the
insurrection, and defence, and administration of Venice, which, from the resource of statesmanlike moderation displayed, commanded almost the respect and sympathy of Europe, were accomplished by a Jew—Manini, who by the bye is a Jew who professes the whole of the Jewish religion, and believes in Calvary as well as Sinai, ‘a converted Jew’, as the Lombards styled him, quite forgetting, in the confusion of their ideas, that it is the Lombards who are the converts—not Manini.

Thus it will be seen that the persecution of the Jewish race has deprived European society of an important conservative element and added to the destructive party an influential ally. Prince Metternich, the most enlightened of modern statesmen, not to say the most intellectual of men, was, though himself a victim of the secret societies, fully aware of these premises. It was always his custom, great as were the difficulties which in so doing he had to encounter, to employ as much as possible the Hebrew race in the public service. He could never forget that Napoleon in his noontide hour had been checked by the pen of the greatest of political writers; he had found that illustrious author as great in the cabinet as in the study; he knew that no one had more contributed to the deliverance of Europe. It was not as a patron, but as an appreciating and devoted friend, that the high chancellor of Austria appointed Frederick Gentz secretary of the congress of Vienna—and Frederick Gentz was a child of Israel.***

In her autobiography *My Life*, Golda Meir, like Adolf Hitler, could not understand why the British refused to allow Jews to emigrate to Palestine during the Nazi régime—one should also note in this context that British and American Jews prevented the exodus of Jews from the Continent to England and the United States. Meir tries very hard to blame the Palestinians, the Germans and the British for all the horrors that befell the Jews of Europe, but her pangs of guilt for her own actions reveal themselves in her constant need to justify herself and to try to explain away the shared and greater guilt of the Zionists. She even justifies the Holocaust as the only means that would accomplish a “Jewish State”. However, the only real obstacle to the formation of a lasting “Jewish State” was the reality that the vast majority of Jews did not want to live in such a racist State. Many of those Jews under Nazi persecution who emigrated to Palestine returned to Europe in disgust.

Meir headed the Jewish Agency and missed an opportunity to save Jewish lives at the Evian Conference in July of 1938. Some believe that Zionists sabotaged this effort, because they believed there was no gain for them to be had from shuffling Jews who had been assimilating in Germany to a new destination like America or Britain, where they would again have the opportunity to assimilate. Many Zionists had no concern for Jewish lives or Jewish deaths unless they Jews were sent directly to Palestine, thereby furthering Zionist ambitions. Jewish tradition held that Jews who assimilated ought to be killed and if a Holocaust would restore Jewish fear in God, so much the better—in the view of many Zionists. Meir wrote,

“I suppose I must have tried a thousand times since 1939 to explain to
Nazism is Zionism 1597

myself—let alone to others—just how and why it happened that during the very years that the British stood with so much courage and determination against the Nazis, they were also able (and willing) to find the time, energy and resources to fight so long and so bitter a war against the admittance of Jewish refugees from the Nazis to Palestine. But I have still not found any rational explanation—and perhaps there is none. All I know is that the State of Israel might not have come into being for many years if that British war within a war had not been waged so ferociously and with such insane persistence.

As a matter of fact, it was only when the British government decided—in the face of all reason or humanity—to place itself like an iron wall between us and whatever chance we had of rescuing Jews from the hands of the Nazis that we realized that political independence was not something that we could go on regarding as a distant aim: The need to control immigration because human lives depended on such control was the one thing that pushed us into making the sort of decision which might otherwise have waited for much better (if not ideal) conditions. But the 1939 White Paper—those rules and regulations laid down for us by strangers to whom the lives of Jews were obviously of secondary importance—turned the entire subject of the right of the yishuv to govern itself into the most pressing and immediate need that any of us had ever known. And it was out of the depth of this need, essentially, that the State of Israel was founded, only three years after the end of the war.”

Zionists were by no means as innocent as Golda Meir would have us believe, nor were British Gentiles, as a group, responsible for what happened. British Jews sabotaged the efforts of German Jews to flee to safety in England, because the Zionists wanted the assimilationist Jews to suffer and die so that the Jewish remnant that eventually moved to Palestine would remain in the country out of fear. They also insisted that any Jewish exodus that took place must force the fleeing Jews to Palestine and nowhere else. The anti-Zionist Jews feared the emigration of large numbers of Jews to the West would provoke anti-Semitism in their home countries, and so the Jews obstructed the emigration of other Jews seeking sanctuary. British Jews, not a small number of them the former Sephardic Jews of Spain, had little love for Russian, or even German, Ashkenazi Jews.

Zionists had long been committing acts of terrorism against the British and the British had no legitimate reason to believe that a “Jewish State” in Palestine was in their, or anyone else’s, best interests. That said, many British Gentiles were duped, or bought, into embracing the Zionist cause. Most British Gentiles and British Jews, who tended to be anti-Zionists, believed that a Jewish nation in the Middle East would inflame Moslem passions against England and jeopardize British interests in the region and her trade route to her Asian colonies. The Zionists determined that both British and French interests in the region had to be destroyed by the Nazis and the Imperial Japanese, before the Jews could take Palestine (even Greater Israel) from the Palestinians—and the British—and the French.
The Second World War accomplished many things for the Zionists. It frightened Jews into accepting Zionism. It segregated Jews and taught them the skills needed to live in an agrarian country. It killed off weak Jews and anti-Zionist Jews. It largely destroyed British and French Imperial interests in Asia, thereby lessening their incentive to remain in Palestine and Greater Syria, which they had wanted to keep for themselves as an allegedly important trade route to their colonies.

It took the Second World War, the Holocaust, the independence of India from Great Britain and the creation of Pakistan, as well as pervasive corruption both clerical and profane to overcome the political and religious obstacles to Zionism which remained after the First World War. The Jews used the French under Napoleon, and then the British in the First World War, to chase the Turks out of Palestine and Greater Syria. The Jews lured the French and the British into the region by leading them to believe that a route to their East Asian colonies was vitally important to their national interests.

The Jews created the illusion that only Jews could be the Europeans’ friends in the Middle East to secure this route, while Moslems could not. The opposite was true as both the French and the British soon learned after the First World War. When the Turks were finally forced out of Palestine and Greater Syria, the French and British almost went to war over who would control this region, into which they had been led by the Jews. The Jews then felt a need to destroy the French and the British Imperial interests in Asia. The Jews accomplished this goal in the Second World War with their Zionist National Socialists, with the Nazis; and with their old friends, the Imperial Japanese. Zionist Jews murdered one hundred million people in two world wars in order to create a racist “Jewish State” in Palestine, which would house one to five million Jews in a place where they did not want to live.

In 1921, Boris Brasol told of the Zionists’ plan in 1920 to create a Socialist German army that would crush British Imperialism and secure Palestine for the Jews, and note that this army became the Nazi army, an army Walther Rathenau began to build in cooperation with the Bolsheviks in 1922 with the Rappallo Treaty (Poale-Zion were Russian Jewish Communist Zionists),

“Mr. Eberlin, a Jew himself, and one of the foremost leaders of the Poale-Zion movement, in a book recently published in Berlin, entitled ‘On the Eve of Regeneration,’” stated:

‘The foreign policy of England in Asia Minor is determined by its interests in India. There was a saying about Prussia that she represents the army with an admixture of the people. About England it could be said that she represents a colonial empire with a supplement of the metropolis. . . . It is obvious that England desires to use Palestine as a shield against India. This is the reason why she is feverishly engaged in the construction of strategic railroad lines, uniting Egypt to Palestine, Cairo to Haifa, where work is started for the construction of a huge port. In the near future Palestine will be in a position to compete with the Isthmus of Suez, which is the main artery of the great sea route from the Mediterranean to the Indian Ocean.’ [Footnote: Translation from Russian, ‘On the Eve of Regeneration,’ by I. Eberlin, pp. 129, 130, Berlin, 1920.]
But this Poale-Zionist goes a step farther when he asserts that:

‘It is only Socialism attained in Europe which will prove capable of giving honestly and without hypocrisy Palestine to the Jews, thus assuring them unhampered development. . . . The Jewish people will have Palestine only when British Imperialism is broken.’

The Second World War unhitched England from the East and largely destroyed British Imperialism. The Zionists deliberately caused those events and created those circumstances. The lost lives and misery were a deliberate human sacrifice the Zionists made to their Jewish God.

One group of Zionists openly fought against the British and called for an alliance of the Zionists with the Nazis. Francis R. Nicosia has demonstrated that the Nazis were not only anti-assimilationists, but were also very pro-Zionist. Michael Bar-Zohar wrote in his book Ben-Gurion: The Armed Prophet,

“The danger soon became a reality. Many were unable to distinguish between the British Government and the British people, and when war broke out, the extremists adopted radical methods. Supporters of Abraham Stern, who dreamed of a Kingdom of Israel extending from the Nile to the Euphrates, fired the first shots against the British. They even committed the unpardonable crime of recommending an alliance with Nazi Germany, against Britain. When the British shot Stern, his gang avenged him by bomb attacks. These men were few in number and represented a very small part of the Yishuv, but their terrorist activities began a new, violent phase in the struggle against the British, a phase which was to lead to open warfare between various factions and groups in Palestine, when Jew fought against Jew and disaster almost came to the Zionist cause.”

David Ben-Gurion showed his utter disregard for the value of Jewish life,

“If I knew that it would be possible to save all the children in Germany by bringing them over to England, and only half of them by transporting them to Eretz Yisrael, then I would opt for the second alternative. For we must weigh not only the life of these children, but also the history of the People of Israel.”

Zionists obstructed efforts to rescue Jews by not allowing them into countries like England and America. The Zionists wanted to ensure that the Jews felt that the only country that would receive them was Palestine and that the only community that would welcome them was the “Yishuv”—but only after the undesirable (in the minds of the Zionists) “7 million Jews” had been murdered with the approval, if not the active planning, of the Zionist Jews.

According to Johannes Buxtorf in 1603, Jewish authors had long ago planned the decimation of their own people and had planned that the rest of the world should turn
a blind eye to the injustice and murder. Buxtorf recounts that 14th Century Jewish author Machir of Toledo’s (this is perhaps a pseudonym and the work may have been fabricated by Turkish Jews) *Avkat Rokhel*, Constantinople/Istanbul, (1516), states:

“The sixth miracle, God shall permit the kingdom of *Edom* (to whit that of the Romans) to bear rule over the whole world. One of whose Emperours shall reign over the whole earth nine moneths, who shall bring many great kingdoms to desolation, whose anger shall flame towards the people of Israel, exacting a great tribute from them, and so bringing them into much misery and calamity. Then shall Israel after a strange manner be brought low and perish, neither shall they have any helper: of this time *Esa* [Isaiah] prophesied, {Esa. 59.16.} *And he saw that there was no man, and wondered that there was no intercessor: therefore his arm brought salvation unto him.* After the expiration of these nine moneths, God shall send the *Messias son of Joseph*, who shall come of the stock of *Joseph*, whose name shall be *Nehemiah*, the son of *Husiel*. He shall come with the stem of Ephraim, *Benjamin* and *Manasses*; and with one part of the sons of *Gad*. As soon as the Israelites shall hear of it, they shall gather unto him out of every City and nation, as it is written: {Jer. 3.14.} *Turn ye backsliding children saith the Lord, for I will reign over you, I will take you one of a City, and two of a tribe, and bring you to Sion.*

Then shall *Messias* the son of *Joseph*, make great war against the king of *Edom*, or the *Pope of Rome*, and being conqueror shall kill a great part of his army, and also cut the throat of the king of *Edom*, make desolate the Roman Monarchie, bring back some of the holy vessels to Jerusalem, which are treasured up in the house of *Ælianus*. Moreover the king of Egypt shall enter into league with Israel, and shall kill all the men inhabiting about Jerusalem, Damascus, and Ascalon: which thing once noised over the whole earth, a horrid dread and astonishment shall overwhelm the inhabitants thereof.”

Nothing could put greater fear into apostate and anti-Zionist Orthodox Jews than the fact that almost no one interceded to rescue the assimilating Jews of Europe from the Nazi régime. The horrific indifference of the world to the mistreatment, degradation, humiliation and murder of Jews was a key factor in establishing the will of formerly non-Zionist, or anti-Zionist, Jews around the world to found the “Jewish State” in Palestine. Without the Nazis, and without the indifference of heads of state to the plight of Europe’s Jews, there would have been no Israel. Christopher Sykes wrote,

“[.. .]Zionist leaders were determined at the very outset of the Nazi disaster to reap political advantage from the tragedy.”

Zionist leaders were planning these events thousands of years before the Nazi disaster. After the Nazi disaster, Zionist Matin Buber wrote in 1958,
“Effects of Hitlerism

This organic phase of the settlement in Palestine went on till the days of Hitler. It was Hitler who brought Jewish masses to Palestine, not selected people who felt that here they must fulfill their lives and prepare the future. So, selective organic development was replaced by mass immigration and the indispensable necessity to find political force for its security. This was the hour when my great friend, the late Judah Leib Magnes, and I, and other friends felt that we must state clearly our own proposals. But the majority of the Jewish people preferred to learn from Hitler rather than from us. Hitler showed them that history does not go the way of the spirit but the way of power, and if a people is powerful enough, it can kill with impunity as many millions of another people as it wants to kill. This was the situation that we had to fight.”

Hannah Arendt wrote in her book *Eichmann in Jerusalem: A Report on the Banality of Evil*,

“Of greater importance for Eichmann were the emissaries from Palestine, who would approach the Gestapo and the S.S. on their own initiative, without taking orders from either the German Zionists or the Jewish Agency for Palestine. They came in order to enlist help for the illegal immigration of Jews into British-ruled Palestine, and both the Gestapo and the S.S. were helpful. They negotiated with Eichmann in Vienna, and they reported that he was ‘polite,’ ‘not the shouting type,’ and that he even provided them with farms and facilities for setting up vocational training camps for prospective immigrants. (‘On one occasion, he expelled a group of nuns from a convent to provide a training farm for young Jews,’ and on another ‘a special train [was made available] and Nazi officials accompanied’ a group of emigrants, ostensibly headed for Zionist training farms in Yugoslavia, to see them safely across the border.) According to the story told by Jon and David Kimche, with ‘the full and generous cooperation of all the chief actors’ (*The Secret Roads: The ‘Illegal’ Migration of a People, 1938-1948*, London, 1954), these Jews from Palestine spoke a language not totally different from that of Eichmann. They had been sent to Europe by the communal settlements in Palestine, and they were not interested in rescue operations: ‘That was not their job.’ They wanted to select ‘suitable material,’ and their chief enemy, prior to the extermination program, was not those who made life impossible for Jews in the old countries, Germany or Austria, but those who barred access to the new homeland; that enemy was definitely Britain, not Germany. Indeed, they were in a position to deal with the Nazi authorities on a footing a mounting to equality, which native Jews were not, since they enjoyed the protection of the mandatory power; they were probably among the first Jews to talk openly about mutual interests and were certainly the first to be given permission ‘to pick young Jewish pioneers’ from among the Jews in the concentration camps. Of course, they were unaware of the sinister
implications of this deal, which still lay in the future; but they too somehow believed that if it was a question of selecting Jews for survival, the Jews should do the selecting themselves. It was this fundamental error in judgment that eventually led to a situation in which the non-selected majority of Jews inevitably found themselves confronted with two enemies—the Nazi authorities and the Jewish authorities. As far as the Viennese episode is concerned, Eichmann’s preposterous claim to have saved hundreds of thousands of Jewish lives, which was laughed out of court, finds strange support in the considered judgment of the Jewish historians, the Kimches: ‘Thus what must have been one of the most paradoxical episodes of the entire period of the Nazi regime began: the man who was to go down in history as one of the arch-murderers of the Jewish people entered the lists as an active worker in the rescue of Jews from Europe.’”

7.8 Documented Collaboration Between the Palestinian Zionists and the Zionist Nazis

History records numerous well-documented instances where Zionist leaders, like Rudolf Kastner who assisted in the deportation of one-half-million Jews to concentration camps, collaborated with Zionist Nazi leaders, including Adolf Eichmann, to help them control mass Jewish populations allegedly destined for extermination, in order to save comparatively scant numbers of prominent Zionist Jews—an act which some allege was pardoned by the Israeli Government after the war so as to prevent an investigation into the broader collaboration between Zionists and Nazis in the persecution of Jews. Indeed, Adolf Eichmann—who was of Jewish descent—called himself a Zionist in 1939 in a conversation with Anny Stern,

“‘Are you a Zionist?’ Adolph Eichmann, Hitler’s specialist on Jewish affairs, asked her. ‘Jawohl,’ she replied. ‘Good,’ he said, ‘I am a Zionist, too. I want every Jew to leave for Palestine.’”

There were many Zionists in Palestine who placed the acquisition of land from Palestinians above saving European Jewish lives during the Holocaust. Herzl actively conspired with the Sultan of Turkey to cover up the atrocities committed against Armenian Christians in Herzl’s efforts to acquire Palestine and force the expulsion of Jews from other nations of the world and drive them into Palestine. Many prominent and highly respected Jews have, over the course of many years, expressed concern and outrage over the alliance of Zionists and anti-Semites during the Hitler régime.

Though certainly not an endorsement of racism, anti-Semitism or Nazism, Samuel Landman’s statements in 1936 evince that some Zionists saw an opportunity to forward their agenda as Hitler’s persecution of Jews escalated. This disincentive to fight Hitler directly and with all available means, due to a wish to promote Zionism among reluctant, especially assimilationist, Jews before the Holocaust began, is highly troubling; especially so when it comes from English sources.
England did little to combat Nazism and prepare for war. It is also disturbing to note that Jews were among those who most strongly opposed the emigration of German Jews out of Germany. Landman, and every sensible person in the world, should have been calling for England to take immediate action against Nazism and to absorb Jews who wished to leave Germany or were forced out. Landman wrote,

“The rise of Hitler to power in Germany, with its ruthless forms of anti-Semitism, has driven home the Zionism of Herzl and given a tremendous impetus to Jewish national feeling all over the world. A few years ago, the view, adopted by Sir Herbert Samuel in 1921, that a smallish Jewish model settlement in Palestine living on healthy national lines would provide spiritual sustenance for the vast majority of Jewry outside Palestine still had a good few adherents, but to-day, German anti-Semitism and its repercussions in other lands, has all but given this doctrine its coup de grâce. Every Jew now sees clearly that without a physical and political as well as a spiritual centre, Jewry stands very little chance of survival. This conviction has spread much more rapidly than certain Zionist leaders, who have lost touch with the masses, realise. The Jewish land hunger has grown immeasurably and the Jewish masses feel that Palestine without Transjordan is far too small for the urgent and imperative need of Jewish emigration. Transjordan was originally part of the mandated territory of Palestine to which the Jewish National Home applied. Hence one of the other main points in the platform of the new Zionist Organisation is the opening of Transjordan to Jewish immigration. [***] The British Empire can afford to wait or hasten slowly; but it will be conceded that in their tragic plight the choice before Jewry is either speedily to rebuild Palestine or slowly to perish in the Diaspora. The words of the traditional Jewish toast—“Next year in Jerusalem” (Leshana Habaa Birushalayim)—are therefore no longer conventional words, but inspiring and instinct with meaning and action and must assuredly appeal to the sense of humanity and fair play of the British Government and people.”

Political Zionists wanted Ostjuden to emigrate to a “Jewish homeland”, not to England and America. Some assimilated American Jews had long opposed the immigration of more Jews to America for fear it would cause anti-Semitism. Richard Gottheil stated in 1898,

“They must feel, for example, that a continual influx of Jews who are not Americans is a continual menace to the more or less complete absorption for which they are striving.”

*The New York Times* reported on 20 September 1920 on page 16,

“F. Warburg Seeks to Check
Exodus Here of Jews in Europe

Paris, Sept. 18.—Felix M. Warburg of New York, Chairman of the Joint Distribution Committee for American Jewish Relief Funds, who is here, is endeavoring to impress Jewish leaders in Europe with the necessity of discouraging European Jews from flocking to the United States, in order to keep Jewish emigration within reasonable limits.

In this connection Mr. Warburg has conferred with a number of leading Jews in Paris, including Nahum Sokolow, head of the Jewish Delegations Committee.”

Albert Einstein wrote to Max Born on 22 March 1934 that the same impediments Western European Jews had put in place against the emigration of Eastern European Jews during the Pogroms were now being instituted against German Jews by the Jews of America, France and England,

“...It is particularly unfortunate that the satiated Jews of the countries which have hitherto been spared cling to the foolish hope that they can safeguard themselves by keeping quiet and making patriotic gestures, just as the German Jews used to do. For the same reason they sabotaged the granting of asylum to German Jews, just as the latter did to Jews from the East. This applies just as much in America as in France and England.”

The Zionists obstructed the migration of Jews away from Hitler to any sanctuary other than Palestine, allegedly in the belief that this meant certain death and eventually in the knowledge that Jews could not emigrate to Palestine. They wanted the Jews to feel that no other country would allow Jews in their borders and that no other people would want them than Zionist Palestinian Jews. The Zionists used their strong and powerful influence to bring this fate upon the helpless Jews of Europe.

The Nazis were eager to expel Jews and the only reason Jews could not escape Continental Europe was because other Jews stood in their way. Hitler was interviewed in the Staatszeitung of New York and stated,

“...Why does the world shed crocodile’s tears over the richly merited fate of a small Jewish minority? But what happened to the conscience of the world when millions in Germany were suffering from hunger and misery? I ask Roosevelt, I ask the American people: Are you prepared to receive in your midst these well-poisoners [Brunnenvergifter] of the German people and the universal spirit of Christianity? We would willingly give everyone of them a free steamer-ticket and a thousand-mark note for travelling expenses, if we could get rid of them. Am I to allow thousands of pure-blooded Germans to perish so that all Jews may work, live, and be merry in security while a nation of millions is a prey to starvation, despair, and Bolshevism?”

Hitler’s 7 April 1933 speech to the “Doctors’ Union” was paraphrased in The Speeches of Adolf Hitler April 1922-August 1939, Volume 1, Howard Fertig, New...
York, (1969), page 728, as follows:

“He said that America of all countries had the least ground to object to these measures. America’s own Immigration Laws had excluded from admission those belonging to races of which America disapproved, while America was by no means prepared to open the gates to Jewish ‘fugitives’ from Germany. ‘As a matter of fact the Jews in Germany had not a hair of their heads rumpled.’”

The New York Times published an interview with Hitler by Anne O’Hare McCormick on 10 July 1933 on the front page extending to page 6. Hitler disclosed his revolutionary and Marxist ideals—Hitler admired Henry Ford for removing class distinctions with his Model T and hinted at the Volkswagen. He also stated,

“‘As to the ‘persecuted’ Jews, whom you see peacefully walking in the streets and dining in all the best cafés in Berlin,’ he continued, ‘I would be only too glad if the nations which take such an enormous interest in Jews would open their gates to them.

‘It is true we have made discriminatory laws, but they are directed not so much against the Jews as for the German people, to give equal economic opportunity to the majority.

‘You say the Jews suffer, but so do millions of others. Why should not the Jews share the privations which burden the entire nation?

You must remember our fight is not primarily against the Jews as such but against the Communists and all elements that demoralize and destroy us. When I proceed against a Communist, I do not ask if he is a Saxon or a Prussian. What I mean is that I cannot spare a Communist because he is a Jew.”

On 24 October 1933, Hitler delivered a speech in the Sportpalast in Berlin,

“In England people assert that their arms are open to welcome all the oppressed, especially the Jews who have left Germany. England can do this! England is big, England possesses vast territories. England is rich. We are small and overpopulated, we are poor and without any possibility for living. But it would be still finer if England did not make her great gesture dependent on the possession of £1,000—if England should say: Anyone can enter—as we unfortunately have done for thirty or forty years. If we too had declared that no one could enter Germany save under the condition of bringing with him £1,000 or paying more, then to-day we should have no Jewish question at all. So we wild folk have once more proved ourselves to be better humans—less perhaps in external protestations, but at least in our actions! And now we are still as generous and give to the Jewish people a far higher percentage as their share in possibility for living than we ourselves possess.”
American Zionists, who sponsored the emigration of Eastern European Jews through the 1920's, had come to despise Russian (“red assimilationist”) Jews in the 1930's. At this time in Russia, the man behind Stalin’s genocide and anti-Semitism was an alleged “self-hating Jew”, 1796 Lazar Moiseyevich Kaganovich. American Communists, many, if not most, of whom were ethnic Jews, largely turned a blind eye to these atrocities, which cost tens of millions of Gentile lives. Kaganovich may well have been a Zionist who wanted to both punish assimilatory Jews (“red assimilationist”) and develop in them a keen interest in Palestine. Kaganovich, perhaps the bloodiest mass murderer in history, was the power behind the throne of the Stalinist Regime. Kaganovich directed the genocide of the Ukrainians, as well as “Stalin’s purges” and anti-Semitic campaigns.

Perhaps the most compelling evidence that Soviet anti-Semitism was a ploy meant to force reluctant, assimilating Jews into Zionism against their will, was the fact that the most virulent anti-Semitic purges began after the failed attempt to create a “Jewish State” in the far Eastern regions of the Soviet Union, the Jewish Autonomous Oblast in Khabarovsk Krai in the districts of Birobidzhan, Leninsk, Obluchensky, Oktyabrsky and Smidovichsky. 1797 This plan failed, in part, due to the interference of some Zionist Socialists, who insisted that Palestine was the Jews’ national home. An even earlier attempt to found a “Jewish State” in Russia in the districts of Homel, Witebsk and Minsk, 1798 also failed, largely due to a lack of Jewish interest. The Zionists insisted that anti-Semitism alone could force the Jews to segregate. When the Zionists put Hitler in power, they had the needed impetus to force Jews to flee Europe and the Zionists attempted to steal Chinese territory for a “Jewish homeland” with the help of the Imperial Japanese under the “Fugu Plan”. Zionist Jews sought to establish a “Jewish State” in China, which had been taken over by the Imperial Japanese whom the Jews had been financing since the days when Jacob Schiff loaned them $200,000,000.00 in the Russo-Japanese War. The Zionists used the Imperial Japanese to destroy the Chinese government in preparation for the formation of a Jewish nation in China under the “Fugu Plan” in Manchuria or Shanghai. The Jews even promoted the Protocols of the Learned Elders of Zion to the Japanese as evidence as to how powerful they were. The “Fugu Plan” failed to attract enough Jews, even under Nazi pressure, and die hard Zionists wanted Palestine. The Zionists then arranged for war between the United States and Japan. When America declared war on Japan, Hitler, seemingly inexplicably, declared war on the United States ensuring the ultimate defeat of Germany. Hitler also went to war with the Soviets, which gave him access to large numbers of Jews the Zionists could then segregate and ready for deportation to Palestine.

American Zionists took Hitler’s rise to power as an opportunity to promote Jewish nationalism, force Jewish ethnocentricism, and consolidate Zionist-Jewish power in the United States to the detriment of Europe’s Jews—those Jews the prominent and well read European Zionist Jakob Klatzkin had said had “seceded” from being Jews,

“A Jew who no longer wishes to belong to the Jewish people, who betrays the covenant and deserts his fellows in their collective battle for redemption,
has thereby abandoned his share in the heritage of the past and seceded from his people. [***] Let us assume that the Galut can survive and that total assimilation will not inevitably follow the abandonment of religion. Nonetheless we must assert: The Judaism of the Galut is not worthy of survival. [***] Perhaps it is conceivable that, even after the disintegration of our national existence in foreign lands, there will yet remain for many generations some sort of oddity among the peoples going by the name—Jew. [***] We must increase self-restrictions and prohibitions, for the sake of protecting our identity and apartness, and we must define boundary after boundary between ourselves and the nations among whom we are assimilating. [***] The very culture that engulfs us so transforms our moral and aesthetic sense that we return to our own people, for we have learned to be sensitive to the crime of assimilation and its consequences."

In 1933, prominent American Zionist Ludwig Lewisohn expressed his bitterness towards Jews who dared to disagree with him. Lewisohn issued an ominous warning to Jews who failed to convert to Zionism:

“[F]or Jews it has become a matter of life and death for each one and for our whole people. A matter of life and death. For the same sparks from which burst forth this year the foul and fatal German conflagration are smoldering, however hid in ashes, however swept out of sight by sincere gentile good will and by unacknowledged Jewish terror, in every land of the dispersion. [***] Hence millions of Jews must be converted, must achieve a teshuvah (repentance), each for himself, in order to consent to the saving of their people, in order to consent to the reconstruction of the Jewish communities of the world. Nothing less than a conversion, nothing less than a profound inner change, nothing less than a broken and a contrite Jewish heart, and yet a heart proud in its brokenness and its contrition, will avail. [***] And our books, instead of becoming instruments toward the auto-emancipation of Jewry and the warding off of a catastrophe, were patronized by a few high-brows whose ‘ifs’ and ‘butts’ were stamped out in the year 1933 in blood and dirt. [***] The Polish communities, though less catastrophically stricken, are so oppressed and burdened that leadership cannot be expected from them. The Russian Jews are lost to us in this generation by the device of Red assimilation, quite analogous to Prussian assimilation and mass baptism during certain decades of the nineteenth century, or to the processes of any polity which, in the period of consolidation, is willing temporarily to admit that assimilation can proceed to the point of paying. Hence the leadership of world-Jewry outside of Palestine devolves upon American Jewry, and American Jewry, the most populous and powerful in the world today, is also the most ignorant and the one in which the crippling sickness of preoccupation without knowledge is most prevalent. . . It is a necessity and a duty to be brutal today. It is necessary to be brutal even at the risk of being misunderstood. For, given the precise circumstances that confront us from
now on, the Jewish ignorance of American Jewry may prove a disaster of incalculable consequences to all Israel.”

Ludwig Lewisohn lived with, and had a homosexual relationship with, poet George Sylvester Viereck. Viereck was reputedly the grandson of Kaiser Wilhelm the First and Edwina Viereck, and was the son of the Marxist Louis Viereck. George Sylvester Viereck was one of the chief pro-German propagandists in America during World War I, defended the Kaiser after World War I, was a devoted friend to Sigmund Freud and promoted Albert Einstein—as well as Adolf Hitler. Just as the poet Ezra Pound propagandized for the Fascists in Italy, Viereck propagandized for the Nazis from the 1920's through the 1940's and served time in prison in America for his pro-Nazi activities. Viereck and Lewisohn remained friends after the Second World War—and the Holocaust. Eustace Mullins stated that Viereck was flattered and pleased when Mullins told Viereck that Viereck had cost Germany victory in both world wars.

“Yet the answer, which in accordance with the title this book offers us, is clear enough: remove the Arabs from Palestine and Transjordania, over a million of them, (p. 188), and put in their place a majority of the Jewish population of the world (p. 19). Mr. Lewisohn is indeed aware of the fact that not only will a large part of the Jewish population of the world never go to Palestine but that it will take a long time before all those who wish to go can be transported and find room there. Not only are Mr. Lewisohn’s ideas hazy, confused, and disdainful of the facts, but his major premises are indistinguishable from the current anti-scientific racial dogmas which threaten to destroy liberal civilization. Mr. Lewisohn resorts to downright misrepresentation of Dr. Boas’ position when he says (p. 310) that the latter ‘hoped that Jewish babies would develop Indian skulls in America.’ It is not necessary to refute this absurd and baseless charge; but it is well to call attention to the fact that neither Boas nor Fishberg ever denied the existence of Jews. What they did show by actual measurement is that there are no discoverable hereditary physical traits common to all Jews which distinguish them from other people. Mr. Lewisohn froths at this because it runs counter to the dogma which he shares with Hitler and Mussolini that cultural traits are inherited in the racial blood and cannot be changed (p. 46). It seems cruel to link such an ardent Zionist as Mr. Lewisohn with Hitler and Mussolini, even ideologically. But the fact is that he does agree with them not only in their dogmatic racial fatalism but also in one of the conclusions that they and others draw from it, and that is that the democratic liberal regime of emancipation and toleration has not only failed but cannot and indeed ought not to succeed. From the way Mr.
Nazism is Zionism 1609

Lewisohn writes, one would suppose that the emancipation of the Jews from the ghetto was a calamity second only to the destruction of the Jewish Commonwealth. By implication he is committed to the view that one born a Jew cannot enter completely into English, French or German culture, not only because he will not be allowed to, but because it is contrary to fate or God’s will. [***] The implication that emancipation is responsible for the anti-Semitism in Poland and Rumania belongs to the same class [of misinformation]."[1805]

Zionists promised the Jews of the world that if Jews abandoned their calling to nationalism and refused to embrace Zionism, they would face annihilation in Europe. This had long been a common theme of Zionists and anti-Semites. The “Hamburg Resolutions of the German Social Reform Party” proclaimed in 1899,

“The strivings of Zionism are a fruit of the antisemitic movement. [***] Unfortunately [any hope that all Jews will emigrate to Palestine] appears to be infeasible. [***] As such, [the Jewish question] should be solved in common with other nations and result finally in full separation, and—if self-defense demands—in final annihilation [Vernichtung] of the Jewish race."[1806]

Adolf Hitler and Hans Frank later threatened the Jews of the world that if Jewish leadership “forced another world war”, then Jews would face annihilation in Europe. Hitler stated before the Reichstag on 30 January 1939,

“If international finance Jewry in and outside Europe succeeds in plunging the peoples into another world war, then the end result will not be the Bolshevization of the earth and the consequent victory of Jewry but the annihilation of the Jewish race in Europe.”[1807]

“Wenn es dem internationalen Finanzjudentum in und außerhalb Europas gelingen sollte, die Völker noch einmal in einen Weltkrieg zu stürzen, dann wird das Ergebnis nicht der Sieg des Judentums sein, sondern die Vernichtung der jüdischen Rasse in Europa!”[1808]

The Jewish Nazi tyrant of Poland, Dr. Hans Frank, stated at a Cabinet Session on 16 December 1941,

“As far as the Jews are concerned, I want to tell you quite frankly, that they must be done away with in one way or another. The Fuehrer said once: should united Jewry again succeed in provoking a world war, the blood of not only the nations which have been forced into the war by them, will be shed, but the Jew will have found his end in Europe”[1809]

Did the crypto-Jewish Zionists Adolf Hitler and Hans Frank mean that they would exterminate the Jews of Europe in death camps, or did they mean that they would
deport the Jews of Europe to Palestine as a final solution to the Jewish question? Frank was a long-term Zionist who wanted to segregate the Jews in Polish concentration camps and then ship them to Palestine—not to say that he did not intend to kill off a large percentage of his brethren in the process. In the fall of 1933 in Nuremberg on Reichsparteitag, Frank stated that his goal was to secure a “Jewish State”,

“Unbeschadet unseres Willens, uns mit den Juden auseinanderzusetzen, ist die Sicherheit und das Leben der Juden in Deutschland staatlich, reichsamtlich und juristisch nicht gefährdet. Die Judenfrage ist rechtlich nur dadurch zu lösen, dass man an die Frage eines jüdischen Staates herangeht.”

World War II began soon after, and resulted in the Bolshevization of half of Germany, Eastern Europe, China, North Korea, and ultimately Indochina, with disastrous consequences for a large segment of humanity. Western Europe came very close to falling under the Bolshevists’ control and endured the Bolshevization of Nazism for many years. The war was also a victory for the Zionists—in their minds.

The Nazis and the Zionists iterated a common message. Even after Germany had initiated war and invaded Poland, where Jews had been forced to gather, the Jews of Europe did not embrace Zionism. They were then annihilated. Lest the Zionists be confused with visionaries who sought to rescue the Jews of Europe, one must bear in mind the Zionists’ all too common disdain for “surplus” and assimilationist Jews and the fact that instead of fighting the Nazis, they too often endorsed and encouraged the views of the Nazis—even offered a military alliance with the Nazis.

The unfortunate Jews of Eastern Europe and Germany were caught between Zionists, who hated their “red assimilation”, sponsoring racial and nationalistic mythologies in Germany, the Soviet Union, and elsewhere in collusion with the anti-Semites; and powerful and influential assimilated Jews in France, England and America who feared an increase in anti-Semitism should these Eastern Jews be permitted sanctuary in their lands. The Eastern Jews were chased from place to place and often murdered in cowardly cold blood, with the approval of the Zionists. Though many in positions of power around the world could have done much to help the Jews in danger, most did nothing. Immediately after the Second World War ended, the push for Israel became immensely strong among American Jews who had spent the war in relative safety—just as the political Zionists had always planned would happen. Israel Zangwill stated in 1914,

“But whether persecution extirpates or brotherhood melts, hate or love can never be simultaneous throughout the diaspora, and so there will probably always be a nucleus from which to restock this eternal type.”

The Zionists caused the Holocaust in the twisted belief that American and British Jews would “restock this eternal type” and that “Red assimilationists” and “rich assimilationists” were unworthy of life. Hitler’s threat to annihilate the European
Jews occurred shortly before England declared war on Germany and Frank’s resolution came shortly after Germany declared war on America.

Before Hitler, there was Alfred Rosenberg. Rosenberg, perhaps a Bolshevik agent of what was to become “The Trust”, under the tutelage of Houston Stewart Chamberlain, List and Liebenfels, crafted what was to become the party ideology of the NSDAP. The Zionists created the ideology of the Nazi régime through these men. The Russian Jewess Helena Petrovna Blavatsky gave these men their mystic aryanaistic dogmas and mythologies. In 1893, Blavatsky created the dogma behind the adoption of the “Aryan” Swastika they and the Nazis adopted—from her.1814

One of the architects of political Zionism, Max Nordau, wrote extensively on the Übermensch and his role in history and politics (continuing the themes of Nietzsche’s Übermensch in Thus Spoke Zarathustra and Dostoevsky’s dialectic and Hegelian Übermensch turned evil in the form of Raskolnikov in Crime and Punishment). Nordau, while formulating a biologically and physiologically based political psychology of the superior man—much in agreement with Hitler’s later belief system, adopted the ideologies of Hegel, Schopenhauer and their progeny, while viciously criticizing them. He wrote of “Degeneration” in the arts and philosophy by Wagner and Nietzsche and throughout society—political elements which became fundamental in Nazi culture and science through a direct tranference to Jews.

It was something more than common interest and circumstances which drove Rosenberg (in his many rôles as Nazi party leader, Nazi propagandist, and the creator of National Socialist policy) to attempt to fulfill Herzl’s goals of a dramatic rise in international anti-Semitism, the distillation of Jews into segregated groups meant for deportation, and the destruction and punishment of upperclass Jews who had opposed Herzl and whom Herzl had repeatedly threatened, and the creation of a “Jewish State”. There was common control of the Zionist, Nazi and Communist movements, with the common goals of wreaking havoc on Europe, destroying the genetic and cultural future of Europeans, and herding up the reluctant Jews of Europe for deportation to Palestine, and killing off weak Jews in order to “improve the bloodline” of Israeli Jews, since Palestine could not in any event house the majority of European Jews.

Zionist Jews had no compunctions about killing off a large percentage of assimilatory European Jewry. Bernard Lazare was one of many Zionist Jews who hated wealthy assimilating Jews and wrote in the late 1890’s, “It is obvious that the so-called upper class among western Jews, and especially among French Jews, is in an advanced state of decay.” Jakob Stern published a rather famous critique of Herzl’s Der Judenstaat, in which Stern saw Herzl’s book as a Utopian Marxist vision. Stern also ridiculed wealthy “Jewish capitalists” who sought sanctuary in “civilized countries”, and noted, in his view, “How little racial and tribal kinship and community of religion prevent Jewish capitalists from exploiting Jewish proletarians, could be witnessed again at the International Socialist Congress a short time ago.”

We learn from Paul Ehrenfest’s correspondence that Zionist Jacques Oppenheim believed that secular Jews were not Jews and that all the problems Jews faced were due to educated and influential Jews who had betrayed the “Jewish masses.”
Einstein joined the chorus,

“The greatest enemies of the national consciousness and honour of the Jews are fatty degeneration—by which I mean the unconscionableness which comes from wealth and ease—and a kind of inner dependence on the surrounding Gentile world which comes from the loosening of the fabric of Jewish society.”

Anti-Semite Gyözö Istóczy issued an anti-Semitic Zionistic appeal to rich Jews. In 1878, Istóczy wrote,

“There is only one means of remedying this great international evil: the Jews must be expelled from Europe. [***] In Palestine the Jews will be in position to create a grand state. [***] The innermost, secret wish of most Jews can now become reality if they can overcome those powerful Jews who have acquired power in Europe and for whom it is so very congenial to rule the world from London, Paris, Berlin, Vienna, and Budapest. I appeal to the oft-mentioned patriotism of the Jews; they can now create their own empire; they will surely become a mightier, more influential state. My sincerest and best wishes will accompany the Jews. May the Jews find this acceptable and cease their continuing efforts to exterminate the Christians.”

Roman Dmowski iterated a Polish anti-Semite’s view of the struggle between wealthy Western Jews and Zionist Jews in his article *The Jews and the War* of 1924,

“Meanwhile there developed a stubborn battle between generally poor idealists, as the Zionists were, and those representing financial power. Englishmen, Americans, Germans, and Frenchmen of Jewish faith were not thinking of leaving the Parises, Londons, Berlins, and New Yorks, with everything they offered. [They] considered Zionism an absurd fantasy. [***] Palestine was never the fatherland of the Jews because they never had a fatherland, but they made Jerusalem their spiritual center; recovering this center along with controlling Palestine, with its non-Jewish population, is the necessary goal of this new current. Yet, at the same time, [this new current] bid them not to forget that they are supposed to ‘possess the earth,’ that therefore they must be everywhere, and everywhere gain positions and organize their influences.”

Alfred Rosenberg focused attention in Germany on *The Protocols of the Learned Elders of Zion*, which Gottfried zur Beek, under the *nom de plume* Ludwig Müller von Hausen, had translated into German in 1919 and published in early 1920 as *Die Geheimnisse der Weisen von Zion*. Rosenberg published *Die Protokolle der Weisen von Zion und die jüdische Weltpolitik*, Deutsche Volksverlag, München, (1923), in an effort to generate, and promote extant, anti-Semitism.

Alfred Rosenberg, Hitler’s mentor, promoted Zionist programs as the state policy
of the Nazis, stating in his *Die Spur des Juden im Wandel der Zeiten* of 1920 that,

“The Jews are recognized as a nation living in Germany. [***] Zionism must be powerfully supported, in order to promote yearly a certain number of German Jews to Palestine or, in general, over the borders.”

“Die Juden werden als eine in Deutschland lebende Nation anerkannt. [***] Der Zionismus muß tatkräftig unterstützt werden, um jährlich eine zu bestimmende Zahl deutscher Juden nach Palästina oder überhaupt über die Grenze zu befördern.”

Though many authentic anti-Semites distrusted Zionism, both Adolf Hitler and Joseph Goebbels encouraged Zionism, as did SS officer Baron Leopold Itz von Mildenstein. Adolf Hitler’s ethnologist, Hans Günther, embraced and advocated Zionism in 1923, copying verbatim from the amended Zionist Program of 1897,

“Research has shown time and again that the dispersion of the Jews among Gentile Peoples causes endless unrest, and again and again the racial antagonism of necessity escalates into hatred. Having exposed this is one of the most courageous realizations of Zionism. Zionism has clearly shown that the only dignified settlement of relations would be the removal of the Jews from living among the Gentile nations. The creation of a publically, legally secured homeland for the Jewish people in Palestine seems to now be politically attainable.”

“Immer wieder zeigt die Betrachtung, dass die Zerstreuung der Juden unter nichtjüdischen Völkern eine endlose Unruhe bewirkt, und immer wieder die Artgegensätze bis zum Hass steigern muss. Dies eingesehen zu haben, ist eine der mutigsten Erkenntnisse des Zionismus. Der Zionismus hat es klar eingesehen, dass einzig die Herauslösung der Juden aus dem Zusammenwohnen mit nichtjüdischen Volkstämmern eine würdevolle Klärung der Verhältnisse bedeutet. Die Schaffung einer öffentlich rechtlichen gesicherten Heimstätte für das jüdische Volk in Palästina scheint jetzt politisch erreichbar zu sein.”

The infamous “Nuremberg Laws” of 1935 forbade Jews from raising the Reich’s flag, but Section 4 specifically granted them the right to display the “Jewish colors”, which encouraged Zionist nationalism. The Zionists embraced the Nuremberg Laws, which sponsored the racial segregation they desired and which forbade intermarriage or any sexual relations between “Jews” and “Aryans”. At least as early as 1914, Zionist racist Ignatz Zollschan iterated the Nazi goals of concentrating and segregating Russian Jews in order to prevent the assimilation of Jews after emancipation. Zollschan asserted that Jews must choose the ghetto or Zionism, if they wished to perpetuate the “Jewish race”. Since the vast majority of Jews did not want to segregate and congregate in Palestine, the Zionists and Nazis collaborated
to force Jews into ghettos. Since a very large percent of Jews in Germany were marrying Gentiles, the Zionists and Nazis collaborated to discourage and eventually outlaw such marriages. Political Zionist Zollschan stated at least as early as 1914,

"II.
The Significance of the Mixed Marriage

What can we say with certainty about the purity of the Jewish race? The answer to this question is of vital importance. For if intermarriage with alien races had in former years played a great role among Jews, it is self-evident that we are not justified in speaking of a Jewish race at all. Are the Jews of to-day really the pure descendants of Abraham, Isaac and Jacob?

Nobody assumes to-day that all the Jews are the direct descendants of the three patriarchs; they are derived from the mingling of various stocks which were, however, essentially varieties of one and the same race.

When in the thirteenth century before the current era the Bedouin tribe of the Habiri, that is to say, the Hebrews, took possession of Palestine, they found there a vast native population, the Ganaanites, Hetites, Getites, Aniorites and Phihistines. During the period of the Judges and Kings, the Jewish tribes intermarried with all these nations. Their blood was mingled with that of the nations in whose midst they lived. This slow process of intermixture continued till after the first exile, till the time when the powerful word of Ezra severed all existing marriage connections with foreign nations, and henceforth the purity of the race became the dominating principle.

It is quite gratuitous to enter into a controversy about the exact definition and classification of such nations as the Hittites, Amorites, Philistines and others, to which, in a broader sense, the Egyptians, as well as the Babylonians, Assyrians, Phoenicians and Jews belong. Whether we speak of Semites and Hamites in accordance with the inadequate linguistic methods, or of Semites, Hittites, Amorites and Kushites, we regard these nations as related to one another in the racial sense. Ample anthropological evidence exists for this statement, though naturally it cannot be presented in this lecture.

Many historians are of the opinion that the appearance of Ezra did not put an end to the racial intermixture. They think that also in all subsequent centuries the Jews continued to mingle with the nations of the diaspora, just as in the time before the Babylonian exile. They advocate the theory that the Jews of to-day are the descendants of the heathen proselytes during the Hellenistic period, or the offspring of mixed marriages between the Jews and their surrounding nations during the Christian centuries.

We can to-day assert with certainty that the extent of proselytism has been greatly exaggerated. There can indeed be no doubt that Judaism found numerous adherents among the pagan nations during the Roman and Hellenistic and early Christian periods. We have, however, sufficient reason to assume that those proselytes were only the so-called ‘proselytes before the
gate,’ that is to say, converts who practiced the worship of one God, but were never admitted to circumcision or marriage. They were proselytes who later on embraced Christianity.

And in the times that followed immediately, the policy of discriminating between Jew and Gentile was inaugurated. Hadrian’s laws forbidding circumcision were, it is true, revoked by his successor, Antoninus Pius, but it was expressly prohibited to make converts to Judaism. In consequence of this, the formal embracing of Judaism became a punishable crime, and it remained such until quite recent times. Even during the periods when the Jews commanded respect to some extent, the Church took good care that the religious boundary-line should be kept intact. In times of persecution and oppression, no appreciable number of adherents of other religions could have gone over to outlawed Judaism. The bars of the Ghetto formed a reliable dividing wall.

But even if we grant that in some cases a few heathens became Jews in every respect prior to the Christian era, they could have been of no significance. As in the Hellenistic period there already existed millions of Jews, the admixture of foreign blood must have been infinitely small. And this foreign blood was, after all, derived from the kindred nations in ‘Syria, Asia Minor and Egypt.

It may be regarded as certain that proselytism almost entirely ceased since the appearance of European Jewish history. Even the invasion of the Khazars in the eighth century does not alter the fact that during the Middle Ages not much of foreign blood was added to the Jews. For already in the tenth century the empire of the Khazars was confined to a small territory, something like Crimea of to-day, and in the eleventh century it was entirely wiped out. A small remnant of Khazarite Jews are still living in Crimea to-day, and belong to the Karaitic sect. But even if we assume that the entire nation of the Khazars embraced Judaism, and professed that religion for a long time, this admixture would still be a quantite negligeable and would not alter the ethnical character of the Jewish race. Moreover, it is doubtful whether this conversion was not confined to the rulers and the ruling classes of the Khazars. We would be losing sight of historical proportion, if we were to infer from the conversion of the Khazars that the Jews have any remarkable admixture of foreign blood.

As far as legal mixed marriages are concerned we know that they actually existed in the times of high material culture, namely, in Egypt during the Hellenistic period and in Spain during the twelfth and thirteenth centuries. But, as is the case now in Europe, where there is a strong leaning towards intermarriage, the offspring of those marriages preponderantly went over to Christianity. Besides this, those early periods quickly passed away owing to the changed political conditions, the reaction of orthodoxy and the decisions of the councils of the Christian Church. Moreover, this movement at that time, in contradistinction to the general spread of intermarriage of to-day, was only confined to one country. Intermarriage with northern nations never
took place in former years to any considerable extent.

The Jewish nation accordingly has propagated itself in an essentially pure manner from the time of Ezra until to-day, and for more than two thousand years represents an ethnically peculiar race, which was not diluted by foreign blood. It is self-evident that a few drops of foreign blood must have found their way among the Jews during the long time in the diaspora. But these admixtures were too insignificant to have any essential influence upon the ethnical character of the nation. Thus the Cohanim, who were absolutely excluded from mixed marriages, are typically the same as the other Jews. The state of affairs can best be described in one sentence: A great deal of blood was exported from Jewry, but little indeed was imported from outside. And, consequently, we can assume with certainty, that the blood which flows to-day in the veins of the Jews, is the same as that of two thousand years ago.

That Ezra’s commandments, among which is also the one about purity of blood, have been kept for thousands of years, is due to the fact that they claimed to be religious ordinances coming from God. It is the case with all nations that social institutions which are interwoven with, and supported by religion are kept most tenaciously. In addition to this, Ezra’s prescriptions owe their strength to the circumstance that they consisted in the practical laws of the cult, and not in theoretical doctrines; and that the Jews, after being scattered among other nations, were forced to social and economic isolation.

The true consideration of this circumstance, indicates the great significance of the solution of the problem of intermarriage in our own times. Economic and social isolation and the power of religious legislation, account for the fact that up till to-day this people did not fall a victim to intermarriage, despite its wanderings among strange nations for the last 2,000 years.

As long as ceremonial religion was a great power in the civilized life of all nations, this influence of religion was easily explained. But nowadays, for reasons which will presently become apparent, this influence upon the great masses is confined to the Ghetto environment. As soon as the Jew leaves this Ghetto environment, and participates in the national industry of his country as a factor of equal rights, and adapts himself to the speech and culture of his native land, he begins to free himself from the power of ceremonial religion. A century of free activity in the world of capital; combined with a secular education, entirely estranged the Jews, in all countries where the system of capital is developed, from their former mode of life. The pressure of changed economic conditions and the scientific materialistic conception of our age, sap the vitality of orthodox Judaism and undermine its foundation.

Now since ceremonial religion on the one hand and economic and social isolation on the other, together with the prohibition of Church and State, were the only reasons why intermarriage with foreign nations did not take place on a larger scale, it necessarily follows that affairs to-day have reached a critical stage. Free legislation in countries where the system of capital is
Nazism is Zionism

Na
devolved, has done away with the economic and political isolation; rationalism has shaken ceremonial religion, and no State nowadays prohibits mixed marriages.

In countries where one or another of these important conditions is not fulfilled, as, for instance, Galicia, Russia, and the Orient, Judaism is still kept alive, though the lot of the masses residing there is by no means to be envied. But in the Occident, and in all countries where the Jews are allowed to develop themselves freely, their lot is the same as that of other nations in a similar situation.

Without exception, all the nations who were compelled to leave their native soil and who never formed a compact majority in any part of the world, but were scattered in small communities, have vanished through intermarriage. And the Jews likewise would be swept away by the immense tide of the human race in the five continents, if all obstacles were removed. As can be easily shown, Jews have always married outside the fold whenever conditions were favorable. But never were conditions which make for the disintegration of Judaism as powerful as to-day. Nations who dwell together always mingle, unless intermarriage is made impossible by outside pressure of law or religion. The Jews nowadays come into contact with other nations, the civil law permits intermarriage, and the authority of religion is beginning to wane. The laws of love and material interests are mightier than all religious barriers, especially when the latter are weakened and enfeebled as they are to-day. The result of these considerations is, that to-day more than ever, Judaism is in danger of being dismembered.

The facts derived from statistics confirm this conclusion in all its details.

The first impulse to abrogate the laws forbidding marriage between Christians and Jews went forth from the French Revolution, and gradually spread from country to country—to Holland, Belgium, Denmark and Scandinavia; to England and the United States; to Germany, Italy and Hungary. It is even permitted in the Balkan States. On the other hand, it is still prohibited to-day in Austria, Russia, Spain and Portugal, and in Mohammedan countries. The most favorable places for mixed marriages are naturally those countries in which Jews have been domiciled for a considerable time and where they have attained prosperity. This is especially the case in the States of Western Europe.

The losses to Judaism in these western countries cannot be numerically ascertained, as there are no statistics in Italy, France and England relating to mixed marriages. Among the high-class Jewish families in Italy, for instance, it has almost become a rule to marry their children to Christians. All observers are unanimous in declaring that mixed marriages are extremely frequent in that country. As early as 1881, the mixed marriages in the province of Rovigo formed 34 per cent. of the pure Jewish marriages. Mixed marriages are also very common in Sweden, Denmark, Australia and France. In the last-named country, the highest aristocracy has often intermarried with Jewish heiresses. The Jews who had been domiciled in England for several
generations, have occasionally allied themselves to the aristocracy, during the nineteenth century. On the other hand, the Jewish population that immigrated to that country in the last few decades from Russia, Galicia and Roumania, is averse to intermarriage. The same holds good of France. In Sweden, the number of mixed marriages is actually greater than that of pure Jewish marriages.

Three-fourths of the Denmark Jews reside in Copenhagen. In that city, the average percentage of mixed marriages from 1880 to 1905, amounted to 69 per cent. of the pure Jewish marriages. The mixed marriages showed a tendency to increase, whereas pure Jewish marriages gradually decreased, as may be seen from the following table:

<table>
<thead>
<tr>
<th>Year Range</th>
<th>Percentage</th>

<tr>
<td>1900-1905</td>
<td>93.1%</td>
</tr>
</tbody>
</table>

According to the latest statements it is 96 per cent. It also appears that the Jewish population of Denmark did not increase from 1840 to 1901, but rather relatively decreased. In 1840, 0.30 per cent. of the general population were Jewish, while in 1901 there were only 0.14 per cent. The Jewish percentage, accordingly, was reduced to less than a half. The chief reason for this phenomenon is to be sought, along with the fact that fewer children were born to each family in the mixed marriages, through which the Christian population has gradually encroached upon the Jewish. In the other Scandinavian countries, as has already been remarked, the number of mixed marriages is actually greater than pure Jewish marriages.

In the United States, where no confessional statistics exist, conditions resemble those of England. The few Jews who had settled there for some time and who mostly belong to the wealthy classes, as, for instance, those of the Portuguese congregations now in process of disintegration, incline towards intermarriage, while the great masses of Jews who immigrated there since 1881, keep away from mixed marriages. But even here, at least in the congested districts of New York, marriages with the surrounding elements, such as the Irish and particularly the Italian, occur with growing frequency.

In Prussia, the number of couples who intermarried rose from 2,100 in the year 1885, to 5,100 in the year 1905. The marriage of a Jew to a Christian woman is, as a rule, more frequent than the opposite case. Along with the growth of mixed marriages, the number of children resulting from such marriages has naturally increased. Where the husband is Jewish about a fourth only of the offspring remained Jews; while where the woman is Jewish, only one-fifth—four-fifths falling to the lot of Christianity. In Germany, the mixed marriages in 1905 amounted to 21 per cent. and in 1910, to 26 per cent. of the pure Jewish marriages. This average was greatly exceeded in the large cities. Thus the number of mixed marriages amounted to 45 per cent. in Berlin, and to 60 per cent. in Hamburg. And even in
Frankfort on the Main, which has the reputation of being orthodox, there were about 30 per cent. of mixed marriages in the year 1908.

In Austria, intermarriage between Christians and Jews is forbidden, while intermarriage between Jews and nonconformists is permitted. Marriage is, accordingly, only possible when one of the parties embraces the religion of the other, or belongs to no denomination. It is obvious, for this reason, that the number of mixed marriages is much smaller in that country. The greater number of such marriages are contracted in Vienna. In the year 1906, they amounted to 13 per cent. While in Austria, as a rule, intermarriages between Jews and nonconformists are pretty rare, they are rather frequent in Triest. The following is a table of the average percentage of mixed marriages in the last few decades:

<table>
<thead>
<tr>
<th>Period</th>
<th>Percentage</th>

<td>1896-1899</td>
<td>41%</td>
</tr>
<tr>
<td>1900-1903</td>
<td>62%</td>
</tr>
</tbody>
</table>

This is to be accounted for by the fact that Triest is on the border of Italy where, as is the case also in Denmark and Australia, the increasing frequency of mixed marriages actually threaten the existence of the Jewish population.

In Hungary, mixed marriages have been permitted since 1895, and they have become very numerous since that time. The capital towns of all countries offer the best opportunities for mixed marriages. In Hungary, the greater part of such marriages are contracted at Budapest. They amount in that town to 20 per cent.

The majority of Holland Jews reside in Amsterdam. Here also, mixed marriages between Jews and Christians show a constant increase. In 1903, they formed a fifth part of all the pure Jewish marriages.

Statistical figures recently obtained show a steady progress in the same direction. The language of these statistics is so eloquent and forceful, that it almost renders all discussion superfluous.

If we wish to draw up a summary of the above data, we can divide the countries, where mixed marriages are contracted, into four classes, according to Ruppin’s scheme.

The first place must be accorded to the great mass of Jews whom modern culture has not reached as yet, and who remain in the same stage of civilization as they were during the Middle Ages. To this class belong the vast lower masses of the Jews in Russia, Roumania and Galicia, the native Jews of Morocco, Asia and European Turkey. They have their own vernaculars, the so-called Yiddish and Ladino, respectively. They dwell in their national exclusiveness, wear their peculiar garb and live for the greater part according to the old Jewish laws. The greater bulk are poor workmen or artisans and store keepers of precarious existence. It is in those countries that we still find the home of religious fervor and talmudic study. At the utmost,
two mixed marriages out of a hundred pure marriages are contracted there.

The second class has been somewhat influenced by European culture, and speak the language of the country either exclusively or along with their jargon. They have abandoned their peculiar garb, and are dressed like their Christian neighbors. They still practice Jewish observances, but the intolerance towards the non-Jewish is abated, and the imitation of Christian manners and the occupation with non-Jewish literature, are no longer regarded as reprehensible. The members of this class mostly live in conditions free from care, and some of them have even attained decided prosperity. To this class belong chiefly the Russian and Galician Jews who immigrated to America, the Jews of Hungary and of the small towns of Austria and Germany. Their number amounts to three millions. Mixed marriages occur there from two to ten per cent. The third class have renounced all Jewish ceremonial practices, especially the Sabbath, speak exclusively the language of the country and no longer occupy themselves with Jewish literature. The fact that the people of this class belong to Judaism is only proved by their contracting marriages with Jews, by circumcising their sons, and by attending synagogue during the High Festivals. To this class which, as a rule, lives in good material conditions, belongs the wealthy Jewish class of the large cities in Europe and America. Their number amounts to about two millions. In this class mixed marriages take place from ten to thirty per cent.

The fourth and last class has severed all connections with Judaism and religion. It still remains Jewish, because a sense of honor, family and social ties prevent it from going over to Christianity. To this class belong the Jews in the capital towns, and those who possess an academic education. Their number may be computed as something like a million. Mixed marriages are very frequent in this class—from thirty to fifty per cent.

These four classes, however, which I have attempted to portray with a few bold strokes, are not fixed groups, but cross-cuts at at different positions, of a constantly flowing stream whose source to-day is in orthodox Judaism of eastern Europe, and which wends its way into the sea of Christianity. The process of infiltration of modern culture into Judaism goes on incessantly, and in the same manner, orthodox Judaism constantly yields to the members of the second tolerant class. The latter gradually yields to the class of reformers and freethinkers, and finally baptism, and especially intermarriage, leads the Jews to Christianity. These four classes can also be represented as four consecutive generations. Four or five generations intervene between our own age and the time of Mendelssohn. It is a melancholy reflection, that hardly one of the Jews who lived at that time in Berlin has any Jewish descendants.

This process would also assume equally large dimensions in Russia, if the Jews were granted equal rights and if the Pale of Settlement were removed. The amelioration of the material conditions would remove the Ghetto environment which is one of the factors in preserving orthodox Judaism. But
still more important would be the elimination of the second factor, namely, the keeping together of the Jews in one compact mass. If it were possible for the Russian Jews to spread themselves over the immense Russian Empire, the Jewish population in that country would not be denser than in western Europe. Thereby the progressive changes which exercise their destructive influences upon the western Jews would also apply to their Russian brethren. For the country that is more developed, serves as a picture of the future of the one that is less developed. Accordingly, eastern Jews will after some time apparently find themselves in the same position as the western Jews are today.

We may epitomise our conclusions from the processes described above, as follows: When the Jews in the diaspora became prosperous, assimilation which appears on the scene takes them away more or less from Judaism. It is mainly when they are oppressed, when they are in economically unfavorable conditions, that the Ghetto environment, in its old sense, is still retained. And although conditions to-day are not favorable in all countries, the beginning of this development can be recognized everywhere. Under favorable material conditions, and through the prevalence of secular education, Judaism, on account of its being scattered among nations of an alien race, is in danger of being disintegrated and destroyed, since the influence of ceremonial religion is waning.

It is not for the first time that we notice this process of disintegration. There were similar phases in all countries and throughout all ages. In accordance with the laws of historical evolution ever since the exile, this process has appeared in every country where a high culture brought about freedom from political pressure, from care for a livelihood, and from superstition. These phenomena appeared in those cases where Judaism actually imported foreign cultures, as for instance the Greek culture in the second century before the present era up till the first century of the common era, and afterwards the Arabian culture from the eighth till the twelfth century. Greek culture, from whose combination with Judaism, Christianity sprang, brought Judaism to the brink of ruin, and deprived it of a great part of its adherents. The million of Jews who, during the first century after Christ lived in Egypt, which was then the center of Hellenistic culture, appear to have gone over to Christianity. And the intimate and friendly intercourse which prevailed later on between Jews and Mohammedans in Babylon and Spain, caused the frequent recurrence of mixed marriages and conversions to Islam. The fact that in the empire of Castile, from the year 1290 till the year 1474, the number of Jews was reduced from 850,000 to 150,000, may serve as a proof for this assertion.

It is impossible to deny the resemblance of these two periods with the process of disintegration of our own times. Only, nowadays, the beginning of this process exists in all countries, and it has the tendency of becoming universal. Formerly, these processes were only partial, confined to certain domains of culture. Modern culture, however, has broken all boundaries, and
The Manufacture and Sale of St. Einstein

has become a world culture.

In China, the Jews who in former centuries were quite numerous, have almost entirely disappeared without leaving a trace, through intermarriage with the Chinese. And finally, we have to take into consideration the ten tribes who disappeared among the foreign nations, because at that time religion had not yet become ceremonial in the same sense as it existed after the Reformation of Ezra and Nehemiah. And also to-day it is possible, that wherever religion ceases to be ceremonial, the greater part of Jewry in the diaspora will, in the near future, become absorbed among the nations in whose midst it exists.

From all these considerations it becomes clearly manifest, how significant the problem of intermarriage is to-day. An inexorable process of disintegration is in progress. Although this process of breaking up Judaism is only gradual, from individual to individual, from family to family, it is of significance on account of the principle and inevitable result that it involves. The future of the Jews is seriously menaced by economic impoverishment in the East, and by baptism and mixed marriages in the west of Europe. In addition to this, there is a decrease in the birth-rate of the latter.

The Jewish people which existed almost from the time when the history of the world began, which flourished in antiquity, which defied fire and sword in the Middle Ages, which is the only one of the nations that survived from the earliest times until to-day, whose representatives even to-day have brilliant achievements to their credit—it is just to this people that culture and the development of civilization have brought nothing but misfortune; they have estranged many of its best sons, and through political and economic anti-Semitism have slowly but surely taken away the ground from under the feet of the great masses.

It is therefore not impossible that Judaism may be disbanded in the near future—to be more precise, when the amelioration of the lot of the Jews will enable them to spread themselves still more. Are we justified in hindering these historical processes, which may mean the termination of thousandfold tribulations? Can the continued existence of a nation which is externally persecuted by fate, be of any value to us? What our sentiment says is quite clear; but what answer do we get from positive Science? Would it not be perhaps of great benefit to the development of civilization if the Jews were to assimilate with other races of high standing?

These are questions and problems which cannot be solved from our subjective point of view, but we must seek for an answer in Sociology, History and Natural Science. Which is better when considered from the general point of view, race-mixture or race-purity? The point of view which modern Science adopts towards the important questions of race-mixture and in-breeding is totally different from that which prevailed up till the last quarter of the preceding century.

Whereas it was formerly believed that in the intermarriage of two different races, the qualities of both component parts would appear in the
offspring, we know now that the question of race-mixture is by no means so simple. It is possible, but not certain, that only kindred elements could improve through crossing. On the other hand, the interbreeding of totally different nations produces a bastard type whose character is far below the level of either parent.

The observations made in countries which have a population of half-breeds, have pointed to the unfavorable effect of crossing. In India, the progress of race-crossing caused civilization to retrograde. We also know very well the wretched conditions of Central and South America, which are inhabited by half-breeds, whose cultural stagnation stands in striking contrast to the rapid and ambitious development of the United States and Canada. It is certain that the conditions in Central and South America must, to some extent, be considered as the result of race-crossing. It is true that also in North America the population arose from a blending of various nationalities. But here it was chiefly Englishmen, Frenchmen, Spaniards, Dutchmen and Germans; that is to say, nations which were closely related to one another, who were amalgamated; whereas in South America it was Spaniards, Indians, Negroes and Mongolians who formed affinities.

Colonization in newly discovered countries has always succeeded in those places where, like in North America, the conquering nations have avoided crossing. In Brazil, on the other hand, there rules an indescribable mixed type whose bodily, intellectual and moral energy is exceedingly enfeebled. The natives of South Africa have a proverb: ‘God created the white man, God created the black man, but the devil created the mulatto.’

According to the laws of Nature, the general instinctive abilities, from which depth of talent and character emanate, dwindle among half-breeds; while individual abilities often become more pronounced. Almost all observers are unanimous that through cross-breeding, bodily shapeliness, facility of talent could be gained, but resistibility of body and strength of character are impaired. Furthermore, the ability to achieve anything great and extraordinary, as well as nobility of mind are, as a rule, unknown to half-breeds. The latter characteristics form the constitutional ability, and the former the individual. The constitutional type becomes enfeebled through crossing, and the more distant the two races are, the more pronounced is this weakening.

Let us take a few examples. On the coast of Labrador there are a great number of half-breeds which are the offspring of Eskimos and Scotch immigrants. The old Scotch settlers were able to brave the adverse surroundings more easily than the new generation. At present, tuberculosis is raging there. Also the other polar nations, who have for thousands of years defied the most dreadful influences of their surroundings, are now retrogressing, after crossing found its way among them. The only exceptions are the Tunguses, who with their own culture, withstood the European settlers. The same recurrence is repeated elsewhere. Wherever the intermixture is limitless, as in Hawaii, that type which is numerically weaker,
gradually dies out without even increasing the number of half-breeds. The crossing of the Hawaiians chiefly takes place with the Chinese. Besides, those islands were exempt from war, pestilence and starvation, which are otherwise the causes of the destruction of uncivilized peoples. The Tasmanians and Australian negroes have vanished through crossing. The Eurasians at Java, who are the offspring of Europeans and Indian natives, are weaklings who are rapidly perishing. The Spanish mulattoes in the Philippines are a bastard race, doomed to destruction. The bushmen have for hundreds of years waged the battle for existence under the hardest conditions, for Hottentots and Bantus were their superior enemies. And yet it is only now, after general intermixture stepped in, that they are about to disappear.

These examples will suffice to prove that crossing is one of the principal causes of the destruction of nations, and that the interbreeding of widely different types leads to the reduction of fertility and vitality. The difference of race and character leads as also animal breeders assert, to the formation of discordant, irresolute characters. It is for this reason that all half-breeds who are the offspring of widely different races have a had repptttation in respect to character.

In history there are many examples of the impossibility for half-breeds, even when their parents did not belong to races very far from each other, to reach a state capable of developing a living culture. This impossibility is also observed in cases where each nationality in itself possessed very great ability. All investigations thus point to the ennobling influences of racial purity, and to the destructive effects of racial chaos.

One calls to mind the flourishing nations of the ancient Orient: the Indians, Persians, Egyptians and Greeks. One also compares their former creativeness and influence with those of the time when the tide of foreign nations began to overwhelm them. How brave were the old Romans, and how capable did the Germanic race that mingled with them prove to be later on; and yet how wretched was the product of this crossing! After the barbarism of the Middle Ages, it took about a millenium before men of firmly rooted greatness arose once more, and before the national character strongly and harmoniously asserted itself! How changed were the inhabitants of Greece after they absorbed the Slavonic tribes! What became of the Indians after the Arabs and Mongolians broke into their country? Each of these racial components proved itself capable of high culture, and yet the result was always a change for the worse for both parent-races. That these results were not due to historical and social conditions alone, can be seen from the case of smaller nations like the Armenians and Jews who have retained their racial purity, and have consequently preserved and increased their cultural ability despite their unhappy lot. One calls to mind the high cultural ability of the Moors and the Goths, and one considers the result of the mixture in Spain, when the Gothic population absorbed the former after the destruction of the Moorish rule. One also thinks of the racial medley of Germans, Slays and Tartars in Russia. It becomes evident from these
examples, not speaking of the single individuals, but of the greater majority, what a bad effect the mixture of races has. The normal historical development does not tend towards the effacement of race, but rather towards making the racial features more pronounced, and is thus combatting political influences. The quintessence of race is the hero, the genius.

From experiments on and observations of our domestic animals, we also learn that thoroughbred animals which possess superior characteristics, become deteriorated with respect to these very characteristics, through intermixture. The same holds good of the human races. It is now regarded as certain, that virtues and superior qualities are mostly to be found among races which have kept themselves pure, while mixed breeds usually develop the defects and vices of their parents, but none of their good sides.

There is thus no doubt that the power of heredity is more powerful among pure races. Potential cultural energy will always predominate in pure untainted races. It is only among such races that ingenious creative power as well as artistic and moral genius find a favorable home.

These are, accordingly, the answers which Science gives to-day to the above questions. Even from the cosmopolitan point of view, therefore, it would be no advantage if Judaism were to disappear through assimilation with those Slavonic nations, in whose midst the bulk of the Jews reside to-day. Such an event would be detrimental to both sides. We have to strive after race-purity, not after racial chaos. Greatness of intellect, and character in the highest degree, and genius, can only emanate from the rich source of instincts which are to be found in pure races. In order to get an exact idea of the power of instincts and the effect of heredity, we ought to bear in mind that every man, in twenty generations, is the product of more than a million forefathers, and in thirty generations he is the product of a thousand million forefathers. If all these forefathers descend from one race, this enormous sum of similar instinctive talent, and with it the strength of constitutional capacity, becomes manifest. For it is this constitutional type, as above indicated, which produces bodily resistance, depth of intellect and strength of character. And this constitutional type becomes enfeebled through crossing. Accordingly, if a nation wishes to achieve something great and powerful for itself and mankind, its policy with reference to the future must have only one aim: to force its way from racial chaos to racial purity.

We have proved by our investigations that the Jews have racial purity and that an extraordinary high racial value falls to their share. Their disappearance would not only be a national loss, but also an irretrievable loss for the general culture. But unfortunately, even at this present moment, this race is in danger of being destroyed. The conservation and further development of the distinguished possibilities that are found in this ancient race owing to its long-standing purity, are just now being questioned. For there is not so much danger to the Jew from baptism, as is usually maintained, as there is from intermarriage. In the first place, because baptism only finds its way among Jews of ignoble character, while intermarriage is
found among all classes; and secondly, because intermarriage is practiced even in countries where baptism, for one reason or another, is of rare occurrence.

In conclusion, I wish to repeat the following sentence which contains the social law appertaining to mixed marriages, and for which we have previously cited statistical proofs: Tribes which live together always intermarry when such marriages are not forbidden by law or religion. Since they have been scattered all over the globe, the Jews have mingled with other nations. Civil law to-day permits mixed marriages, and religion has actually begun to lose its authority.

In order to preserve the Jews for Judaism two remedies are possible: to preserve the Ghetto with its external and social influences, or to abolish the diaspora. The first alternative can only mean a continued morbid existence.

This is the Jewish question in a quite different sense from that in which it is usually conceived, namely, the question about the future lot of the Jewish race, which, after thousands of years of splendid development and stubborn resistance, now presents the sad picture of the body of a people which is partly perishing in misery and partly in course of decomposition.”

“26:34 And Esau was forty years old when he took to wife Judith the daughter of Beeri the Hittite, and Bashemath the daughter of Elon the Hittite: 26:35 Which were a grief of mind unto Isaac and to Rebekah. [***] 28:1 And Isaac called Jacob, and blessed him, and charged him, and said unto him, Thou shalt not take a wife of the daughters of Canaan. 28:2 Arise, go to Padan-aram, to the house of Bethuel thy mother’s father; and take thee a wife from thence of the daughters of Laban thy mother’s brother. 28:3 And God Almighty bless thee, and make thee fruitful, and multiply thee, that thou mayest be a multitude of people; 28:4 And give thee the blessing of Abraham, to thee, and to thy seed with thee; that thou mayest inherit the land
wherein thou art a stranger, which God gave unto Abraham. 28:5 And Isaac sent away Jacob: and he went to Padan-aram unto Laban, son of Bethuel the Syrian, the brother of Rebekah, Jacob’s and Esau’s mother. 28:6¶ When Esau saw that Isaac had blessed Jacob, and sent him away to Padan-aram, to take him a wife from thence; and that as he blessed him he gave him a charge, saying, Thou shalt not take a wife of the daughters of Canaan; 28:7 And that Jacob obeyed his father and his mother, and was gone to Padan-aram; 28:8 And Esau seeing that the daughters of Canaan pleased not Isaac his father; 28:9 Then went Esau unto Ishmael, and took unto the wives which he had Mahalath the daughter of Ishmael Abraham’s son, the sister of Nebajoth, to be his wife.”—Genesis 26:34-35; 28:1-9

“14 For thou shalt worship no other god: for the LORD, whose name is Jealous, is a jealous God: 15 Lest thou make a covenant with the inhabitants of the land, and they go a whoring after their gods, and do sacrifice unto their gods, and one call thee, and thou eat of his sacrifice; 16 And thou take of their daughters unto thy sons, and their daughters go a whoring after their gods, and make thy sons go a whoring after their gods.”—Exodus 34:14-16

“20:24 But I have said unto you, Ye shall inherit their land, and I will give it unto you to possess it, a land that floweth with milk and honey: I am the LORD your God, which have separated you from other people. [***] 20:26 And ye shall be holy unto me: for I the LORD am holy, and have severed you from other people, that ye should be mine. [***] 21:14 A widow, or a divorced woman, or profane, or an harlot, these shall he not take: but he shall take a virgin of his own people to wife.”—Leviticus 20:24, 26; 21:14

“This is the thing which the LORD doth command concerning the daughters of Zelophehad, saying, Let them marry to whom they think best; only to the family of the tribe of their father shall they marry. So shall not the inheritance of the children of Israel remove from tribe to tribe: for every one of the children of Israel shall keep himself to the inheritance of the tribe of his fathers.”—Numbers 36:6-7

“When the LORD thy God shall bring thee into the land whither thou goest to possess it, and hath cast out many nations before thee, the Hittites, and the Girgashites, and the Amorites, and the Canaanites, and the Perizzites, and the Hivites, and the Jebusites, seven nations greater and mightier than thou; 2 And when the LORD thy God shall deliver them before thee; thou shalt smite them, and utterly destroy them; thou shalt make no covenant with them, nor show mercy unto them: 3 Neither shalt thou make marriages with them; thy daughter thou shalt not give unto his son, nor his daughter shalt thou take unto thy son. 4 For they will turn away thy son from following me, that they may serve other gods: so will the anger of the LORD be kindled against you, and destroy thee suddenly.”—Deuteronomy 7:1-4
“12 Else if ye do in any wise go back, and cleave unto the remnant of these nations, even these that remain among you, and shall make marriages with them, and go in unto them, and they to you: 13 Know for a certainty that the LORD your God will no more drive out any of these nations from before you; but they shall be snares and traps unto you, and scourges in your sides, and thorns in your eyes, until ye perish from off this good land which the LORD your God hath given you.”—Joshua 23:12-13

“3:5 And the children of Israel dwelt among the Canaanites, Hittites, and Amorites, and Perizzites, and Hivites, and Jebusites: 3:6 And they took their daughters to be their wives, and gave their daughters to their sons, and served their gods. 3:7 And the children of Israel did evil in the sight of the LORD, and forgat the LORD their God, and served Baalim and the groves. 3:8 Therefore the anger of the LORD was hot against Israel, and he sold them into the hand of Chushan-rishathaim king of Mesopotamia: and the children of Israel served Chushan-rishathaim eight years. [***] 14:1 And Samson went down to Timnath, and saw a woman in Timnath of the daughters of the Philistines. 14:2 And he came up, and told his father and his mother, and said, I have seen a woman in Timnath of the daughters of the Philistines: now therefore get her for me to wife. 14:3 Then his father and his mother said unto him, Is there never a woman among the daughters of thy brethren, or among all my people, that thou goest to take a wife of the uncircumcised Philistines? And Samson said unto his father, Get her for me; for she pleaseth me well. 14:4 But his father and his mother knew not that it was of the LORD, that he sought an occasion against the Philistines: for at that time the Philistines had dominion over Israel.”—Judges 3:5-8; 14:1-4

“But king Solomon loved many strange women, together with the daughter of Pharaoh, women of the Moabites, Ammonites, Edomites, Zidonians, and Hittites: 2 Of the nations concerning which the LORD said unto the children of Israel, Ye shall not go in to them, neither shall they come in unto you: for surely they will turn away your heart after their gods: Solomon clave unto these in love. 3 And he had seven hundred wives, princesses, and three hundred concubines: and his wives turned away his heart. 4 For it came to pass, when Solomon was old, that his wives turned away his heart after other gods: and his heart was not perfect with the LORD his God, as was the heart of David his father. 5 For Solomon went after Ashtoreth the goddess of the Zidonians, and after Milcom the abomination of the Ammonites. 6 And Solomon did evil in the sight of the LORD, and went not fully after the LORD, as did David his father. 7 Then did Solomon build an high place for Chemosh, the abomination of Moab, in the hill that is before Jerusalem, and for Molech, the abomination of the children of Ammon. 8 And likewise did he for all his strange wives, which burnt incense and sacrificed unto their gods.”—I Kings 11:1-8
“9:1 Now when these things were done, the princes came to me, saying, The people of Israel, and the priests, and the Levites, have not separated themselves from the people of the lands, doing according to their abominations, even of the Canaanites, the Hittites, the Perizzites, the Jebusites, the Ammonites, the Moabites, the Egyptians, and the Amorites. 9:2 For they have taken of their daughters for themselves, and for their sons: so that the holy seed have mingled themselves with the people of those lands: yea, the hand of the princes and rulers hath been chief in this trespass. 9:3 And when I heard this thing, I rent my garment and my mantle, and plucked off the hair of my head and of my beard, and sat down astonied. 9:4 Then were assembled unto me every one that trembled at the words of the God of Israel, because of the transgression of those that had been carried away; and I sat astonied until the evening sacrifice. 9:5 And at the evening sacrifice I arose up from my heaviness; and having rent my garment and my mantle, I fell upon my knees, and spread out my hands unto the LORD my God. 9:6 And said, O my God, I am ashamed and blush to lift up my face to thee, my God: for our iniquities are increased over our head, and our trespass is grown up unto the heavens. 9:7 Since the days of our fathers have we been in a great trespass unto this day; and for our iniquities have we, our kings, and our priests, been delivered into the hand of the kings of the lands, to the sword, to captivity, and to a spoil, and to confusion of face, as it is this day. 9:8 And now for a little space grace hath been shewed from the LORD our God, to leave us a remnant to escape, and to give us a nail in his holy place, that our God may lighten our eyes, and give us a little reviving in our bondage. 9:9 For we were bondmen; yet our God hath not forsaken us in our bondage, but hath extended mercy unto us in the sight of the kings of Persia, to give us a reviving, to set up the house of our God, and to repair the desolations thereof, and to give us a wall in Judah and in Jerusalem. 9:10 And now, O our God, what shall we say after this? for we have forsaken thy commandments, 9:11 Which thou hast commanded by thy servants the prophets, saying, The land, unto which ye go to possess it, is an unclean land with the filthiness of the people of the lands, with their abominations, which have filled it from one end to another with their uncleanness. 9:12 Now therefore give not your daughters unto their sons, neither take their daughters unto your sons, nor seek their peace or their wealth for ever: that ye may be strong, and eat the good of the land, and leave it for an inheritance to your children for ever. 9:13 And after all that is come upon us for our evil deeds, and for our great trespass, seeing that thou our God hast punished us less than our iniquities deserve, and hast given us such deliverance as this; 9:14 Should we again break thy commandments, and join in affinity with the people of these abominations? wouldest not thou be angry with us till thou hadst consumed us, so that there should be no remnant nor escaping? 9:15 O LORD God of Israel, thou art righteous: for we remain yet escaped, as it is this day: behold, we are before thee in our trespasses: for we cannot stand before thee because of this. [***] 10:17 And they made an end with all the men that had taken
And among the sons of the priests there were found that had taken strange wives: namely, of the sons of Jeshua the son of Jozadak, and his brethren; Maaseiah, and Eliezer, and Jarib, and Gedaliah. And they gave their hands that they would put away their wives; and being guilty, they offered a ram of the flock for their trespass. 

All these had taken strange wives: and some of them had wives by whom they had children.”—Ezra 9:17-19, 44

In September of 1935, the Nazis passed the anti-miscegenation Nuremberg Laws, which proscribed intermarriage and sexual contact between “Jews” and “Aryans”. Many Zionists were delighted. Despite the fact that these laws needlessly caused many Jews great pain and suffering, the Zionists, many of them hypocrites, rejoiced in the fact that the “race” of Jews had been saved from the death of assimilation. Their religion taught them to oppose “intermarriage” and to consider Jews who intermarried as traitors against God who must be killed.

The Old Testament is filled with proscriptions against “intermarriage”. Those who fabricated the Old Testament riddled it with racist messages to frighten anyone who would marry outside of the fold, and to provide the community with a justification to murder those who elected to “intermarry”. The ills of the Jews were often blamed on “intermarriage”, which allegedly brought down God’s wrath upon them. Even Solomon the wise is said to have been ruined by “intermarriage”. While tied to religion, the real motivation behind the myths is racism. The Biblical stories tell the Jews to keep the seed of Abraham pure so that there will be a pure race of
God’s chosen to rule the world and subjugate the allegedly inferior Gentiles. In the Old Testament, God punished the Jews for “intermarriage” with death—God often instructed the Jews to murder their own people who “intermarried”. [For example, Malachi 2:12—to “cut off” means to kill.]

On 26 April 1946, Nazi propagandist Julius Streicher affirmed at the Nuremberg Trials that the Nuremberg Laws of 1935 were patterned after Jewish Law. 1829

“Yes, I believe I had a part in it insofar as for years I have written that any further mixture of German blood with Jewish blood must be avoided. I have written such articles again and again; and in my articles I have repeatedly emphasized the fact that the Jews should serve as an example to every race, for they created a racial law for themselves—the law of Moses, which says, ‘If you come into a foreign land you shall not take unto yourself foreign women.’ And that, Gentlemen, is of tremendous importance in judging the Nuremberg Laws. These laws of the Jews were taken as a model for these laws. When, after centuries, the Jewish lawgiver Ezra discovered that notwithstanding many Jews had married non-Jewish women, these marriages were dissolved. That was the beginning of Jewry which, because it introduced these racial laws, has survived throughout the centuries, while all other races and civilizations have perished.” 1830

Dr. Marx asked Julius Streicher, and note that the “1935 legislation” called for the segregation of Jews, not the extermination of the Jews, and was lauded by Zionists like Georg Kareski, 1831

“Were you of the opinion that the 1935 legislation represented the final solution of the Jewish question by the State?” 1832

Streicher responded that Zionism was the final solution of the Jewish question,

“With reservations, yes. I was convinced that if the Party program was carried out, the Jewish question would be solved. The Jews became German citizens in 1848. Their rights as citizens were taken from them by these laws. Sexual intercourse was prohibited. For me, this represented the solution of the Jewish problem in Germany. But I believed that another international solution would still be found, and that some day discussions would take place between the various states with regard to the demands made by Zionism. These demands aimed at a Jewish state.” 1833

Bernhard Lösener found common ground with the Zionists in the new Nuremberg Laws. He stated in November of 1935,

“If the Jews already had their own state in which the greater part of their people were settled, then the Jewish question could be considered completely resolved today, also for the Jews themselves. The least amount of opposition
to the underlying ideas of the Nürnbergs Laws has been raised by Zionists, because they know at once that these laws represent the only correct solution for the Jewish people as well. For each nation must have its own state as the outward form of appearance of its particular nationhood.”

The new laws did indeed meet with much applause from the political Zionists, who had for years been vocal advocates of such a policy. The political Zionists even went so far as to take credit for the Nuremberg Laws unto themselves, as if it were an honor. A. I. Berndt, an editor, published a statement of solidarity with the Nazi restrictions in the *Jüdische Rundschau* on 17 September 1935, stating, *inter alia*,

“Germany has merely drawn the practical consequences from this and is meeting the demands of the International Zionist Congress when it declares the Jews now living in Germany to be a national minority. Once the Jews have been stamped a national minority it is again possible to establish normal relations between the German Nation and Jewry. The new Laws give the Jewish minority in Germany their own cultural life, their own national life. In future they will be able to shape their own schools, their own theater, their own sports associations; in short, they can create their own future in all aspects of national life. On the other hand, it is evident that from now on and for the future there can be no interference in questions connected with the Government of the German people, that there can be no interference in the national affairs of the German Nation.”

Georg Kareski, “the Jew who has accepted office under the Nazi Government as Reich Commissioner for Jewish Cultural Affairs”, whom Lenni Brenner called a “Hitler’s Zionist Quisling before Quisling”, stated in an interview in the Nazi Party’s *Der Angriff* in late 1935, as quoted in “Georg Kareski Approves of Ghetto Laws. Interview in Dr Goebbels’ ‘Angriff’”, *The Jewish Chronicle* on 3 January 1936 on page 16,

“I have for many years regarded a complete separation between the cultural activities of the two peoples as a condition for a peaceful collaboration and I have always been in favour of such a separation, provided it is founded on the respect for the alien nationality. [***] The Nuremberg Laws of September 15th, 1935, seem to me, apart from their legal provisions, entirely to conform with this desire for a separate life based on mutual respect.”

The racist legacy of political Zionism, and of Judaism, lingers. Israeli Supreme Court Justice Haim Cohn was quoted in *The London Times* on 25 July 1963 on page 8:

“It is one of the bitterest ironies of fate that the same biological or racist approach which was propagated by the Nazis and characterized the infamous Nuremberg laws should, because of an allegedly sacrosanct Jewish tradition,
Years later, Zionist Meir Kahane sought to establish the Nuremberg-style laws in Israel. Kahane wrote on 11 May 1979,

“We will also act to end the relationships between Arab men and Jewish women that is now growing and that so desecrates the Name of G-d.”

After leading Jews announced that “Judea Declares War on Germany” in March of 1933, and instituted a boycott of German goods following Hitler’s election, there was a very short-lived boycott of Jewish businesses in Germany, on 1 April 1933. Nazis placed yellow and black emblems in the storefronts of Jewish owned shops, despite the fact that most German Jews were loyal to the Fatherland. Strangely, Robert Weltsch published an editorial in the Jüdische Rundshau, which was the official party organ of the Zionist Federation of Germany, in which he blamed assimilationist Jews for Nazism. He called on Jews to bear the medieval stigmata with pride. The resentment Weltsch expressed towards assimilationist Jews leads one to wonder if the Nazis were created in order to sponsor Zionism and eventually to punish those who would not embrace the cause after being warned of the consequences of a failure to do so—should the Jews of Europe continue to resist emigrating away from their homes after being warned. Weltsch wrote, inter alia,

“What should be recommended at this time is that the work which witnessed the infancy of Zionism, Theodor Herzl’s The Jewish State, be disseminated among Jews and non-Jews in hundreds of thousands of copies. If there is still left any feeling for greatness and nobility, gallantry and justice, then every National Socialist who looks into this book is bound to shudder at his own blind actions. Every Jew who reads it would also begin to understand and would be consoled and uplifted by it. Page after page of this booklet, which first appeared in 1896, would have to be copied to show that Theodor Herzl was the first Jew dispassionate enough to examine anti-Semitism in connection with the Jewish question. And he recognized that an improvement cannot be effected by ostrich-like behavior, but only by dealing with facts frankly and in full view of the world. . .

We Jews who have been raised in Theodor Herzl’s spirit want to ask ourselves what our own guilt is, what sins we have committed. At times of crisis throughout its history, the Jewish people has faced the question of its own guilt. Our most important prayer says, ‘We were expelled from our country because of our sins.’ Only if we are critical toward ourselves shall we be just toward others.

Jewry bears a great guilt because it failed to heed Theodor Herzl’s call and even mocked it in some instances. The Jews refused to acknowledge that ‘the Jewish question still exists.’ They thought the only important thing was not to be recognized as Jews. Today we are being reproached with having
betrayed the German people; the National Socialist press calls us the ‘enemies of the nation,’ and there is nothing we can do about it. It is not true that the Jews have betrayed Germany. If they have betrayed anything, they have betrayed themselves and Judaism.

Because the Jews did not display their Jewishness with pride, because they wanted to shirk the Jewish question, they must share the blame for the degradation of Jewry. . ."1644

Though many Jews and philo-Semites organized an international boycott of German goods in hopes of defeating the Hitler régime, there was one place where German products and services were not only welcomed, they were commissioned. In Palestine, Zionists worked in collusion with the Nazis to extort monies from Jews emigrating from Germany to Palestine and to use those funds to buy German products, thus nullifying the effect of the boycotts and stimulating Hitler’s economy with investment capital. This conspiracy to take the wealth of German Jews and use it to further persecute European Jews in the interest of forcing Jews into Palestine was called the “Ha’avara Agreement”.1845 which fulfilled Herzl’s plan for both Zionists and anti-Semites to profit from the suffering and expulsion of assimilationist Jews. Hitler, the SS and the Gestapo, being staunch Zionists, supported Ha’avara over the objections of the more authentically anti-Semitic, pro-German, members of the Nazi Party.1846 A good deal of evidence of the collaboration of Nazis and Zionists is presented in Roger Garaudy’s book Les Mythes Fondateurs de la Politique Israélienne, Samizdat, Paris, (1996); English translations: The Founding Myths of Israeli Politics, and The Mythical Foundations of Israeli Policy, Studies Forum International, London, (1997) and The Founding Myths of Modern Israel, Institute for Historical Review, Newport Beach, California, (2000).

The Zionist Federation of Germany (Zionistische Vereinigung für Deutschland, or ZVfD) welcomed Hitler and the Nazi Party as their best hope for forcing Jews into Zionism.1847 The Federation celebrated the emergence of governmental and nationalist racism in Germany. On 21 June 1933, soon after Hitler was elected, they sent a memorandum to the Nazi Government embracing and encouraging Nazism. This memorandum iterated many prevalent Zionist myths, such as the belief that the emancipation of Jews by the French Revolution caused assimilation which was destructive to the “Jewish race” and to “Gentile races”. The memorandum also anticipated the segregationist spirit of the Nuremberg Laws. The Zionist Federation of Germany’s memoranda stated, among other things,

“The emancipation of the Jews, begun at the end of the 18th, beginning of the 19th century, was based on the idea that the Jewish question could be solved by having the nation-state absorb the Jews living in its midst. This view, deriving from the ideas of the French Revolution, discerned only the individual, the single human being freely suspended in space, without regarding the ties of blood and history or spiritual distinctiveness. Accordingly, the liberal state demanded of the Jews assimilation into the non-Jewish environment. Baptism and mixed marriage were encouraged in
political and economic life. Thus it happened that innumerable persons of
Jewish origin had the chance to occupy important positions and to come
forward as representatives of German culture and German life, without
having their belonging to Jewry become visible. [***] On the foundation of
the new state, which has established the principle of race, we wish so to fit
our community into the total structure so that for us too, in the sphere
assigned to us, fruitful activity for the Fatherland is possible. We believe it
is precisely the new Germany that can, through bold resoluteness in the
handling of the Jewish question, take a decisive step toward overcoming a
problem which, in truth, will have to be dealt with by most European
peoples—including those whose foreign-policy statements today deny the
existence of any such problem in their own midst. [***] Thus, a self-
conscious Jewry here described, in whose name we speak, can find a place
in the structure of the German state, because it is inwardly unembarrassed,
free from the resentment which assimilated Jews must feel at the
determination that they belong to Jewry, to the Jewish race and past. We
believe in the possibility of an honest relationship of loyalty between a
group-conscious Jewry and the German state. [***] We are not blind to the
fact that a Jewish question exists and will continue to exist. From the
abnormal situation of the Jews severe disadvantages result for them, but also
scarce tolerable conditions for other peoples. Our observations, presented
herewith, rest on the conviction that, in solving the Jewish problem according
to its own lights, the German Government will have full understanding for
a candid and clear Jewish posture that harmonizes with the interests of the
state.”

In 1937, evidently referring to the above cited memoranda of the Zionist
Federation of Germany, Zionist Joachim Prinz recalled,

“Everyone in Germany knew that only the Zionists could responsibly
represent the Jews in dealings with the Nazi government. We all felt sure that
one day the government would arrange a round table conference with the
Jews, at which—after the riots and atrocities of the revolution had
passed—the new status of German Jewry could be considered. The
government announced very solemnly that there was no country in the world
which tried to solve the Jewish problem as seriously as did Germany.
Solution of the Jewish question? It was our Zionist dream! We never denied
the existence of the Jewish question! Dissimilation? It was our own appeal!
. . . In a statement notable for its pride and dignity, we called for a
conference.”

On 4 August 1933, the Jüdische Rundschau, the official party organ of the
Zionist Federation of Germany, published an article entitled “Rasse als Kulturfaktor”
on page 392, which stated,
“We who live here as a ‘foreign race’ have to respect racial consciousness and the racial interest of the German people absolutely. This however does not preclude a peaceful living together of people of different racial membership. The smaller the possibility of an undesirable mixture, so much less is there need for ‘racial protection’. . . There are differentiations that in the last analysis have their root in ancestry. Only rationalist newspapers who have lost feeling for the deeper reasons and profundities of the soul, and for the origins of communal consciousness, could put aside ancestry as simply in the realm of ‘natural history’.”

Heinz Höhne wrote,

“Alongside this majority [of patriotic German-Jews who did not wish to leave Germany], however, a small group of Zionist spokesmen was at work, and their object was to turn the minds of German Jewry away from their traditional German patriotism and direct them towards Palestine. Initially therefore they regarded the advent of National-Socialism as by no means a catastrophe; in their eyes it presented Zionism with a unique opportunity to fulfil its object, the return to a Jewish State and Jewish national consciousness. The rise of anti-Semitism in Germany exerted a curious fascination over the Zionists, for in it they saw the defeat of westernised Jewry which, they considered, was striving to identify itself with the non-Jewish industrialised peoples. After the Nazi seizure of power the Zionist newspaper *Jüdische Rundschau* proclaimed on a note of triumph: ‘An ideology has collapsed; we will not lament it but will think of the future.’

Many were tempted to regard 30 January 1933 as a favourable turning-point in Jewish history—‘Jewry for the Jews’ could become the watchword once more. This remark was to be found in an article entitled ‘We Jews’ written by a young Rabbi, Dr Joachim Prinz. (Hans Lamm, the historian of German Jewry under the Third Reich, described it as ‘a curious, almost apologetic, interpretation of the anti-Semitic phenomenon.’) Prinz considered that ‘there can be no further evasion of this Jewish problem; emancipation has forced the Jew to accept anonymity and deny his Jewish nationality.’ But this, he continued, had not profited the Jews at all. ‘Among those who nevertheless realised that a man was a Jew, this anonymity gave rise to the tensions generated by mistrust and the sense of contact with a foreigner.’ What solution could there be to the Jewish tragedy other than to take the road to Palestine? Prinz continued: ‘No subterfuge can save us now. In place of assimilation we desire to establish a new concept—recognition of the Jewish nation and Jewish race.’

For the Jewish nationalists the prospect was tempting; under the pressure of German racialism and with its assistance the Zionist ideal might win that victory denied it in the humanitarian and democratic atmosphere of the Weimar republic. If both the Zionists and National-Socialists regarded race and nationhood as universally valid criteria, some common ground must be
discoverable between the two. As early as 13 June 1933, the Jüdische Rundschau had come out into the open: ‘Zionism recognises the existence of a Jewish problem and desires a far-reaching and constructive solution. For this purpose Zionism wishes to obtain the assistance of all peoples, whether pro- or anti-Jewish, because in its view, we are dealing here with a concrete rather than a sentimental problem, in the solution of which all peoples are interested.’

At this point von Mildenstein stepped in. The task of the SD, he argued, was to turn the German-assimilated Jews back into ‘conscious Jews, to promote ‘dissimilation’ in order to awaken in the breasts of the largest possible number of Jews the urge to go to Palestine, the only country open at the time to large-scale Jewish immigration. Himmler seized on Mildenstein’s plan and set him to work. Within the SD Hauptamt Mildenstein set up a Jewish desk (entitled II 112); a period of SS Jewish policy began in which, according to Hans Lamm, ‘the adoption or affectation of a pro-Zionist attitude’ was in order.

The new SS policy made its first appearance in the columns of the Schwarze Korps; in place of the paper’s anti-Jewish tirades references began to appear to the ‘sensible, totally unsentimental Jew’ of the Zionist movement. The paper forecast: ‘The time cannot be far distant when Palestine will again be able to accept its sons who have been lost to it for over a thousand years. Our good wishes together with our official goodwill go with them.’

An SS officer, Baron Leopold Itz von Mildenstein traveled to Palestine and reported on his impressions in the official Nazi Party organ Der Angriff in a series of twelve articles under the heading “Ein Nazi fährt nach Palästina” from 26 September 1934 to 9 October 1934. As director of the central office of the “Jewish desk” in the intelligence branch of the SS, Mildenstein promoted the Zionist cause in Nazi Germany. His primary goal was to convert reluctant Jews to Zionism. Jacob Boas wrote,

“The gist of that policy was to assist the expansion of Zionist influence among Germany’s Jews who, despite the oppressive conditions under which they lived, still showed no great desire to emigrate to Palestine. By making a distinction between race-minded, emigration-conscious Zionists and ‘assimilationists’ out to destroy National Socialism, the S. S. strove to strengthen the Zionist position in the Jewish community. Accordingly, S. S. officials were instructed to encourage the activities of Zionists and to discourage those of non-Zionists. Zionists were given privileges denied to other groups. A police decree of March, 1935, for example, ordered officers to favour Zionist youth groups over non-Zionist ones; the former were to be allowed to don uniforms but not the latter. The S. S. also looked with favour on the Zionist vocational and agricultural training centres which groomed young Jews for a life of toil in Palestine, and access to Nazi functionaries
generally proved easier for Zionists than for assimilationists. Even the Nuremberg Laws (September 15th, 1935), which deprived Jews of their German citizenship and condemned them to pariah status, contained a special ‘Zionist’ provision: forbidden to fly the German colours, Jews were given the right to hoist their own flag, i.e. the Zionist emblem, the blue Star of David between stripes, also blue, against a white background.”

The SS issued a report in the summer of 1934 which recommended that Jewish youth be trained for the laborious task of improving Palestine for massive settlement. The report recommended that the German Government sponsor Zionism and persuade German-Jewish leadership to promote the Zionist cause. Should this fail, other measures would have to be taken. On 26 September 1935, Das Schwarze Korps, the official organ of the Schutzstaffeln (SS), reported,

“In the context of its Weltanschauung, National Socialism has no intention of attacking the Jewish people in any way. On the contrary, the recognition of Jewry as a racial community based on blood, and not as a religious one, leads the German government to guarantee the racial separateness of this community without any limitations. The government finds itself in complete agreement with the great spiritual movement within Jewry itself, the so-called Zionism, with its recognition of the solidarity of Jewry throughout the world and the rejection of all assimilationist ideas. On this basis, Germany undertakes measures that will surely play a significant role in the future in the handling of the Jewish problem around the world.”

This statement relates to the fact that the Zionists had reacted negatively to Moses Mendelssohn’s reforms of Judaism to make it a universal spiritual religion, as opposed to the racist and nationalistic religion found in the Old Testament. Zionists like Moses Hess asserted in consort with anti-Semites, that Judaism is not a religion, but a race and a nation, and that Jews produced their religion as a product of their unique racial characteristics. In 1862, racist Zionist Moses Hess called the “new Jew” a traitor to the “Jewish race”,

“The most touching point about these Hebrew prayers is, that they are really an expression of the collective Jewish spirit; they do not plead for the individual, but for the entire Jewish race. The pious Jew is above all a Jewish patriot. The ‘new’ Jew, who denies the existence of the Jewish nationality, is not only a deserter in the religious sense, but is also a traitor to his people, his race and even to his family. If it were true that Jewish emancipation in exile is incompatible with Jewish nationality, then it were the duty of the Jews to sacrifice the former for the sake of the latter. This point, however, may need a more elaborate explanation, but that the Jew must be above all a Jewish patriot, needs no proof to those who have received a Jewish education. Jewish patriotism is not a cloudy Germanic abstraction, which dissolves itself in discussions about being and appearance, realism and
idealism, but a true, natural feeling, the tangibility and simplicity of which require no demonstration, nor can it be disposed of by a demonstration to the contrary."

In Hess’ view, better the Ghetto and persecution than emancipation, if emancipation meant assimilation. Hess asserted that a “race war” was needed to subjugate the German People to submit to Hess’ racist Zionist ideology,

“The democrats of 1848 undoubtedly fully demonstrated their superiority over the demagogues of the ‘War of Liberation,’ the Romantic lads of the Jahn and Arndt type, whom they left far behind on the road of progress. And yet, on the basis of my long experience, I feel inclined to assert that Germany as a whole, in spite of its collective intellectuality, is in its practical social life far behind the rest of the civilized nations of Europe. The race war must first be fought out and definitely settled before social and humane ideas become part and parcel of the German people, as was the case with the Romance peoples which, after a long historical process, finally defeated race antagonism.”

Hess described Judaism as a national cult and argued that the essence of Judaism is national, and that pure Judaism, which balances spiritualism with materialism, would supplant the spiritual extremism of the Christian Judaic cult, which Hess alleged was out of balance and therefore unstable. Hess believed that things evolve in three stages and that the modern age is the Messianic Age, begun by Spinoza and the French Revolution. Hess adopted the racism of Judaism and of German Folkish mythology and expressed his beliefs that there are various races which each serve their function in the human organism led by Jews, allegedly the true People of God. He wanted to kill off the “German race”—eliminate Esau—with “Jewish love” in this third era of human history, so that the Jews can lead the world into a Utopia dominated by the “Jewish race”, as prophesied in the Hebrew Bible,

“The laws of universal history, I mean the history of the universe, namely, those of the cosmic, organic and social life, are as yet little known. We have particular sciences, but not a science of the universe; we still do not know the unity of all life. One thing, however, is certain, that a fusion of cults, an ideal to which so many aspire, and which was realized, at least in part, for thousands of years by Catholic Rome, will as little establish a lasting peace in human society as the philanthropic but unscientific belief in the absolute equality of men. In their attempt to base the granting of equal rights to all men on the primitive uniformity of all races and types, the humanitarians confound the organization of social life on the basis of solidarity, which is the result of a long and painful process of historical development, with a ready-made, inorganic equality and uniformity, which becomes rarer and rarer the farther back we go in history. The reconciliation of races follows its own natural laws, which we can neither arbitrarily create
nor change. As to the fusion of cults, it is really a past stage in the development of social life. It was the watchword of that religion which, owes its existence to the death of the nations of antiquity, i.e., Christianity. To-day the real problem is how free the various oppressed races and folk-types and allow them to develop in their own way. The dangerous possibility that the various nationalities will separate themselves entirely from each other or ignore each other is to be feared as little as the danger that they will fight among themselves and enslave one another.

The present-day national movement not only does not exclude humanitarianism, but strongly asserts it; for this movement is a wholesome reaction, not against humanism, but against the things that would encroach upon it and cause its degeneration, against the leveling tendencies of modern industry and civilization which threaten to deaden every original organic life-force, by introducing a uniform inorganic mechanism. As long as these tendencies were directed against the antiquated institutions of a long-passed historical period, their existence was justified. Nor can this nationalistic reaction object to them, insofar as they endeavor to establish closer relations between the various nations of the world. But, fortunately, people have gone so far in life, as well as in science, as to deny the typical and the creative; and as a result the vapor of idealism, on the one hand, and the dust of atomism on the other, rest like mildew on the red corn, and stifle the germinating life in the bud. It is against these encroachments on the most sacred principles of creative life that the national tendencies of our time react, and it is against these destructive forces that I appeal to the original national power of Judaism.

Like the general universal cosmic life which finds its termination in it, and the individual microcosmic life in which all the buds and fruits of the spirit finally ripen. Humanity is a living organism, of which races and peoples are the members. In every organism changes are continually going on. Some, quite prominent in the embryonic stage, disappear in the later development. There are organs, on the other hand, hardly noticeable in the earlier existence of the organism, which become important only when the organism reaches the end of its development.

To the latter class of members of organic humanity (which class is really the creative one) belongs the Jewish people. This people was hardly noticeable in the world, where it was greatly oppressed by its powerful, conquering neighbors. Twice it came near being destroyed; namely, in the Egyptian and Babylonian captivities; and twice it rose to new spiritual life and fought long and successfully against the mightiest as well as the most civilized peoples of antiquity—the Greeks and the Romans. Finally, in the last struggle of the ancient world, it was this people which fertilized the genius of humanity with its own spirit, so as to rejuvenate itself, along with the regeneration of humanity. To-day, when the process of rejuvenation of the historical peoples is ended and each nation has its special function in the organism of humanity, we are for the first time beginning to conceive the
special significance of the various organs of humanity.

England, with its industrial organization, represents the nerve-force of humanity which directs and regulates the alimentary system of mankind; France, that of general motion, namely, the social; Germany discharges the function of thinking; and America represents the general regenerating power by means of which all elements if the historical peoples will be assimilated into one. We observe that every modern people, every part of modern society, displays in its activity as an organ of humanity a special calling, then he must also determine the importance and function of the only ancient people which still exists to-day, as strong and vigorous as it was in days of old, namely, the people of Israel.

In the organism of humanity there are no two peoples which attract and repel each other more than the Germans and the Jews; just as there are no two mental attitudes which are simultaneously akin to each other and still diametrically opposed, as the scientific-philosophical and the religious-moral. Religion, in its higher form, is the spiritual tie which binds the creature to the Creator, the infinite thread, the end of which returns to its source, the bridge which leads from one creation to the other, from life to death, and from death back to life. It not only brings man to know the Absolute more intimately, but it inspires and sanctifies his whole life with the divine spirit. In religion, as in love, especially in a religion like Judaism, which is neither one-sidedly materialistic nor one-sidedly spiritualistic, body and spirit merge into one another. The greatest and most dangerous enemy of the Jewish religion in antiquity was the religion of gross sensualist, the material love of the Semites, namely, Baal worship. In mediaeval ages, the enemy was represented by the embodiment of spiritualistic love—Christianity. The Jewish people which, thanks to its prophets of antiquity and rabbis of the Middle Ages, kept its religion from both extremes of degeneration, was, and is still to-day that organ of humanity which expresses the living, creative force in universal history, namely, the organ of unifying and sanctifying love. This organ is akin to the organ of thought, but is, at the same time, opposed to it. Both draw their force from the inexhaustible well of life. But, while the religious genius individualizes the infinite, philosophic, scientific thought abstracts from life all its individual, subjective forms and generalizes it. Objective philosophy and science have no direct connection with life; religious teaching is intimately united with it, for either religion is identical with the national, social and moral life, or it is mere hypocrisy.

I have wandered from my trend of thought. I merely wanted to explain to you why I do not ally myself with the humanitarian aspirations which endeavor to obliterate all differentiation in the organism of humanity and in the name of such catch words as ‘Liberty’ and ‘Progress,’ build altars to arbitrariness and ignorance, on which our light-minded youth offers its best energies and sacrifices.’
Die Geheime Staatspolizei (the Gestapo) also assisted the Zionists, as Zionist leader Hans Friedenthal noted,

“The Gestapo did everything in those days to promote emigration, particularly to Palestine. We often received their help when we required anything from other authorities regarding preparations for emigration. This position remained constant and uniform the entire time, until the year 1938.”

In April of 1936, Zionist Meyer Steinglass quoted Zionist Emil Ludwig in the American Jewish Times,

“‘Hitler will be forgotten in a few years, but he will have a beautiful monument in Palestine. You know’, and here the biographer-historian seemed to assume the role of a patriarchal Jew—‘the coming of the Nazis was rather a welcome thing. So many of our German Jews were hovering between two coasts; so many of them were riding the treacherous current between the Scylla of assimilation and the Charybdis of a nodding acquaintance with Jewish things. Thousands who seemed to be completely lost to Judaism were brought back to the fold by Hitler, and for that I am personally very grateful to him.”

In 1937, it was becoming increasingly clear to both the Nazis and the Zionists that the mere existence of the Nazi regime was not enough to drive Jews into Zionism, and that even if it were, Great Britain and other nations had placed too many obstacles in the way of a massive migration to Palestine for Zionism to succeed. The Ha’avara Agreement was a failure. The British had long wanted Palestine for a route to India and later to oil, ironically thoughts which were implanted into the British mind by opportunistic Jewish Zionists. Many of the German Jews who had fled to Palestine quickly became disenchanted with the desert and returned to Germany. The Nazis soon began to target Jews, especially healthy rich assimilated male Jews, for arrest and imprisonment in concentration camps. It was inexplicable act of self-destruction for the Germans headed by two Jews, Reinhard Heydrich and Adolf Eichmann.

Theodor Herzl had long ago warned rich assimilated Jews that if they did not follow the political Zionists, there would be dire consequences for them. Herzl wrote in his book The Jewish State,

“The Governments of all countries scourged by Anti-Semitism will serve their own interests in assisting us to obtain the sovereignty we want. [***] Great exertions will not be necessary to spur on the movement. Anti-Semites provide the requisite impetus. They need only do what they did before, and then they will create a love of emigration where it did not previously exist, and strengthen it where it existed before. [***] I imagine that Governments will, either voluntarily or under pressure from the Anti-Semites, pay certain
In the early 1940’s, the Zionists had drawn the inhuman conclusion that since all other avenues had been tried and had failed, the only avenue for success for their tyrannical vision was the literal destruction of assimilatory Jewry. The Zionists had always exhibited an ungodly hubris and believed that they had the God given right to decide for all Jews and for all the world how each individual Jew must act and think. The Zionists’ dogma was similar in this respect to the dogmatic insistence of the Marxists that they had a right to ruin the lives of the peoples the world over in order to promote the destruction of Capitalism and set the stage for their Communist world revolution. Marxists, too, believed that they knew better than each individual how that individual must think and how he or she must act. Many Zionists and Marxists believed that those who dared disagree with their “truths” must be rescued from themselves, by death if necessary—or even just convenient—to them life and liberty are cheap and comradeship means blind obedience—ultimately blind obedience to genocidal Jewish bankers seeking to create the “Jewish Utopia” of the “end times” of Jewish Messianic myth. Knowing what was soon to come, knowing the Zionist Nazis were about to turn up the heat on European Jews, some Zionists began to pull away from their public expressions of unity with the Nazis in the late 1930’s, while working with Nazi authorities behind the scenes to annihilate the assimilatory and Orthodox anti-Zionist Jewry of Europe.

Zionist leader Feivel Polkes met with several high-ranking Nazi officials in Berlin in 1937, including Adolf Eichmann. The Zionists invited Adolf Eichmann and Herbert Hagen to Palestine to discuss how to purge Europe of Jews and ensure that they ended up in Palestine, so that the Jews could change the demographics of the region and take Palestine from the majority Moslem population. Eichmann and Hagen accepted the invitation and traveled to Palestine under the pretense that they were editors of the Berliner Tageblatt. After being refused permission to enter Palestine by the British authorities, they met with Polkes in Egypt, where Zionist Polkes commended the Zionist Nazis for persecuting the Jews. This was recorded in Eichmann and Hagen’s reports on the meetings,

“Nationalist Jewish circles expressed their great joy over the radical German policy towards the Jews, as this policy would increase the Jewish population in Palestine, so that one can reckon with a Jewish majority in Palestine over the arabs in the foreseeable future.”

In 1938, Albert Einstein stated in his essay “Our Debt to Zionism”,

“Rarely since the conquest of Jerusalem by Titus has the Jewish community experienced a period of greater oppression than prevails at the present time. [**] Yet we shall survive this period too, no matter how much sorrow, no matter how heavy a loss in life it may bring. A community like ours, which is a community purely by reason of tradition, can only be strengthened by...
pressure from without.”

The Zionists proposed a military alliance with the Nazis. The Zionists asked to facilitate the Nazis’ “new order in Europe” with a fascistic totalitarian Zionist state in Palestine. Klaus Polkehn wrote,

“All that was on offer was no more and no less than the establishment of a fascist Jewish state in Palestine as an ally of German fascism!”
8 HOW THE JEWS MADE THE BRITISH INTO ZIONISTS

The Biblical story of Esau and Jacob teaches the Jews that Gentiles will soldier and slave for the Jews. The Bible also prophesied that the Jews would be dispersed unto the ends of the Earth. Cabalistic Jewish racists believed that Jews must dwell in England in order for the Messianic Era to commence. The Jews gained great power in England and even managed to convince the British that they, the British, were of Jewish descent, and that British Royalty descended from the Messianic line of King David. Zionist Jews used Great Britain to ruin the Turkish Empire, which ruled over Palestine for many centuries. More than a million British have died while killing off millions more Germans, Italians, Turks, Japanese and Iraqis on behalf of the Zionist cause.

“Let their table become a snare before them: and that which should have been for their welfare, let it become a trap.”—PSALM 69:22

¶7 And the children of Israel were fruitful, and increased abundantly, and multiplied, and waxed exceeding mighty; and the land was filled with them. 8 Now there arose a new king over Egypt, which knew not Joseph. 9 And he said unto his people, Behold, the people of the children of Israel are more and mightier than we: 10 Come on, let us deal wisely with them; lest they multiply, and it come to pass, that, when there falleth out any war, they join also unto our enemies, and fight against us, and so get them up out of the land. 11 Therefore they did set over them taskmasters to afflict them with their burdens. And they built for Pharaoh treasure cities, Pithom and Raamses. 12 But the more they afflicted them, the more they multiplied and grew. And they were grieved because of the children of Israel.”—EXODUS 1:7-12

8.1 Introduction

The Old Testament’s solution to the Jewish question was two-fold. If the Jews obeyed God and remained segregated, God would give them the land from the Nile to the Euphrates. Note that the Jews were not the original inhabitants of the land and that they promised it to themselves. If the Jews did not obey God and assimilated into the Gentile world, they would be laid to waste in the lands in which they dwelt, and the righteous remnant—the most racist Jews—would steal the Promised Land from its original inhabitants. Note that racist Jews created this religious mythology and only racist Jews feel obliged to fulfill it.
8.2 The Rothschilds and Disraeli Lead the British Down the Garden Path to Palestine

Jewish British Prime Minister Benjamin Disraeli illegally purchased shares in the Suez with a check written on the Bank of Rothschild. In 1875, Lionel Rothschild advanced Disraeli £4,000,000.1864 The Rothschilds profited from the purchase with a commission on the huge sum and by its interest—as well as with speculation in the money, stock and commodities markets—Egyptian cotton was quite valuable.

The purchase accomplished little for England, but much for the Zionists. It tied England to the region and gave the Zionists an opportunity to persuade the British that they had an incentive to sponsor a “Jewish State” in Palestine in order to protect the illegal investment to which the Jewish racist Zionist Prime Minister of England Benjamin Disraeli had committed England in 1875. It also provoked hostility between England and Russia, and Zionists had long wished to destroy the Russian Empire. Not coincidentally, both the Egyptian Khedive and the Sultan of Turkey were on the verge of bankruptcy when approached by the Zionists for the purchases of the Suez Canal and Palestine—bankruptcy brought on by the Rothschilds, who wanted to secure their loans with Palestine. International finance coupled with bad advice given to a sovereign can easily drive a nation into bankruptcy. What is worse, many a corrupt sovereign were covertly agents of the Jewish financiers.

The Rothschilds profiteered from Disraeli’s purchase of shares in the Suez Canal and they were accused of it. Disraeli defended the Rothschilds by arguing that there had been “stock-jobbing” at Waterloo, but that the Rothschilds were honorable and would not do such a thing. In a rather obvious non sequitur, Disraeli argued that since the British victory at Waterloo was beneficial to the British Nation and was accompanied by stock-jobbing, stock-jobbing must be good for the British Nation, or at least a necessary consequence of positive events. Everyone knew that the Rothschilds had robbed the British People after the Battle of Waterloo. Disraeli’s argument obviously fails, because the British could have won the Battle of Waterloo without the Rothschilds having exploiting the event with lies to steal from their fellow countrymen. However, Disraeli was able to insult the intelligence of the Gentile members of the British Government with impunity, because the Rothschilds had the financial might to shut down the British Empire at any time.

Disraeli purchased the shares without lawful authority and had his friend Lionel Rothschild secure the check, earning the Rothschilds an enormous commission and enabling them to corruptly profit from the purchase on the stock markets with “inside information”, as they had earlier done by lying about the outcome of the Battle of Waterloo. Disraeli protested with sophistries, knowing that the Rothschilds could break the Bank of England, if it came to it,

‘Sir, although, according to the noble Lord, we are going to give a unanimous vote, it cannot be denied that the discussion of this evening at least has proved one result. It has shown, in a manner about which neither the House of Commons nor the country can make any mistake, that had the right honourable Gentleman the Member for Greenwich been the Prime Minister
of this country, the shares in the Suez Canal would not have been purchased.

. . . . . The right honourable Gentleman defies me to produce an instance of a Ministry negotiating with a private firm. . . . . . The right honourable Gentleman found great fault with the amount of the commission which has been charged by the Messrs. Rothschild and admitted by the Government; and, indeed, both the right honourable Gentlemen opposite took the pains to calculate what was the amount of interest which it was proposed the Messrs. Rothschild should receive on account of their advance. It is, according to both right honourable Gentlemen, 15 per cent; but I must express my surprise that two right honourable Gentlemen, both of whom have filled the office of Chancellor of the Exchequer, and one of whom has been at the head of the Treasury, should have shown by their observations such a lamentable want of acquaintance with the manner in which large amounts of capital are commanded when the Government of a country may desire to possess them under the circumstances under which we appealed to the House in question. I deny altogether that the commission charged by the Messrs. Rothschild has anything to do with the interest on the advance; nor can I suppose that two right honourable Gentlemen so well acquainted with finance as the Member for Greenwich and the Member for the University of London can really believe that there is in this country anyone who has £4,000,000 lying idle at his bankers. Yet one would suppose, from the argument of the right honourable Gentleman the Member for Greenwich, that such is the assumption on which he has formed his opinion in this matter. In the present instance, I may observe, not only the possibility, but the probability, of our having immediately to advance the whole £4,000,000 was anticipated. And how was this £4,000,000 to be obtained? Only by the rapid conversion of securities to the same amount. Well, I need not tell anyone who is at all acquainted with such affairs that the rapid conversion of securities to the amount of £4,000,000 can never be effected without loss, and sometimes considerable loss; and it is to guard against risk of that kind that a commission is asked for before advances are made to a Government. In this case, too, it was more than probable that, after paying the first £1,000,000 following the signature of the contract, £2,000,000 further might be demanded in gold the next day. Fortunately for the Messrs. Rothschild they were not; but, if they had, there would in all likelihood have been a great disturbance in the Money Market, which must have occasioned a great sacrifice, perhaps the whole of the commission. The Committee, therefore, must not be led away by the observations of the two right honourable Gentlemen, who, of all men in the House, ought to be the last to make them.

But the right honourable Gentleman the Member for Greenwich says we ought to have gone to our constitutional financiers and advisers, the Governor and Deputy Governor of the Bank of England, and, of course, the honourable Member for Galway (Mr. Mitchell Henry), who rose much later in the debate, and who spoke evidently under the influence of strong feeling, also says that we ought to have asked the Governor of the Bank of England
to advance the £4,000,000. But they forget that it is against the law of this country for the Bank to advance a sum of money to the Ministry.

But then it may be said—‘Though the Bank could not have advanced the £4,000,000, you might have asked them to purchase the shares.’ But how could they have purchased the shares? They must have first consulted their legal adviser, who probably would have told them that they had not power to do it; but, even if that doubtful question had been decided in the affirmative, they must have then called a public Court in order to see whether they could be authorized to purchase those shares to assist the Government. Now, I ask the Committee to consider for a moment what chance would we have had of effecting the purchase which we made under the circumstances, and with the competitors we had to encounter, and the objects we had to attain, if we had pursued the course which the right honourable Gentleman opposite has suggested? ‘But,’ says the Member for the University of London—and this also has been echoed by his late right honourable Colleague—‘you would have avoided all this, if you adopted the course which we indicate, and which I have just reminded the Committee is illegal, if you had only taken the illegal course we recommend, you would have got rid of this discreditable gambling, because although the Messrs. Rothschild, some of whom have been Members of this House, are men of honour, yet they have a great number of clerks who are all gambling on the Stock Exchange.’ Now, my belief is that the Messrs. Rothschild kept the secret as well as Her Majesty’s Government, for I do not think a single human being connected with them knew anything about it. And, indeed, it was quite unnecessary for the Messrs. Rothschild to have violated the confidence which we reposed in them, and quite unnecessary even for the Members of Her Majesty’s Government to hold their tongues, for no sooner was the proposal accepted than a telegram from Grand Cairo transmitted the news to the Stock Exchange, and it was that telegram which was the cause of all the speculation and gambling to which the right honourable Gentleman has referred. It is a fact that while the matter was a dead secret in England, the news was transmitted from Cairo. That was the intelligence on which the operations occurred. But I wish to say one word respecting the moral observations which have been made. As to gambling on the Stock Exchange, are we really to refrain from doing that which we think is proper and advantageous to the country because it may lead to speculation? Why, not a remark was made by the noble Lord, who has just addressed the House, the other night, or by me in reply, that would not affect the funds. On the one side people would say—‘The Government are in great difficulty, and probably a Vote of Censure will arise out of this Suez Canal speculation,’ while other persons would observe—‘There is evidently something coming about Egypt, and he is not going to let it all out.’ Ought we to refrain from doing what is necessary for the public welfare because it leads to stock-jobbing? Why, there is not an incident in the history of the world that led to so much stock-jobbing as the battle of Waterloo, and are we to regret that
that glorious battle was fought and won because it led to stock-jobbing? So much for the operations on the Stock Exchange. I think we have been listening all night to remarks on this transaction that have very little foundation. We have been admonished for conduct which has led to stock-jobbing and we have been admonished because we applied to a private firm when from the state of the law, I have shown that it was absolutely necessary from the character of the circumstances we had to deal with that a private firm should be appealed to.**

Disraeli continues in his speech to attempt to justify the purchase of the Suez as if it were England’s only hope for securing trade with India and China. Disraeli’s hidden plan was to cajole England into the misguided and self-defeating belief that her destiny lay in the hands of the Jews, who Disraeli and his fellow Zionists planned would come to occupy Palestine and regulate trade between the continents. In the Zionists’ chimera, England was a helpless child without means, who required the Jews to rescue her. The disingenuous nature of this fallacy is revealed by the fact the Zionists had made precisely the same pitch to the French some ten years prior.

It was far wiser for England, for her own sake, to make alliances with Turkey, Egypt and Russia and improve their economies, than to drive Egypt, Turkey and Russia towards bankruptcy and war with England for the benefit of the Jews, as the Zionists were attempting to do. It was only by manipulating public opinion with lies, that the Zionists were able to vilify the Moslems and drive a wedge between Christians and Islam, despite the fact that Moslems and Jews had lived together for centuries in peace and prosperity. The British would have been far better off allying themselves with the Moslems and suppressing Jewish racism, than alienating and antagonizing the Moslems by creating a racist “Jewish State” in the heart of the Moslem world.

Many crypto-Jewish English Zionists sought to convert Christians to Judaism by asking the Jews to “convert” to Christianity in order to subvert it. They asked Jews to convert to Christianity in order to make the Christians common allies with the Jews against Islam. Zionists feared that if Jewish finance, or a common collection taken from the Jews, were to simply buy Palestine from the Turks, without the appearance of the Jewish Messiah to lead them into Palestine; then Christians would join forces with Islam to crush the Jews, as prophesied in the apocalyptic visions of both the Old and the New Testaments, and in the Koran. Many Gentiles in England realized these facts and sought alliances with Egypt, Turkey and Russia.

A quite similar situation exists today, where it would have been in the interests of England and America to have given Russia greatly more financial aid after the fall of the Soviet Union than they did, and to have joined forces with, and improved the lot of, Turkey, Lebanon, Syria, Jordan, Egypt, Iraq, Iran, etc. against Israel, in order to facilitate international trade through the Middle East and Russia. Instead, due in no small part to the corrupting influences of Zionism on public opinion, the Zionists have made Christianity and Judaism the unnatural common enemy of Islam, and Islam the unnatural enemy of an alliance of Judaism and Christianity—to the detriment of Christendom, Islam, Judaism, and the rest of humanity.
The Zionists have successfully blinded Americans and Jews around the world to their own best interests. If the Moslems had played the game by the same rules as the Zionists and sponsored the formation of a political party in America with the agenda of removing Zionists from the Middle East, allying America with the Moslem world to promote trade with India, China and Russia, and working with Russia to flood it with investment capital, while increasing trade with Pakistan, many of the world’s problems would be lessened. Instead, the Zionists are leading America into alienation from Russia, China, Pakistan and the Moslem world; which increases world poverty, world-wide instability, and the likelihood of another—though even more disastrous—world war. Six and one half billion people face world war, death and absolute destruction for the sake of about five million obscenely selfish Zionists living in Israel, who stole the Palestinians’ land on the racist premise that their religion is a nationalistic religion and that their Jewish God had promised the land to them thousands of years ago. (Note that Jews have long suffered from the superstition that they ought not to count their own, and it is sometimes difficult to know how many Jews have lived at any given time in any given place, see: Exodus 30:12. II Samuel 24. I Chronicles 21. Hoshea 2:1. Yoma 22b. Rashi on Exodus 30:11-12. In addition, there are many crypto-Jews throughout the world, who go uncounted as Jews.)

For centuries prior to forming a state, Jewish Zionists incited violence and world war. Subsequent to forming the State of Israel, they have endlessly incited violence and desire another world war.

If the Arabs had invested their oil-monies in advanced education and American media outlets, instead of palaces, limousines and other unproductive ends, they could have helped to form public opinion in America with the facts and turned it against the inhuman Jewish Zionists, who have artificially created a religious war between Christians and Moslems. Jews took Palestine without a Messiah; which in Christianity means that these Jewish Zionists, who reject Christ, are in league with the “anti-Christ” and must be annihilated. Whereas it would be in the mutual best interests of both Christians and Moslems to join forces to defeat racist Jewish Zionism, racist warmongering Jews have turned Christianity against the Christians and made the Christians the artificial enemies of the Moslems. Instead of presenting the American public with a fair analysis of the facts, the media in America is led by tribal racist Jews who defame all Moslems in the American media as if genetically inferior terrorists, who are inherently prone to war, and in consort with the devil. Jews had done the same thing to the Catholics and Protestants, when they fomented the Kulturkampf.

The Zionists believed it was in their interests to destroy Catholicism (truly all of Christianity) and the Turkish Empire. They had initially hoped that the French Revolution would accomplish both these ends—as is revealed in the eleventh and twelfth “letters” in Hess’ Rome and Jerusalem of 1862. Napoleon came close to achieving their ends. Since the Jewish People would not go to Palestine, the Zionists promoted the idea that the purchase of the Suez Canal would benefit France or England, in an attempt to draw the French, or the British, into the region as a means of creating a European commitment to the region that would provide security for the
establishment of Jewish colonies. The Jews sold this plan to the French and British public on the false premise that Jews in the region would provide security for French and English interests—the Zionists created a problem where one did not exist, in order to offer themselves as its solution, which they were not.

Only after the Zionist effort to coax the French into purchasing the Suez failed, did the Zionists turn to Disraeli, who deceived England in the 1870's with the same self-defeating mythologies that had been tried upon the French in the 1860's—and yet earlier with Napoleon Bonaparte.

In the 1840's Christian Zionist agents of the Rothschilds had already promoted the myth that a Jewish state in Palestine would benefit England and Christendom. The Zionists’ plans eventually resulted the First and Second World Wars, where both England and France were pitted against Germany and Turkey. Racist Jewish Zionist Moses Hess published a book entitled Rome and Jerusalem in 1862, which was a direct precursor to Adolf Hitler’s Mein Kampf. Note the tone of the Kulturkampf and the attacks on the Ottoman Turks from the racist Zionists. Note further that Hess discredits Christianity, the alleged divinity of Jesus and claims that Jesus hated Gentiles by quoting extensively from the Jewish historian Graetz in the Epilogue, Part 2, “Christ and Spinoza” [pages 186-211 in the 1943 edition of Hess’ Rome and Jerusalem] though the later attacks in the Kulturkampf were more openly vitriolic, the goal was consistently to tear down Christianity and Islam in order to make way for the Jews in Palestine—a goal often iterated in the Talmudic and Cabalistic writings. Hess wrote,

“What we have to do at present for the regeneration of the Jewish nation is, first, to keep alive the hope of the political rebirth of our people, and next, to reawaken that hope where it slumbers. When political conditions in the Orient shape themselves so as to permit the organization of a beginning of the restoration of a Jewish State, this beginning will express itself in the founding of Jewish colonies in the land of their ancestors, to which enterprise France will undoubtedly lend a hand. You know how substantial was the share of the Jews in the subscriptions to the fund raised for the benefit of the Syrian war victims. It was Cremieux who took the initiative in the matter, the same Cremieux who twenty years ago traveled with Sir Moses Montefiore to Syria in order to seek protection for the Jews against the persecutions of the Christians. In the Journal des Debats, which very seldom accepts poems for publication, there appeared, at the time of the Syrian expedition, a poem by Leon Halevi, who at the time, perhaps, thought as little of the rebirth of Israel as Cremieux, yet his beautiful stanzas could not have been produced otherwise than in a spirit of foreseeing this regeneration. When the poet of the Schwalben mournfully complains:

Where tarries the hero? Where tarries the wise?
Who will, O my people, revive you anew;
Who will save you, and give you again
A place in the sun?
The French poet answers his query with enthusiastic confidence:

Ye shall be reborn, ye fearsome cities!
A breath of security will always hover
O’er your banks where our colors have fluttered!
Come again a call supreme!
Au revoir is not adieu—
France is all to those she loves,
The future belongs to God.

Alexander Weill sang about the same time:

There is a people stiff of neck,
Dispersed from the Euphrates to the Rhine,
Its whole life centered in a Book
Oft times bent, yet ever straightened;
Braving hatred and contempt,
It only dies to live again
In nobler form.

France, beloved friend, is the savior who will restore our people to its place in universal history.

Allow me to recall to your mind an old legend which you have probably heard in your younger days. It runs as follows:

‘A knight [Esau] who went to the Holy Land to assist in the liberation of Jerusalem, left behind him a very dear friend. While the knight fought valiantly on the field of battle, his friend spent his time, as heretofore, in the study of the Talmud, for his friend was none other than a pious rabbi [Jacob].

‘Months afterward, when the knight returned home, he appeared suddenly at midnight, in the study room of the rabbi, whom he found, as usual, absorbed in his Talmud. ‘God’s greetings to you, dear old friend,’ he said. ‘I have returned from the Holy Land and bring you from there a pledge of our friendship. What I gained by my sword, you are striving to obtain with your spirit our ways lead to the same goal.’ While thus speaking, the knight handed the rabbi a rose of Jericho.

‘The rabbi took the rose and moistened it with his tears, and immediately the withered rose began to bloom again in its full glory and splendor. And the rabbi said to the knight: ‘Do not wonder, my friend that the withered rose bloomed again in my hands. The rose possesses the same characteristics as our people: it comes to life again at the touch of the warm breath of love, in spite of its having been torn from its own soil and left to wither in foreign lands. So will Israel bloom again in youthful splendor; and the spark, at present smoldering under the ashes, will burst once more into a bright flame.’

The routes of the rabbi and the knight dear friend, are meeting to-day. As
the rabbi in the story symbolizes our people, so does the knight of the legend signify the French people which in our days, as in the Middle Ages, sent its brave soldiers to Syria and ‘prepared in the desert the way of the Lord.’

Have you never read the words of the Prophet Isaiah: ‘Comfort ye, comfort ye, my people, saith your God. Speak ye comfortably to the heart of Jerusalem, and cry unto her, that the appointed time has come, that her iniquity is pardoned; for she hath received at the Lord’s hand double for all her sins. The voice of one that crieth in the wilderness; prepare ye the way of the Lord, make straight in the desert a highway for our God. Every valley shall be exalted, and every mountain and hill shall be made low, and the crooked shall be made a straight place, and the rough places a plain. And the glory of the Lord shall be revealed, and all flesh shall see it together: for the mouth of the Lord hath spoken it.’[Footnote: Isaiah xl, 1-5.]

Do you not believe that in these words, with which the second Isaiah opened his prophecies, as well as in words with which the Prophet Obadiah closed his prophecy,[Footnote: ‘And saviors shall come up on Mount Zion to judge the mount of Esau; and the kingdom shall be the Lord’s.’] the conditions of our own time are graphically pictured? Was not help given to Zion in order to defend and establish the wild mountaineers there? Are not things being prepared there and roads leveled, and is not the road of civilization being built in the desert in the form of the Suez Canal works and the railroad which will connect Asia and Europe? They are not thinking at present of the restoration of our people. But you know the proverb, ‘Man proposes and God disposes.’ Just as in the West they once searched for a road to India, and incidentally discovered a new world, so will our lost fatherland be rediscovered on the road to India and China that is now being built in the Orient. Do you still doubt that France will help the Jews to found colonies which may extend from Suez to Jerusalem, and from the banks of the Jordan to the Coast of the Mediterranean? Then pray read the work which appeared shortly after the massacres in Syria, by the famous publisher, Dentu, under the title The New Oriental Problem. The author hardly wrote it at the request of the French government, but acted in accordance with the spirit of the French nation when he urged our brethren, not on religious grounds, but from purely political and humanitarian motives, to restore their ancient state.[Footnote: I have heard that an American writer has discussed this question from a practical point of view, for a number of years. Also representative Englishmen have repeatedly declared themselves in favor of the restoration of the Jewish State.]

I may, therefore, recommend this work, written, not by a Jew, but by a French patriot, to the attention of our modern Jews, who plume themselves on borrowed French humanitarianism. I will quote here, in translation, a few pages of this work, The New Eastern Question, by Ernest Laharanne.[Footnote: See note IX at end of book.]

‘In the discussion of these new Eastern complications, we reserved a special place for Palestine, in order to bring to the attention of the world the
important question, whether ancient Judæa can once more acquire its former place under the sun.

‘This question is not raised here for the first time. The redemption of Palestine, either by the efforts of international Jewish bankers, or the nobler method, of a general subscription in which all the Jews should participate, has been discussed many times. Why is it that this patriotic project has not as yet been realized? It is certainly not the fault of pious Jews that the plan was frustrated, for their hearts beat fast and their eyes fill with tears at the thought of a return to Jerusalem.[Footnote: My friend, Armond L., who traveled for several years through the Danube Principalities, told me that the Jews were moved to tears when he announced to them the end of their suffering, with the words ‘The time of the return approaches.’ The more fortunate Occidental Jews do not know with what longing the Jewish masses of the East await the final redemption from the two thousand year exile. They know not that the patriotic Jew cannot suppress his cry of anguish at the length of the exile, even in the midst of his festive songs, as, for instance, the patriotic poem which is read on Chanukah, closes with the mournful call:

‘For salvation is delayed for us and there is no end to the days of evil.’

‘They asked me,’ continued my friend, ‘what are the indications that the end of the exile is approaching?’ ‘These,’ I answered, ‘that the Turkish and the papal powers are on the point of collapse.’]

‘If the project is still unrealized, the cause is easily cognizable. The Jews dare not think of the possibility of possessing again the land of their fathers. Have we not opposed to their wish our Christian veto? Would we not continually molest the legal proprietor when he will have taken possession of his ancestral land, and in the name of piety make him feel that his ancestors forfeited the title to their land on the day of the Crucifixion?

‘Our stupid Ultramontanism has destroyed the possibility of a regeneration of Judæa, by making the present of the Jewish people barren and unproductive. Had the city of Jerusalem been rebuilt by means of Jewish capital, we would have heard preachers prophesying, even in our progressive nineteenth century, that the end of the world is at hand and predictions of the coming of the Anti-Christ. Yes, we have lived to see such a state of affairs, now that Ultramontanism has made its last stand in oratorical eloquence. In the sacred beehive of religion, we still hear a continuous buzzing of those insects who would rather see a mighty sword in the hands of the barbarians, than greet the resurrection of nations and hail the revival of a free and great thought inscribed on their banner. This is undoubtedly the reason why Israel did not make any attempt to become master of his own flocks, why the Jews, after wandering for two thousand years, are not in a position to shake the dust from their weary feet. The continuous, inexorable demands that would be made upon a Jewish settlement, the vexatious insults that would be heaped upon them and which would finally degenerate into persecutions, in which fanatic Christians and pious Mohammedans would unite in brotherly accord—these are the reasons, more potent than the rule of the Turks, that
have deterred the Jews from attempting to rebuild the Temple of Solomon, their ancient home, and their State.

‘But if this cause explains the lack of courage on the part of patriotic Jews, we cannot refrain from accusing the so-called progressive Jews of indifference to the fate of the Jewish people; for whenever a project for the restoration of the Jewish State is being considered, they display toward it a naïveté that neither does credit to their reasoning power nor to their heart. The explanations offered by them on such occasions are inadmissible both from a moral and from a political point of view. A declaration, composed by the representatives of the progressive Jews at their meeting in Frankfort, contains the following Article:

‘We acknowledge as our fatherland only the land where we are born and to which we are inseparably united by the bonds of citizenship.’

‘No member of the Jewish race can renounce the incontestable and fundamental right of his people, without at the same time denying the history of the Jews and his own ancestors. Such an act is especially unseemly, at a time when political conditions in Europe will not only not obstruct the restoration of a Jewish State, but will rather facilitate its realization. What European power to-day would oppose the plan that the Jews, united through a Congress, should buy back their ancient fatherland? Who would object if the Jews flung to decrepit old Turkey a few handfuls of gold, and said to her: ‘Give me back my home and use this money to consolidate the other parts of your tottering empire?’

‘No objections would be raised to the realization of such a plan, and Judæa would be permitted to extend its boundaries from Suez to the harbor of Smyrna, including the entire area of the western Lebanon range. For we will not be eternally engaged in war; the time must come when this wholesale massacre, usually accompanied by the booming of cannon, will be condemned by humanity, so that the nation which desires conquest in addition to commerce, will not dare to carry out its designs. We must therefore prepare and break new ground for the peaceful struggles of industry. European industry has daily to search for new markets as an outlet for its products. We have no time to lose. The time has arrived when it is imperative to call the ancient nations back to life, so as to open new highways and byways for European civilization.’

In another passage, the author speaks with so much enthusiasm, love and reverence for the Jews, that what he says overshadows all that has ever been said by a Jew in praise of his own people.

‘There is a mysterious power which rules the destiny of humanity. Once the hand of the Infinite Power has signed the decree of a nation to be banished forever from the fact of the earth, the fate of that nation is irrevocable. But when we see a nation, torn from its cradle in its early childhood, and after having tasted all the bitterness of exile is brought back to its land, only to be tossed again into the wide world; and that nation, during the eighteen centuries of its wandering has displayed such remarkable
powers of endurance, suffering age-long martyrdom without extinguishing in its heart the fire of patriotism, then we just admit that we are standing before an infinite mystery, unparalleled in the history of humanity.'

In these few words there is concentrated the whole history of Israel.

What an example! What a race! You, Roman conquerors, led your legions in battle against the already ruined Zion and drove the children of Israel out of their ancestral land. Your European, Asiatic and African barbarians lent your ear to superstition and pronounced your curse upon them. You feudal kings branded the Jews with the mark of shame—the Jews, who, in spite of all your persecutions, supplied you with the necessary gold wherewith to arm your vassals and serfs and who provided your markets with goods. You, grand Inquisitors, searched among the children of the dispersed people of Israel for your richest victims, with whom to fill your prisons and coffers, and in order to feed your auto-da-fe’s—and you revoked the edict of Nantes and drove out of the land the remnant that had escaped the destruction of Apostolic fanaticism. And finally, you modern nations have denied these indefatigable workers and industrious merchants civil rights. What persecutions! What tears! What blood you children of Israel have shed in the last eighteen hundred years! But you sons of Judæa, in spite of all suffering are still here. You have overcome the innumerable obstacles which the hatred, contempt, fanaticism and barbarism of the centuries have placed in your way. The hand of the Eternal has surely guided you.

France finally freed you. On the eve of the great world epoch, France, while shattering its own chains, called all nations and also you, into freedom. You became citizens and now you are brothers. The year 1789 was the first step in the process of rehabilitation. Pursuing its mission, liberation, the eye of France searched after all persecuted races, and it found you in your ghetto and shattered its doors forever.\[Footnote: The old Beneday, who was still alive in 1842, at the time of the publication of the first Rhenische Zeitung used to come, from time to time, to the office of that paper to converse with the members of the staff; and on one of these occasions he told us the story, which I had really heard before, how he, at the commission of the first French Republic had laid the ax at the gates of the Bonn Ghetto. Beneday could hardly conceive how his son Jacob could, at one and the same time, be a liberal and yet unfriendly toward the French. I comforted him by pointing to the progressive German Jews, who in reality have to thank the French for whatever political and civil rights they possess here or elsewhere in Germany, and yet rail, in company with the Germans, against the ‘hereditary enemy.’\] France invited you to its Chambers. You participated in its triumphs; you shared its happiness and its reverses. You have raised your voice on the day of council, shouted for joy at our victories and wept at our defeats. You are good citizens and devoted brothers. France will perhaps be to you a lighthouse of salvation, a rock against your enemies, who are also the enemies of our modern institutions. It will defend you against the libelers of your nationality, your character and your religion.
You are an elemental force and we bow our heads before you. You were powerful in the early period of your history, strong even after the destruction of Jerusalem, and mighty during the Middle Ages, when there were only two dominant powers—the Inquisition and its Cross, and Piracy with its Crescent. You have escaped destruction in your long dispersion, in spite of the terrible tax you have paid during eighteen centuries of persecution. But what is left of your nation is mighty enough to rebuild the gates of Jerusalem. This is your mission.

Providence would not have prolonged your existence until to-day, had it not reserved for you the holiest of all missions. The hour has struck for the resettlement of the banks of the Jordan. The historical books of the royal prophets can, perhaps, be written again only by you.

A great calling is reserved for you: to be a living channel of communication between three continents. You should be the bearers of civilization to the primitive people of Asia, and the teachers of the European sciences to which your race has contributed so much. You should be the mediators between Europe and far Asia, open the roads that lead to India and China—those unknown regions which must ultimately be thrown open to civilization. You will come to the land of your fathers crowned with the crown of age-long martyrdom, and there, finally, you will be completely healed from all your ills! Your capital will again bring the wide stretches of barren land under cultivation; your labor and industry will once more turn the ancient soil into fruitful valleys, reclaim the flat lands from the encroaching sands of the desert, and the world will again pay its homage to the oldest of peoples.

The time has arrived for you to reclaim, either by way of compensation or by other means, your ancient fatherland from Turkey, which has devastated it for ages. You have contributed enough to the cause of civilization and have helped Europe on the path of progress, to make revolutions and carry them out successfully. You must henceforth think of yourselves, of the valleys of Lebanon and the plains of Gennesareth.

March forward! At the sight of your rejuvenation, our hearts will beat fast, and our armies will stand by you, ready to help.

March forward, Jews of all lands! The ancient fatherland of yours is calling you, and we will be proud to open its gates for you.

March forward, ye sons of the martyrs! The harvest of experience which you have accumulated in your long exile, will help to bring again to Israel the splendor of the Davidic days and rewrite that part of history of which the monoliths of Semiramis are the only witness.

March forward, ye noble hearts! The day on which the Jewish tribes return to their fatherland will be epoch-making in the history of humanity. Oh, how will the East tremble at your coming! How quickly, under the influence of labor and industry, will the enervation of the people vanish, in the land where voluptuousness, idleness and robbery have held sway for thousands of years.
You will become the moral stay of the East. You have written the Book of books. Become, then, the educators of the wild Arabian hordes and the African peoples. Let the ancient wisdom of the East, the revelations of the Zend, the Vedas, as well as the more modern Koran and the Gospels, group themselves around your Bible. They will all become purified from every superstition and all will proclaim alike the principles of freedom, humanity, peace and unity. You are the triumphal arch of the future historical epoch, under which the great covenant of humanity will be written and sealed in your presence as the witnesses of the past and future. The Biblical traditions which you will revive, will also sanctify anew our Occidental society and destroy the weed of materialism together with its roots.

And when you shall have made this wonderful progress, remember, ye sons of Israel, remember Modern France which, from the moment of its rebirth, has loved you continually and has never wearied of defending you.

If one appreciates fully the infinitely tragic rôle which the Jewish people has thus far played in history, he must also inevitably perceive the only way that will bring salvation to our misery. This solution is at present not as impractical as it may look at first sight. It is in accordance with the sympathies of the French people and with the interests of French politics, that after France’s victorious armies shall have overthrown the modern Nebuchadnezzar, France will extend its work of redemption also to the Jewish nation. It is to the interest of France to see that the road leading to India and China should be settled by a people which will be loyal to the cause of France to the end, in order that it may fulfil the historical mission which has fallen to it as a legacy from the great Revolution. But is there any other nation more adapted to carry out this mission than Israel, which was appointed for the same mission from the beginning of its history?

‘Frenchmen and Jews!’ I hear you exclaim. ‘If so, then the Christian German reactionaries were right in their denunciations of the Jews!’ Yes, my dear friend, the animal instinct which scents the enemy in the distance is always infallible. Reaction has everywhere recognized its mortal enemy in those who stand midway between reaction and revolution and who act as the midwife of progress, the giant who is to smite reaction over its head. For it is a law of organic and social life history, that the mediate being whose existence is limited to the transition epoch, should pave the way from the imperfect to the more perfect and higher scales of life.

Frenchmen and Jews! It seems that in all things they were created for one another. They resemble one another in their humane and national aspirations, and differ only in such qualities as can only be complemented by another nation, but which are never united in one and the same people. The French people excel in alertness, in the humanistic and sympathetic quality to assimilate all elements; the Jews, on the other hand, possess more ethical seriousness than the French, and in meeting other types, the Jew will rather impress his stamp on his environment than be molded by it. The French can
rule the world because they absorbed the best of the entire human race. The Jews can only be masters of their own flock, and with the holy fire which they have kindled in their own midst, they will warm and enlighten a world composed of heterogeneous elements, and thus prevent this world from disintegrating into its elements and relapsing into the chaos out of which it was raised once before by Judaism.

The generous help which France has extended to civilized peoples toward the restoration of their nationality, will be remembered longer by our nation than by any other. How easily will we come to an understanding with this humane French people about our religion and its sacred places in Palestine. But matters have not gone so far yet. The Jewish people must first show itself worthy of the regeneration of its historical cult; it must first feel the necessity of a national restoration if it would reach that point. Until then we need not think about building the Temple; we must win the heart of our brethren for the great work which will finally bring eternal glory to the Jewish nation and salvation to humanity.

For Jewish colonization on the road to India and China, there is no lack, either of Jewish laborers or of Jewish talent and capital. Let only the germ be planted under the protection of the European powers, and the tree of a new life will spring forth by itself and bear excellent fruit.\textsuperscript{1867}

Just as when the French were unwilling to buy the Suez Canal for the Jews, the Zionists looked to Disraeli in England to accomplish this end; when the English moved toward improving their relations with Russia, Egypt and Turkey, the Zionists looked to Germany as a sword with which to conquer the Turks and the Russians, and with which to manipulate the British and the French, resulting in the First and Second World Wars. When Germany failed them, they turned America against Germany and ruined it. In more modern times in America, when the French, who emancipated the Jews of Continental Europe, opposed war against Islam for Israel’s sake, the Zionists stirred up hatred of the French in America, though Hess had long ago tried lure the French into Palestine with the promise that the Jews would forever be loyal to France, the France which had liberated them,

“It is to the interest of France to see that the road leading to India and China should be settled by a people which will be loyal to the cause of France to the end, in order that it may fulfill the historical mission which has fallen to it as a legacy from the great Revolution. But is there any other nation more adapted to carry out this mission than Israel, which was appointed for the same mission from the beginning of its history?”

Zionists are loyal to none but themselves. When the French failed them, they became eternally loyal to England, and when that failed them, to Germany, and when that failed them, to America. Should America fail to perpetually slave for Israel, they will turn to China.

The Zionists repay the ancient gift (in Jewish myths) of the Persian King Cyrus
of the freedom of the Jews from the captivity of Babylon, as well as King Cyrus’
restoration of the Jews to Judea and the rebuilding Jerusalem and the Temple, as well
as the gift of Persian King Ahasuerus, who assisted Queen Esther and Mordecai to
mass murder “the enemies of the Jews”—modern Jews repay these ancient gifts by
perpetually destroying Iran and corrupting its leadership to the detriment of the
Iranian People. Though the Book of Esther is a work of fiction, it provides a model
that the Jews have often followed. The Rothschilds often followed the ancient Jewish
model of Jacob and Esau, whereby Jacob exploited Esau’s deathly hunger to steal
Esau’s freedom and Esau’s land; and the ancient Jewish model of Joseph, whereby
Joseph exploited the deathly hunger of the Egyptians to steal the Egyptians’ freedom
and the Egyptians’ land—this in collusion with a corrupt Pharaoh, who helped the
Jews destroy the currency—this after the Egyptians had given Jews land in Egypt.
Genesis 47 tells the Jews to ruin host nations and then leave them taking their wealth,

“1 Then Joseph came and told Pharaoh, and said, My father and my brethren,
and their flocks, and their herds, and all that they have, are come out of the
land of Canaan; and, behold, they are in the land of Goshen. 2 And he took
some of his brethren, even five men, and presented them unto Pharaoh. 3 And
Pharaoh said unto his brethren, What is your occupation? And they said unto
Pharaoh, Thy servants are shepherds, both we, and also our fathers. 4 They
said moreover unto Pharaoh, For to sojourn in the land are we come; for thy
servants have no pasture for their flocks; for the famine is sore in the land of
Canaan: now therefore, we pray thee, let thy servants dwell in the land of
Goshen. 5 And Pharaoh spake unto Joseph, saying, Thy father and thy
brethren are come unto thee: 6 The land of Egypt is before thee; in the best
of the land make thy father and brethren to dwell; in the land of Goshen let
them dwell: and if thou knowest any men of activity among them, then make
them rulers over my cattle. 7 And Joseph brought in Jacob his father, and set
him before Pharaoh: and Jacob blessed Pharaoh. 8 And Pharaoh said unto
Jacob, How old art thou? 9 And Jacob said unto Pharaoh, The days of the
years of my pilgrimage are an hundred and thirty years: few and evil have
the days of the years of my life been, and have not attained unto the days of
the years of the life of my fathers in the days of their pilgrimage. 10 And
Jacob blessed Pharaoh, and went out from before Pharaoh. 11 And Joseph
placed his father and his brethren, and gave them a possession in the land of
Egypt, in the best of the land, in the land of Rameses, as Pharaoh had
commanded. 12 And Joseph nourished his father, and his brethren, and all his
father’s household, with bread, according to their families. 13 ¶ And there
was no bread in all the land; for the famine was very sore, so that the land of
Egypt and all the land of Canaan fainted by reason of the famine. 14 And
Joseph gathered up all the money that was found in the land of Egypt, and in
the land of Canaan, for the corn which they bought: and Joseph brought the
money into Pharaoh’s house. 15 And when money failed in the land of
Egypt, and in the land of Canaan, all the Egyptians came unto Joseph, and
said, Give us bread: for why should we die in thy presence? for the money
faileth. 16 And Joseph said, Give your cattle; and I will give you for your cattle, if money fail. 17 And they brought their cattle unto Joseph: and Joseph gave them bread in exchange for horses, and for the flocks, and for the cattle of the herds, and for the asses: and he fed them with bread for all their cattle for that year. 18 When that year was ended, they came unto him the second year, and said unto him, We will not hide it from my lord, how that our money is spent; my lord also hath our herds of cattle; there is not ought left in the sight of my lord, but our bodies, and our lands: 19 Wherefore shall we die before thine eyes, both we and our land? buy us and our land for bread, and we and our land will be servants unto Pharaoh: and give us seed, that we may live, and not die, that the land be not desolate. 20 And Joseph bought all the land of Egypt for Pharaoh; for the Egyptians sold every man his field, because the famine prevailed over them: so the land became Pharaoh’s. 21 And as for the people, he removed them to cities from one end of the borders of Egypt even to the other end thereof. 22 Only the land of the priests bought he not; for the priests had a portion assigned them of Pharaoh, and did eat their portion which Pharaoh gave them: wherefore they sold not their lands. 23 Then Joseph said unto the people, Behold, I have bought you this day and your land for Pharaoh: lo, here is seed for you, and ye shall sow the land. 24 And it shall come to pass in the increase, that ye shall give the fifth part unto Pharaoh, and four parts shall be your own, for seed of the field, and for your food, and for them of your households, and for food for your little ones. 25 And they said, Thou hast saved our lives: let us find grace in the sight of my lord, and we will be Pharaoh’s servants. 26 And Joseph made it a law over the land of Egypt unto this day, that Pharaoh should have the fifth part; except the land of the priests only, which became not Pharaoh’s. 27 ¶ And Israel dwelt in the land of Egypt, in the country of Goshen; and they had possessions therein, and grew, and multiplied exceedingly. 28 And Jacob lived in the land of Egypt seventeen years: so the whole age of Jacob was an hundred forty and seven years. 29 And the time drew nigh that Israel must die: and he called his son Joseph, and said unto him, If now I have found grace in thy sight, put, I pray thee, thy hand under my thigh, and deal kindly and truly with me; bury me not, I pray thee, in Egypt: 30 But I will lie with my fathers, and thou shalt carry me out of Egypt, and bury me in their buryingplace. And he said, I will do as thou hast said. 31 And he said, Swear unto me. And he sware unto him. And Israel bowed himself upon the bed’s head.”

This story taught the Jews that they could ruin any nation if they could control the nation’s money supply. They controlled the money supply by melting down gold and silver and keeping the metals for themselves. Once they had ruined metallic currency, the Jews could then operate on a barter system with the subjugated Gentiles. They learned that with gold reserves, they could loan out more script money than they had gold and silver on reserve, and they could loan it out at interest. They could also buy up debts for foreign goods whether the securities for those
supposed goods actually existed, or not. In this manner, the Jews could increase the money supply and earn interest on monies which they never possessed.

Their profits came at the expense of inflation, which again taxed the people for their sake. In Socialist countries taxes gave them complete control over the flow of money. In Capitalist countries, they rigged the system so that the wealthiest paid little or no tax, while benefitting from the infrastructure of the nation and from the protection of their trade and property by the military and courts, which served their interests and their interests alone. Not only did they not pay the taxes, they reaped the profits of the bond markets which also effectively taxed the people. They not only kept the monies which they should have been paying in taxes, they earned interest on the monies which otherwise would have been lost to them in taxes—interest for which the people paid. All of these advantages quickly put virtually all of the wealth of the nation into their hands and prevented others from ever advancing to a point where they could effectively challenge them.

Jews could also contract the money supply by refusing loans, by calling in loans, by selectively issuing different rates for loans in different nations, and by melting down metallic currencies. This is an especially powerful means for garnering international control, because it provides empires with a means of securing protectionism and favoritism, by increasing the costs of production and other costs in colonial and competing nations. In this way, the Jews were able to accumulate much of the world’s wealth into a given nation or empire which they effectively ran through corruption, and then take that wealth unto themselves, leaving the nation which otherwise would fight to take back the wealth the Jews had taken from them, in ruins. The Jews would then take the wealth they had stolen to another nation they could build up in order to knock down. The last ruined nation had not the funds with which to attack the new host nation, or host empire, and the Jews obtained security by means of bribery and blackmail. Those who were aware of what the Jews were doing and objected to it were often assassinated. Thomas Jefferson warned Americans, in anticipation of the Great Depression in the Twentieth Century, when he stated in an 1802 letter to Albert Gallatin, Secretary of the Treasury,

“\[I believe that banking institutions are more dangerous to our liberties than standing armies. . . . If the American people ever allow private banks to control the issue of their currency, first by inflation, then by deflation, the banks and corporations that will grow up around \[the banks]. . . will deprive the people of all property until their children wake-up homeless on the continent their fathers conquered. . . . The issuing power should be taken from the banks and restored to the people, to whom it properly belongs.\]”

Even if the issuing power of money is granted to the people, a group acting in collusion can melt down metallic currencies and syphon off the money supply. Fiat money is no guarantee of safety if the money is based on bonds, because the Jews can then tax the people into poverty by instigating wars or government projects which cannot be paid for immediately by direct taxes. Should this fail to give the Jews control over the money supply, as in the case of Russia, the Jews can then
instigate a revolution and deliberately cause chaos in a nation. They then spread word that banking reform and a dictatorship are the only means to restore order. Then the Jews install a dictator of their choosing, who funnels off the wealth of the subject nation into Jewish coffers, and who instigates wars of the Jews’ choosing, which further profits them.

The Jews again ruined the Egyptians many times in the modern era. They deliberately bankrupted the nation and exploited its cotton markets and water ways. The purchase of the Suez, which was made to draw England into the region to sponsor Zionist ambitions, was then used as an excuse to secure alleged English interests in the region by means of Jewish colonialism. However, had it not been for the corrupt actions of Disraeli and Rothschild which brought England into the region, there would have been no English interests to secure, and placing a Jewish colony in Palestine would have worked against British interests in that it would have destabilized the region.

An article in the Christian Reader, Volume 3, Number 67, (19 November 1824), p. 366 evinces that the Jews were not needed by the British to secure British interests in the region, but rather that the British were needed by the Jews to secure Jewish Messianic interests in the region. Note that the Rothschilds and the Jews believed they had an incentive to ruin the Egyptians, in order to promote their own interest in the theft of the land of Palestine. Of course, any Egyptian who reacted to the Jewish attack on their civilization would be called a racist and religiously intolerant, which defamations Jewish racists would employ as an excuse to further ruin the Egyptians.

“CHRISTIAN REGISTER.

BOSTON, FRIDAY, NOVEMBER 19, 1824.

THE JEWS. It is stated with much assurance in the Gazette of Spires, that the Sublime Porte has recently made proposals to the House of Rothschild for the loan of a considerable sum of money, and has offered as a security for payment, the entire country of Palestine. It is stated also that in consequence of this proposal a confidential agent had been dispatched by that House to Constantinople, ‘to examine into the validity of the pledge offered by the Turkish Cabinet.’

The editor of the National Advocate observes in relation to this report, that he at first supposed it was intended as a satire on the prevailing custom of raising loans for different nations; but on a nearer view of the subject, the proposition might be supposed probable. The Advocate proceeds with some interesting remarks on the subject, tending to show, that if such a proposition had been made it could not be accepted with any prospect, on the part of the Rothschilds, (who are Jews,) of the immediate restoration of their countrymen to Palestine, as it was probably not in the power even of the Turkish government, to guarantee to the Jews the quiet possession of the country against the prejudices and interests of the Egyptians, the Wechabites, the Wandering Arabs, and the Tartar Hordes.

It is also argued that the discrepancy of education, habits, views, and
manner, existing between the Jews of different countries, unfit them to amalgame and become united under one government. They must be prepared for this by the same discipline which their fathers, who went out of Egypt were subjected to under Moses, for forty years in the wilderness, to prepare them for the promised land. ‘Our country,’ continues the Advocate, ‘must be an asylum to the ancient people of God. Here they must reside; here, in calm retirement, study laws, governments, sciences; become familiarly known to their brethren of other religious denominations; cultivate the useful arts; acquire a knowledge of legislation, and become liberal and free. So, that appreciating the blessings of just and salutary laws, they may be prepared to possess permanently their ancient land, and govern rightly.’”

The pretext Disraeli and the racist Zionists used to justify the purchase of the Suez Canal was to persuade England that she had a vital interest in securing a route to India—the same pretext Hess and the racist Zionists had used in their earlier attempts to draw France into the region. The common denominator of this prolonged effort to take land from the Moslems was racist Zionism, not a genuine need for a European presence in the Middle East.

Disraeli flattered the Queen by dubbing her the “Empress of India”. Disraeli is perhaps overrated as an intellect and politician. He probably only succeeded because of support from the Rothschilds, who had the ability to shut down the English economy. Disraeli did not create this scheme to draw England into Egypt. Rather, it arose in the mind of an American Ashkenazi Jew named Mordecai Manuel Noah, who pretended to be a Sephardic Jew, and who published *Discourse on the Evidences of the American Indians Being the Descendants of the Lost Tribes of Israel: Delivered Before the Mercantile Library Association*, Clinton Hall: J. Van Norden, New York, (1837); so as to make it appear that the Jews had a greater right to America than the Gentiles. Noah published *Discourse on the Restoration of the Jews: Delivered at the Tabernacle, Oct. 28 and Dec. 2., 1844*, Harper, New York, (1845); in which he laid out the plan to draw England into the Mideast, which Disraeli and Rothschild fulfilled.

The *New York Times* reported on 31 December 1897 on page 5 that some Jews—especially those allied with the Puritans, a sect likely created by Cabalist Jews—had long sought America as a new Israel, and told of Judge Noah’s plan to draw the British into the region and destroy the Turks:

“Ameria and the Ten Tribes.

Dr. Alder, in reply to Dr. Kohler, contended that Anthony Montecinos originated the idea that America was the abode of the ten tribes.

Dr. Kohler said that the term Arsaveth was never used in Jewish writings. The term these was Eretz Aheret.

Dr. Leo Wiener gave some striking specimens of the folk-lore of the Russian Jews, which, he said, had thus far been virtually ignored in literature. He repeated an amusing story of a little Jewish tailor who set out to discover
the lost tribes. He found them at last beyond a great river, and they were giants. One of them put the little tailor in his pocket, and going into the synagogue, forgot all about him. The little tailor made answer of ‘Amen,’ however, to the prayer that was offered. Then he was taken out of the pocket, was recognized as a Jew, and was greatly honored.

Sarcastic comments upon several of the theories about the lost tribes that have been put forward were made by Dr. H. P. Mendes and others. The Rev. A. H. Neito reported upon some inscriptions upon ancient Jewish tombstones in New York which he had deciphered.

**Early Zionist Projects.**

A paper by Max J. Kohler on ‘Some Early American Zionist Projects’ was next read, and engaged the close attention of those present. The most curious part of it, and one which excited both laughter and applause, was an account of the three projects of Mordecai M. Noah, once a distinguished figure in New York, to re-establish the Jewish Kingdom. Mr. Kohler first reviewed the efforts to colonize Jews in this hemisphere, from the establishment of the settlement in Curacao, in 1652, and the scheme of Maurice de Saxe, about 1749, to create a kingdom for himself, peopled by the descendants of Abraham, and the projects of Dr. Kayurling and W. D. Robinson in this country, the former in 1783 and the latter in 1819. Judge Noah’s first idea, announced in 1818, was that the Jews were to overthrow the Turkish domination in Northern Africa and Western Asia, and to regain possession of Palestine. In 1825 he devised the plan of founding the ‘City of Ararat’ on Grand Island in the Niagara River. He got some of his friends to constitute him ‘Governor and Judge of Israel.’ He issued proclamations and decrees, and made appointments which were laughed at and refused. In setting forth his third idea in 1845, in a pamphlet, ‘The Restoration of the Jews,’ Judge Noah made this remarkable forecast: ‘England must possess Egypt, as affording the only secure route to her possessions in India, through the Red Sea.’ This, he thought, would lead to the resettlement of the Jews in Palestine, with the consent of the Christian, and for the safety of the neighboring nations. This was to be accomplished by gradual means, the first step being to induce the Sultan to grant to the Jews permission to purchase and hold land in Palestine. Mr. Kohler drew attention to the parallelism of the arguments employed by Noah, from whom he quoted at length, in favor of this scheme, and those of the Zionites of to-day, as represented by the Congress at Basel.

A sketch of the Jewish pioneers of the Ohio Valley by the Rev. Dr. David Philipson of Cincinnati, a paper on ‘Ezra Stiles (first President of Yale) and the Jews of Newport,’ notes on New York wills by Dr. Herbert Friedenwald, ‘A Statement Relative to Manuscripts Belonging to Hyam Solomon,’ by Dr. J. H. Hollander of Johns Hopkins University, and a paper entitled ‘A Brave Frontiersman,’ by the Rev. Henry Cohen of Galveston, Texas, were among the other contributions. Dr. C. D. Spivak of Denver sent an argument in favor of the society making an index of periodical and pamphlet literature and data
on Jewish-American history. On motion a committee was appointed consisting of Prof. R. J. H. Gottheil, Dr. Friedenwald, and the Rev. Dr. Mendes, to take charge of the matter.

The selection of the place for holding the next annual meeting was left in the hands of the council. The meeting was then adjourned.”

Disraeli and Rothschild artificially created an animosity in England towards Russia. Zionist publications called the Turkish Sultans and the Russian Czars the anti-Christs. The Rothschilds curbed Pan-Slavic interests by regulating Russia’s access to funds, in order to promote instead the interests of Pan-Judaism. The Rothschilds, who were already the Kings of the Gentile world, had long been seeking to have one of their own become the official King of the Jews and rule the world from Jerusalem as Messiah, as prophesied in Isaiah. On 14 July 1878, The Chicago Daily Tribune reported on page 9 that the Rothschilds, and their agents around the world, organized an international Pan-Judaic union, which would rule the Jews and the world,

“PAN-JUDAISM.
WHAT IS LIKELY TO BE DONE AT THE PARIS CONFERENCE.

An International Jewish Conference will be held this month in Paris for the purpose of discussing measures to improve the political and social condition of the Jews in various parts of the world. Delegates will be sent from Jewish congregations in every quarter of the globe. The veteran Adolphe Crenneix [sic] is expected to preside, and among the delegates will probably be Chief Rabbi Astruc and M. Oppenheim from Belgium, Senator Artom from Italy, Chief Rabbi Cahn and Baron de Rothschild from France, Sir Julian Goldsmid and Baron de Worms from England, Baron de Rothschild and Dr. Jellinck from Austria, Mr. William Seligman from the United States, and a member of the Jewish clergy. Among the matters which occupy the attention of the conference are: The condition of the Jewish residents of the Danubian principalities and of Russia, Morocco, and Persia; the best means for securing industrial and educational advantages for the Jews of Jerusalem; the adoption of measures for the promotion of Hebrew education and for the advancement of Hebrew literature. The most important subject to be considered is a proposition to convene a synod for the purpose of inquiry into the condition of modern Judaism and the authoritative exposition of Jewish ecclesiastical law. Within the past few years two synods have been held, avowedly for this purpose, one at Leipzig, attended chiefly by European Jews, and the other at Philadelphia, attended exclusively by American Jews. The proposition to be considered at the coming conference is to call a synod which shall represent the Jews all over the world.

Since the destruction of the Temple and the dispersion of the Jews there has been no regular priesthood nor any recognized ecclesiastical authority, except such as was assumed by the chief rabbis of the various communities, who frequently differ among themselves. Such changes and modifications as
have been made in the Jewish ritual or the Jewish law have been introduced by the various communities on their own responsibility, and are not recognized by the Jews generally. Therefore, if such a synod as it is proposed to call could be convened, it would have a powerful effect upon the condition of the Jews everywhere, and it might result in the establishment of some central recognized ecclesiastical authority which would restore to the synagogue the discipline that it now lacks. Even the most orthodox Jews would pay respectful attention to the opinion of such a body, and, indeed, they are in favor of calling the synod. Mr. M. S. Isaacs, the President of the American Board of Jewish Delegates, says in a recent report:

There is a choice between an exposition by skillful, learned, competent, authoritative teachers, expounders, and judges of the ecclesiastical law, and the capricious, unreliable, ephemeral decisions of the mere officials in a particular territory, town, or congregation. The latter method is seen in its full extent in America. . . . Such a representative synod, aiming to strengthen Judaism by the recognition of current forces and agencies, by the education and guidance of the general body, without interfering with individual liberty or congregational independence within its sphere, would be an intense relief after that groping for a settlement of vexed questions, which has in despair turned in every direction for the counsel and example, and found no resource save in the untrained and deceptive public opinion of a congregation rarely fortunate in a minister at once educated and practical, versed in the law and able to calculate the effect of a novel interpretation, or a conscious departure from an existing ordinance.”

When the Czars responded with suspicion towards the Jews of Russia (whom the English Zionists had asked to sponsor attacks on Persia and Turkey and later the Czars, at least since the days of David Alroy, in order to secure Palestine for the Jews), Rothschild feigned indignation and published his “Memorial of the Jews in England to the Czar of Russia” in 1882. *The Chicago Daily Tribune* reported on 19 February 1882 on page 5,

“THE JUDENHETZE.

Text of the Memorial of the Jews in England to the Czar of Russia.

The following is the full text of the memorial of the Jews of England which was handed to Prince Lobanoff for transmission to the Emperor of Russia, but which the Prince declined to transmit, in accordance with instructions from his Government:

‘To his Imperial Majesty Alexander III., Emperor of All the Russias: The humble memorial of the Jews of England on behalf of the Jews of Russia. May it please your Imperial Majesty, a grievous cry of suffering has reached us from our brethren in faith in many parts of your Majesty’s great empire. For the past nine months large numbers of your Majesty’s Jewish subjects, especially those residing in the southern provinces of your Majesty’s dominions, have been the victims of serious civil outbreaks. The security of
life and property, so many years enjoyed by them, has vanished. Murder, rapine, and pillage have taken its place. The most terrible deed of violence have been perpetrated on helpless women and children. Unarmed and unoffending men have become a prey to the fury of a brutal mob. The survivors, scarcely more fortunate than the slain, live only to find their homes devastated or burned, their fortunes wrecked, and their means of subsistence gone.

Great, indeed, is our horror at these atrocities, but greater still, we feel certain, must be your gracious Majesty’s pain and indignation at the sufferings thus inflicted on thousands of your subjects.

Until last year Jews and Christians throughout your Majesty’s empire lived on terms of amity rarely, if ever, disturbed. No act of the Jews has been committed to warrant the interruption of the friendly attitude of their neighbors or the goodwill of their rulers. Your Jewish subjects love and honor your Majesty, and in their homes and synagogues pray for your welfare. They respect the laws and pay the State its just dues. They serve your Majesty in peace and war, even without hope or chance of promotion, and willingly lay down their lives for the country that has given them birth, and that has hitherto protected them. In truth, they are commanded by our sacred books to promote the welfare of the land which shelters them, to obey its laws, to honor its rulers, and to love as themselves their neighbors, though differing in faith; and the Israelites, acting in conformity with those precepts, are innocent of cause for the oppression that has befallen them.

We have reason to believe that in most cases it has not been the honest, law-abiding neighbors of the Jews who have originated or perpetrated these lamentable excesses, but professional agitation from a distance, acting upon the turbulent and revolutionary spirits, the enemies of law, loyalty, and order. No better proof of this can be afforded than the fact that the ringleaders have in many localities, with an audacity and shamelessness unparalleled in history, traitorously used the august name of your Majesty as a warrant for their infamous projects, and have published a forged ukase purporting to authorize the general spoliation of the Jews.

But we fear the cup of affliction of our brethren is not yet full, for the future appears even blacker than the past. For now the enemies of our brethren seek to palliate the atrocities that have been perpetrated, falsely declaring the Jews to have merited their persecution by their own misconduct, by their odious mode of trading, and by their having overreached their neighbors; and these enemies endeavor to induce the Government of your Majesty to impose upon all Israelites such new restrictions as to residence, occupation, and education as will not only prevent their fairly competing with their Christian fellow-subjects, but will practically prevent their becoming useful citizens and servants of the State, and will even debar them from earning their subsistence.

We have heard with alarm and grief that commissions have been issued with instructions couched in terms of opprobrium and hostility, teeming with
charges, assumed, but not true, which would render impossible any result favorable to the Jews. The worst effects are, therefore, apprehended. Even in Poland, where the Israelites have ever dwelt on terms of good fellowship with their neighbors, and where, until the lamentable event of last month, they have always enjoyed immunity from outrage of any kind, like commissions have been issued with similar instructions, so that everywhere throughout your Majesty’s dominions the populace seems to imagine that it has the Imperial sanction for its ill-treatment of our brethren, an idea which we are convinced could never have been, however faintly, conceived by the benignant and humane spirit of your Majesty.

‘Already deplorable results have ensued from the terms in which these commissions have been issued. For many local authorities, in anticipation of the reports of the commission, have put in force certain ancient laws of domicile, which had fallen into desuetude, and have forcibly driven the Jews, still smarting from their recent calamities, away from the towns and villages which they have so long been permitted to inhabit; while others, perhaps a little less inhuman, have allowed them to remain only on condition of their being pent up within the limits of their ancient ghettos.

‘With regard to the imputations that have been made upon your Majesty’s Jewish subjects, we humbly submit to your Majesty that whatever exceptional social position they may occupy, or whatever failings may be charged to some of them, these are due mainly to the exceptional laws to which they have been so long subjected.

‘If, in some places, undue activity has characterized their conduct in certain trades and occupations, we believe it to be because other means of earning a subsistence have been denied them, because they have been too crowded in particular localities, and have, therefore, experienced the greatest difficulty in gaining a livelihood.

‘We feel certain that if the special laws affecting the Jews were abolished their exceptional status, social and civil, would come to an end. Complaint would no longer be heard of their undue commercial and economic activity operating to the detriment of others if the Jews were suffered to disperse themselves at will so as to become merged amid their fellow-subjects instead of being concentrated, to the injury of themselves and others, in overcrowded hives of industry.

‘Here in England, where perfect civil and religious equality has been granted us, we English Jews can bear testimony to the happy results effected by such complete emancipation. Here all those restrictions—civil, commercial, and educational—which formerly oppressed us have happily been removed, and, as a result, Jew and Christian here live and work side by side on terms of mutual respect and good fellowship, engaged in friendly rivalry, which stimulates public industry and adds to the common weal.

‘And so, sire, may it be in the mighty Empire whose destinies you wield with wisdom and enlightenment. For, as the late Emperor, your father, of sainted memory, rendered his name immortal as emancipator of millions of
serfs, even so it may be your Mejesty’s high destiny to give life and protection to those now trembling on the verge of destruction, to give equal rights to the millions of your loyal Jewish subjects, who in their dread emergency look up to you, sire, Emperor and father of your people, only for leave to live with home and hearth secure from violence.

‘Humbly do we present this memorial to your Majesty on behalf of our brethren in the name of humanity—the foundation of all religion; in the name of justice—the heritage of all; in the name of mercy—the prerogative of Imperial power.

‘And we shall ever pray that the Supreme King or Kings may bless the efforts of your Majesty for the glory of your mighty Empire and the well-being of your subjects, and that He may grant your Majesty a long, and prosperous, and happy reign.

‘Signed, on behalf of the Jews of England, this 19th day of January.

‘N. M. de Rothschild.’

British Jews organized for centuries to destroy Russia and Turkey. They set forth their plans in countless books and articles, which concomitantly called for the “restoration of the Jews to Palestine” and the annihilation of the Russian and/or Turkish “anti-Christs”. Jews were behind the revolts in those lands in the Twentieth Century which decimated their empires, cultures and their futures. Jews in general considered Gentiles to be animals, and not their Hebrew “neighbors”, and thus Russians were not protected by Jewish law in the sense which Rothschild alleged. In addition, many Jews considered Slavs to be lower than Aryans, and thus beneath the contempt many Jews had for Gentiles in general. Contrary to Rothschild’s assertions, Jewish tribalism, racism and corruption did indeed continue after emancipation and became most manifest when Jews were accorded the greatest freedom after the Bolshevik Revolution and took advantage of their liberty as an opportunity to slaughter Gentiles. Most tellingly, when Russian Jews sought to emigrate to England and America, it was English and American Jews who most strongly opposed their emigration, realizing better than anyone else how tribal, racist and corrupt Russian and Galician Jews could be.

The Zionist financiers were so successful in making it appear that Great Britain was acting out of its own best interests by inserting itself into the Turkish Empire, and not acting pursuant to the instigation of the Zionists; that many came to conclude that the Balfour Declaration materialized out of British interests. Ironically, this backfired on the Zionists, and some sectors of the British Government were reluctant to give up Palestine to the Jews, while others were reluctant to incite the French to war by interfering with French interests in the region—all of which frustrated the Zionists’ efforts to steal the land from the Palestinians after the First World War. The London Times reported on 29 June 1920 on page 15,

“The Pope and Zionism.
ACRIMONIOUS ITALIAN COMMENT.
(FROM OUR OWN CORRESPONDENT.)
ROME, JUNE 27.

Sir Herbert Samuel, High Commissioner to Palestine, who left Rome last night, visited both the King and the Pope. His visit to the Pope has attracted a certain amount of attention, as it was bound to do.

The Tempo comments acrimoniously on British policy in Palestine, saying that England merely supported Zionism in order to find an excuse for establishing herself there, where she had no other excuse to be. But the Tempo has never been anything but anti-British. The article finishes by asking whether Sir Herbert Samuel attempted to assure the Pope that fears inspired by Zionism were unfounded, and whether he is likely to have succeeded.

Certainly the Vatican has been nervous about Zionism, and certain utterances have given it cause to be. But there is every reason to believe that Sir Herbert should be able to still these fears by proving them to be unjustified.”

This was, however, a minor obstacle for the Rothschilds when compared with the fact that most Jews did not wish to live in Palestine and did not have the racist mindset of the Zionists. The London Times reported on 17 June 1918 on page 5,

“FUTURE OF PALESTINE.
OPPOSITION TO ZIONISM.

The ideals of the League of British Jews in regard to the future of Palestine as distinct from those of the Zionists were expounded by Dr. Israel Abrahams, of Cambridge, at Wigmore Hall yesterday.

What divided the League from the Zionists, he said, was that the former could not assent to the setting up in Palestine of a State composed exclusively of Jews. They maintained that, whatever the government, the State should be absolutely free from any racial or religious test. Citizenship and nationality had nothing to do with religion. As to the Jews outside, the League could not assent to the statement that they constituted a nation. They belonged to many nations, and could neither control Palestinian politics nor be controlled by them. The Jews of the world were not united, but divided by nationality, and now were actually fighting each other. The Palestine of the future was for the Jews who desired to live there, and for those who wished to escape from countries where they had no home.

In a discussion which followed, some opposition to the lecturer’s point of view was shown, and one speaker asserted that the League had hindered the colonization of Palestine.”

The tribalism of Rothschild is apparent not only his covert designs to destroy Russia and to use English treasure and lives to achieve his ends, not only in the fact that he felt a tribal kinship with the Jews of Russia and rushed to defend them, but
in his statement that even after the Jews had been emancipated in England they were at perpetual war with the Christians,

“Here all those restrictions—civil, commercial, and educational—which formerly oppressed us have happily been removed, and, as a result, Jew and Christian here live and work side by side on terms of mutual respect and good fellowship, engaged in friendly rivalry, which stimulates public industry and adds to the common weal.”

How did the Rothschilds gain the wealth which fed their arrogance? In part by stealing from the English, who had granted the Jews freedom. This Jewish theft of British treasure took place at a time when England was at war. That was how the Rothschilds repaid English generosity. It was the Rothschilds’ method of “friendly rivalry” with the Christians. If the Christians had responded in unkind, the Jews would have been wiped out in a very short while. Perhaps the English example gave the Czar pause.

Concerned that the Rothschilds were moving into America during the Civil War, after having largely ruined the markets of Europe by plundering Europe’s wealth, on 2 June 1867 on page 3, *The Chicago Tribune* told part of the story of the Jewish war profiteers and cheats, the Rothschilds of their day. It was one of many stories the Tribune ran, which exposed the Rothschilds:

“THE HOUSE OF ROTHSCHILD.

(Frankfort Correspondence of the Boston Journal.)

THE RED SHIELD.

Come with me to the eastern part of the city—the old town—where you will discover scarcely a sign of modern architecture. The streets are narrow; the houses lean toward each other from opposite sides of the way, as if they were friends about to fall into each other’s arms. It is the Jews’ quarter. The door-ways are crowded with women and children—all bearing the unmistakable features which, the world over, characterize this historic people—rejected of God, despised of men, scattered everywhere, yet retaining their nationality, endowed with a vitality which has no parallel in the human race.

We turn down the Judengasse, the Jew’s alley, from the chief thoroughfare of the modern town. In this street, 124 years ago, lived a dealer in old clothes who had a red shield for a sign, which in German reads Roth Schild. It was in 1743 that a child was born to this Israelite. The name given to the boy was Anselm Meyer, who also became a clothes dealer and a pawn broker, succeeding to the business of his father. By degrees he extended his business, lending money at high rates of interest during the wars of the last century, managing his affairs with such skill that Prince William the
Landgrave made him his banker. When Napoleon came across the Rhine, in 1806, this clothes dealer was directed to take care of the treasures of the Prince, amounting to twelve million dollars, which he invested so judiciously that it brought large increase to the owner, and especially to the manager.

This banker died in 1812, leaving an estate estimated at $5,000,000—not a very large sum these days—but he left an injunction upon his five sons, which was made binding by an oath given by sons around his death-bed, which has had and still has a powerful influence upon the world. The sons bound themselves by an oath to follow their father’s business together, holding his property in partnership, extending the business, that the world might know of but one house of the red shield! (Rothschild.)

The sons were true to their oath. Nathan went to Manchester, England, as early as 1797, but afterward moved to London. Anselm remained at Frankfort, James went to Paris, Solomon to Vienna, and Charles to Naples, the five brothers thus occupying great financial centres. Nathan, in London, amassed money with great rapidity, and the same may be said of all the others, the wars of Napoleon being favorable to the business of the house. Nathan went to the Continent to witness the operations of Wellington in his last campaign against Napoleon, prepared to act with the utmost energy, let the result be as it might. He witnessed the battle of Waterloo, and, when assured of Napoleon’s defeat, rode all night, with relays of horses, to Ostend; went across the channel in a fishing smack—for it was before the days of steam—reached London in advance of all other messengers, and spread the rumor that Wellington and Blucher were defeated. The 20th of June in that memorable year was a dismal day in London. The battle was fought on the 18th. Nathan Meyer, of the house of Red Shield, by hard riding, reached London at midnight on the 19th. On the morning of the 20th, the news was over town that the cause of the allies was lost, that Napoleon had swept all before him. England had been the leading spirit in the struggle against Napoleon. The treasury of Great Britain had supplied funds to nearly all of the allied Powers. If their cause was lost what hope was there for the future? Bankers flew from door to door in eager haste to sell their stocks. Funds of every description went down. Anselm Meyer was besieged by men who had funds for sale. He too had stocks for sale. What would they give? But meanwhile he had scores of agents purchasing. Twenty four hours later Wellington’s messenger arrived in London; the truth was known. The nation gave vent to its joy; up went the funds, pouring, it is said, five million dollars into the coffers of this one branch of the house of the Red Shield!

Though Frankfort is comparatively a small city, though it has no imperial court, it is still a great money centre, solely because that here is the central house of the Rothschild and other bankers.

The House of the Red Shield is the greatest banking house of the world—the mightiest of all time. Its power is felt the world over—in the Tuileries of Paris, in the ministerial chamber of Berlin, in the imperial palace at St. Petersburg, in the Vatican at Rome, in the Bank of England, in Wall
street, State street, and by every New England fireside. The house of the Red Shield, by the exercise of its financial power, can make a difference in the yearly account of every man who reads these words of mine! Though Anselm Meyer has been half a century dead; though several of his sons have gone down to the grave—the house is the same. The grand-children have the spirit of the children. The children of the brothers have intermarried, and it is one family, animated by a common purpose, that the world shall know only one red shield.

AMERICAN BONDS.

The house, at an early stage of the American war, took hold of the United States bonds. Germany had confidence in America. England strove for our ruin, but the people of the Rhine believed in the star of American liberty. Fifty years of peace had been long enough to bring wealth to this land, and so with every steamer orders were sent across the Atlantic for investment in American securities. It is supposed that Germany holds, at the present time, about three hundred and fifty millions of United States bonds, and it is said that there have been no less than fifty million dollars profit to the bankers of Frankfort on American securities since 1863!

The great banking houses here make little show. The transactions of the Rothschilds amount to millions a day, and yet the operations are conducted as quietly as the business of a small counting house. You can purchase any stock here. Passing along the street I noticed bonds of the State of California—of several American States—of the United States—bonds in Dutch, Russian, Turkish, Arabic, Spanish, Italian, French—bonds of all lands—of States, cities, towns and companies. The reports of the Frankfort exchange are looked at by European bankers with as much interest as that of London or Paris.

Erlanger, the banker who negotiated the rebel cotton loan, and who fleeced English sympathizers with the South out of fifteen million dollars, has a house here. he has just now taken hold of the new Tunisian loan, but his management of the rebel loan has brought discredit upon his house.

The power of the Red Shield was felt by Prussia last summer. The Prussian Government demanded an indemnity of great amount, twenty-five million dollars, I believe, from the city of Frankfort. The head of the house of the Red Shield informed the Count Bismark that if the attempt was made to enforce that levy he would break every bank in Berlin; that he had the power to do it, and that he should exercise the power. Prussia had won a victory at Konnigratz; but here, in the person of one man, she had met an adversary who had the power to humble her, and she declined the contest. A much lower sum was agreed upon, which was paid by the city.

THE ROTHSCHILDS AND THE POPE.

For fifteen centuries the Jews have been cursed by the Pope, and persecuted by the Roman Church. There is no more revolting chapter of horrors in history than that of the treatment of the Jews at the hands of the Pontiffs. In all lands where the Roman religion is dominant the children of
Israel have been treated with barbaric rigor—allowed few privileges, denied all rights, looked upon as a people accursed of God, and set apart by divine ordination to be trampled upon by the church. In Rome, at the present day, the Jews are confined to the Ghetto; they are not allowed to set up a shop in any other part of the city; they cannot leave the city without a permit; they can engage only in certain trades; they are compelled to pay enormous taxes into the Papal treasury; they are subject to a stringent code of laws established by the Pope for their special government; they are imprisoned and fined for the most trivial of offences. They cannot own any real estate in the city; cannot build or tear down or remodel any dwelling or change their place of business, without Papal permission. They are in abject slavery, with no right whatever, and entitled to no privileges, and receive none, except upon the gracious condescension of the Pope. In former times they were unmercifully whipped and compelled to listen once a week to the *Christian* doctrine of the priests. But time is bringing changes. The Pope is in want of money; and the house of the red shield has money to lend on good security. The house is always ready to accommodate Governments. Italy wants money, so she sells her fine system of railroads to the Rothschilds. The Pope wants money, and he sends his Nuncio to the wealthy house of the despised race, offers them security on the property of the church, the Compagna, and receives ten million dollars to maintain his army and Imperial State. That was in 1865. A year passes, and the Pontifical expenditures are five million more than the income, and the deficit is made up by the Rothschilds, who take a second security at a higher rate of interest. Another year has passed and there is a third great annual vacuum in the Papal treasury of six million, which quite likely will be filled by the same house. The firm can do it with as much ease as your readers can pay their yearly subscription to the weekly *Journal*. When will the Pope redeem his loan at the rate he is going? Never. Manifestly the day is not far distant when these representatives of the persecuted race will have all the available property of the Church in their possession. Surely time works wonders.”

Russians had many reasons to suspect Russian Jews, who were pledged to retaliate against Russian Gentiles for the persecutions they had faced. *The Chicago Daily Tribune* wrote on 21 July 1878 on page 13,

**“BEACONSFIELD’S LUCK.”**

Bismarck’s Hand Disclosed in the
Workings of the Congress
at Berlin.
How the Jew Bankers Revenged
Themselves for Insults to Their
Race.
Correspondence New York Graphic.

London, July 6.—All hail, Beaconsfield!

He is the hero of the hour. He is looked upon by all loyal Englishmen as the pivot on which has turned all the deliberations of the Berlin Congress. But is this the correct view?

Not at all. England’s triumphs at Berlin are simply incidents in the ‘streak of luck’ which has marked the career of this great political adventurer.

I am enabled to furnish the Graphic with the first true account of the recent moves on the chess-board of European politics.

The result of the Congress may be briefly stated as the complete humiliation of Russia. True, she receives Batoum, with conditions that render the concession practically valueless. True, she regains her little strip of Bessarabia that had been given to Roumania, and she is permitted to retain Kars. But it is her rivals who have secured the material advantages at the Congress, and, worse than all, it is England, her special rival, who has been made the chief recipient of the fruits of Russia’s expenditure of blood and treasure.

It is now certain—it will be published in the journals and confirmed in Parliament ere this letter is 1,000 miles on its way to you—that England is to have Cyprus as her own, and is to acquire a protectorate of the whole of Asiatic Turkey, with practically illimitable possibilities of the extension of trade in the Levant and down the Valley of the Euphrates. Egypt is virtually hers; the Suez Canal is absolutely in her control.

Russia has acquired neither facilities for the extension of her trade nor territory; and she has lost all the prestige acquired by the war.

What does this mean?

The answer to this question involves three names—Rothschild, Bismarck, Andrassy.

First, as to Rothschild. The sympathy of the Hebrews all over the world has been with Turkey and against Russia. Russia, in the nineteenth century, has oppressed and persecuted the Jews with the most bitter and malignant cruelty. The hatred of the Greek Church for the Jews to-day is as intense as was that of some of the bigoted Catholics in the Middle Ages for that long suffering and persecuted race. The success of the Russian arms against Turkey filled the Jews with indignation and alarm. The Turks in their rule in Europe and in Asia have been tolerant alike to Christian and to Jew; it may be said they have been forced to award this tolerance; but it was not in violation of their faith nor of the will of their great Prophet, for to this day there exists the authenticated manuscript of the famous decree of Mohammed, in which he commands the faithful to abstain from persecuting and to treat charity and kindness the Jews and Christians dwelling under their rule. But, against the personal wishes of the Czar, the blind and bitter hatred of the Russians for the Jews continually manifests itself, and their persecution of the chosen people has never ceased.
Russia was forced to make great pecuniary sacrifices to keep her armies in the field; she taxed her monetary resources to the utmost; and when the San Stefano treaty had been negotiated and the question of war or peace hung trembling in the balance, she found to her dismay that if she ventured upon a war with England she must reckon with a potent foe, of whose existence she had hitherto been disdainful, if not ignorant.

This foe was the most powerful element in Continental Europe.

All bankers are not Jews. But the Hebrew element among the money-lenders and money-masters of Europe is so widespread and so powerful that it was easy for it to effect combinations by which Russia was shut out from the privilege of borrowing money to continue to renew her march of conquest.

She tried to borrow in England—no money! She sought to effect a loan in Paris—no money! She intrigued through her most skillful agents in all the minor Bourses of Europe—not a rouble could she obtain. And now, as you will probably learn in a few days, she is in such desperate financial straits that, as a last resort, she is about to call upon her patriotic subjects—if she has any—to put their hands in their pockets and lend her their own money,—if they have any, which is doubtful.

Yes! In the very hour of Russia’s military triumph, when, flushed with her dearly-bought victories, and with the Sultan willing to prostrate himself as a vassal at her feet, the despised and persecuted Israelite was able to say to the Czar: ‘Thus far and no farther!’

It was not England who forced Russia to appear before the Berlin Congress, and submit to a revision of her extorted treaty with Turkey.

Russia was forced into this humiliation by the Jew bankers of the world.

Once in the Congress, Gortschakoff and Schouvaloff found to their dismay and horror that they were contending single-handed against all Europe.

Bismarck proved to be the arch enemy of Russia in the Congress, the master-spirit who formed the combination to humiliate her by the Treaty of Berlin after her victories more than she had been humiliated by the Treaty of Paris after her defeats.

Now for a State secret, hinted at in various ways, but which has never come to light in any official form, and the details of which cannot be fully known until after Kaiser William and Prince Bismarck are dead.

Bismarck, with true statesmanlike prescience, detests Russia. Russia is a military power of incalculable possibilities, capable, perhaps, in time, of overrunning and conquering all Europe. A war that would increase the military prestige or augment the territorial domain of Russia, Bismarck regarded with alarm and indignation.

Why, then, did he not put an end to the Russian and Turkish war?

The answer is—Kaiser William.

The German Emperor is swayed by his personal affections and his dynastic prejudices. The old gentleman never had much political sense. He
supposed his personal honor was pledged to Russia. The Czar had not interfered with Prussia in her wars with Austria and France. He, then, should not interfere in Russia’s contest with Turkey. Bismarck had been quite willing to have an amicable understanding with Russia as regarded Austria and France; but he had no intention of permitting Russia to gain a military and territorial predominance that might overshadow Germany.

Thus it was Bismarck who formed the combination that robbed Russia of the fruits of her great victories.

How did he effect this? Here comes in the third name—Andrassy.

The Prime Minister of Hungary, be it remembered, is a Hungarian statesman. Blood with him, also, is thicker than water. He remembers that, when Hungary had German-Austria at her feet in 1848, Russia sent 60,000 troops to the aid of Austria, turned the tide of victory, and crushed out forever the hopes of Hungary for independent neutrality. The hated Slav was thus used to overcome the legitimate and patriotic aspirations of Hungary.

I state upon the best authority that, in the conferences held in the beginning of the late war by Bismarck and Andrassy, the scheme was concocted which culminated in the yet unsigned Treaty of Berlin. It was in these conferences determined that Russia should be despoiled of the fruits of her victories. One of the results is seen in the virtual annexation of Bosnia and Herzegovina by Austria, and the great strengthening of that Power thereby.

Here, then, is the key to the mysteries of the Congress of Berlin. Rothschild, the representative of the Jews, closing the Bourses Europe against Russia; Bismarck, intent on the purpose of curbing and manacling the giant of the North in the interests of Western civilization; Andrassy paving off Russia for the injuries inflicted on Hungary in 1848, and turning her victories into Dead Sea fruit,—pleasant to the sight, but turning to ashes upon the lips.

But how about Disraeli—Beaconsfield? Is he not the real hero of this great dam? Not at all.

True, again, blood with him is thicker than water; and undoubtedly he placed himself in relation with the Jewish money-kings to effect the humiliation of Russia. True, he withdrew the timid and hesitating Lord Derby at the right moment, and put the courageous Marquis of Salisbury in his place. But the cession of Cyprus to England, and investing her with protectorate of Asiatic Turkey, was really the work of Bismarck.

Cyprus should have been given to France. The trade of the Levant properly belongs to her and to Italy more than to England. But Bismarck, in view of the prejudices of his own people,—not that he shares these prejudices, for he is a true statesman, but merely out of deference to these narrow hatreds and dislikes,—was compelled to permit England to take what really belongs to France, and by doing this he has crowned with a new chaplet the brow of that strange personage, the novelist and the political adventurer who is now Premier of England, who will certainly become a
Duke, and who is possibly destined—as gossip will have it—to still further honor, to wear the Royal robes of Prince Consort and to occupy the long vacant bed of ‘Albert the Good.’"

Bismarck followed the advice of, and was at the mercy of, Jewish bankers. As part of the Bolsheviks controlled opposition, Hitler also argued that Pan-Germany could save Western Civilization from Pan-Slavism and Bolshevism. He expected England’s support in this posture. Again and again, from Napoleon onward, Russia was attacked by Western Europe and the central issue was Jews. Whether the pretext was to rescue them or to attack them, the results were to gain control of the Holy Land from Turkey and to use the Jews of Russia to take and to occupy it—then to use the Russian Jews as a slave labor force to construct palatial estates for wealthy Western Jews.

G & C Merriam believed that Bismarck was a Jew, and they expressed this belief, perhaps not coincidentally, in the context of Disraeli and Rothschild. The Chicago Tribune published the following article on 13 March 1872 on page 3:

“THE DICTIONARY QUESTION.
To Jew, a Verb—Jesuitical—Card from the Merriams.

To the Editor of the Springfield (Mass.) Republican:

Some few days since you commented upon the course of the dictionaries in regard to ‘jew’ and Jesuitical.’

In a recently issued circular of ours, which we hand you herewith, replying to certain strictures upon Webster’s definitions of political terms, you will notice the ground the dictionary professes to take in regard to opprobrious and offensive appellations, that of strict impartiality. It is an error of judgment, and not of intention, if that position is not maintained in regard to two words in question. Some few weeks since a respected business acquaintance, Mr. Solomons, of Washington, a Jew, wrote us complaining, in substance, that the use of ‘jew, verb, active, to cheat or defraud; to swindle,’ in Webster, was unjust and unauthorized;—that is, that it wronged his people, and was unsanctioned by good usage. An examination by us disclosed the fact, after a careful collation, that the word as a verb, in any sense, does not appear in any dictionary ever published in England, so far as we have the means at hand of ascertaining. It is not found in Bailey, Johnson, Richardson, Walker, Reid, Smart, Ogilvie, Knowles, etc. The inference seems fair that the word has no recognized use out of this country. It is found in none of the earlier editions of Webster, and first appears in the present. Our attention is now originally called to it, and how it found its way with us, we know not. We fear it must have been drawn from Worcester, where we first find it. Then, as to popular or recognized usage; we do not recall ever seeing it employed in literary composition,—rarely, if ever, to have heard it used colloquially. In these circumstances it seemed due to truth, to our correspondent, and to literary impartiality, to adopt the course pursued.
You allude to it as a ‘Shakspearean word.’ Whilst we think the masterly
delineation of Shylock the Jew, in the Merchant of Venice, by Shakspeare,
thus attaching this offensive characteristic, as a national trait, to the Jewish
race, (and a writer of fiction, in a strongly-drawn character, is usually
understood as justified in a very considerable exaggeration), if not first, yet
most strongly, fastened this feature of a sharp bargainer upon the poor
Hebrew, yet we believe you will nowhere find ‘jew,’ as a verb, employed by
him. We speak only from memory, but such is our strong conviction. Sir
Walter Scott, in Ivanhoe, more justly and more naturally, because giving a
mixed character, presents, in Rebecca the Jewess, one of his loveliest female
portraits, and Isaac her father has noble as well as mercenary traits.

Injustice, perhaps, is done to the Jewish race, by not sufficiently
considering the past and current conditions of their national, or rather race
existence; while the noble traits which characterized them whilst the chosen
people of the Lord, and which still exist, are forgotten or overlooked. Who
ever heard of one depending upon public charity, or un cared for by his race?
Two circumstances seem to have combined to make them a trading people.
The severest civil disabilities, until quite recently enforced against them in
nearly all lands, frequent banishments, and the bitterest persecutions, have
prevented permanent settlements, and agricultural or mechanical pursuits.
They must stand ready to depart at a moment’s notice, and a life of traffic
seemed their only resource. Men, with beautiful, if misplaced faith (yet
eminent Christian scholars, in the light of prophecy, look to their final
restoration to Palestine, with something of its pristine glory), they believe
they are but strangers and pilgrims in all other lands, and are to find rest only
in their own.

The founder of Christianity was himself a Jew, and the race are
‘Israelites, to whom pertaineth the adoption, and the glory and the covenants,
and the giving of the law and the promises; whose are the fathers, and of
whom, as concerning the flesh, Christ came, who is over all, God blessed
forever.’ Should we not hesitate, on this ground alone, about applying an
epithet to the race of somewhat doubtful propriety? So far as our personal
observations goes, the Jews are much like other men, neither essentially
better, nor worse. Certainly, we have known excellent people among them.
One of the most prominent booksellers of Philadelphia a few years since was
a Jew, and liberal and equitable in his dealings. Although with Christian
partners, the store was invariably and closely closed on Saturdays, (on
Sunday’s likewise), thus involving much business sacrifice and negativing,
certainly, inordinate mercenary views, and so presented a marked aspect on
the thronged thoroughfare of Chestnut street. Rothschild, the banker,
Disraeli, the statesman (we have the impression Bismarck, the Prussian
Premier), all Jews, certainly give evidence of extraordinary intellectual
powers, not coupled with unennoblimg traits. The isolated distinctive
existence of the Jewish race, thus secured by Providential causes, as well as
by their own religious faith and rites, while yet they mingle without
commixing with all people, assures, wonderfully, the fulfillment of prophecies uttered more than twenty centuries ago, and it thus a marked proof of the truth of revelation.

We have but a few words in regard to ‘jesuitical.’ In preparing for the revision of the dictionary, we applied, through a Roman Catholic friend, to the late Archbishop Hughes of New York, then at the head of the Catholic prelacy in this country, as to the person of highest scholarship in that Church to whom we could intrust the revision and preparation of Roman Catholic terms. He introduced us to Dr. O’Callghan of Albany, by whom that revision was made. These, of course, were subsequently submitted to President Porter, the editor-in-chief, and as left by him now appear in the dictionary. Jesuitical, as now defined, meets the approval of the scholars and dignitaries of the Catholic Church, who accord to it, as employed in popular use, the signification given in the dictionary, which is also accepted by Protestants. This use in neither colloquial nor local, like ‘jew,’ but is employed by the best writers and speakers, and so has long been. Intelligent men, of whatever faith do not take umbrage at this, and if others do, it is from want of a proper understanding of the province of the lexicographer. Loyola, the founder of the order, as have, presumably, those since connected with it, probably claimed that a ‘higher law’ in divine and religious obligation, was paramount and superior to civil rule and rulers: and hence justified to themselves measures to thwart the latter, unjustifiable on any other supposition. Hence their practices, and the word growing out of them. As with Jews, there might be some sacred associations with the word Jesus, Jesu-itical, to make undesirable the use of the term in an offensive sense, yet the usage seems too well established to be changed. Do we meet your difficulty?

G. & C. Merriam.”

How did Disraeli and Rothschild, both of whom were Zionists, skirt the laws of England and purchase the Suez with Rothschild’s credit? Legend had it that the Rothschilds had demonstrated that they could break the Bank of England at any time. *The Chicago Daily Tribune* published the following article on 21 February 1877 on page 2,

“NATHAN ROTHSCHILD.

His Little Scrimmage with the Bank of England.

Somewhere near a score of years ago, I think, I read the story, then fresh. It has been recalled to my mind by its telling in my presence to an English gentleman, who assured us that he could personally vouch for its truth, he having had business with the old lady of Threadneedle street while the transaction was in progress; and, from this assurance of an eye-witness, I deem the thing worth repeating. I think I remember it as it was told to me.

A bill of exchange, for a large amount, was drawn by Anselm Rothschild, of London. When the gentleman who held it arrived in London, Nathan was away, and he took the bit of paper to the Bank of England, and asked them
there to discount it. The managers were very stiff. With haughty assurance they informed the holder that they discounted only their own bills; they wanted nothing to do with the bills of ‘private persons.’ They did not stop to reflect with whom they had to deal. Those shrewd old fellows in charge of the change of the realm should have known and remembered that that bit of paper bore the sign manual of a man more powerful than they,—more powerful because independent of the thousand-and-one hampers that rested upon them.

‘Umph!’ exclaimed Nathan Rothschild, when the answer of the bank was repeated to him. ‘Private persons! I will give those important gentlemen to know with what sort of private persons they have to deal!’

And then Nathan Rothschild went at work. He had an object in view,—to humble the Bank of England,—and he meant to do it. He sent agents upon the Continent, and through the United Kingdom, and three weeks were spent in gathering up notes of the smaller denominations of the bank’s own issue. One morning, bright and early, Nathan Rothschild presented himself at the bank at the opening of the teller’s department, and drew from his pocketbook a five pound note, which he desired to have cashed. Five sovereigns were counted out to him, the officers looking with astonishment upon seeing the Baron Rothschild troubling himself personally about so trivial a matter. The Baron examined the coins one by one, and, having satisfied himself of their honesty in quality and weight, he slipped them into a canvas bag, and drew out and presented another five pound note. The same operation was gone through with again, save that this time the Baron took the trouble to take a small pair of scales from his pocket and weigh one of the pieces, for the law gave him that right. Two—three—ten—twenty—a hundred—five hundred pound notes were presented and cashed. When one pocketbook had been emptied another was brought forth; and when a canvas bag had been filled with gold it was passed to a servant who was in waiting. And so he went on until the hour arrived for closing the bank; and at the same time he had nine of the employes of the house engaged in the same work. So it resulted that ten men of the house of Rothschild had kept every teller of the bank busy seven hours, and had exchanged somewhere about £22,000. Not another customer had been able to get his wants attended to.

The English like oddity. Let a man do something original and piquant, and they will applaud even though their own flesh is pricked. So the people contrived to smile at the eccentricity of Baron Rothschild, and when the time came for closing the bank, they were not a tenth part so much annoyed as were the customers from abroad, whose business had not been attended to. The bank officials smiled that evening but—

On the following morning, when the bank opened, Nathan Rothschild appeared again, accompanied by his nine faithful helpers, this time bringing with him as far as the street entrance four heavy two-horse drays, for the purpose of carting away the gold, for to-day the Baron had bills of a larger denomination. Ah, the officers of the bank smiled no more, and a trembling
seized them when the banker monarch said, with stern simplicity and directness:

‘Ah, these gentlemen refuse to take my bills. Be it so. I am resolved that I will keep not one of theirs. It is the house of Rothschild against the Bank of England!’

The Bank of England opened its eyes very wide. Within a week the house of Rothschild could be demanding gold it did not possess. The gentlemen at the head of affairs saw very plainly that in a determined tilt the bank must go to the wall. There was but way out of the scrape, and they took it. Notice was at once publicly given that thenceforth the Bank of England would cash the bills of Rothschild as well as its own!—Exchange.”

Under the heading “Foreign Articles”, the following statement appeared in Niles’ Weekly Register, Volume 17, Number 427, (13 November 1819), p. 169,

“Mr. Rothschild, the great London banker, indignant at the persecution of his Jewish brethren in Germany, has refused to take bills upon any of the cities in which they are persecuted; and great embarrassments to trade have been experienced in consequence of his determination. It is intimated that the persecution of the Jews is in part owing to the fact, that Mr. Rothschild and his brethren were among the chief of those who furnished the ‘legitimates,’ with money to forge chains for the people of Europe.”

Not only could no nation claim to be a democracy while the Rothschilds held so much sway in politics, no nation could claim national sovereignty. Michael Shapiro wrote of the Rothschilds, in Shapiro’s book The Jewish 100: A Ranking of the Most Influential Jews of All Time,

“Although their political power would wane after the First World War as more banking houses rose to prominence and competition set in, the Rothschilds helped shape the political fortunes of many of the great figures of the age, including, but certainly not limited to, Napoleon, the Duke of Wellington, Talleyrand, Metternich, Queen Victoria, Disraeli, and Bismarck (and the futures of their countries).”

and of Disraeli,

“With his sister’s fiancé, William Meredith, Disraeli left Britain in 1830 for a ‘Grand Tour’ of the Mediterranean. The sixteen-month trip made a permanent impression on him. Disraeli was particularly taken with Jerusalem. He began to understand the relationship between his Jewish heritage and Christian assimilation. Indeed, this Middle Eastern journey inspired creation of the protagonist of his novel Alroy (1833). Set in an exotic twelfth-century milieu, the character, David Alroy, fails in his attempt to restore the Holy Land to Jewish dominion. Later, in his novel Tancred,
Disraeli’s early Zionism would result in the often quoted line that ‘a race that persists in celebrating their vintage although they have no fruits to gather, will regain their vineyards.’”

Rabbi Emil G. Hirsch was quoted in *The Chicago Tribune* on 5 November 1889 on page 10, and capsulized the disparate views of wealthy “assimilated” Jews many of whom were under Rothschild’s influence, reformed Jews, and Orthodox Jews,

“‘Many orthodox Jews go to Jerusalem to die. They believe that when the resurrection takes place those who are not buried there will have to go there from their graves. In order to avoid the journey after death they go before. The restoration of the City of Jerusalem was a dream of Disraeli and of ‘Daniel Deronda.’ The reformed Jews are entirely indifferent to this question, though the orthodox expect the restoration and rebuilding to take place in some miraculous way.”

Disraeli admitted that the purchase of the Suez was not made as an investment for England, but was a purely political maneuver to draw England into Egypt for the benefit of Zionists and to take Palestine from the Turkish Empire and its native population,

“The noble Lord himself has expressed great dissatisfaction, because I have not told him what the conduct of the Government would be with regard to the Canal in a time of war. I must say that on this subject I wish to retain my reserve. I cannot conceive anything more imprudent than a discussion in this House at the present time as to the conduct of England with regard to the Suez Canal in time of war, and I shall therefore decline to enter upon any discussion on the subject. . . . . What we have to do tonight is to agree to the Vote for the purchase of these shares. I have never recommended, and I do not now recommend this purchase as a financial investment. If it gave us 10 per cent of interest and a security as good as the Consols I do not think an English Minister would be justified in making such an investment; still less if he is obliged to borrow the money for the occasion. I do not recommend it either as a commercial speculation although I believe that many of those who have looked upon it with little favour will probably be surprised with the pecuniary results of the purchase. I have always, and do now recommend it to the country as a political transaction, and one which I believe is calculated to strengthen the Empire. That is the spirit in which it has been accepted by the country, which understands it though the two right honourable critics may not. They are really seasick of the ‘Silver Streak.’ They want the Empire to be maintained, to be strengthened; they will not be alarmed even it be increased. Because they think we are obtaining a great hold and interest in this important portion of Africa—because they believe that it secures to us a highway to our Indian Empire and our other dependencies, the people of England have from the first recognized the propriety and the wisdom of the
step which we shall sanction tonight.”

In an allusion to Shakespeare’s character Shylock in the play *A Merchant of Venice*, The Chicago Daily Tribune reported on 4 July 1881 on page 7,

“**ROTHSCHILD’S POUND OF FLESH**

It appears from the report, too, that the foreign bondholders, mostly French and English, still have possession of the country, and are like the leeches of that valley in the days of Moses. There have been some changes in the physical conditions, and the boundaries of the domain of the security lands have been changed; still, the Government sees to it that the foreign usurers are paid their pound of flesh. Mr. Farman says:

When the decree appeared abolishing the law of the moukabalah, the Rothschilds refused to pay over the balance of the proceeds of the loan then in their hands until other securities were given them. The result was, that, while they consented to the increase of their taxes in an amount of about $500,000, this was not to be paid until their coupons were provided for, and they had also pledged to them, as a further guarantee, the revenues of the Province of Kenah, which contains 283,842 acres of cultivable land, on which the annual tax is $1,478,805. The whole revenues of the province are in excess of this sum.

It will be seen that the interest is amply secured; and that the increase of the taxes caused by the repeal of the law of the moukabalah, so far as relates to lands mortgaged to secure this loan, is only nominal, and cannot injuriously effect the bondholders. In case of a low Nile or bad crops from any other cause, full provision has been made for their coupons. On the occurrence of any such event, it will be the people of Egypt who are to suffer, and not the Parisian or London bankers.”

### 8.3 Jews Provoke Perpetual War

The power and duplicity of Jewish finance again revealed itself in the First World War. In 1920, the Zionist Organization of America, New York, published *A Guide to Zionism*, edited by Jessie E. Sampter, which contained a time-line, which states on pages 238-239, *inter alia*,

“[1914] Sept. Whole press in England begins active agitation for Jewish rights in Russia. [***] [1915] June. Zionist Organization (in Germany) refuses request of Government that it issue appeal to all Zionists asking for sympathy with Germany, replying that it could not involve the Zionist movement in world politics.”

*The New York Times* reported on 30 December 1917 on page 5,
“JEWS IN GERMANY FIRM.
Won’t Support War Loan Until
Palestine Independence Is
Sanctioned.
Special Cable to THE NEW YORK TIMES.
THE HAGUE, Dec. 29.—It is reported here that the leading Jewish financiers of Germany refused to support the German war loan unless the German Government undertook to refrain from all opposition to the establishment of a Jewish State in Palestine, independent of any Turkish suzerainty or control.

By Associated Press.
THE HAGUE, Dec. 29.—The Jewish Correspondence Bureau here has received a telegram from Berlin stating that at a Zionist conference in Germany a resolution was adopted in which satisfaction was expressed that Great Britain had recognized the right of the Jewish people to a national existence in Palestine.”

Eduard Bernstein wrote after the war,

“To many Social Democrats the war really seemed to be one for national existence; and to many passionate natures the opposition of so many Jews to the war credits might have seemed to betray un-German or anti-German thinking. How little such feeling had to do with anti-Semitism can be seen from the fact that those Jews who voted for the war loans were more highly esteemed and sought after than ever.”

After the war, Kaiser Wilhelm II lived in exile in the Netherlands at Doorn. Many in the Jewish controlled press tried to place the blame for the war on him. Baron Clemens von Radowitz-Nei alleged that he had discussed politics with the former Emperor on May 20th, 21st and 22nd of 1922. The Baron reported on his alleged conversations with the former Kaiser in The Chicago Daily Tribune on 3 July 1922 on the front page in an article which continued onto page 4, where the Baron alleged, among other things,

“The former emperor had a very great respect for Dr. Rathenau’s ability, but considered him a great danger to Germany. In the first place, Rathenau was a Jew, and the Kaiser has come apparently to the firm conviction that the Jews are at the bottom of most of the troubles in Germany and Europe.

‘The much talked of Wiesbaden agreement,’ said the former emperor, ‘was not an international agreement. It was an understanding between two groups of capitalists, two great trusts—between Rathenau and the interests represented by Loucheur and Giraud.’

And curiously enough, when I saw Dr. Rathenau a few weeks later, he asked me if many people did not think that—in France.
The Kaiser is convinced that all the evils of the modern world originate with the Jews.

‘A Jew cannot be a true patriot,’ he exclaimed. ‘He is something different—like a bad insect. He must be kept apart, out of a place where he can do mischief—even if by pogroms, if necessary.

‘The Jews are responsible for bolshevism in Russia, and Germany, too. I was far too indulgent with them during my reign, and I bitterly regret the favors I showed to prominent Jewish bankers and business men.’

I notice that one of the generals in attendance on him at the time wore the swastika, symbol of an anti-Semitic organization in Germany.

[The former emperor] was much disturbed by the strong Jewish-Masonic influence in France, and thought that this was at the bottom of much that went wrong.

The Jewish influence among the Young Turks worries him, and he fears that bolshevist elements are becoming too powerful among them; but he thinks that Turkey and Egypt will form the nucleus, sooner or later, of a Moslem bloc.”

The Baron’s allegations also appeared in The New York Times on 3 July 1922 on the front page continuing onto page 3. However, the following statements, which appeared in The Chicago Daily Tribune, were absent in The New York Times:

“[. . .]to the firm conviction that the Jews are at the bottom of most of the troubles in Germany and Europe.”

“The Kaiser is convinced that all the evils of the modern world originate with the Jews. ‘A Jew cannot be a true patriot,’ he exclaimed. ‘He is something different—like a bad insect. He must be kept apart, out of a place where he can do mischief—even if by pogroms, if necessary. ‘The Jews are responsible for bolshevism in Russia, and Germany, too. I was far too indulgent with them during my reign, and I bitterly regret the favors I showed to prominent Jewish bankers and business men.’ I notice that one of the generals in attendance on him at the time wore the swastika, symbol of an anti-Semitic organization in Germany.”

“The Jewish influence among the Young Turks worries him, and[. . .]”

The following statement, which appeared in The New York Times, was absent in The Chicago Daily Tribune:

“Yet, while the former Emperor disliked Rathenau, on the matter of the treaty with the Russian Bolsheviki signed at Rapallo, he was even more indignant
at Baron von Maltzahn, head of the Russian Division of the Foreign Office. That Rathenau should have signed a treaty with the Bolsheviki he thought more or less intelligible, but that a professional diplomat should have thrown in his lot with them was a different and to him far more serious matter."

Kaiser Wilhelm II denied that he had had a political discussion with the Baron, though he admitted that the Baron had visited him. The Kaiser alleged that the visits were limited to non-political small talk about family, and to photo sessions. The Baron reaffirmed that the political discussions took place and The New York Times supported the Baron’s contention that he had visited the Kaiser over the course of three days.1874

The publication of these articles soon after Rathenau’s assassination tended to place the blame for his murder on the Monarchy and on anti-Semitism. The Kaiser had long ago been under the influence of men like Adolf Stoecker and Heinrich von Treitschke, who, like Rathenau, wanted the Jews to assimilate and give up nationalistic ambitions and disloyalties. They quoted Jewish authors like Heinrich Graetz, who, like Moses Hess, stated that Judaism is more than a mere religion, but represents a racial perspective and national culture.

Nevertheless, this was strange talk coming from Kaiser Wilhelm II, who was the grandson of Queen Victoria, a woman who believed that she was directly descended from King David, making Wilhelm his supposed heir as well. The Messiah was to come from the seed of King David (II Samuel 7; 22:44-51; 23:1-5. Isaiah 9:6-7. Jeremiah 23:5; 33:15, 17). Wilhelm II was the proud owner of the “Spear of Destiny”,1875 which had supposedly pierced the side of Jesus and rendered its holder invincible in battle.

General von Ludendorff believed that the Kaiser had betrayed Germany. Ludendorff iterated the common belief that Jews were an enemy of the German People and intimated that they sought to make Germany a Communist state—which in fact did occur in part, in Bavaria, and the Soviets again took over a large part of Germany after the Second World War, creating East Germany out of the Soviet Sector. Ludendorff was quoted in the Chicago Daily Tribune on 1 March 1924 on page 3 in article with the header “‘I Fought Rule by Red or Jew’—Ludendorff”, and his statements were in full agreement with those of Jewish Zionists—it almost appears as if he were scripted by Zionists, like Moses Pinkeles, who discussed such things in his autobiography. The Tribune wrote,

“[. . .]With this introduction Gen. von Ludendorff launched into a long explanation of the reasons for attempting a coup d’état against the republican government, which he sees undermined by the socialist principles of Marxism and pan-Judaism.

‘There cannot be the slightest doubt of my attitude towards the communists,’ he continued. ‘Before the war this Marxist world turned against every military power. Philip Scheidemann said to France, ‘You are not our enemies, but our friends and allies.’

‘In connection with this is the Jewish question. I made its acquaintance
during the war. For me it is a question of race. Little as the Englishmen or Frenchmen can be permitted to obtain domination over us, so little can the Jew be permitted. Freedom of the nation cannot be expected from him. Therefore I was against him.

‘We want a Germany free of Marxism, semitism, and papal influences.’"

*The Dearborn Independent* published an article alleging that the Zionists knew that the First World War was coming long before it came. The article was titled, “Did the Jews Foresee the World War?”, and it appeared on 21 August 1920:

“Fortunately the clue to the answer is supplied to us by unquestionable Jewish sources. The *American Jewish News* of September 19, 1919, had an advertisement on its front page which read thus:

‘WHEN PROPHETS SPEAK
By Litman Rosenthal

Many years ago Nordau prophesied the Balfour Declaration. Litman Rosenthal, his intimate friend, relates this incident in a fascinating memoir.’

The article, on page 464, begins: ‘It was on Saturday, the day after the closing of the Sixth Congress, when I received a telephone message from Dr. Herzl asking me to call on him.’

This fixes the time. The Sixth Zionist Congress was held at Basle in August, 1903.

The memoir continues: ‘On entering the lobby of the hotel I met Herzl’s mother who welcomed me with her usual gracious friendliness and asked me whether the feelings of the Russian Zionists were now calmer.

‘Why just the Russian Zionists, Frau Herzl?’ I asked. ‘Why do you only inquire about these?’

‘Because my son,’ she explained, ‘is mostly interested in the Russian Zionists. He considers them the quintessence, the most vital part of the Jewish people.’

At this Sixth Congress the British Government (‘Herzl and his agents had kept in contact with the English Government’—Jewish Encyclopedia, Vol. 12, page 678) had offered the Jews a colony in Uganda, East Africa. Herzl was in favor of taking it, not as a substitute for Palestine, but as a step toward it. It was this which formed the chief topic of conversation between Herzl and Litman Rosenthal in that Basle hotel. Herzl said to Rosenthal, as reported in this article: ‘There is a difference between the final aim and the ways we have to go to achieve this aim.’

Suddenly Max Nordau, who seems at the conference held last month in London to have become Herzl’s successor, entered the room, and the Rosenthal interview was ended.

Let the reader now follow attentively the important part of this Rosenthal story:—(the italics are ours)
‘About a month later I went on a business trip to France. On my way to Lyons I stopped in Paris, and there I visited, as usual, our Zionist friends. One of them told me that this very same evening Dr. Nordau was scheduled to speak about the Sixth Congress, and I, naturally, interrupted my journey to be present at this meeting and to hear Dr. Nordau’s report. When we reached the hall in the evening we found it filled to overflowing and all were waiting impatiently for the great master, Nordau, who, on entering, received a tremendous ovation. But Nordau, without paying heed to the applause showered upon him, began his speech immediately, and said:

‘You all came here with a question burning in your hearts and trembling on your lips, and the question is, indeed, a great one, and of vital importance. I am willing to answer it. What you want to ask is: How could I—I who was one of those who formulated the Basle program—how could I dare to speak in favor of the English proposition concerning Uganda, how could Herzl as well as I betray our ideal of Palestine, because you surely think that we have betrayed it and forgotten it. Yet listen to what I have to say to you. I spoke in favor of Uganda after long and careful consideration; deliberately I advised the Congress to consider and to accept the proposal of the English Government, a proposal made to the Jewish nation through the Zionist Congress, and my reasons—but instead of my reasons let me tell you a political story as a kind of allegory.

‘I want to speak of a time which is now almost forgotten, a time when the European powers had decided to send a fleet against the fortress of Sebastopol. At this time Italy, the United Kingdom of Italy, did not exist. Italy was in reality only a little principality of Sardinia, and the great, free and united Italy was but a dream, a fervent wish, a far ideal of all Italian patriots. The leaders of Sardinia, who were fighting for and planning this free and united Italy, were the three great popular heroes: Garibaldi, Mazzini, and Cavour.

‘The European powers invited Sardinia to join in the demonstration at Sebastopol and to send also a fleet to help in the siege of this fortress, and this proposal gave rise to a dissension among the leaders of Sardinia. Garibaldi and Mazzini did not want to send a fleet to the help of England and France and they said: ‘Our program, the work to which we are pledged, is a free and united Italy. What have we to do with Sebastopol? Sebastopol is nothing to us, and we should concentrate all our energies on our original program so that we may realize our ideal as soon as possible.’

‘But Cavour, who even at this time was the most prominent, the most able, and the most far-sighted statesman of Sardinia, insisted that his country should send a fleet and beleaguer with the other powers Sebastopol, and, at last, he carried his point. Perhaps it will interest you to know that the right hand of Cavour, his friend and adviser, was his secretary, Hartum, a Jew, and in those circles, which were in opposition to the government, one spoke fulminantly of Jewish treason. And once at an assembly of Italian patriots one called wildly for Cavour’s secretary, Hartum, and demanded of him to
defend his dangerous and treasonable political actions. And this is what he said: ‘Our dream, our fight, our ideal, an ideal for which we have paid already in blood and tears, in sorrow and despair, with the life of our sons and the anguish of our mothers, our one wish and one aim is a free and united Italy. All means are sacred if they lead to this great and glorious goal. Cavour knows full well that after the fight before Sebastopol sooner or later a peace conference will have to be held, and at this peace conference those powers will participate who have joined in the fight. True, Sardinia has no immediate concern, no direct interest in Sebastopol, but if we will help now with our fleet, we will sit at the future peace conference, enjoying equal rights with the other powers, and at this peace conference Cavour, as the representative of Sardinia, will proclaim the free and independent, united Italy. Thus our dream for which we have suffered and died, will become, at last, a wonderful and happy reality. And if you now ask me again, what has Sardinia to do at Sebastopol, then let me tell you the following words, like the steps of a ladder: Cavour, Sardinia, the siege of Sebastopol, the future European peace conference, the proclamation of a free and united Italy.’

‘The whole assembly was under the spell of Nordau’s beautiful, truly poetic and exalted diction, and his exquisite, musical French delighted the hearers with an almost sensual pleasure. For a few seconds the speaker paused, and the public, absolutely intoxicated by his splendid oratory, applauded frantically. But soon Nordau asked for silence and continued:

‘Now this great progressive world power, England, has after the pogroms of Kishineff, in token of her sympathy with our poor people, offered through the Zionist Congress the autonomous colony of Uganda to the Jewish nation. Of course, Uganda is in Africa, and Africa is not Zion and never will be Zion, to quote Herzl’s own words. But Herzl knows full well that nothing is so valuable to the cause of Zionism as amicable political relations with such a power as England is, and so much more valuable as England’s main interest is concentrated in the Orient. Nowhere else is precedent as powerful as in England, and so it is most important to accept a colony out of the hands of England and create thus a precedent in our favor. Sooner or later the Oriental question will have to be solved, and the Oriental question means, naturally, also the question of Palestine. England, who had addressed a formal, political note to the Zionist Congress—the Zionist Congress which is pledged to the Basle program, England will have the deciding voice in the final solution of the Oriental question, and Herzl has considered it his duty to maintain valuable relations with this great and progressive power. Herzl knows that we stand before a tremendous upheaval of the whole world. Soon, perhaps, some kind of a world-congress will have to be called, and England, the great, free and powerful England, will then continue the work it has begun with its generous offer to the Sixth Congress. And if you ask me now what has Israel to do in Uganda, then let me tell you as the answer the words of the statesmen of Sardinia, only applied to our case and given in our version; let me tell you the following words as if I were
showing you the rungs of a ladder leading upward and upward: Herzl, The Zionist Congress, the English Uganda proposition, the future world war, the peace conference where with the help of England a free and Jewish Palestine will be created.’

‘Like a mighty thunder these last words came to us, and we all were trembling and awestruck as if we had seen a vision of old. And in my ears were sounding the words of our great brother Achad Haam, who said of Nordau’s address at the First Congress:

‘I felt that one of the great old prophets was speaking to us, that his voice came down from the free hills of Judea, and our hearts were burning in us when we heard his words, filled with wonder, wisdom and vision.’

The amazing thing is that this article by Litman Rosenthal should ever have been permitted to see print. But it did not see print until the Balfour Declaration about Palestine, and it never would have seen print had not the Jews believed that one part of their program had been accomplished.

The Jew never betrays himself until he believes that what he seeks has been won, then he lets himself go. It was only to Jews that the 1903 ‘program of the Ladder’—the future world war—the peace conference—the Jewish program—was communicated. When the ascent of that ladder seemed to be complete, then came the public talk.”

In the English translation of Max Nordau’s The Interpretation of History, Willey, New York, (1910), p. 293; Nordau employs the image of the ladder,

“The politician uses the parliamentary system as a ladder up which he may climb from being a secretary to a member, parliamentary reporter, or honorary secretary to some political club, to member of a parliamentary committee, member of Parliament itself, party leader, and finally minister.”

The London Times reported on 15 August 1914, on page 3,

“JEW AND GERMAN.

A PROTEST AGAINST UNFAIR SUSPICION.

The Editor of the Jewish Chronicle and Jewish World writes:—

‘Instance after instance has come to my knowledge of the ignorant assumption up and down the country that every Jew is necessarily a German and is hence being made an object of hatred as an enemy of this country. In Germany I learn that our Jews are in a somewhat similar case. But there they are not called ‘German’ Jews, but ‘Russian’ Jews. The fact is, of course, that Jews are by their tradition and, indeed, by absolute Jewish law, bound in loyalty to the country of which they are citizens. The Jew in Germany is no
more German than the German, and the Jew in England is no less English than the English. Even in Russia the Russian Jew, at this hour of Russia’s trial, is as Russian as the Russian.

‘From end to end of the Empire Jews of all classes have shoulder to shoulder with their fellow-citizens manifested their unswerving loyalty in a hundred directions to this country in the righteous cause for which it has drawn the sword. This attitude of our people is perhaps only natural, seeing what the Jews of all the world owe to England for the example she has set in relation to Jews. But I do think it unwise at this juncture in the nation’s affairs that anything should be done or said which it is possible may encourage in the ignorant some doubt about the loyalty of a section of the country’s citizens.’”

Karl Lamprecht published an article in the *Berliner Tageblatt*, on 23 August 1914, arguing that the First World War was a racial war. Some Germans were concerned by the success of Serbia against the Young Turks in the Balkan Wars and feared that it would provide Russia, which allegedly sought to unify all Slavs in a Pan-Slavic Russian Empire and to take Constantinople, in order to establish a port and route into the Adriatic and Mediterranean Seas through Albania and Constantinople. This area of the world had long been a source of international conflict throughout the period of the “Eastern Question” with the wars between Turkey, Russia, England, France, etc. These conflicts were fomented by Zionist Jews.

The political Zionists Theodor Herzl and Max Nordau were both products of the Austro-Hungarian Empire, where the Pan-Germanic and Pan-Slavic forces directly confronted one another. They must have known that this antagonism could provoke a massive conflict. Friedrich August Hayek stated,

“I think the decisive influence was really World War I, particularly the experience of serving in a multinational army, the Austro-Hungarian army. That’s when I saw, more or less, the great empire collapse over the nationalist problem. I served in a baffle in which eleven different languages were spoken. It’s bound to draw your attention to the problems of political organization.”

At the end of the First World War, the breakup of the Austro-Hungarian Empire into small ethnically segregated nations would provide the precedent and the climate for the Zionists’ artificial creation of the nonexistent “small nation” of Israel in Palestine, as if the Jews dispersed among all the nations of the Earth were one small nation among many small nations deserving of recognition and protection by the major powers of Western Europe. Not only would the First World War break up the Austro-Hungarian Empire, it would dissolve Turkish Empire, which owned Palestine. Under the influence of “Colonel” House, the recognition of the rights of minor nations became one of Zionist President Woodrow Wilson’s favorite themes. The Zionists knew that a Peace Conference would be held at war’s end at which they
could petition for the creation of a “Jewish State” in Palestine. The entire war served the interests of the Zionists. They had been planning it and fomenting it for centuries.

Some have argued that the “racial” tribalism of the Pan-Germanic and Pan-Slavic forces was modeled after ancient Judaic tribalism and “racial” nationalism. The political Zionists, many of whom were positivists, were one of many interested parties fanning the fires of “racial”, nationalistic and religious discord in Vienna. Some Zionists believed that these Empires harmed Jews by insisting upon assimilation—the case of Czar’s proclamation against Zionism being a primary example. Horace Mayer Kallen stated, “Pan-Germanism, Pan-Slavism, and all the other panic movements are assimilationist.” The Turkish Empire prevented the formation of a sovereign “Jewish State” in Palestine and encouraged assimilation. Political Zionism preferred smaller democracies where ethnicities were encouraged to segregate. They had plans to eventually wipe out all of these small nations with the force of Communism and replace all nations with a Jewish world government, after they had formed their “Jewish State” in Palestine. But first they had to break up the Gentile Empires.

8.4 Jewish World Government—A Prophetic Desire

Political Zionist Moses Hess forecast a “race war” and “last catastrophe” in 1862. From the 1870's onward in England, the fabulously wealthy businessman Cecil John Rhodes, who was an agent for the Rothschild family, planned for a world government to be led by the British and Americans; because, so he asserted, the English were a master race which had the moral authority to exploit the inferior races. Rhodes was a “pacifist”, who used the liberal sentiment of pacifism to justify tyranny, colonialism and slavery. He was very close to the Rothschild family and Alfred Beit. Rhodes formed a “secret society”—to use his term—of the world’s wealthiest persons, which had as its goal the accumulation of the world’s wealth for the purpose of world domination. Rhodes advocated the reunification of the “English-speaking race”. Rhodes enslaved the blacks he sent to South Africa to work the gold and diamond mines and the British introduced the use of concentration camps to destroy the Boers. Rhodes openly called for a “secret society” patterned after the Jesuits, which he planned would rule the world. The New York Times wrote on 9 April 1902,

“MR. RHODES’S IDEAL OF ANGLO-SAXON GREATNESS

Statement of His Aims, Written for W. T. Stead In 1890,
He Believed a Wealthy Secret Society Should Work to Secure the World’s Peace and a British-American Federation.

LONDON, April 9.—An article on the Right Hon. Cecil J. Rhodes, by
William T. Stead, will appear in the forthcoming number of The American Review of Reviews. The article, excerpts from which follow, consists of a frank, powerful explanation of Mr. Rhodes’s views on America and Great Britain, and for the first time sets forth his own inmost aims. It was written mainly by himself for Mr. Stead in 1890. For originality and breadth of thought it eclipses even his now famous will, yet it is merely a collection of disoriented ideas, hurriedly put together by ‘The Colossus,’ as a summary of a long conversation between himself and Mr. Stead. In those days Mr. Stead was not only one of Mr. Rhodes’s most intimate friends, as indeed he was till the last, but also his executor. Mr. Stead’s name was only removed from the list of the trustees of Mr. Rhodes’s will on account of the Boer war, which forced the two men into such vehement political opposition. Of this, episode Mr. Stead says:

‘Mr. Rhodes’s action was only natural, and, from an administrative point of view, desirable, and it in no way affected my attitude as political confidant in all that related to Mr. Rhodes’s world-wide policy.’

In its three columns of complex sentences the whole of Mr. Rhodes’s international and individual philosophy is embraced. Perhaps it can best be summarized as an argument in favor of the organization of a secret society, on the lines of the Jesuit order, for the promotion of the peace and welfare of the world, and the establishment of an American-British federation, with absolute home rule for the component parts.

‘I am a bad writer,’ says Mr. Rhodes in one part of what might be called his confession, ‘but through my ill-connected sentences you can trace the lay of my ideas, and you can give my idea the literary clothing that is necessary.’

RHODES’S ROUGH NOTES UNEDITED.

But Mr. Stead wisely refused to edit or dress it up, saying:

‘I think the public will prefer to have these rough, hurried, and sometimes ungrammatical notes exactly as Mr. Rhodes scrawled them off, rather than have them supplied with literary clothing by any one else.’

Mr. Rhodes began by declaring that the ‘key’ to his idea for the development of the English-speaking race was the foundation of ‘a society copied, as to organization, from the Jesuits.’ Combined with ‘a differential rate and a copy of the United States Constitution,’ wrote Mr. Rhodes, ‘should be home rule or federation.’ An organization formed on these lines In the House of Commons, constantly working for decentralization and not wasting time on trivial questions raised by ‘Dr. Tanner, or the important matter of O’Brien’s breeches,’ would, Mr. Rhodes believed, soon settle the all-important question of the markets for the products of the empire.

‘The labor’ question,’ Mr. Rhodes wrote, ‘is important, but that is deeper than labor.’

THE MENACE TO BRITISH TRADE.

America, both in its possibilities of alliance and its attitude of commercial rivalry, was apparently ever present in Mr. Rhodes’s mind. ‘The world, with America in the forefront,’ he wrote, ‘is devising tariffs to boycott
your manufactures. This is the supreme question. I believe that England, with
fair play, should manufacture for the world, and, being a free trader, I believe
that, until the world comes to its senses, you should declare war, I mean a
commercial war, with those trying to boycott your manufactures. That is my
programme. You might finish the war by a union with America and universal
peace after a hundred years.’ But toward securing this millennium Mr. Rhodes
believed the most powerful factor would be ‘a secret society, organized like
Loyola’s, supported by the accumulated wealth of those whose aspiration is
a desire to do something,’ and who would be spared the ‘hideous annoyance’
daily created by the thought to which ‘of their incompetent relations’ they
should leave their fortunes. These wealthy people, Mr. Rhodes thought,
would thus be greatly relieved and be able to turn ‘their ill-gotten or Inherited
gains to some advantage.’

Reverting to himself. Mr. Rhodes said:

‘It is a fearful thought’ to feel you possess a patent, and to doubt whether
your life will last you through the circumlocution of the Patent Office. I have
that inner conviction that if I can live I have thought out something that is
worthy of being registered in the Patent Office. The fear is shall I have time
and opportunity? And I believe, with all the enthusiasm bred in the soul of
an inventor, that it is not self-glorification that I desire, but the wish to live
and register my patent for the benefit of those who I think are the greatest
people the world has ever seen, but whose fault is that they do not know their
strength, their greatness, or their destiny, but who are wasting their time in
minor or local matters; but, being asleep, do not know that through the
invention of steam and electricity, and, in view of their own enormous
increase, they must now be trained to view the world as a whole, and not
only to consider the social questions of the British Isles. Even a Labouchere
who possesses no sentiment should be taught that the labor of England is
dependent on the outside world, and that, as far as I can see, the outside
world, if he does not look, out, will boycott the result of English labor.’

Once again the personal feelings of the man crop out. ‘They are calling
the new country Rhodesia,’ he wrote. ‘I find I am human, and should like to
be living after my death. Still, perhaps, if that name is coupled with the
object of England everywhere it may convey the discovery of an idea which
will ultimately lead to the cessation of all wars, and on language throughout
the world, the patent being the gradual absorption of wealth and human
minds of the higher order to the object.’

Here Mr. Rhodes used the sentence cabled to America, in Mr. Stead’s
article of April 4:

‘What an awful thought it is that if, even now, we could arrange with the
present members of the United States Assembly and our House of Commons
the peace of the world would be secured for all eternity! We could hold a
Federal Parliament, five years in Washington and five in London.’

Mr. Rhodes added: ‘The only thing feasible to carry out this idea is a
secret society gradually absorbing the wealth of the world, to be devoted to
such an object.

‘There is Baron Hirsch,’ interpolated Mr. Rhodes, ‘with twenty millions, very soon to cross the unknown border and struggling in the dark to know what to do with his money, and so one might go on ad infinitum.’

‘Fancy,’ Mr. Rhodes goes on to say, the charm to Young America, just coming on, and dissatisfied, for they have filled up their own country and do not know what to tackle next, to share in a scheme to take the government of the whole world. Their present President [Mr. Harrison] is dimly seeing it; but his horizon is limited to the New World, north and south, and so he would intrigue in Canada, Argentina, and Brazil, to the exclusion of England. Such a brain wants but little to see the true solution. He is still groping in the dark, but very near the discovery, for the American has been taught the lesson of home rule and of the success of leaving the management of the local pump to the parish beadle. He does not burden his House of Commons with the responsibility of cleansing the parish drains. The present position of the English House is ridiculous. You might as well expect Napoleon to have found time to have personally counted his dirty linen before he sent it to the wash and to have recounted it upon its return.

‘It would have been better for Europe if Napoleon had carried out his idea of a universal monarchy. He might have succeeded if he had hit upon the idea of granting self-government to the component parts.’

COUNTRIES ‘FOUND WANTING.’

Dealing with the ‘sacred duty of the English-speaking world of taking the responsibility for the still uncivilized world,’ and commenting upon the necessary departure from the map of such countries as Portugal, Persia, and Spain, ‘who are found wanting.’ Mr. Rhodes said:

‘What scope! What a horizon of work for the next two centuries for the best energies of the best people in the world!’

In regard to tariffs, Mr. Rhodes was characteristically positive.

‘I note,’ he wrote, ‘with satisfaction that the committee appointed to inquire into the McKinley tariff, reports that in certain articles our trades have fallen off 50 per cent. Yet the fools do not see that if they do not look out they will have England shut out and isolated, with 90,000,000 to feed and capable of internally supporting about 6,000,000. If they had a statesman they would at the present moment be commercially at war with the United States, and would have boycotted the raw products of the United States until she came to her senses; and I say this because I am a free trader. Your people have not known their greatness. They possess one-fifth of the world and do not know it is slipping away from them. They spend their time in discussing Mr. Parnell and Dr. Tanner, the character of Sir Charles Duke, compensation for beer houses, and omne hoc genus. Your supreme question at present is the seizure of the labor vote for the next election. Read the Australian bulletins and see where undue pandering to the labor vote may lead you. But, at any rate, the eight-hour question is not possible without a union of the English-speaking world; otherwise you drive your manufactures to Belgium,
Holland, and Germany, just as you have placed a great deal of cheap shipping trade the hands of Italy by your stringent shipping regulations.’

Here this ‘political will and testament,’ as Mr. Stead calls it, abruptly breaks off. Mr. Stead, commenting on this, says:

‘It is rough and inchoate and almost as uncouth as one of Cromwell’s speeches. But the central idea glows luminous throughout. Its ideal is the promotion of racial unity on the basis of the principles embodied in the American Constitution.’”

Rhodes’ statement, sans the literary clothing The New York Times supplied, appeared in The American Monthly Review of Reviews, Volume 25, Number 5, (May, 1902), pp. 548-560, at 556-557. Stead had founded this journal in order to promote Rhodes’ millenniumistic vision. Rhodes’ wrote,

“Please remember the key of my idea discussed with you is a Society, copied from the Jesuits as to organization, the practical solution a differential rate and a copy of the United States Constitution, for that is Home Rule or Federation, and an organization to work this out, working in the House of Commons for decentralization, remembering that an Assembly that is responsible for a fifth of the world has no time to discuss the questions raised by Dr. Tanner or the important matter of Mr. O’Brien’s breeches, and that the labor question is an important matter, but that deeper than the labor question is the question of the market for the products of labor, and that, as the local consumption (production) of England can only support about six million, the balance depends on the trade of the world.

That the world with America in the forefront is devising tariffs to boycott your manufactures, and that this is the supreme question, for I believe that England with fair play should manufacture for the world, and, being a Free Trader, I believe until the world comes to its senses you should declare war—I mean a commercial war with those who are trying to boycott your manufactures—that is my programme. You might finish the war by union with America and universal peace, I mean after one hundred years, and a secret society organized like Loyola’s, supported by the accumulated wealth of those whose aspiration is a desire to do something, and a hideous annoyance created by the difficult question daily placed before their minds as to which of their incompetent relations they should leave their wealth to. You would furnish them with the solution, greatly relieving their minds, and turning their ill-gotten or inherited gains to some advantage.

I am a bad writer, but through my ill-connected sentences you can trace the lay of my ideas, and you can give my idea the literary clothing that is necessary. I write so fully because I am off to Masbonaland, and I can trust you to respect my confidence. It is a fearful thought to feel that you possess a patent, and to doubt whether your life will last you through the circumlocution of the forms of the Patent Office. I have that inner conviction that if I can live I have thought out something that is worthy of being
registered at the Patent Office; the fear is, shall I have the time and the opportunity? And I believe with all the enthusiasm bred in the soul of an inventor it is not self-glorification I desire, but the wish to live to register my patent for the benefit of those who, I think, are the greatest people the world has ever seen, but whose fault is that they do not know their strength, their greatness, and their destiny, and who are wasting their time on their minor local matters, but being asleep do not know that through the invention of steam and electricity, and in view of their enormous increase, they must now be trained to view the world as a whole, and not only consider the social questions of the British Isles. Even a Labouchere, who possesses no sentiment, should be taught that the labor of England is dependent on the outside world, and that as far as I can see, the outside world, if it does not look out, will boycott the results of English labor. They are calling the new country Rhodesia, that is from the Transvaal to the southern end of Tanganyika; the other name is Zambesia. I find I am human and should like to be living after my death; still, perhaps, if that name is coupled with the object of England everywhere, and united, the name may convey the discovery of an idea which ultimately led to the cessation of all wars and one language throughout the world [see: Zephaniah 3:9—CJB], the patent being the gradual absorption of wealth and human minds of the higher order to the object.

What an awful thought it is that if we had not lost America, or if even now we could arrange with the present members of the United States Assembly and our House of Commons, the peace of the world is secured for all eternity. We could hold your federal parliament five years at Washington and five at London. The only thing feasible to carry this idea out is a secret one (society) gradually absorbing the wealth of the world to be devoted to such an object. There is Hirsch with twenty millions, very soon to cross the unknown border, and struggling in the dark to know what to do with his money; and so one might go on ad infinitum.

Fancy the charm to young America, just coming on and dissatisfied—for they have filled tip their own country and do not know what to tackle next—to share in a scheme to take the government of the whole world! Their present President is dimly seeing it, but his horizon is limited to the New World north and south, and so he would intrigue in Canada, Argentina, and Brazil, to the exclusion of England. Such a brain wants but little to see the true solution; he is still groping in the dark, but is very near the discovery. For the American has been taught the lesson of Home Rule and the success of leaving the management of the local pump to the parish beadle. He does not burden his House of Commons with the responsibility of cleansing the parish drains. The present position in the English House is ridiculous. You might as well expect Napoleon to have found time to have personally counted his dirty linen before he sent it to the wash, and recounted it upon its return. It would have been better for Europe if he had carried out his idea of Universal Monarchy; he might have succeeded if lie had hit on the idea of
granting self-government to the component parts. Still, I will own tradition, race, and diverse languages acted against his dream all these do not exist as to the present English-speaking world, and apart from this union is the sacred duty of taking the responsibility of the still uncivilized parts of the world. The trial of these countries who have been found wanting—such as Portugal, Persia, even Spain—and the judgment that they must depart, and, of course, the whole of the South American republics. What a scope and what a horizon of work, at any rate, for the next two centuries, the best energies of the best people in the world; perfectly feasible, but needing an organization, for it is impossible for one human atom to complete anything, much less such an idea as this requiring the devotion of the best souls of the next 200 years. There are three essentials (1) The plan duly weighed and agreed to. (2) The first organization. (3) The seizure of the wealth necessary.

I note with satisfaction that the committee appointed to inquire into the McKinley Tariff report that in certain articles our trade has fallen off 50 per cent., and yet the fools do not see that if they do not look out they will have England shut out and isolated with ninety millions to feed and capable internally of supporting about six millions. If they had had statesmen they would at the present moment be commercially at war with the United States, and they would have boycotted the raw products of the United States until she came to her senses. And I say this because I am a Free Trader. But why go on writing? Your people do not know their greatness; they possess a fifth of the world and do not know that it is slipping from them, and they spend their time on discussing Parnell and Dr. Tanner, the character of Sir C. Dilke, the question of compensation for beer-houses, the *omne hoc genus*. Your supreme question at the present moment is the seizure of the labor vote at the next election. Read the *Australian Bulletin* (New South Wales), and see where undue pandering to the labor vote may lead you, but at any rate the eight-hour question is not possible without a union of the English-speaking world, otherwise you drive your manufactures to Belgium, Holland, and Germany, just as you have placed a great deal of cheap shipping trade in the hands of Italy by your stringent shipping regulations which they do not possess, and so carry goods at lower rates.”

William Winwood Reade described the origins of the millennium concept, with its one language, nihilistic “last catastrophe” destruction to renew, world government and lasting peace,

“Those Jews of Judea, those Hebrews of the Hebrews, regarded all the Gentiles as enemies of God; they considered it a sin to live abroad, or to speak a foreign language, or to rub their limbs with foreign oil. Of all the trees, the Lord had chosen but one vine; and of all the flowers but one lily; and of all the birds but one dove; and of all the cattle but one lamb; and of all the builded cities only Sion; and among all the multitude of peoples he had elected the Jews as a peculiar treasure, and had made them a nation of priests
and holy men. For their sake God had made the world. On their account alone empires rose and fell. Babylon had triumphed because God was angry with his people; Babylon had fallen because he had forgiven them. It may be imagined that it was not easy to govern such a race. They acknowledged no king but Jehovah, no laws but the precepts of their holy books. In paying tribute they yielded to absolute necessity, but the tax-gatherers were looked upon as unclean creatures; no respectable men would eat with them or pray with them; their evidence was not accepted in the courts of justice.

Their own government consisted of a Sanhedrin or Council of Elders, presided over by the High Priest. They had power to administer their own laws, but could not inflict the punishment of death without the permission of the procurator. All persons of consideration devoted themselves to the study of the law. Hebrew had become a dead language, and some learning was therefore requisite for the exercise of this profession, which was not the prerogative of a single class. It was a rabbinical axiom that the crown of the kingdom was deposited in Judah, and the crown of the priesthood in the seed of Aaron, but that the crown of the law was common to all Israel. Those who gained distinction as expounders of the sacred books were saluted with the title of rabbi, and were called scribes and doctors of the law. The people were ruled by the scribes, but the scribes were recruited from the people. It was not an idle caste—an established Church—but an order which was filled and refilled with the pious, the earnest, and the ambitious members of the nation.

There were two great religious sects which were also political parties, as must always be the case where law and religion are combined. The Sadducees were the rich, the indolent, and the passive aristocrats; they were the descendants of those who had belonged to the Greek party in the reign of Antiochus, and it was said that they themselves were tainted with the Greek philosophy. They professed, however, to belong to the conservative Scripture and original Mosaic school. As the Protestants reject the traditions of the ancient Church, some of which have doubtless descended viva voce from apostolic times, so all traditions, good and bad, were rejected by the Sadducees. As Protestants always inquire respecting a custom or doctrine, ‘Is it in the Bible?’ so the Sadducees would accept nothing that could not be shown them in the law. They did not believe in heaven and hell because there was nothing about heaven and hell in the books of Moses. The morality which their doctors preached was cold and pure, and adapted only for enlightened minds. They taught that men should be virtuous without the fear of punishment and without the hope of reward, and that such virtue alone is of any worth.

The Pharisees were mostly persons of low birth. They were the prominent representatives of the popular belief, zealous in patriotism as well as in religion—the teaching, the preaching, and the proselytising party. Among them were to be found two kinds of men. Those Puritans of the Commonwealth with lank hair and sour visage and upturned eyes, who wore sombre garments, sniffled through their noses, and garnished their discourse
with Scripture texts, were an exact reproduction, so far as the difference of
place and period would allow, of certain Jerusalem Pharisees who veiled
their faces when they went abroad lest they should behold a woman or some
unclean thing; who strained the water which they drank for fear they should
swallow the forbidden gnat; who gave alms to the sound of trumpet, and
uttered long prayers in a loud voice; who wore texts embroidered on their
robes and bound upon their brows; who followed minutely the observances
of the ceremonial law; who added to it with their traditions; who lengthened
the hours and deepened the gloom of the Sabbath day, and increased the
taxes which it had been ordered should be paid upon the altar.

On the other hand, there had been among the Puritans many men of pure
and gentle lives, and a similar class existed among the Pharisees. The good
Pharisee, says the Talmud, is he who obeys the law because he loves the
Lord. They addressed their god by the name of ‘Father’ when they prayed.
‘Do unto others as you would be done by’ was an adage often on their lips.
That is the law, they said; all the rest is mere commentary. To the Pharisees
belonged all that was best and all that was worst in the Hebrew religious life.

The traditions of the Pharisees related partly to ceremonial matters which
in the written law were already diffuse and intricate enough. But it must also
be remembered that without traditions the Hebrew theology was barbarous
and incomplete. Before the captivity the doctrine of rewards and punishments
in a future state had not been known. The Sheol of the Jews was a land of
shades in which there was neither joy nor sorrow, in which all ghosts or souls
dwelt promiscuously together. When the Jews came in contact with the
Persian priests they were made acquainted with the heaven and hell of the
Zend-Avesta. It is probable, indeed, that without foreign assistance they
would in time have developed a similar doctrine for themselves. Already in
the Psalms and Book of Job are signs that the Hebrew mind was in a
transition state. When Ezekiel declared that the son should not be responsible
for the iniquity of the father nor the father for the iniquity of the son, that the
righteousness of the righteous should be upon him, and that the wickedness
of the wicked should be upon him, he was preparing the way for a new
system of ideas in regard to retribution. But as it was, the Jews were indebted
to the Zend-Avesta for their traditional theory of a future life, and they also
adopted the Persian ideas of the resurrection of the body, the rivalry of the
evil spirit, and the approaching destruction and renovation of the world.

The Satan of Job is not a rebellious angel, still less a contending god: he
is merely a mischievous and malignant sprite. But the Satan of the restored
Jews was a powerful prince who went about like a roaring lion, and to whom
this world belonged. He was copied from Ahriman, the God of Darkness,
who was ever contending with Ormuzd, the God of Light. The Persians
believed that Ormuzd would finally triumph, and that a prophet would be
sent to announce the gospel or good tidings of his approaching victory.
Terrible calamities would then take place; the stars would fall down from
heaven; the earth itself would be destroyed. After which it would come forth
new from the hands of the Creator; a kind of Millennium would be established; there would be one law, one language, and one government for men, and universal peace would reign.

This theory became blended in the Jewish minds with certain expectations of their own. In the days of captivity their prophets had predicted that a Messiah or anointed king would be sent, that the kingdom of David would be restored, and that Jerusalem would become the headquarters of God on earth. All the nations would come to Jerusalem to keep the feast of tabernacles and to worship God. Those who did not come should have no rain; and as the Egyptians could do without rain, if they did not come they should have the plague. The Jewish people would become one vast priest-hood, and all nations would pay them tithe. Their seed would inherit the Gentiles. They would suck the milk of the Gentiles. They would eat the riches of the Gentiles. These same unfortunate Gentiles would be their ploughmen and their vine-dressers. Bowing down would come those that afflicted Jerusalem, and would lick the dust off her feet. Strangers would build up her walls, and kings would minister unto her. Many people and strong nations would come to see the Lord of Hosts in Jerusalem. Ten men in that day would lay hold of the skirt of a Jew saying, ‘We will go with you, for we have heard that God is with you.’ It was an idea worthy of the Jews that they should keep the Creator to themselves in Jerusalem, and make their fortunes out of the monopoly.

In the meantime these prophecies had not been fulfilled, and the Jews were in daily expectation of the Messiah—as they are still, and as they are likely to be for some time to come. It was the belief of the vulgar that this Messiah would be a man belonging to the family of David, who would liberate them from the Romans and become their king; so they were always on the watch, and whenever a remarkable man appeared they concluded that he was the son of David, the Holy One of Israel, and were ready at once to proclaim him king and to burst into rebellion. This illusion gave rise to repeated riots or revolts, and at last brought about the destruction of the city.

But among the higher class of minds the expectation of the Messiah, though not less ardent, was of a more spiritual kind. They believed that the Messiah was that prophet, often called the Son of Man who would be send by God to proclaim the defeat of Satan and the renovation of the world. They interpreted the prophets after a manner of their own: the kingdom foretold was the kingdom of heaven, and the new Jerusalem was not a Jerusalem on earth but a celestial city built of precious stones and watered by the Stream of Life.

Such were the hopes of the Jews. The whole nation trembled with excitement and suspense; the mob of Judea awaiting the Messiah or king who should lead them to the conquest of the world; the more noble-minded Jews of Palestine, and especially the foreign Jews, awaiting the Messiah or Son of Man who should proclaim the approach of the most terrible of all events. There were many pious men and women who withdrew entirely from the
cares of ordinary life, and passed their days in watching and in prayer.

The Neo-Jewish or Persian-Hebrew religion, with its sublime theory of a single god, with its clearly defined doctrine of rewards and punishments, with its one grand duty of faith or allegiance to a divine king, was so attractive to the mind on account of its simplicity that it could not fail to conquer the discordant and jarring creeds of the pagan world as soon as it should be propagated in the right manner. There is a kind of natural selection in religion; the creed which is best adapted to the mental world will invariably prevail, and the mental world is being gradually prepared for the reception of higher and higher forms of religious life. At this period Europe was ready for the reception of the one-god species of belief, but it existed only in the Jewish area, and was there confined by artificial checks. The Jews held the doctrine that none but Jews could be saved, and most of them looked forward to the eternal torture of Greek and Roman souls with equanimity, if not with satisfaction. They were not in the least desirous to redeem them; they hoarded up their religion as they did their money, and considered it a heritage, a patrimony, a kind of entailed estate. There were some Jews in foreign parts who esteemed it a work of piety to bring the Gentiles to a knowledge of the true God, and as it was one of the popular amusements of the Romans to attend the service at the synagogue a convert was occasionally made. But such cases were very rare, for in order to embrace the Jewish religion it was necessary to undergo a dangerous operation and to abstain from eating with the pagans—in short, to become a Jew. It was therefore indispensable for the success of the Hebrew religion that it should be divested of its local customs. But however much the Pharisees and Sadducees might differ on matters of tradition, they were perfectly agreed on this point, that the ceremonial laws were necessary for salvation. These laws could never be given up by Jews unless they first became heretics, and this was what eventually occurred. A schism arose among the Jews: the sectarians were defeated and expelled. Foiled in their first object, they cast aside the law of Moses and offered the Hebrew religion without the Hebrew ceremonies to the Greek and Roman world. We shall now sketch the character of the man who prepared the way for this remarkable event.

It was a custom in Israel for the members of each family to meet together once a year that they might celebrate a sacred feast. A lamb roasted whole was placed upon the table, and a cup of wine was filled. Then the eldest son said, ‘Father, what is the meaning of this feast?’ And the father replied that it was held in memory of the sufferings of their ancestors, and of the mercy of the Lord their God. For while they were weeping and bleeding in the land of Egypt there came his voice unto Moses and said that each father of a family should select a lamb without blemish from his flock, and should kill it on the tenth day of the month Abib, at the time of the setting of the sun; and should put the blood in a basin, and should take a sprig of hyssop and sprinkle the door-posts and lintel with the blood; and should then roast the lamb and eat it with unleavened bread and bitter herbs. They should eat it as
if in haste, each one standing with his loins girt, his sandals on his feet, and his staff in his hand. That night the angel of the Lord slew the first born of the Egyptians, and that night Israel was delivered from her bonds.

When the father had thus spoken the lamb was eaten, and four cups of wine were drunk, and the family sang a hymn. At this beautiful and solemn festival all persons of the same kin endeavoured to meet together, and Hebrew pilgrims from all parts of the world journeyed to Jerusalem. When they came within sight of the Holy City and saw the Temple shining in the distance like a mountain of snow, some clamoured with cries of joy, some uttered low and painful sob. Drawing closer together, they advanced towards the gates singing the Psalms of David, and offering up prayers for the restoration of Israel.

At this time the subscriptions from the various churches abroad were brought to Jerusalem, and were carried to the Temple treasury in solemn state; and at this time also the citizens of Jerusalem witnessed a procession which they did not like so well. A company of Roman soldiers escorted the lieutenant-governor, who came up from Caesarea for the festival that he might give out the vestments of the High Priest, which, being the insignia of government, the Romans kept under lock and key.

It was the nineteenth year of the reign of Tiberius Caesar. Pontius Pilate had taken up his quarters in the city, and the time of the Passover was at hand. Not only Jerusalem, but also the neighbouring villages, were filled with pilgrims, and many were obliged to encamp in tents outside the walls.

It happened one day that a sound of shouting was heard; the men ran up to the roofs of their houses, and the maidens peeped through their latticed windows. A young man mounted on a donkey was riding towards the city. A crowd streamed out to meet him, and a crowd followed him behind. The people cast their mantles on the road before him, and also covered it with green boughs. He rode through the city gates straight to the Temple, dismounted, and entered the holy building. In the outer courts there was a kind of bazaar in connection with the Temple worship. Pure white lambs, pigeons, and other animals of the requisite age and appearance were there sold, and money merchants, sitting at their tables, changed the foreign coin with which the pilgrims were provided. The young man at once proceeded to upset the tables and to drive their astonished owners from the Temple, while the crowd shouted and the little gamins, who were not the least active in the riot, cried out, ‘Hurrah for the son of David!’ Then people suffering from diseases were brought to him, and he laid his hands upon them and told them to have faith and they would be healed. When strangers inquired the meaning of this disturbance they were told that it was Joshua—or—as the Greek Jews called him, Jesus—the Prophet of Nazareth. It was believed by the common people that he was the Messiah. But the Pharisees did not acknowledge his mission. For Jesus belonged to Galilee, and the natives of that country spoke a vile patois, and their orthodoxy was in bad repute. ‘Out of Galilee,’ said the Pharisees with scorn, ‘out of Galilee there cometh no
prophet.’

All persons of imaginative minds know what it is to be startled by a thought; they know how ideas flash into the mind as if from without, and what physical excitement they can at times produce. They also know what it is to be possessed by a presentiment, a deep, overpowering conviction of things to come. They know how often such presentiments are true, and also how often they are false.”

Like the firstborn of Egypt, the story of Jesus (the lamb of God) is the story of bloody human sacrifice for the sake of Jewish “restoration to Palestine”—in this instance God sacrifices his firstborn child, just as the Jews had so often sacrificed their own children to Baal.

In Austria, Georg Schönerer, or Georg Ritter von Schönerer, agitated for Pan-Germanism, or an Alldeutscher Verband, in which all members of the “German race” or “Aryan Race” would unite to form a unified state with broad borders across Middle Europe. Schönerer advocated the segregation of Jewish children from Christian schools, a goal of the Zionists. He also founded a worker’s party, which eventually morphed into the NSDAP. Schönerer was staunchly anti-Catholic and founded the Los von Rom Bewegung. In 1892, a thirty page pamphlet appeared entitled Ein deutsches Weltreich?, Sammlung deutscher Schriften, Volume 7, Lüstenöder, Berlin. This brochure called for the “German races” to unite and form an empire to rule the world. Between the British Imperialist racists and the German Imperialist racists, between the remnants of the Holy Roman Empire (the Catholics of France and Italy) and the Ottoman Turks, Moses Hess’ Pan-Judaic Zionists had the makings of their Biblical race war to end all wars, and they did what they could to provoked it. They planned to eventually replace all the other empires they had pitted against one another with a universal Jewish Empire.

8.5 Puritans and Protestants Serve Jewish Interests

Racist Zionist Moses Hess was one of the founders of the Jewish Communist factions. The Jewish Communists, with their blind and brutal cult following, looked forward to a devastated Europe, which weakened world would enable them to take over the Earth through violent revolt. The Communists’ world of universal “equality”, would give every Gentile an equal opportunity to slave for Jewish leadership—as prophesied in Isaiah. The Communists justified their dark visions of ultimate destruction with the same false premise as the Jews and Christians, that a new millennium would occur after the devastation, and the Earth would become a Utopia. All their terrible attacks on humanity and their Socialist dictatorships were merely transitional phases working toward the Utopia of Communism, the Jewish “End Times”.

It is interesting to note that the Communists in Russia prevented wealth accumulation and the pooling of investment capital for decades, which left Russia, after having shaken off the yoke of Communism, vulnerable to another Jewish takeover led by Jewish financiers. From the beginning, the Communists drew off the
wealth of Russia and fed it to the Jewish financiers who had funded and organized the Russian Revolution. Communism always served the interests of Jewish Capitalists.

Like the Communism the Jews gave the Christians, Christianity itself also taught Gentiles that wealth accumulation was immoral. This worked against the interests of the Gentiles, while providing more opportunities for Jews to accumulate the Christians’ wealth. Jewish sponsored Christianity led the Romans and Europe into the Dark Ages. It was the more Judaically minded Protestants, with their Judaic concept of the “elect” (Isaiah 65. Enoch) that justified wealth accumulation, who materialistically prospered under a new form Judaized Christianity—at the expense of the colonial peoples—and resulting in the second destruction of a Roman Empire, the slow decline of the Roman Catholic Church. The Protestants became the parasites of the “Third World” colonies.

One suspects that Cabalists and other Jews may have been the instigators of the Christian Reformation; for they, more than anyone else, were opposed to Catholicism, that second Roman Empire which according to them: worshiped idols, treated the Pope as they would treat a Jewish Messiah, gave the Pope the authority to interpret God’s word while taking away that right from Rabbis and individuals, and stood in the way of Jewish desires on Jerusalem. There was also the issue of faith versus works.

Jewish mythology holds that nations which worship idols must be exterminated (Exodus 34:11-17. Isaiah 65; 66. Ezekiel), and that when this divine obligation is accomplished, the Jews will rule the world. The Talmud teaches in one opinion that “heathens” can annul idols and that Jews can use force to make heathens annul their idols (Abodah Zarah 43a). The annulment of Catholic idol worship was one of the main goals of the Reformation. Frankist Jews became Catholics in order to undermine the religion, in order annul the worship of idols and ruin the authority of the Pope. The Illuminati and Free Masonry sought to destroy “superstitious” religion. The Communists use force to make other religions annul their idols.

Catholicism became the focal point of Jewish genocidal hatred and mythology. They had a model for the Reformation in the lives, writings and practices of Jon Wycliffe and Jan Hus. All they lacked were spokesmen in the Christian community, whom they recruited in the form of their friend Martin Luther, as well as John Calvin (some claim “Calvin” is a corruption via “Cauin” of “Cohen”—the man had a classical Jewish appearance) and the new Enoch—Melchior Hofmann, Ignatius Loyola, the father of the Jesuits, etc.

There are many allegations of a long term plan carried out by Prussian Protestants, French free thinkers, the Illuminati and Freemasonry to convert Catholics to Judaism and eventually atheism. This charge was strongly brought forth after the French Revolution by John Robison and Abbé Barruel. The alleged plan to subjugate the world to a tyranny of hypocrites preaching disingenuous Liberalism took on its ultimate protagonist in Marx’s Communism, which failed in its promise of a liberal Utopia, but succeeded quite well in its nihilistic ambitions. More recent accusations include, among many others: George Pitt-Rivers’, World Significance of the Russian Revolution, B. Blackwell, Oxford, (1920); Nesta Helen
Martin Luther had direct and indirect connection to Cabalistic Jews, influential Jews and anti-Semitic Jews, who claimed to have converted to Christianity, including: Konrad Mutian (a. k. a. Conradus Mutianus Rufus), Johann Reuchlin, Pico della Mirandola, Jakob Questenberg, Jakob ben Jehiel Loans, Obadja Sforno of Cesena, Johann Pfefferkorn, etc. Note that in the Dualistic and dialectical terms of the Cabalah, both anti-Semites, and the defenders of Judaism as a “racial” and nationalistic sect, serve the same purpose—the beloved hateful segregation of the Jews from the Gentiles, after which the Jews sought.  

For Cabalistic Jews, both evil and good are functions of, and serve, God. Contemporary Jews believed that Martin Luther was preparing the way for the arrival of the Jewish Messiah. The Encyclopaedia Judaica writes in its article “Messianic Movements”:

“About the same time many Jews pinned their hopes on Martin *Luther as a man who had come to pave the way for the Messiah through gradually educating the Christians away from their idolatrous customs and beliefs."  

Luther caused the slaughter of countless Christians, then caused Christian enmity towards Jews—which were Zionist aspirations.  

Malachi 3:1 and 4:5 speak of a forerunner of the Messiah who will prepare the way, like John the Baptist (Matthew 11:10). Cabalist Jews considered Martin Luther (1483-1546) to have been this forerunner,

“Behold, I will send my messenger, and he shall prepare the way before me: and the LORD, whom ye seek, shall suddenly come to his temple, even the messenger of the covenant, whom ye delight in: behold, he shall come, saith the LORD of hosts. [***] Behold, I will send you Elijah the prophet before the coming of the great and dreadful day of the LORD:”

Some Cabalist Jews believed that Isaac ben Solomon Luria (1534-1572) was “the Messiah, son of Joseph” (as opposed to: “the Messiah, son of David”). Luria formulated a new Cabalistic dogma, which preached Metempsychosis and emphasized the Messianic prophecies in a way that was forbidden in the Talmud (Kethuboth 111a). The Lurian Cabalah inspired Shabbatai Zevi and Jacob Frank, both of whom claimed to be the Davidic Messiah—Frank claiming to have received the soul of the Messiah of Shabbatai Zevi through Cabalistic Metempsychosis—the transmigration of souls.

The Messiahship was believed to have been a dynasty of Jewish Kings descended from Joseph and David—in fact many myths alleged that their were two Messiahs, one a sacrificial warrior, and the other a genocidal tyrant to rule over the entire Earth. Many believe that the Lurian Cabalah became the basis for the Hasadic dynasty of the Lubavitchers, whose descendants today claim that the Jewish Messiah is among
us. They are eagerly waiting to anoint him King of the Jews.

The followers of this Hasidic dynasty were said to number 3,000,000 strong in 1930, and are, so some claim, the descendants of the Frankists of Poland and Russia. Jacob Frank taught that both good and evil are necessary functions of God, and that Jews should cause rampant evil in the world in order to hasten the coming of the Messianic Era.

Frank taught that since God is hidden in all things and yet controls them, and since Jews are to humanity what God is to the Universe, Jews should act as a hidden force controlling humanity. He taught his followers to feign conversion to other religions, as Shabbatai Zevi had, so as to infiltrate other religions and governments and, once in power, destroy them. Frank taught his followers to engage in sexual orgies and practice other forms of depravity—practices allegedly common among some groups of Hasidic Jews as evidenced in their frequent fits of frantic dancing.

Many of the descendants of Jacob Frank have come to America and live as crypto-Jews. Hasidic Jews tend to be very secretive.

The Lubavitchers were initially outspoken anti-Zionists. It shocked many when the last of the Lubavitch Dynasty, the Rebbe whose life was to herald the coming of the Messiah, the seventh Rebbe in the line, Rebbe Menachem Mendel Schneerson, declared that he was a Zionist and that the Messiah is here alive among us. One wonders if this influential dynasty had been secretly planning the rise of Israel for centuries—if they had employed Frankist followers to destroy governments and religions and create bloody wars. The Lubavitchers were notoriously racist and considered Gentiles to be something less than human. The Talmud states that Gentiles are subhuman at Baba Mezia 108b and 114b.

The Zionist racists who believe that they are the divine leaders of the world, will, if successful, destroy all nations and replace them with a world government led from Jerusalem by the King of the Jews. They will proscribe all religions other than Judaism and will force Gentiles into atheism. Then they will systematically exterminate all Gentiles.

Zionism is based on the Judaic myth of a new Utopian millennium following world-wide nihilistic devastation—which is to say Utopian for “righteous Jews”, hellish for non-racist Jews and Gentiles. Judaism and Christianity make the Christians vulnerable to an absolute genocidal Zionist tyranny, in that Judaism asked Gentiles to slave and fight for Jews, and Christianity promotes a slavish mentality and a self-defeating fatalism which sponsors the suicidal belief that the worse one’s conditions are, the better off one is in God’s eyes.

8.6 The Planned Apocalypse

Since God had not yet brought about the horrific wars prophesied in the end times, some Jews began to intervene on God’s behalf. In the 1800’s, Baron Edward Bulwer-Lytton wrote of an extraordinary “occult” force called “Vril”, which was so destructive that it resulted in peace among those who could control it, because it assured mutual destruction between combatants. His book was titled The Coming Race: Or the New Utopia. Lord Lytton wrote of a race of giants descended from
Aryans which lived below the surface of the Earth, flew about on artificial wings, and which would one day again surface to exterminate all who lived on the surface of the Earth.

Lytton’s tale recalls the Jewish myth of the race of giants bred from women and angels told in the Old Testament and the book of Enoch. It is also derivative of the Hindu myths of the Nagas, a serpent-human cross which lives underground. Lytton had his angelic characters instruct us that humans evolved from tadpoles in a Lamarckian manner and in a process of natural and sexual selection (this before Spencer, Wallace and Darwin, though much after Empedocles), that souls undergo reincarnation pursuant to the principles of Metempsychosis, that the name of God must not be written, that all forces are unified, that form should follow function, that the principle of logical economy made dictatorships more reasonable than democracies, that we should practice vegetarianism, that enemy races must be unemotionally and mercilessly exterminated, etc. Many of these ideas, which stem from various sects of Judaism and Hinduism, found their way into Nazi mythology.

In the Bible, the angels, like Lytton’s children of the underworld, committed genocide and other atrocities against human beings. In Lytton’s book, six children could—like the Lord’s angels—destroy thirty million of us, by harnessing the force of “Vril”, an ethereal fluid as destructive as nuclear bombs.

This fantasy of alien races and super forces later became a facet of Thule-Gesellschaft mythology, which influenced Adolf Hitler and several other prominent Nazis. They taught that Aryans descended from aliens from outer space, which had interbred with humans. Other Earthly sub-human races were akin to the apes.

This mythology has roots in Jewish mythologies centered around the Biblical people called Nefilim, and more broadly around the Gentiles. Jewish myth has it that this people called Nefilim is descended from a mixture of fair humans and angels who fell from heaven to fall in love with the beautiful human women whose beauty had seduced them, much like Adam was tempted to sin by a woman—much like the Sirens who seduced sailors into suicide. For their sin, God banished the angels from the future world as He had banished Adam from the Garden—yet another instance of misogyny in Jewish mythology. Another Jewish myth also holds that the Gentiles are descended from a race begun by the fornication of Eve with the serpent who tempted her—an attack transferred to Jews themselves by the Apostate crypto-Jews who founded the Christian Identity movement in America.

There is also a Jewish myth which holds that angels dubbed “Watchers” fell from heaven to Earth, became men, and bred with the fair daughters of the Earth to produce a race of giants, who were evil and destructive. This myth holds that the angels taught humans the secrets of nature and that this is how evil came to the world. After fornicating with women, the angels lost their immortality. This mythology, which again mirrors the story of Adam and Eve, is one of the major themes of the book of Enoch, which is probably in large part a plagiarism of the story of Gilgamesh. The apocalyptic book of Enoch contains much that later appeared in the Reformation of the Protestants and in the “second Reformation” of the Puritans, with their emphasis on the mythology of the “elect”, the destruction of the Earth, damnation, and their hatred and reluctance to look to redeem those who
have sinned against them (Isaiah 65; 66. Enoch); which tends to indicate that Jews, especially Cabalistic Jews, were the driving force behind the Reformation and Puritanism, which had as their main goal the destruction of Roman Catholicism.

The apocalyptic works derive from the flood story told in the legends of Gilgamesh, and the flood is a genocide meant to cleanse the Earth of the unclean mixture of the blood of angels which had commingled with humans and other animals through angelic miscegenation with women and animals. The character Enoch parallels Enmeduranna and Noah replicates Utnapishtim. In Jewish mythology, the angels brought evil to the world and taught humans to do wrong.

The ultimate source of the giant myths, as told in Gilgamesh, Enoch, the book of Giants, and in the legends of the Greeks, is probably to be found in dinosaur, elephant, mastodon and mammoth bones; which Adrienne Mayor has shown were kept in ancient temples and which were believed to be the bones of the legendary giant beasts and men. Christian Messianic and apocalyptic mythology certainly derives not only from the prophecies found in the Old Testament, but also from the genocidal book of Enoch, with its “Elect” and “Elect One”, and the book of Giants, which were valued by the Essenes who created, or at least contributed to, the Christian myth. These dangerous mythologies each teach their blind adherents to welcome genocide, and they provide a religious basis for the mass murder of our fellow human beings and the destruction of our natural environment.

In another instance of Jewish genocidal hatred, the book of Enoch calls for the extermination of the “seed of Cain”, which “race” descended from the evil mixture of the “angels” with women. This gives Jews religious license to mercilessly mass murder any group which they oppose. It is interesting that the genocidal Nazis, as a philosophical movement, sprang forth from, and adopted, the ancient Jewish myths expressed in the book of Enoch. One also sees the book of Enoch in the legend of Faust, and the story of Mohammed and his flight with Gabriel.

William Winwood Reade published an influential book which applied Darwinist principles to history, The Martyrdom of Man, Trübner & Co., London, (1872). This work influenced Cecil John Rhodes, among many others. Reade discussed various revolutionary movements and concluded that they would next destroy religion—he very much wanted to destroy Christianity—a goal he had in common with Talmudic writers,

“The anti-slavery movement, which we shall now briefly sketch, is merely an episode in that great rebellion against authority which began in the night of the Middle Ages; which sometimes assumed the form of religious heresy, sometimes of serf revolt; which gradually established the municipal cities, and raised the slave to the position of the tenant; which gained great victories in the Protestant Reformation, the two English Revolutions, the American Revolution, and the French Revolution; which has destroyed the tyranny of governments in Europe, and which will in time destroy the tyranny of religious creeds.”

Reade saw that Communism was patterned after the Christian faith, with its
homogenous and obedient followers; and the damnation of the wealthy, which led Christians to accept their own misery with joy,

“A young man named Joshua or Jesus, a carpenter by trade, believed that the world belonged to the devil, and that God would shortly take it from him, and that he the Christ or Anointed would be appointed by God to judge the souls of men, and to reign over them on earth. In politics he was a leveller and communist, in morals he was a monk; he believed that only the poor and the despised would inherit the kingdom of God. All men who had riches or reputations would follow their dethroned master into everlasting pain. He attacked the churchgoing, sabbatarian ever-praying Pharisees; he declared that piety was worthless if it were praised on earth. It was his belief that earthly happiness was a gift from Satan, and should therefore be refused. If a man was poor in this world, that was good; he would be rich in the world to come. If he were miserable and despised, he had reason to rejoice; he was out of favour with the ruler of this world, namely Satan, and therefore he would be favoured by the new dynasty. On the other hand, if a man were happy, rich, esteemed, and applauded, he was for ever lost. He might have acquired his riches by industry; he might have acquired his reputation by benevolence, honesty, and devotion; but that did not matter; he had received his reward. So Christ taught that men should sell all that they had and give to the poor; that they should renounce all family ties; that they should let tomorrow take care of itself; that they should not trouble about clothes: did not God adorn the flowers of the fields? He would take care of them also if they would fold their hands together and have faith, and abstain from the impiety of providing for the future. The principles of Jesus were not conducive to the welfare of society; he was put to death by the authorities; his disciples established a commune; Greek Jews were converted by them, and carried the new doctrines over all the world. The Christians in Rome were at first a class of men resembling the Quakers. They called one another brother and sister; they adopted a peculiar garb, and peculiar forms of speech; the Church was at first composed of women, slaves, and illiterate artisans but it soon became the religion of the people in the towns. All were converted excepting the rustics (pagani) and the intellectual freethinkers, who formed the aristocracy. Christianity was at first a republican religion; it proclaimed the equality of souls; the bishops were the representatives of God, and the bishops were chosen by the people. But when the emperor adopted Christianity and made it a religion of the state, it became a part of imperial government, and the parable of Dives was forgotten. The religion of the Christians was transformed; its founder was worshipped as a god; there was a doctrine of the incarnation; they had their own holy books, which they declared to have been revealed; they established convents, and nunneries, and splendid temples, adorned with images, and served by priests with shaven heads, who repeated prayers upon rosaries, and who taught that happiness in a future state could best be obtained by long prayers and by liberal presents
to the Church. In the Eastern or Greek world, Christianity in no way assisted civilisation, but in the Latin world it softened the fury of the conquerors, it aided the amalgamation of the races. The Christian priests were revered by the barbarians, and these priests belonged to the conquered people.”

The Communists replaced the slavish dogma of Christianity with the slavish dogma of Marx, making their leaders the new gods and breaking the power of the emerging democracies of Europe, which had led to the assimilation of the Jews. Reade believed that war had many beneficial effects for humanity, though he predicted that weapons of mass destruction would eventually make war unthinkable,

“Thus war will, for long years yet to come, be required to prepare the way for freedom and progress in the East; and in Europe itself, it is not probable that war will ever absolutely cease until science discovers some destroying force, so simple in its administration, so horrible in its effects, that all art, all gallantry, will be at an end, and battles will be massacres which the feelings of mankind will be unable to endure.”

The same principle of assured mutual destruction, with which we are all familiar in this age of nuclear weapons, had already appeared in the writings of Edward Bulwer-Lytton. In *The Coming Race*, Lord Lytton wrote, at least as early as 1848,

“But the effects of the alleged discovery of the means to direct the more terrible force of vril were chiefly remarkable in their influence upon social polity. As these effects became familiarly known and skillfully administered, war between the Vril-discoverers ceased, for they brought the art of destruction to such perfection as to annul all superiority in numbers, discipline, or military skill. The fire lodged in the hollow of a rod directed by the hand of a child could shatter the strongest fortress, or cleave its burning way from the van to the rear of an embattled host. If army met army, and both had command of this agency, it could be but to the annihilation of each. The age of war was therefore gone, but with the cessation of war other effects bearing upon the social state soon became apparent. Man was so completely at the mercy of man, each whom he encountered being able, if so willing, to slay him on the instant, that all notions of government by force gradually vanished from political systems and forms of law. It is only by force that vast communities, dispersed through great distances of space, can be kept together; but now there was no longer either the necessity of self-preservation or the pride of aggrandizement to make one State desire to preponderate in population over another.”

Henri de Saint-Simon predicted the end of war due to the destructive force of modern technologies, in the early 1800's. He also argued for a United Nations, a world government, and a socialistic world in which science liberated mankind. His concepts were derivative of Francis Bacon’s Seventeenth Century work, *New
Atlantis, which in turn is derivative of Campanella’s Civitas Solis and Sir Thomas More’s Utopia—all these Utopian works deriving from Plato’s description of Atlantis in his Timeus. It is interesting to note that Saint Simon of Trent was a young Christian boy who was murdered on 21 March 1475. It was alleged that a group of Rabbis had ritually murdered the boy in order to ridicule Christ and use the boy’s blood in the matzoh for Passover. He was made a Saint and became one of the most popular Saints in history.

In 1913, H. G. Wells crafted a novel which envisioned many of the events which later took place in the First World War and in the Second World War. This novel was titled, The World Set Free: A Story of Mankind, Macmillan, London, (1914); also published in Leipzig, Germany, by B. Tauchnitz. Wells’ story tells of a “world war” which ends when “atomic bombs” fall and a “world government” is formed. Wells later published The Open Conspiracy; Blue Prints for a World Revolution, V. Gollancz Ltd., London, (1928); and several other related works. Wells’ book inspired Michael Higger to publish a depiction of the rabbinical “Utopia” Zionists had planned for their domination of the Earth entitled: The Jewish Utopia, Lord Baltimore Press, Baltimore, (1932). Racist Zionist Albert Einstein used his fame to promote world government, an ideal which in the Old Testament, as well as Cabalistic and Talmudic writings, takes the form of universal Jewish rule and the subjugation and eventual extermination of the Gentiles.

Many believed and believe that the events of the Twentieth Century fulfilled many of the Bible’s prophecies. Many of these persons do not recognize the willful intervention of groups who organized themselves for the expressed purpose of bringing these events about in order to “fulfill prophecy”. When the “race war”, the First World War, finally broke out, it was not easy to define just what “race” was fighting which other “race”, and “races” came to defined by religious affiliation and language, as well as historical groupings and phenotypes.

The Frankists, their cabalistic predecessors and their nihilistic descendants were successful in breaking apart Western Christendom under the Roman Catholics of the Holy Roman Empire. They worked to destroy the hegemony of Christianity and replace it with Judaic hegemony in fulfilment of ancient Judaic prophecies. This struggle played out in part Vienna during the Kulturkampf.

A common theme of many politicians was the notion that war must not result in changed borders—beyond the dissolution of empires. Both World Wars did little to change the map of Europe from its traditional complexion, other than to enhance segregation, and promote Bolshevism. Though many Zionists allegedly sponsored “Internationalism”, they sought to segregate out the “Nationalities” which were disappearing under the empires and thereby causing Jews to assimilate in a spirit of true internationalism and integration. The Zionists, who were forbidden to practice their racism in the empires, sought to promote instead the rabid and racist Nationalism which led to the near destruction of Europe, without much changing its ethnic map. This was their short term goal, because it enabled the Zionists to justify their racism and to take the opportunity of peace talks which would follow a world war—at which talks small nations would appeal for independence—to ask for Palestine as an independent nation for the formation of a “Jewish State”.
The *Kulturkampf* further complicated matters, because some Catholics desired to take Constantinople and Jerusalem from the Turks, who were Germany’s allies, and make them Christian centers. The Zionists sought sympathy for their cause by promising Christians easy access to the Holy Land and by promoting Biblical prophecies, and more recent pseudo-Christian inventions like the “rapture”, which they themselves did not believe. Many Catholics, as well as British and American Protestants, desired that Rome, Athens, Jerusalem and Constantinople forever be in Jewish and Christian hands. Greece had obtained its independence from the Turks with help of England, France and Russia and had long desired to reconquer all of the Byzantine Empire for Christendom. Greek Christians (dubtless many were crypto-Jews or the agents of Jews) managed the accounts of the Sultan and despite the prosperity the rise in cotton prices (which resulted from the American Civil War1904) and other factors should have brought to the region, the Sultan was led towards bankruptcy.

Before political Zionism and Theodor Herzl, many “Christian” writers (dubtless many were crypto-Jews or the agents of Jews) and movements sought to reestablish a Jewish nation in Palestine allegedly in order to fulfill Biblical prophecy and hasten the second coming of Christ. Napoleon sought to destroy the Turkish Empire and take Palestine and give it to the Jews, believing himself to be the Messiah. Napoleon invaded Poland and Russia in order to emancipate the Jews—at the expense of his French soldiers and the Russian people, as well as many peoples in between the Russians and the French.

There were many Christian Zionists in the Nineteenth Century many of whom hoped to bring on the Apocalypse (whose loyalty had been bought with Rothschild money). These included Queen Victoria, Louis Way, the Christadelphians, William Blackstone, Charles Henry Churchill, Lord Anthony Ashley Cooper, the Earl of Shaftesbury, Lord Manchester, Lord Lindsay, Lord Palmerston, F. Laurence Oliphant, Holman Hunt, Sir Charles Warren, George Eliot, Hall Caine, George Gawler, Orson Hyde, John Nelson Darby, Jean Henri Dunant, and William Henry Hechler—who inspired and encouraged Theodor Herzl when he was feeling defeated, and who contacted Frederick the Grand Duke of Baden, Kaiser Wilhelm II, the Sultan of Turkey and Arthur Balfour on behalf of the Zionist cause.1905 David Lloyd George’s Christianity made him favorable to Zionism.

Then, as now, England and America were the staunchest supporters of Zionism. English Protestants had been promoting the “restoration of the Jews” for centuries. Many English believed that the ancient Britons were of Jewish descent and that the Royal Family were direct descendants of King David—David who took Jerusalem and whose seed was prophesied to bear the Messiah. The Germans had hoped in both World Wars that the British and Americans would side with them against the Slavs, or remain neutral.

### 8.7 Cabalistic Jews Calling Themselves Christian Condition the British to Assist in Their Own Demise—Rothschild Makes an Open Bid to Become the Messiah

It is interesting to note that the Damascus Affair, which united Jews around the
world, happened shortly after a broad based and well-publicized Zionist movement got underway in England in the 1830's. Both this movement to "restore Jews to Palestine" and the Damascus Affair received a great deal of press coverage in England. Was the Damascus Affair and the murder of Father Thomas the work of agents provocateur of the Lavon Affair type today celebrated in Israel?

In an article entitled “The Jews”, The Knickerbocker; or New York Monthly Magazine, Volume 53, Number 1, (January, 1859), pp. 41-51, at 50-51, wrote,

“Of all Mussulmans the Egyptians doubtless regard the Jews with most aversion. In the year 1844 a young man belonging to a respectable family in Cairo, suddenly disappeared. Several of the resident Consuls, moved by the solicitations of the wretched mother, requested of the Viceroy a searching investigation into the circumstances of the case. It could only be discovered that the young man had gone to the Jews’ quarter, from which no one had seen him return. He had been missed a few days before the feast of the Passover, and the terrible accusation was laid upon the Jews of having offered the blood of a human victim as a holocaust, instead of the blood of the paschal lamb.

Had the Israelites not been protected by the Austrian Consul, it is probable that the infuriated and bigoted populace would have razed their quarter of the city level with the ground. Four years previous a similar event had occurred at Damascus. The Père Thomas, a Christian priest, greatly beloved by the people, was treacherously murdered in the house of an opulent Jew named Daout-Arari. The affair created much excitement even in Europe. Two celebrated French advocates were sent to Egypt to plead the cause of the accused before Mohammed Ali, then master of Syria. The intrigues of the Austrian Consul and other secret influences brought to bear, procured. an acquittal of the accused. But during the judicial investigation, several important revelations were obtained. Seven Israelites confessed the crime, and turned Mussulmans in order to claim the clemency of the Cadis. From them it was learned that a Jewish barber had murdered the Père Thomas in the house of Daout-Arari, and that the blood of the priest had been mixed with the unleavened bread. The same year the Jews of Rhodes were charged with a like offence. Similar accusations have been brought against the Israelites living in Germany and Hungary.

The Greeks of Constantinople affirm that heretofore the Jews have been in the habit of purloining children, in order to sacrifice them as paschal lambs. This sacrilege was universally talked of and generally believed a few years ago in Pera and the Fanar, when the traditional enmity of the Jews and Greeks was at its height. During the Greek Revolution the Israelites assisted the Turks against the Hellenes; and when the venerable Greek Patriarch was hanged by the Moslems, the Jews volunteered to drag his corpse through the streets to the sea.”

Sandwiched between the memorandum to the Protestant monarchs of Europe and
the leader of the United States on the “Restoration of the Jews” which was published together with attendant correspondence, and a story about the murder of Father Thomas which “occupies in a marked manner the whole journalism of Europe”, were the following two Letters to the Editor of The London Times published on 26 August 1840 on page 6 (note the expression of tensions which led to WW I and WW II),

“TO THE EDITOR OF THE TIMES.

Sir,—Every right-minded person must feel gratified at the general expression of interest in the Jewish nation which has been elicited by the recent sufferings of their brethren at Damascus. It is to be hoped that the public feeling will not be allowed to evaporate in the mere expression of sympathy, but that some effectual measures may be adopted to prevent a recurrence of these atrocities, not merely in our own times, but in generations yet to come. We must not forget, when giving utterance to our indignation at the late transactions in the east, that but a few centuries have passed since our own country was the scene of similar enormities on a far larger scale. What reader of English history does not recall with shame and sorrow the wholesale tortures, executions, and massacres of the Jews who had sought shelter here, or who can estimate the amount of property seized and confiscated, or the number of hearts wrung by the endless repetition of cruelty and injustice? If in England they have till lately been thus treated, how can they look for more security elsewhere? Instead of wondering that they should become sordid and debased, the only cause for surprise is that any should rise to intelligence and respectability. Subject to the caprice and cruelty of any nation among whom they may dwell, fleeing from the persecutions of one only to meet with like treatment from another, having no city of refuge where they can be in safeguard, no single spot to call their own, they are in a more pitiable condition than the Indian of the forest, or the Arab of the desert.

‘The wild bird hath her nest, the fox his cave,
‘Mankind their country, Israel but the grave.’

Is this state of things always to continue? They think not. Though many hundreds of years of hope deferred might have been enough to quench the anticipations of the most sanguine, they still hope on, and turn with constant and earnest longing to the land of their forefathers. Their little children are taught to expect that they shall one day see Jerusalem. They purchase no landed property, and hold themselves in readiness at a few hours’ notice to revisit what they and we tacitly agree to call ‘their own land.’ It is theirs by a right which no other nation can boast, for God gave it to them, and though dispossessed of it for so many ages, it is still but partially peopled, and held with a loose hand and a disputed title by a hostile power, as if in readiness for their return.

There are political reasons arising from the present aspect of affairs in Russia, Turkey, and Egypt, which would make it to the interest not only of England but of other European nations, either by purchase or by treaty, to
procure the restoration of Judea to its rightful claimants. About a year since, I heard it said by a German Jew, that a proposal had some time before been made by our (then) Government to the late Baron Rothschild, that he should enter into a negotiation for this purpose, and that he declined, assigning as a reason, ‘Judea is our own; we will not buy it, we wait till God shall restore it to us.’ The desirableness as well as the possibility of such a step seems daily to become more evident, but England has lately proved that she needs no selfish motives to induce her to discharge a debt of national honour and justice, or to perform an act of pure benevolence. The one now suggested would not, judging from appearances, cost 20,000,000l. of money, or be unaccomplished after 50 years of exertion, or be so vast and so laborious an undertaking as the extinction of slavery throughout the world. It would be a noble thing for a Christian nation to restore these wanderers to their homes again. It would be a crowning point in the glory of England to bring about such an event. The special blessings promised in the Scriptures to those who befriend the Jews would rest upon her, and her sons and daughters would sit down with purer enjoyment to their domestic comforts when they thought that the persecuted outcasts of so many ages had, through their agency, been replaced in homes as happy and secure as theirs.

Hoping that some master mind may be led to take up this subject in all its bearings, and to form some tangible plan for its accomplishment, and that some Wilberforce may be raised up to plead for it by all the powerful and heart-stirring arguments of which it is capable,

I am, Sir, your obedient servant,

AN ENGLISH CHRISTIAN.

TO THE EDITOR OF THE TIMES.

Sir,—The extraordinary crisis of Oriental politics has stimulated an almost universal interest and investigation, and the fate of the Jews seems to be deeply involved with the settlement of the Syrian dilemma now agitating every Court of Christendom.

You have well and wisely recommended that a system of peaceful umpirage and arbitration should be adopted as the proper role of Britain, France, Austria, Prussia, and Russia, and you have exposed the extreme absurdity which these Powers would commit if in their zeal for accommodating the quarrels of the Ottomans they should stir up bloody wars among themselves.

The peace of Europe and the just balance of its powers being therefore assumed as the grand desideratum, as the consummation most devoutly to be wished, I peruse with particular interest a brief article in your journal of this day relative to the restriction of the Jews in Jerusalem, because I imagine that this event has become practicable through an unprecedented concatenation of circumstances, and that moreover it has become especially desirable, as the exact expedient to which it is the interest of all the belligerent parties to consent.

The actual feasability of the return of the Jews is no longer a paradox; the
time gives it proof. That theory of the restoration of the Jewish kingdom, which a few years ago was laughed at as the phantasy of insane enthusiasm, is now calculated on as a most practical achievement of diplomacy.

Let us view the question more nearly. It is granted that the Jews were the ancient proprietors of Syria; that Syria was the proper heart and centre of their kingdom. It is granted that they have a strong conviction that Providence will restore them to this Syrian supremacy. It is granted that they have entertained for ages a hearty desire to return thither, and are willing to make great sacrifices of a pecuniary kind to the different parties interested, provided they can be put in peaceful and secure possession.

It is likewise notorious, that since the Jews have been thrust out of Syria, that land has been a mere arena of strife to neighbouring Powers, all conscious that they had no legitimate right there, and all jealous of each other's intrusion.

Such having been the case, why, it may be asked, have not the Jews long ago endeavoured to regain possession of Syria by commercial arrangements? In reply it may be said, that though they have evidently wished to do so, and have made overtures of the kind, hitherto circumstances have mainly opposed their desires. For instance, they could not expect to purchase a secure possession of Syria from Turkey, while that empire, in the pride of insolent despotism, could have suddenly revoked its stipulations, and have seized on Jewish treasuries, none venturing to call it to account. Nor could the Jews have ventured to purchase Syria while the right to that country was vehemently disputed between Turkey and Egypt, without any powerful arbitrators to arrange the right at issue, and lend sanction and binding authority to diplomatic documents.

Now, however, these obstacles and hindrances are in a great measure removed; all the strongest Powers in Europe have come forward as arbitrators and umpires to arrange the settlement of Syria.

Under such potent arbitrators, pledged to the performance of any conditions finally agreed on, I have reason to believe that the Jews would readily enter into such financial arrangements as would secure them the absolute possession of Jerusalem and Syria.

If such an arrangement were formed, one great cause of dissension between France and England would be at once removed; for both the Porte and Egypt are decidedly in want of money, and will gladly sell their respective rights in the Syrian territory. They themselves begin to see the folly of enacting the part of the dog in the manger; they will drop the apple of discord if they can get fair compensation for their trouble.

I know no reason, under such powerful umpires, why the Hebrews should not restore an independent monarchy in Syria, as well as the Egyptians in Egypt, or the Grecians in Greece.

As a practical expedient of politics, I believe it will be easier to secure the peace of Europe and Asia by this effort to restore the Jews, than by any allotment of Syrian territories to the Turks or Egyptians, which will be sure
to occasion fresh jealousies and discords.

In offering these remarks, I have viewed the question merely as a lawyer and a politician, and proposed the restoration of the Jews as a sort of tertium quid, calculated to win the votes of several of the parties at issue. But, Sir, there is a higher point of view from which many of the readers of The Times may wish to regard this topic of investigation. Whichever way the restoration of the Jews may finally be brought about, there is no doubt that it is a subject frequently illustrated by Biblical prophecies.

I will, therefore, if I may do so without the vain and presumptuous curiosity which some of the neologists have manifested, endeavour to detail the opinion of the church on this subject in the words of some of her most respectable writers.

It is generally supposed by Newton, Hales, Faber, and others, that the great prophetical period of 1,260 years is not very far from its termination. If they are right in this supposition, the period of the restoration of the Jews cannot be very remote.

These two contingencies are evidently connected by the prophet Daniel, who distinctly states that at the time of the end of this period there shall be great contests among the Eastern nations in Syria. And at that time (continues Daniel) shall Michael stand up, even the great Prince who standeth up for the children of the Jews, and there shall be a time of trouble such as never was since there was a nation, and at that time the Jews shall be delivered. (Daniel xii.)

Whatever this mysterious passage may imply, all the most learned expositors agree that it refers to the same crisis indicated by the author of the Apocalypse (Chapter xvi., verses 12, 16.) Most of these expositors seem to think that by the phrase 'drying up the great river Euphrates, that the way of the Kings of the East might be prepared,' we are to understand the diminution of the Turkish empire, that the Jews may regain their long lost kingdom of Syria.

I will not detain you by quoting a host of learned authorities in confirmation of this interpretation; but it may be important to hint, that the moral and intellectual position of the Jews in the present day, as well as their commercial connexions, has enabled them to assume a political sphere of activity at once lofty and extensive.

As to religion, they have of late years realized many of the predictions of Mendelssohn and D’Israeli. They have thrown off the absurd bigotry which once rendered them contemptible, and begin to give the New Testament and the writings of Christian divines that attention to which they are every way entitled among truth-searching and philosophic men. Though, perhaps, fewer positive conversions to Christianity have taken place than were expected by the clergy, still the Hebrew intellect has made within a few years past a wonderful approximation to that temper of impartial inquiry in which such books as Grotius de Veritate produce an indelible impression.

I believe that the cause of the restoration of the Jews is one essentially
generous and noble, and that all individuals and nations that assist this world-renounced people to recover the empire of their ancestors will be rewarded by Heaven’s blessing. [It was and is commonplace for Zionists to appeal to the superstitions of Christians and others with the myth that Jews have supernatural connections which will bless those who help Jews and punish those who do not. The real forces at work are generally control over public opinion through media, planted rumor and gossip; sophisticated intelligence networks; and the might of higher education and investment capital, or lack thereof, which can raise a nation above others, or destroy it. Whoever controls news outlets and financial institutions is the first to learn of events and investments, and to profit from them, or prevent them.—CJB]

Everything that is patriotic and philanthropic should urge Great Britain forward as the agent of prophetic revelations so full of auspicious consequence.

I dare not allow my mind to run into the enthusiasm on this subject which I find predominant among religious authors. I will, therefore, conclude with one quotation from Hale’s Analysis of Chronology:—

‘The situation of the new Jerusalem,’ says this profound mathematician, ‘as the centre of Christ’s millenary kingdom in the Holy Land, considered in a geographical point of view, is well described by Mr. King in a note to his Hymns to the Supreme Being. How capable Syria is of a more universal intercourse than any other country with all parts of the world is most remarkable, and deserves to be well considered, when we read the numerous prophecies which speak of its future grandeur, when its people shall at length be gathered from all nations among whom they have wandered, and Sion shall be the joy of the whole earth.’

Your very obedient servant,

Aug. 17. F. B.”

The “Memorandum” was advertised in The London Times on 9 March 1840, on page 3,

“RESTORATION OF THE JEWS.—A memorandum has been addressed to the Protestant monarchs of Europe on the subject of the restoration of the Jewish people to the land of Palestine. The document in question, dictated by the peculiar conjuncture of affairs in the East, and the other striking ‘signs of the times,’ reverts to the original covenant which secures that land to the descendants of Abraham, and urges upon the consideration of the powers addressed what may be the possible line of duty on the part of Protestant Christendom to the Jewish people in the present controversy in the East. The memorandum and correspondence which has passed upon the subject have been published.”

The “Memorandum to the Protestant Powers of the North of Europe and America” was published in Memorials concerning God’s Ancient People of Israel.
It was later republished together with attendant correspondence in *The London Times* on 26 August 1840 on pages 5-6. It is an attempt to persuade Protestant leaders to bring to fruition Biblical apocalyptic prophecy by forcing it to “come true” through less than divine willful human intervention. This was a tradition for the Christians which dates from the *Gospels*. For example, *Matthew* 21:1-11 states, referring to *Zachariah* 9:9,

“And when they drew nigh unto Jerusalem, and were come to Bethphage, unto the mount of Olives, then sent Jesus two disciples. Saying unto them, Go into the village over against you, and straightway ye shall find an ass tied, and a colt with her: loose them, and bring them unto me, And if any man say ought unto you, ye shall say, The Lord hath need of them; and straightway he will send them. All this was done, that it might be fulfilled which was spoken by the prophet, saying, Tell ye the daughter of Sion, Behold, thy King cometh unto thee, meek, and sitting upon an ass, and a colt the foal of an ass. And the disciples went, and did as Jesus commanded them, And brought the ass, and the colt, and put on them their clothes, and they set him thereon. And a very great multitude spread their garments in the way; others cut down the branches from the trees, and strawed them in the way. And the multitudes that went before, and that followed, cried, saying, Hosanna to the son of David: Blessed is he that cometh in the name of the Lord; Hosanna in the highest. And when he was come into Jerusalem, all the city was moved, saying, Who is this? And the multitude said, This is Jesus the prophet of Nazareth of Galilee.”

Rothschild saw himself as the Messiah, but could not convince any large number of Jews of the fact. He could buy Palestine, but could not buy enough Jews to populate it. Rothschild could even buy the support of the governments of Europe, but there was only one means to persuade Jews to move to the desert—by mass murdering and otherwise terrorizing European assimilatory Jews. Both the Old Testament (*Leviticus* 26. *Deuteronomy* 4:24-27; 28:15-68; 30:1-3. II *Chronicles* 7:19-22. *Jeremiah* 29:1-7) and the Babylonian Talmud, *Tractate Kethuboth* (also: “Ketubot”), 111a, make it clear that the Jews must not hasten the coming of the Messiah and must wait for the Messiah to establish a Jewish state, before emigrating to Palestine in large numbers. Israel Shahak and Norton Mezvinsky wrote in their book *Jewish Fundamentalism in Israel*,

“The Haredi objection to Zionism is based upon the contradiction between classical Judaism, of which the Haredim are the continuators, and Zionism. Numerous Zionist historians have unfortunately obfuscated the issues here. Some detailed explanation is therefore necessary. In a famous talmudic passage in *Tractate Kethubot*, page 111, which is echoed in other parts of the Talmud, God is said to have imposed three oaths on the Jews. Two of these oaths that clearly contradict Zionist tenets are: 1) Jews should not rebel against non-Jews, and 2) as a group should not massively emigrate to
Palestine before the coming of the Messiah. (The third oath, not discussed here, enjoins the Jews not to pray too strongly for the coming of the Messiah, so as not to bring him before his appointed time.) During the course of post-talmudic Jewish history, rabbis extensively discussed the three oaths. Of major concern in this discussion was the question of whether or not specific Jewish emigration to Palestine was part of the forbidden massive emigration. During the past 1,500 years, the great majority of traditional Judaism’s most important rabbis interpreted the three oaths and the continued existence of the Jews in exile as religious obligations intended to expiate the Jewish sins that caused God to exile them.*

Christians believe that the Jews had broken the Covenant and that a new Covenant had been made between God and the Christians, thereby voiding the Covenant with the Jews (Matthew 12:30; 21:43-45. Romans 9; 11:7-8. Galatians 3:16. Hebrews 8:6-10).

*New Yorker*, Volume 9, Number 13, Whole Number 221, (13 June 1840), pp. 196-197; wrote of Rothschild’s desires to be King of the Jews, and by the implications of Jewish prophecy, King of the World—and by the implications of Christian prophecy, the anti-Christ:

“Restoration of the Jews.—On more than one occasion we have called attention to the signs, of one kind or another, by which the exiles of Israel are beginning to express their impatience for the accomplishment of the prophecies that point to their restoration; and the changes, physical and moral, which are gradually breaking down the barriers to the final fulfilment of the promise. These are curious and worth attention; and more significant in their aggregation, and with reference to the character of the people in question, than those of our readers who have looked at them hastily and separately, may have been prepared to suspect. The Malta letters brings accounts from Syria, in which some curious particulars are given of Sir Moses Montefiore’s proceedings, during his late visit to the Holy Land. We remember rumors, which had currency some years ago, of the Jewish capitalist’s (Rothschild’s) design to employ his wealth in the purchase of Jerusalem, as the seat of a kingdom, and bring back the tribes under his own guidance and sovereignty. If the scheme, amid its sublimity, savored sufficiently of the romantic to make the rumor suspicious, the positive acts of Sir Moses, at least, exhibit an anxiety to gather together the wanderers in the neighborhood of their ancient home and future hopes; that they may await events on the ground where they can best be made available to the fulfilment of the promise. During his pilgrimage he sought his way to the hearts of his countrymen, by giving a talaris (we believe about fifteen piastres) to every Israelite; and having instituted strict inquiries respecting the various biblical antiquities on his way, and ascertained the amount of duty which the sacred places and villages paid to the Egyptian Government to be about 64,000 purses (a purse being equal to fifteen talaris,) he proposed to the Viceroy of
Egypt, that he (Sir Moses) should pay this revenue out of his own pocket, as the price of that prince’s permission to him to colonize all those places with the Children of Israel. The offer has been, it is said, accepted, subject to the condition that the colony shall be considered national, and not under European protection. Athenæum.”

Though the majority of Jews opposed political Zionism from its inception for the very reason that it was an artificial effort to do God’s will in the absence of a Messiah, some modern Jewish and Christian Zionist groups are planning to artificially create the horrors of the Apocalypse, in order to artificially begin the Messianic Era—in their twisted dreams. Jessica Stern writes, referring to Judaism, Christianity and Islam; and citing the Bible at Zechariah 14:2-12, Daniel 12:1-2, Revelation 16:14-16, 20:1-6, and the Koran at Sura 14:48 and Sura 18:8:

“Millenarian Jews believe that at the End of Days, there will be a time of great troubles. Jerusalem will be taken in battle, but God will smite the enemies of the Jews. The wicked will act wickedly and not understand, while the knowledgeable will grow refined and radiant. The righteous among the dead will rise to eternal life, while others will be left to everlasting abhorrence. All three monotheistic traditions have a conception of an apocalypse, but each believes that its own group will prevail in the catastrophic events of the final days. Some millenarians hope to bring on that very catastrophe, which they see as a necessary stage in the process of redemption. Evangelical Christians and Messianic Jews have developed a cooperative relationship, based on their common belief that rebuilding the Temple will facilitate the process of redemption, even though each believes its own group will ultimately triumph.”

The “Memorandum to the Protestant Powers of the North of Europe and America” was soon followed by the memorandum of Lord Ashley (Shaftesbury) to British Foreign Secretary Lord Palmerston of 25 September 1840 and the memorandum to Palmerston of 2 March 1841.

Almost a century before the “Memorandum to the Protestant Powers of the North of Europe and America”, another English “Christian”, David Hartley, published his Observations on Man in 1749. Hartley evinces the desire of a (recently reemerging) sect of philo-Semitic Christian Zionists for the destruction of Catholicism (in anticipation of the French Revolution and the Kulturkampf), the “restoration of the Jews to Palestine”; then Jewish world rule followed by the utter destruction of human kind, in anticipation of the First and Second (and Third?) World Wars. He tried to persuade his Christian readers to welcome despair, death and destruction in the hopes that it “may fit us for the new Heavens, and new Earth.” (Isaiah 65:16-17; 66:22-24). Hartley asked Christians to accept that this life must be miserable, while promising them a better afterlife—a promise he knew he would never be asked to honor.

In the Jewish dominated media of today we find many Jews preaching to the
public that the end times are coming and that Christians ought to view their own
destruction in a positive light as if it were the divine fulfillment of Jewish and
Christian prophecy. Many Christians have been duped by these charlatans, be they
psychics, pseudo-Christians preachers, UFO and ghost investigators, etc. These
dupes must awaken to fact that the destruction of the world and its nations is
occurring as a result of the deliberate intervention of immensely wealthy Jews, and
not as the result of God’s will. These Jewish leaders view the Hebrew Bible as a plan
which they are deliberately fulfilling without their God’s help and in violation of
Christian principles and prophecy, unless it be Christian prophecy of the “anti-
Christ” against whom Christians are duty bound to fight. Christianity, like
Communism has always been used by Jews as a trap to destroy Europeans. It
promises a Utopia if only the Europeans surrender their power to State authority and
surrender their wealth to the Jews. In the meantime, Jews are taught that they need
only obey God’s laws and that they are duty bound to accumulate wealth, most
especially gold and jewels. Under such a system, Christians cannot compete and the
Jews have provided them with belief systems meant to destroy them. Whereas
Christians are taught to surrender their struggle for individual survival to fatalism
under the promise of a perfect afterlife, Jews are taught that immortality rests in the
segregation and survival of their “race” and that the individual must struggle for the
survival and segregation of the “Jewish race”, and must also encourage all other
“races” to destroy themselves, because they view the mere existence of other “races”
as a threat to the survival of the “Jewish race”, both because they sense the ever
present danger that assimilation will dissolve them, and because they sense that Esau
will someday take revenge on Jacob for its deliberate deceit, theft and genocide of
non-Jews.

David Hartley was a Cabalistic Jew who wanted to bring ruin upon the Gentiles
by deceiving them with Christian mythology into mass murdering themselves for the
benefit of the Jews. He was next in a long line of traitors who had come under the
influence of wealthy Cabalistic Jewish mystics, a lineage which can be traced
through Sir Isaac Newton to Henry More and beyond.

The genocidal Zionists attempted to justify their inhuman actions and plans as
if divine manifestations of the Messianic myth of “hevlei Mashiah”, or “the birth
pangs of the Messiah”.¹⁹¹² This madness of self-destruction imposed on Christians
by Jewish Zionists and their Cabalistic agents—including Henry More, Isaac
Newton, Samuel Clarke and David Hartley—has culminated today, after two horrific
world wars which they and their progeny planned and brought about—has
culminated today in the apocalyptic desires of Dispensationalist Christians, who
slavishly promote the evils of Israel and eagerly await a nuclear holocaust they
intend to deliberately bring about, which will destroy human life on Earth.¹⁹¹³ These
insane dupes of the racist Jewish Zionists have been taught that they will be raptured
up into Heaven and that God will create a new heaven and Earth just for them. The
racist Jewish Zionists use their media control and wealth to promote these pseudo-
Christians in America in order to subvert the American political process and to lead
America into World War Three with a dim-witted smile on its face.

David Hartley was influenced by Isaac Newton’s student and defender, the quasi-
Anglican Arian philosopher (cabalistic Jew) Samuel Clarke. Clarke’s Arianism was in fact Judaic—he, Newton, and later Hartley, would not sign the Thirty-Nine Articles of the Church of England, which would have required them to affirm a belief in the Trinity. Clarke compiled a series of Bible quotations concerning the “restoration of the Jews”.\textsuperscript{1914} Hartley apparently copied much from Clarke’s \textit{A Demonstration of the Being and Attributes of God And Other Writings}, without any attribution, including Clarke’s space-time theory of 1705,\textsuperscript{1915} which anticipated the special theory of relativity by two-hundred years, and which had its origins in the Cabalistic space-time theories of Giordano Bruno,\textsuperscript{1916} Henry More,\textsuperscript{1917} John Locke,\textsuperscript{1918} and Isaac Newton—and the \textit{Kabbala Denudata} which inspired all of these pseudo-Christians to destroy Christian society.\textsuperscript{1919} These men were Cabalists who denied the divinity of Jesus, and who were greatly influenced by prominent and wealthy Jewish mystics, and who also wrote about the “restoration of the Jews” and the conversion of Jews to Christianity which they argued would bring about the millennium, the destruction of the old world and the creation of a new world.\textsuperscript{1920}

Again, it is important to stress, that we have as their legacy two world wars and a coming third.

Some Jews were spreading the message that in order for Christianity to succeed, Jews would have to convert Christianity. This gave them privilege and the power to amend Christianity so as to make it more palatable to Jews. It also prevented a backlash against Jews who would emigrate to Palestine and who would be seen by Christians as the minions of the anti-Christ were they not to feign Christian conversion.

Isaac Newton, like Clarke after him, disbelieved in the Trinity, wanted to see the Gentile nations laid to waste, and hoped that the Jews would rule the world from Jerusalem. Newton wrote, among other things,

“For they understand not that ye final return of ye Jews captivity & their conquering the nations <of ye four Monarchies> & setting up a peaceable righteous & flourishing Kingdom at ye day of judgment is this mystery. Did they understand this they would end it in all ye old Prophets who write of ye last times as in ye last chapters of Isaiah where the Prophet conjoyns the new heaven & new earth wth ye ruin of ye wicked nations, the end of all troubles weeping & of all troubles, the return of ye Jews captivity & their setting up a flourishing & everlasting Kingdom.”\textsuperscript{1921}

and,

“‘Tis in ye last days yt this is to be fulfilled & then ye captivity shall return & become a strong nation & reign over strong nations afar off, & ye Lord shall reign in mount Zion from thenceforth for ever, & many nations shall receive ye law of righteousness from Jerusalem, & they shall beat their swords into plow-shares & their spears into pruning hooks & nation shall not lift up a sword against nation, neither shal they learn war any more; all wch never yet came to pass.”\textsuperscript{1922}

depredation of the Jewish race. [i. e. to segregate and persecute Jews as the Zionists desired and to force them to Palestine, while destroying the Judaism of Gentiles—while destroying Christianity.] [***] The general tendency of this movement was directed against Christianity as an ecclesiastical institution, sometimes chiefly against the Catholic Church which was suspected of ‘ultramontanist’ sympathies for a foreign ecclesiastical power.”

After making it appear that he was a neutral arbiter in Chapters 9 and 10, Paul, born Saul, warns Gentiles and apostate Jews of their ultimate fate when he writes in Chapter 11 of Romans,

“I say then, Hath God cast away his people? God forbid. For I also am an Israelite, of the seed of Abraham, of the tribe of Benjamin. 2 God hath not cast away his people which he foreknew. Wot ye not what the scripture saith of Elias? how he maketh intercession to God against Israel, saying, 3 Lord, they have killed thy prophets, and digged down thine altars; and I am left alone, and they seek my life. 4 But what saith the answer of God unto him? I have reserved to myself seven thousand men, who have not bowed the knee to the image of Baal. 5 Even so then at this present time also there is a remnant according to the election of grace. 6 And if by grace, then is it no more of works: otherwise grace is no more grace. But if it be of works, then is it no more grace: otherwise work is no more work. 7 What then? Israel hath not obtained that which he seeketh for; but the election hath obtained it, and the rest were blinded 8 (According as it is written, God hath given them the spirit of slumber, eyes that they should not see, and ears that they should not hear;) unto this day. 9 And David saith, Let their table be made a snare, and a trap, and a stumblingblock, and a recompence unto them: 10 Let their eyes be darkened, that they may not see, and bow down their back alway. 11 I say then, Have they stumbled that they should fall? God forbid: but rather through their fall salvation is come unto the Gentiles, for to provoke them to jealousy. 12 Now if the fall of them be the riches of the world, and the diminishing of them the riches of the Gentiles; how much more their fulness? 13 For I speak to you Gentiles, inasmuch as I am the apostle of the Gentiles, I magnify mine office: 14 If by any means I may provoke to emulation them which are my flesh, and might save some of them. 15 For if the casting away of them be the reconciling of the world, what shall the receiving of them be, but life from the dead? 16 For if the firstfruit be holy, the lump is also holy: and if the root be holy, so are the branches. 17 And if some of the branches be broken off, and thou, being a wild olive tree, wert graffed in among them, and with them partakest of the root and fatness of the olive tree; 18 Boast not against the branches. But if thou boast, thou bearest not the root, but the root thee. 19 Thou wilt say then, The branches were broken off, that I might be graffed in. 20 Well; because of unbelief they were broken off, and thou standest by faith. Be not highminded, but fear: 21 For if God spared not the natural branches, take heed lest he also spare not thee. 22 Behold therefore
the goodness and severity of God: on them which fell, severity; but toward thee, goodness, if thou continue in his goodness: otherwise thou also shalt be cut off. 23 And they also, if they abide not still in unbelief, shall be grafted in: for God is able to graff them in again. 24 For if thou wert cut out of the olive tree which is wild by nature, and wert graffed contrary to nature into a good olive tree: how much more shall these, which be the natural branches, be graffed into their own olive tree? 25 For I would not, brethren, that ye should be ignorant of this mystery, lest ye should be wise in your own conceits; that blindness in part is happened to Israel, until the fulness of the Gentiles be come in. 26 And so all Israel shall be saved: as it is written, There shall come out of Sion the Deliverer, and shall turn away ungodliness from Jacob: 27 For this is my covenant unto them, when I shall take away their sins. 28 As concerning the gospel, they are enemies for your sakes: but as touching the election, they are beloved for the fathers’ sakes. 29 For the gifts and calling of God are without repentance. 30 For as ye in times past have not believed God, yet have now obtained mercy through their unbelief: 31 Even so have these also now not believed, that through your mercy they also may obtain mercy. 32 For God hath concluded them all in unbelief, that he might have mercy upon all. 33 O the depth of the riches both of the wisdom and knowledge of God! how unsearchable are his judgments, and his ways past finding out! 34 For who hath known the mind of the Lord? or who hath been his counsellor? 35 Or who hath first given to him, and it shall be recompensed unto him again? 36 For of him, and through him, and to him, are all things: to whom be glory for ever. Amen.”

Paul, born Saul, also warned his fellow Jews in I Thessalonians 2:15-16, where Paul stated,

“For ye, brethren, became followers of the churches of God which in Judaea are in Christ Jesus: for ye also have suffered like things of your own countrymen, even as they have of the Jews. Who both killed the Lord Jesus, and their own prophets, and have persecuted us; and they please not God, and are contrary to all men: Forbidding us to speak to the Gentiles that they might be saved, to fill up their sins alway: for the wrath is come upon them to the uttermost.”

We see that “Jesus” is an allegory for Judaism, which the Romans had attacked, and which many Jews had abandoned. The name “Jesus” in the original means “Jew”. The “life” of Jesus was concurrent with the life of Philo the Jew, who Hellenized Judaism—an act which made Judaism palatable to Romans; and who obliged the conversion of the Temple to the worship of the Roman Emperors after the Jews had exhibited religious intolerance against Rome. The parallels between the story of “Jesus” and the history of Judaism are many. The sale of Judaism by “Judas”, which name is the same word as “Jesus” in the original and which means “Jew” as in Philo Judæus—the doubting of Thomas and the denial of Peter as Jews
became more secular or pagan—the promise of everlasting life to a religion that was
dying out—the destruction of the Temple—twelve Apostles of “the Jew” judging
the Twelve Tribes of Israel (Matthew 19:28. Luke 22:28-30)—forgiveness of the
whore which had slept with Judah (Genesis 38), etc. What better act of vengeance
could there have been for Caligula’s desecration of the Temple and Titus’ destruction
of it, than to convert Romans to a Romanized and Hellenized branch of Judaism,
which had the Romans worshiping “the Jew” and joyfully looking forward to their
ultimate destruction?

In 1925, Bialik gave a speech at the inauguration of the “Hebrew University” and
arrogantly spoke of the salvation of the pagan and the rôle Jesus played in
conditioning Gentiles to accept the Jewish world view, that ultimately led to the
Balfour Declaration. The closing book of the Old Testament states (Malachi 1:11-
14), in the context of the continual ruin of Edom—the continual ruin of the world of
the Gentiles:

“All For from the rising of the sun even unto the going down of the same my
name shall be great among the Gentiles; and in every place incense shall be
offered unto my name, and a pure offering: for my name shall be great
among the heathen, saith the LORD of hosts. 12 But ye have profaned it, in
that ye say, The table of the LORD is polluted; and the fruit thereof, even his
meat, is contemptible. 13 Ye said also, Behold, what a weariness is it! and ye
have snuffed at it, saith the LORD of hosts; and ye brought that which was
torn, and the lame, and the sick; thus ye brought an offering: should I accept
this of your hand? saith the LORD. 14 But cursed be the deceiver, which hath
in his flock a male, and voweth, and sacrificeth unto the LORD a corrupt
thing: for I am a great King, saith the LORD of hosts, and my name is
dreadful among the heathen.”

The stumblingblocks we face even today are many. Christianity, Islam and
Judaism pose a great danger to our modern existence, with their suicidal hopes and
apocalyptic dreams which are used to justify inhumanity and war and the selfishness
and self-destructiveness of the “elect” (Isaiah 65; 66. Enoch). In the Twentieth
Century, Marxism, Einsteinism and Freudism became dark dogmas rooted in ancient
mythologies, which monopolized discourse, while far more enlightened views were
suppressed. The Christian religion of obedience to the Jewish God of war and
destruction has been one of the worst stumblingblocks Europe (“Rome”) has
faced—as those who fabricated the mythology probably intended (note that Jesus
was effectively the Messiah of the Gentiles, not the Jews). Psalm 69:22, may have
inspired some Jews to trap the Romans with Christianity:

“Let their table become a snare before them: and that which should have
been for their welfare, let it become a trap.”

The Jews, whose religion taught them to mercilessly destroy other peoples, had long
seen religious conversion as a means to trap a people. Deuteronomy 7:2, 16-18
states:

“7:2 And when the LORD thy God shall deliver them before thee; thou shalt smite them, and utterly destroy them; thou shalt make no covenant with them, nor shew mercy unto them: [***] 16 And thou shalt consume all the people which the LORD thy God shall deliver thee; thine eye shall have no pity upon them: neither shalt thou serve their gods; for that will be a snare unto thee. 17 If thou shalt say in thine heart, These nations are more than I; how can I dispossess them? 18 Thou shalt not be afraid of them: but shalt well remember what the LORD thy God did unto Pharaoh, and unto all Egypt;”

Where Christianity has been forcibly replaced by Communism, still worse mythologies have been imposed. Benjamin Disraeli, who was to become Britain’s Prime Minister, wrote in 1852,

“Nor is it indeed historically true that the small section of the Jewish race which dwelt in Palestine rejected Christ. The reverse is the truth. Had it not been for the Jews of Palestine the good tidings of our Lord would have been unknown for ever to the northern and western races. The first preachers of the gospel were Jews, and none else; the historians of the gospel were Jews, and none else. No one has ever been permitted to write under the inspiration of the Holy Spirit except a Jew. For nearly a century no one believed in the good tidings except Jews. They nursed the sacred flame of which they were the consecrated and hereditary depositories. And when the time was right to diffuse the truth among the ethnicks, it was not a senator of Rome or a philosopher of Athens who was personally appointed by our Lord for that office, but a Jew of Tarsus, who founded the seven churches of Asia. And that greater church, great even amid its terrible corruptions, that has avenged the victory of Titus by subjugating the capital of the Caesars and has changed every one of the Olympian temples into altars of the God of Sinai and of Calvary, was founded by another Jew, a Jew of Galilee.

[***]

They may be traced in the last outbreak of the destructive principle in Europe. An insurrection takes place against tradition and aristocracy, against religion and property. Destruction of the Semitic principle, extirpation of the Jewish religion, whether in the Mosaic or in the Christian form, the natural equality of man and the abrogation of property, are proclaimed by the secret societies who form provisional governments, and men of Jewish race are found at the head of every one of them. The people of God co-operate with atheists; the most skilful accumulators of property ally themselves with communists; the peculiar and chosen race touch the hand of all the scum and low castes of Europe! And all this because they wish to destroy that ungrateful Christendom which owes to them even its name, and whose tyranny they can no longer endure.
When the secret societies, in February 1848, surprised Europe, they were themselves surprised by the unexpected opportunity, and so little capable were they of seizing the occasion, that had it not been for the Jews, who of late years unfortunately have been connecting themselves with these unhallowed associations, imbecile as were the governments the uncalled for outbreak would not have ravaged Europe. But the fiery energy and the teeming resources of the children of Israel maintained for a long time the unnecessary and useless struggle. If the reader throws his eye over the provisional governments of Germany, and Italy, and even of France, formed at that period, he will recognise everywhere the Jewish element. Even the insurrection, and defence, and administration of Venice, which, from the resource of statesmanlike moderation displayed, commanded almost the respect and sympathy of Europe, were accomplished by a Jew—Manini, who by the bye is a Jew who professes the whole of the Jewish religion, and believes in Calvary as well as Sinai, ‘a converted Jew’, as the Lombards styled him, quite forgetting, in the confusion of their ideas, that it is the Lombards who are the converts—not Manini.

Is it therefore wonderful, that a great portion of the Jewish race should not believe in the most important portion of the Jewish religion? As however the converted races become more humane in their behaviour to the Jews, and the latter have opportunity fully to comprehend and deeply to ponder over true Christianity, it is difficult to suppose that the result will not be very different. Whether presented by a Roman or Anglo-Catholic, or Geneveve, divine, by pope, bishop, or presbyter, there is nothing one would suppose very repugnant to the feelings of a Jew when he learns that the redemption of the human race has been effected by the mediatorial agency of a child of Israel; if the ineffable mystery of the Incarnation be developed to him, he will remember that the blood of Jacob is a chosen and peculiar blood, and if so transcendent a consummation is to occur he will scarcely deny that only one race could be deemed worthy of accomplishing it. There may be points of doctrine on which the northern and western races may perhaps never agree. The Jew, like them, may follow that path in those respects which reason and feeling alike dictate; but nevertheless it can hardly be maintained that there is anything revolting to a Jew to learn that a Jewess is the queen of heaven, or that the flower of the Jewish race are even now sitting on the right hand of the Lord God of Sabaoth.

Perhaps too in this enlightened age as his mind expands and he takes a comprehensive view of this period of progress, the pupil of Moses may ask himself, whether all the princes of the house of David have done so much for the Jews as that prince who was crucified on Calvary? Had it not been for Him, the Jews would have been comparatively unknown, or known only as a high oriental caste which had lost its country. Has not He made their history the most famous in the world? Has not He hung up their laws in every temple? Has not He vindicated all their wrongs? Has not He avenged the
victory of Titus and conquered the Cæsars? What successes did they anticipate from their Messiah? The wildest dreams of their rabbis have been far exceeded. Has not Jesus conquered Europe and changed its name into Christendom? All countries that refuse the cross wither while the whole of the new world is devoted to the Semitic principle and its most glorious offspring the Jewish faith, and the time will come when the vast communities and countless myriads of America and Australia, looking upon Europe as Europe now looks upon Greece and wondering how so small a space could have achieved such great deeds, will still find music in the songs of Sion and solace in the parables of Galilee.

These may be dreams, but there is one fact which none can contest. Christians may continue to persecute Jews and Jews still persist in disbelieving Christians, but who can deny that Jesus of Nazareth, the Incarnate Son of the Most High God, is the eternal glory of the Jewish race?"1927

The ancient Judeans prevailed in one sense against the Romans, whom they identified as their mortal enemy “Esau”, they themselves being “Jacob”. Jewish proselytes made Rome the new capital of the Jewish religion, where Roman gods were spat upon, where a Jewish son was worshiped as God, and where a Jewish woman, who the Jews claimed was a prostitute, was worshiped as the mother of God.

The Encyclopaedia Judaica writes in its article “Messianic Movements”:

“One trend of Jewish messianism which left the national fold was destined ‘to conquer the conquerers’—by the gradual Christianization of the masses throughout the Roman Empire. Through Christianity, Jewish messianism became an institution and an article of faith of many nations. Within the Jewish fold, the memory of glorious resistance, of the fight for freedom, of martyred messiahs, prophets, and miracle workers remained to nourish future messianic movements.”1928

The story of Jesus appeared at a time when many Jews believed that God was punishing the Jews for a long list of transgressions including Solomon’s marriage to the Pharaoh’s daughter and subsequent idolatry (Sabbath 56b. I Kings 11. II Chronicles 7:19-23), as well as the transgressions of Aaron’s worship of the Golden Calf, and the increase in “intermarriage” with the “daughter of a strange god” and apostasy (Malachi 2:10-12). The ten northern tribes were allegedly sent into captivity (II Kings 18:13; 24:3-16; 25), Solomon’s Temple was destroyed, thus beginning the age of Gentile domination and the yoke on Israel. II Chronicles 36:18-21, attributes the destruction of the First Temple, at least in part, to the failure of the Israelites and Judeans to maintain the Shemmitah (Exodus 23:10-11. Leviticus 25. Deuteronomy 15; 23:20; 31:10-13),

“18 And all the vessels of the house of God, great and small, and the
Solomon was a magician and is said to have built the Temple with the assistance of demons and angels. Due to his evil, Solomon lost his Kingdom and ruled only his staff at the end of his life (Sanhedrin 20b). Some Jews believed that God would not permit the existence of the Temple, or send the Messiah, until the Jews had atoned for Solomon’s sins and for the sins of Israel—some even viewed the Holocaust as atonement for the sins of Israel and justify their conclusion by pointing to the existence of Israel—others believe that Zionists instigated the Holocaust as an artificial atonement for the sin of worshiping the Golden Calf, which the Talmud asserted caused the Jews eternal suffering (Sanhedrin 102a). The very gift of the Covenant is tainted by Jacob’s sins against Esau. Moses iterated many curses which would befall the Jews if they were disobedient to God (Leviticus 26. Deuteronomy 4:24-27; 28:15-68; 30:1-3. II Chronicles 7:19-22. Jeremiah 29:1-7). Many Jews view the Diaspora, and their supposed eternal suffering, as God’s retribution against them for the Jews’ disobedience to God.

The Zionists put Hitler into power in order to bring about an unprecedented human sacrifice, which would finally atone for the Jews’ sins against God, through their own treachery to the Jewish People. Dualist, or Satanist, Jews see Jacob’s treachery against his brother as his greatest strength. They argue that evil deeds are rewarded many times in the Old Testament. The Satanic Cabalistic cults believe that evil triumphs over good. Jewish Dualist cults seek the combined power of both good and evil, but tend to fear the Devil more than God, and so are eager to do the Devil’s bidding. These genocidal Jews found divine authority for their actions throughout the Hebrew Bible, which calls for the mass murder of assimilatory Jewry.

Christians called for Jews to atone for the death of Jesus Christ, and some will not be satisfied unless Israel evaporates beneath a storm of mushroom clouds and rains human ash upon the desert. Jews, especially assimilated Jews, have not only Christian mythology to fear, but Judaic mythology, as well. The Jews killed off many of their fellow Jews in the Holocaust in the belief that they were fulfilling Old Testament prophecies. Their campaign is not over and will not end until all assimilated Jews and all Gentiles are dead.

Some Jews, the same type of racist tribal Jews who caused the Holocaust, want to kill off all Christians and all assimilated Jews. They believe that all anti-Semitism stems from Esau’s pledge to destroy the seed of Jacob, and that God insisted that the Jews exterminate the seed of Amalek, grandson of Esau—and all assimilated Jews. Rather than fault Jacob for his vile treachery, racist Jews excuse their immoral hatred
of Esau, by faulting Esau for being angry at Jacob for stealing the Covenant. Note that Esau was Jacob’s brother and that the genocidal Jews believe in pruning off whole branches from their own family tree and exterminating whole lines of Jewish ancestral blood. Note further that Jews believe in treachery against their own blood as a means of maintaining the Covenant, for after all they are told again and again that only a remnant of Jews will survive in the end times, and racist Jews are convinced that that means them and that they have right to kill off assimilated Jews and Gentiles. This was one of the ways in which the racist Zionist Jews justified their mass murder of fellow Jews to themselves during the Holocaust.

The success of the story of Jesus led the Jews into another dilemma, in that Christians asserted that Jews must convert to Christianity as stated in Romans 9-11, though Saul, a. k. a. Paul, was probably only asking Jews to remain Jews at a time when many Jews were becoming secular. After more than a thousand years of antagonism, something had to give, and some Jews sought to undermine Christianity by converting it to Judaism, while pretending to convert Jews to Christianity. In many waves, over many centuries, swarms of Talmudists, Cabalists and false Messiahs have swept across Europe literally peddling social, spiritual and medical panaceas. Zionist anti-Catholic ministers preached the conversion and restoration of the Jews to Palestine and readied their gullible Christian brethren for their own demise.

The Jews had another reason to feign Christian conversion before colonizing Palestine. They knew that the Christians would see the Biblical implications of Jewish financiers using their corruptly gotten gains to take Jerusalem from its rightful ancient inhabitants as the manifestation of the “anti-Christ”. The Jews feared that the Christians would join forces with Islam to crush the “anti-Christ” Jewish King and with him the Jews. Moses Hess quoted Ernest Laharanne, La nouvelle question d’Orient: Empires d’Egypte et d’Arabie. Reconstitution de la nationalité juive, E. Dentu, Paris, (1860):

“I may, therefore, recommend this work, written, not by a Jew, but by a French patriot, to the attention of our modern Jews, who plume themselves on borrowed French humanitarianism. I will quote here, in translation, a few pages of this work, The New Eastern Question, by Ernest Laharanne. [Footnote: See note IX at end of book.]

‘In the discussion of these new Eastern complications, we reserved a special place for Palestine, in order to bring to the attention of the world the important question, whether ancient Judæa can once more acquire its former place under the sun.

‘This question is not raised here for the first time. The redemption of Palestine, either by the efforts of international Jewish bankers, or the nobler method, of a general subscription in which all the Jews should participate, has been discussed many times. Why is it that this patriotic project has not as yet been realized? It is certainly not the fault of pious Jews that the plan was frustrated, for their hearts beat fast and their eyes fill with tears at the thought of a return to Jerusalem. [Footnote: My friend, Armond L., who
traveled for several years through the Danube Principalities, told me that the Jews were moved to tears when he announced to them the end of their suffering, with the words ‘The time of the return approaches.’ The more fortunate Occidental Jews do not know with what longing the Jewish masses of the East await the final redemption from the two thousand year exile. They know not that the patriotic Jew cannot suppress his cry of anguish at the length of the exile, even in the midst of his festive songs, as, for instance, the patriotic poem which is read on Chanukah, closes with the mournful call:

‘For salvation is delayed for us and there is no end to the days of evil.’

‘They asked me,’ continued my friend, ‘what are the indications that the end of the exile is approaching?’ ‘These,’ I answered, ‘that the Turkish and the papal powers are on the point of collapse.’

‘If the project is still unrealized, the cause is easily cognizable. The Jews dare not think of the possibility of possessing again the land of their fathers. Have we not opposed to their wish our Christian veto? Would we not continually molest the legal proprietor when he will have taken possession of his ancestral land, and in the name of piety make him feel that his ancestors forfeited the title to their land on the day of the Crucifixion?

‘Our stupid Ultramontanism has destroyed the possibility of a regeneration of Judæa, by making the present of the Jewish people barren and unproductive. Had the city of Jerusalem been rebuilt by means of Jewish capital, we would have heard preachers prophesying, even in our progressive nineteenth century, that the end of the world is at hand and predictions of the coming of the Anti-Christ. Yes, we have lived to see such a state of affairs, now that Ultramontanism has made its last stand in oratorical eloquence. In the sacred beehive of religion, we still hear a continuous buzzing of those insects who would rather see a mighty sword in the hands of the barbarians, than greet the resurrection of nations and hail the revival of a free and great thought inscribed on their banner. This is undoubtedly the reason why Israel did not make any attempt to become master of his own flocks, why the Jews, after wandering for two thousand years, are not in a position to shake the dust from their weary feet. The continuous, inexorable demands that would be made upon a Jewish settlement, the vexatious insults that would be heaped upon them and which would finally degenerate into persecutions, in which fanatic Christians and pious Mohammedans would unite in brotherly accord—these are the reasons, more potent than the rule of the Turks, that have deterred the Jews from attempting to rebuild the Temple of Solomon, their ancient home, and their State.’

The Christians believed that the Jews had only one way to save themselves from ultimate annihilation—to convert to Christianity. Christians believe that only a small remnant of the Jews will convert and survive. They plan to slaughter the others. Even those Gentiles who were willing to help the Jews to take Palestine from the Turks believed that the Jews would be attacked by Christians unless they pretended to convert to Christianity. The Jews also believed that the Moslems would attack them
and many toyed with the idea of massive feigned Christian conversion so that the Jews in Palestine would have Christendom as an artificial ally against Islam. Hence the countless books that were published by “Christians” calling for the “restoration of the Jews to Palestine” concurrently called for the conversion of the Jews, so as to protect the Jews from the Christians and grant them Christian protection from Islam.

The Holocaust had the effect of making the Jews appear impotent and vulnerable—non-threatening. Centuries of Jewish intrigues and propaganda eventually had the effect of weakening Christianity and subverting its beliefs such that the threat of a negative Christian response to massive Jewish emigration to Palestine has greatly diminished, though the possibility that the Jews will find themselves in a trap of their own making persists.

The numbing pain inspired by the shocking images of the victimization of the Jews in the Holocaust has been abused by racist Jews to shield themselves from criticism, such that their arrogance makes them an open menace which tarnishes the image of all Jews. As has always happened in the past when leading Jews grow insufferably arrogant and hypocritical, it might some day come about that true Christians will feel that they have been betrayed by “evil Jewish leadership” and will retaliate against the “anti-Christ” and the Zionists—pseudo-Christian and Jew, who have misled them. Real Christians may join forces with Islam and crush a foe which has been attacking them from the beginning, and which views the Hebrew Bible as a plan they intend to fulfill with their own deliberate actions. It is possible that the Christians and Moslems will learn from Jewish racists and adopt Jewish inhumanity and religious intolerance.

Very early on, Cyprian stated in his Twelfth Treatise, “Three Books of Testimonies Against the Jews”, First Book, Testimony 24, that the Jews had but one option to atone for the death of Christ,

“24. That by this alone the Jews can receive pardon of their sins, if they wash away the blood of Christ slain, in His baptism, and, passing over into His Church, obey His precepts.

In Isaiah the Lord says: ‘Now I will not release your sins. When ye stretch forth your hands, I will turn away my face from you; and if ye multiply prayers, I will not hear you: for your hands are full of blood. Wash you, make you clean; take away the wickedness from your souls from the sight of mine eyes; cease from your wickedness; learn to do good; seek judgement; keep him who suffers wrong; judge for the orphan, and justify the widow. And come, let us reason together, saith the Lord: and although your sins be as scarlet, I will whiten [Footnote: ‘Exalbabo.’] them as snow; and although they were as crimson, I will whiten [Footnote: ‘Inalbabo.’] them as wool. And if ye be willing and listen to me, ye shall eat of the good of the land; but if ye be unwilling, and will not hear me, the sword [Esau] shall consume you; for the mouth of the Lord hath spoken these things. [Footnote: Isa. i. 15-20.]”

The Zionists who wanted to remain openly practicing Jews had to carefully
nurture an antagonism over the course of many centuries in Europe against the Pope, and depict him as the anti-Christ, and against Catholicism as the evil ecumenical Church of the Apocalypse, and against Islam and the Turks as heathens; so that “reformed” Christians would not see the Jews and Judaism as the evil ecumenical Church of the Apocalypse headed by the anti-Christ; and so that the English Esau, or some other European force, would take Palestine from the Turks and give it to the Jews, who could then regulate the trade of the world. The best means to accomplish this feat was to create anti-Catholic “reformations” and “second reformations” creating the Protestant and Puritan Churches which mirrored the Jewish faith, and for the Jews to pretend to convert to these Judaised Churches and form an alliance with Gentile Christians against Islam, while destroying Catholic Christianity.

Van Helmont disseminated his message in England though Anne Conway to Henry More, Robert Boyle, John Locke, Isaac Newton, etc. Van Helmont also published on medicine and chemistry, subjects which would later interest David Hartley. The ecumenical Protestants, Puritans, and Arians like Isaac Newton, Samuel Clarke and David Hartley, converted Christians to Judaism under the guise of converting Jews to Christianity.

Frankist Jews converted to Christianity in order to destroy it. Some Jews used the institution of Freemasonry as a means to bring about the conversion of Christians to Judaism. As predicted in Biblical prophecy, they sought to make Jerusalem the capital of the ecumenical church of Judaism, which would replace the supposedly “Universal” or “Catholic” Church seated in Rome. Zionist Moses Hess wrote in his treatise published in 1862, *Rome and Jerusalem*,

“You have certainly heard of Joseph Salvador, the author of the work entitled *History of the Mosaic Institutions and of the Hebrew People*. This same author recently published a work entitled *Paris, Rome and Jerusalem*, in which he clearly shows that even among our enlightened brethren, there are dreamers who wish for a rebuilding of the Temple of Jerusalem. But he attaches to this rebuilding conditions that are acceptable neither to pious nor to progressive Christians and Jews. If I understand the author correctly, he expects his New Jerusalem to become the world capital of the fusionists. Salvador, furthermore, seems to cherish the curious idea that the Jews ought first to turn Christians, so that they may be the better able to convert the Christians afterward to Judaism. This work is, in reality, not as new as Salvador thinks; it began eighteen hundred years ago. It seems, however, that the Judaism of which Salvador is thinking is as new as his Christianity.

More reasonable are the attempts of those fusionists who, like my friend Hirsch, of Luxemburg, are utilizing freemasonry as a means to amalgamate
all the historical cults into one. The Luxemburg Rabbi, the antipode of his namesake, the Frankfort Rabbi Hirsch, developed the idea of fusion so thoroughly in the excellent lectures which he delivered at the Luxemburg Lodge, and later published under the title *Humanity as a Religion*, that, according to him, the matter may be considered closed. All that remains for the rabbis to do is to close up their reform temples and send the school children to the masonic temples. In truth, the logical consequences of reform have long since led those who took the sermons of the reform rabbis seriously, toward making such a step; as you, being a resident of Frankfort, well know. In vain did they afterward ornament their fusionist sermons with Talmudic quotations. It was too late and they had to be satisfied to preach to empty pews.

Jewish rationalists, who have as little reason to remain within the fold of Judaism as have Christian rationalists for clinging to Christianity are, like their Christian friends, very energetic in discovering new grounds for the existence of a religion which, according to them, has no longer any reason to exist. According to them, the dispersion of the Jews was merely a preliminary step to their entering upon their great mission. What great things are the Jews in exile to accomplish in their opinion? First of all, they are to represent 'pure' theism, in contradistinction to Christianity. In the next place, tolerant Judaism is to teach intolerant Christianity the principles of humanitarianism. Furthermore, it is the function of exilic Judaism to take care that morality and life, which in the Christian world are severed from each other, should become one. And lastly, the Jews must also act as industrial and commercial promoters—be the leaven of such activities among the civilized nations in whose midst they live. I have even heard it remarked quite seriously, that the Indo-Germanic race must improve its quality by mingling with the Jewish race!

But, mark you, from all these real or imaginary benefits which the Jews in dispersion confer upon the world, none will be diminished even after the restoration of the Jewish State. For just as at the time of the return from the Babylonian exile not all the Jews settled in Palestine, but the majority remained in the lands of exile, where there had been Jewish settlements since the dispersion of Israel and Judah, so need we not look forward to a larger concentration of Jews at the future restoration. Besides, it seems to me that those benefits which the Jews in exile confer upon the world are exaggerated, ‘for the sake of the cause.’ I consider it an anachronism to assign to the Jews those missions which they certainly performed in antiquity, and to some extent also in mediaeval times, but which, at present, no longer belong peculiarly to them. As to affecting the unity of life and theory, it is only possible with a nation which is politically organized; such a nation alone is able to realize it practically by embodying it in its institutions.

Again, what section of world-Jewry is to teach the Christians tolerance and humanity? You will surely say the enlightened Jews. But is not the enlightened Christian entitled to repeat to the enlightened Jew the words
which Lessing, in his *Nathan the Wise*, puts into the mouth of the liberal Christian in his answer to the liberal Jew: ‘What makes me a Christian in your eyes, makes you a Jew in mine.’

Or, on the other hand, should the enlightened Jew say to the orthodox Christian, ‘Your beliefs are mere superstitions, your religion only fanaticism,’ may the enlightened Christian not turn to the orthodox Jew and make similar remarks in defense of his own religion? Our cultured Jews who accuse Christians of possessing a persecution mania, reason as fallaciously as does Bethmann Hollweg when he charges the Jews with the same trait. History can neither be explained nor changed in its course by such explanations.

From the viewpoint of enlightenment, I see as little reason for the continuation of the existence of Judaism as for Christianity. It is better for the Jew who does not believe in the national regeneration of his people, to labor, like the enlightened Christian, for the dissolution of his religion. I understand how one can hold such an opinion. But what I do not understand is, how it is possible to believe simultaneously in ‘enlightenment’ and in a Jewish Mission in exile; in other words, in the ultimate dissolution and in the continued existence of Judaism at the same time.\(^{1035}\)

Christianity itself was a movement to convert Gentiles to Judaism in the guise of Liberalism, and to take the hatred and menacing nature of the creator God of the Old Testament out of Judaism so as to make it more palatable for Gentile consumption. A new call for “fusion” reappeared in the Zionism of Protestants, who often wrote of converting Jews to “Christianity”—while calling for the restoration of the Jews to Palestine, so as to make Jerusalem (as opposed to Rome) the seat of a new international despotism that was based on Judaism, which treachery against Christians signified the terror and devastation of the prophecies, the mysticism of the gnostics who were influenced by the East, and the despotism and deceit of the worst of the Talmud. Protestantism itself takes a large step towards converting Christianity back into original Judaism, with all its horrors and inhumanity.

### 8.7.1 The “British-Israel” Deceit

Biblical prophecies require that in order for the millennium to begin all of the Tribes of Israel must return to Palestine (*Isaiah* 11:11-12. *Jeremiah* 23:8; 30:3. *Ezekiel* 37:21. *Hosea* 3:4-5). The ten northern tribes were missing (never existed), though some were believed to have been found in the mid-1800's. Some in England had long believed that the English descended from one of the ten lost tribes of Israel which had allegedly traveled to England on Phoenician ships in ancient times.

The belief that the British were a lost tribe of Israel was promoted in Russia as evidence that England might be a place of respite for the anti-Christ—especially since British Royals claimed to be descended from King David and the Zionists published countless books in England and America calling for the “restoration of the Jews to Palestine” and concurrently seeking to foment a war with Rome, Russia and
Turkey by calling the Pope, the Czar and the Sultan the “anti-Christ”. There is little
doubt but that it was Jews in England who inspired the belief that the Pope in Rome,
the Russian Czar and the Turkish Sultan were the anti-Christ, because the
propaganda which popularized these beliefs served the perceived self-interests of the
Jews. It was also likely the Jews in Russia who inspired a belief there that the
English King was the anti-Christ. It was not mere coincidence that this antagonistic
propaganda calling for wars on all sides amongst the empires uniformly called for
the “restoration of the Jews to Palestine” and uniformly stigmatized an artificial
enemy as the “anti-Christ”. The Jews had been trying to provoke a world war
through their hateful and intolerant propaganda for centuries.

A vast movement existed in England and the Commonwealth Nations during and
after Queen Victoria’s reign, which called itself “Anglo-Israel” or “British-Israel”.
They claimed that the English descended from Israel, that Queen Victoria descended
from the House of King David, and that the Jews should be restored to Palestine. It is likely that all movements which call for the “restoration of the Jews to
Palestine” are begun by Jews.

The prophecies require that the Messiah be descended from David (II Samuel 7;
Christian suspicion and persecution, many Jewish groups spread the myth that their
ancestors had left Israel before the crucifixion of Christ, or had opposed it. The
question naturally arises, was the entire British-Israel movement, which began more
than one thousand years ago, initiated by Jews who sought to distance themselves
from the crucifixion of Christ? Some Jews asserted that America was the new Israel
and that Jews were important members and sponsors of Christopher Columbus’
voyage to America—even that Christopher Columbus was himself a Jew searching
for a new homeland for the Jews. In America, Judge Noah, a Jewish Zionist,
argued that the American Indians were descended from the Israelites, and Noah
sought to privilege Jews in America on this basis.

John Spargo was quoted in The New York Times on 22 February 1921 on page
10, referring to the publication of the Protocols of the Learned Elders of Zion in
English translation, in an article entitled “Spargo Condemns Racial Antagonism”

“In 1895 a book was published in France which attempted to prove the
existence of a world-wide conspiracy against Christian civilization. In that
book the theory was advanced that the English people are all of the Jewish
race, and that the British Government is the central force of this worldwide
Jewish conspiracy. In his book Niles reproduced this fantastic theory but,
recognizing that it would cause the protocols to be laughed out of court, The
Dearborn Independent, The London Morning Post and all the other
publishers of the protocols in England and America have carefully deleted
this part of the book by Nilus. The reason for the deletion is as obvious as the
dishonor of it.”

Spargo was mistaken if he would assert that there was no belief among the
British themselves that they had descended from the “Israelites” and that this belief
was instead concocted in Russia in 1895 in order to discredit the Jews and the British. The belief that the British descended from the “Israelites” was very old and enduring, as was the belief that they descended from Noah. William Camden in his *Britannia* of 1586, and Theophilus Evans in his *Drych y prif oesoedd* of 1716, told of the Welsh legend that the Ancient Britons, the Welsh, had descended from Noah’s grandson Gomer. Camden’s view even found its way onto the 1606 English edition of the map *ANGLIÆ, SCOTIÆ ET HIBERNIÆ, SIVE/BRITANNICAR: INSULARVM DESCRIPTIO*:

“The first Inhabitants which settled here not long after the universal Flood and the Confusion of Babel came here from France, considering its Proximity, Similarity of language, Manners, Government, Customs and Name, as is stated by the learned Clarencieux Camden, the only light shining on our histories, as demonstrated in his treatise called Britannia. For to this day the ancient Britans, the Welshmen, call themselves CUMRI, (not Cambri), derived from Gomer, the son of Iaphet (called by the Romans Cimber) from whom the Celtæ or Gauls are descended.”

Circa 800AD, Nennius wrote that the British descended from Noah in his *Historia Britonum*. Aylett Sammes published *Britannia Antiqua Illustrata* in 1676, in which he argued that the British descended from the Phoenicians. Henry Rowlands argued in 1723 that the ancient Druids were the descendants of Noah. In the 1740's, William Stukeley held that the British were the children of Abraham. Queen Victoria believed that she was descended from King David, which also meant that Victoria’s grandson Kaiser Wilhelm II was also believed by the family to be descended from David. In 1924, Laurence Austine Waddell published *The Phoenician Origin of Britons, Scots & Anglo-Saxons Discovered by Phoenician & Sumerian Inscription in Britain, by Pre-Roman Briton Coins & a Mass of New History*.

### 8.7.2 For Centuries, England is Flooded with Warmongering Zionist Propaganda

Zionism appeared early and often in England and America. For example, in addition to the works cited above, Thomas Brightman published his *Apocalypse Apocalypses* in 1585. In 1585, Francis Kett, like Martin Luther, declared that the Pope was the “Beast” prophesied in *Revelation* and the man foretold to pretend to be God in the Temple. In 1585, Kett envisioned Jerusalem as the heavenly seat of the new Kingdom of Christ. Kett was burned at the stake in 1589 for declaring that the Bible prophesied that the Jews would be restored to Palestine. The “Eastern Question” arose again and again in apocalyptic literature and the authors frequently discussed scenarios that eventually played out—Russia’s wars against Turkey, Napoleon and the East, Greek independence, the Crimean War, the Congress of Berlin, World War I and World War II, etc. It is no coincidence that the works which called for the “restoration of the Jews to Palestine” correctly foretold the wars the
Jews deliberately caused to further their goal of creating a “Jewish State”.

“Lord Protector” Oliver Cromwell, Queen Victoria, Prime Minister Benjamin Disraeli, Prime Minister Arthur Balfour, Prime Minister David Lloyd George and Prime Minister Winston Churchill were each outspoken and long-term Zionists. This remarkably high percentage of Zionist leaders in England is especially odd given that only a very small percentage of Jews were Zionists and there was never a large Jewish population in England. This oddity is explained by the grossly disproportionate influence of Cabalistic Jews and Jewish bankers in England over the course of many centuries.

Puritans, like Oliver Cromwell, were ardent Zionists and carried out a “second reformation” in order to attack the Catholics—whom the Jews hated. Many Puritans migrated to America. Though American schools teach that they came for religious freedom, the truth of the matter is that they migrated to America so that they would have the freedom to practice extreme intolerance.

Puritans sought to forcefully convert Christians to Judaism while pretending to seek to convert Jews to Christianity. Like many of the Protestants of Germany, they generally named their children with names taken from the Old Testament, not the New. In Amsterdam, English Puritan Zionists Joanna and Ebenezer Cartwright issued a Zionist petition in 1649 calling on the English and the Dutch to lead the Jews back to Palestine. Zionist Cabalist Franciscus Mercurius van Helmont traveled from Amsterdam to England to spread Cabalistic Judaism and Zionism among the intellectual elite of England—and he was quite successful. Rabbi Manassah ben Israel, of Amsterdam, persuaded Oliver Cromwell to readmit Jews into England on the premise that the Biblical pronouncement that the Jews shall be scattered to the ends of the Earth meant that they shall enter England, which would trigger the “ingathering” of the Jews to Palestine. The Old Testament instructed the Jews to enter every nation and the affluent Jews of Amsterdam no doubt recognized the benefits of gaining inroads into the affairs of England and of profiting from its wealth. Jews were famous for gathering political and economic intelligence from around the world.

Regina Sharif wrote in her article “Christians for Zion, 1600-1919”,

“Nowhere in Europe has support for Zionism been as widespread and popular over the ages as in England. It was there that the idea of Jewish restoration in Palestine became prominent and developed into a doctrine that lasted well over three centuries. Nahum Sokolow, the well-known Jewish historian of the Zionist movement, commented on this permanent connection between England and Zionism: ‘English Christians taught the underlying principles of Jewish nationality.’ He expressed his gratitude to the many ‘English thinkers, men of letters and poets throughout the ages,’ who championed the Zionist cause through many generations. ‘For nearly three centuries Zionism was a religious as well as a political idea which great Christians and Jews, chiefly in England, handed down to posterity.’ [**] [***] Weizmann’s skills in international diplomacy and persuasion, however great they might have been, would have remained fruitless had not English culture been conditioned to
Zionism long before the time of Herzl or Weizmann and had not the seeds of Zionism been sown and cultivated in England by non-Jewish Zionists long before the appearance of Herzl’s Judenstaat.\(^{1955}\)

See also: Eliyahu Tal, *You Don’t Have to be Jewish to be a Zionist: A Review of 400 Years of Christian Zionism*, International Forum for a United Jerusalem, Tel Aviv, (2000).

In the 1500’s and continuing through the 1800’s and beyond, a great many books were published in Great Britain and in America advocating: (1) the overthrow of the Pope, who was called “the Beast”, and the destruction of the Catholic Church; (2) the destruction of the Turkish Empire, and of Mohammedanism; (3) the destruction of the French and German Empires; (4) world war; (5) the “restoration of the Jews to Palestine”, the rebuilding of the Temple and turning Jerusalem into the capital of a new world government—many of which objectives Jewish leaders accomplished through the Russian Revolution and the First World War.

There were many advocates of these beliefs, including Thomas Drake, who published *The Calling of the Jews* in 1608. Henry Finch published *The Worlds Great Restauration. Or the Calling of the Ievves and (With Them) of All the Nations and Kingdomes of the Earth, to the Faith of Christ* in 1621.\(^{1956}\) Manasseh ben Israel’s work was translated into English as: *The Hope of Israel*, Printed by R.I. for Hannah Allen, London, (1650); and *The Great Deliverance of the Whole House of Israel: What it Truly Is, by Whom it Shall Be Performed, and in What Year. . . in Answer to a Book Called the Hope of Israel, Written by a Learned Jew of Amsterdam Named Menasseh ben Israel*, Printed by M.S., London, (1652). John Milton published *Paradise Regained* in 1671.\(^{1957}\) In 1747, John Collet published *A Treatise of the Future Restoration of the Jews and Israelites to Their Land: with Some Account of the Goodness of the Country, and Their Happy Condition There, till They Shall Be Invaded by the Turks : with Their Deliverance from All Their Enemies, When the Messiah Will Establish His Kingdom at Jerusalem, and Bring in the Last Glorious Ages*.\(^{1958}\) Joseph Eyre published *Observations upon the Prophecies Relating to the Restoration of the Jews: with an Appendix in Answer to the Objections of Some Late Writers* in 1771.\(^{1959}\) After winning an award for his work on Zionism in 1795 while a divinity student at Cambridge, Charles Jerram published *An Essay Tending to Shew the Grounds Contained in Scripture for Expecting a Future Restoration of the Jews* in 1796.\(^{1960}\)

Scores of such works appeared in Britain, America, and elsewhere advocating world war, the “restoration of the Jews to Palestine” and the destruction of heaven and Earth; including: G. Fletcher, *The Policy of the Turkish Empire. The First Booke*, Printed by John Windet for W[illiam] S[antsby] and are to be soulde at Powles Wharfe at the signe of the Crosse Keyes, London, (1597); *Of the Rvsse Common Wealth, Or, Maner of Gouernement by the Russe Emperour, (Commonly Called the Emperour of Moskouia): With the Manners, and Fashions of the People of That Countrey*, Thomas Charde, London, (1591); *De literis antiquae Britanniae, regibus praesertim qui doctrinâ clariuerunt, quique Collegia Cantabrigiae fundârunt, Ex Academiae celeberrimae typographeo, Cantabrigiae, (1633); and Israel Redux:
How the Jews Made the British into Zionists

Pretending Himself to Be Sent to Gather Together the Jews from All Parts: as Well the Ten Tribes That Have So Long Absconded Themselves from the World; as the Known Tribes of Judah and Benjamin: Promising to Them the Restoration of the Land of Canaan, and All That They Formerly Enjoyed in the Time of King Solomon. As it Was Communicated to Rabbi Josuah Ben Eleazar, Merchant in Amsterdam, by a Letter from Adrianople. Faithfully Translated into English, by Josephus Philo-Judæus, Gent. With Allowance, Printed for A.G., London, (1671). See also: W. Alleine, The Mystery of the Temple and City Described in the Nine Last Chapeters of Ezekiel, Unfolded Also These Following Particulars Are Briefly Handled, 1. The Calling of the Jews, 2. How the Jews Made the British into Zionists 1753

How the Jews Made the British into Zionists  

Jewish forces in England who wanted to destroy Catholicism and attack the Pope and the Turks in order to “restore the Jews to Palestine” fabricated prophecies meant to win converts to their cause. In 1641, a pamphlet appeared in England purporting to be the prophecies of one Ursula Shipton, a. k. a. Mother Shipton, a. k. a. Agatha Shipton, a. k. a. Ursula Sontheil (ca. 1488-1561). This six-page pamphlet entitled The Prophesie of Mother Shipton in the Reign of King Henry the Eight Foretelling the Death of Cardinall Wolsey, the Lord Percy and Others, as Also What Should Happen in Insuing Times printed several statements of fact in 1641, which purported to be predictions of events yet to occur in Shipton’s lifetime, but which had already occurred by 1641. There were no extant records proving that any such woman as “Mother Shipton” ever existed.

The pamphlet was political propaganda issued by those who wished to rid England of Catholicism and justify revolution and murder. It was so successful, that new prophecies allegedly written by “Mother Shipton” began to appear referring to the Pope, the Turks and the “calling of the Jews”. “Mother Shipton” predicted terrible wars, which had not yet occurred when these new prophecies appeared, but which had been in the plans of the Protestants who would overthrow the Pope and take Palestine from the Turks in order to give it to the Jews. Numerous later and expanded editions appeared. In 1862, Charles Hindley lent greater credibility to the hoax by adding passages about machines, which did not exist in the period of 1488-1561, but which had since been invented. He also infamously added the prediction that the world would end in 1881, but later admitted that these additions were the products of his own imagination.
As a Good Cabalist Jew, David Hartley Conditions Christians to Welcome Martyrdom for the Sake of the Jews

Though he came from humble beginnings, David Hartley was well-connected and had married into the immensely wealthy family of his second wife Elizabeth Packer in 1735. His plea for the destruction of the Christian Temple of Europe—principally Roman Catholicism, and the diaspora of Christendom—smack of revenge for the Jewish Diaspora brought on by the Romans. It is amazing that some Christians, to this day, are gullible enough to destroy themselves and humanity for the sake of ancient Jewish prophecies, for the sake of modern Jews. Their leaders are well paid.

In an odd twist on the Crusader culture of the English, Hartley tried to make one feel un-Christian if one did not support world revolution, Zionism and Jewish world rule after the intentional destruction of Christendom. Anti-Semitic Christian Zionists worked the other end of the political spectrum, but issued the same ultimate message, i.e. they promoted world revolution, Zionism and the destruction of Christendom. It is interesting to note that the founder of Protestantism—the founder of the Gentile movement to destroy Catholicism and label the Pope the “Beast of the Apocalypse”—was an expressed philo-Semite, Martin Luther, a “Reformer” who appeared to seek the cooperation of the Jews to end the religious hegemony of Catholicism—Luther who had published That Jesus Christ was Born a Jew in 1523. After creating a divide in European Christians, Martin Luther forwarded the Zionist agenda by taking an anti-Semitic stand. He published On the Jews and Their Lies in 1543. Luther, with his close contacts with the Jewish community, may well have been an agent for Zionists and Protestantism was a device to divide and destroy Christendom. It might also be that near the end of his life Luther eventually sickened of killing Christians and was sincerely revolted by the Jews’ plans to exterminate all Gentile races. The ultimate motives behind the Crusades and the persecution of Jews during the Crusades are also open to question.

Some have taken the view that Protestantism created Zionism in its quest for an ally against the Catholic Church—and in England with the purpose of securing trade routes to India and China (and later oil). Though these forces were no doubt in play during the movement—at the instigation of Jews, it would appear far more likely that Zionists created Protestantism as a means to destroy the Roman Catholic Church they so hated, than that the Protestants created Zionism—given the fact that Zionism pervades the Old Testament. The Rothschilds had no small amount of influence in England and in France—they helped to put Disraeli and the Napoleons in power—and the alleged trade advantages of securing Palestine for the Jews would profit Jewish financiers, as well as the British or French. It was always the Jews who were whispering of these alleged advantages into the ears of the Christians. It was the Jews who went from one country to another preaching this same message. It was the Jews who alleged that only Jews could secure European interests in the region, which was not only a patently false message, it was absurd and the exact opposite of the truth.

Abbé Barruel alleged that the Jacobins, who instigated the French Revolution, were a current manifestation of a very old revolutionary conspiracy of the
Freemasons to establish a world government through world revolution. In 1806, Barruel produced a letter he received from A. J. B. Simonini, which he alleged proved a Jewish conspiracy to destroy Christendom and rule the world. At about the same time, George Stanley Faber alleged that the Pope and Islam were an evil conspiracy, which stood in the way of the “restoration of the Jews” and the fulfilment of prophecy. Faber proposed the destruction of the Turkish Empire, and the destruction of Catholicism, in preparation for the “restoration of the Jews”. In this period we find such fanatical titles as: W. Ettrick, *The Season and Time, Or, an Exposition of the Prophecies Which Relate to the Two Periods of Daniel Subsequent to the 1260 Years Now Recenter Expired: Being the Time of the Seventh Trumpet*. Together with Remarks upon the Revolutionary Anti-Christ Proposed by Bishop Horsley and the Rev. G. S. Faber, Longman, Hurst, Rees, Orne, and Brown, London, (1816). There was a large and long-lived religious movement in Protestant England and America to bring about World War in order to “restore the Jews to Palestine”. This had no benefits for Christians.

The Bolsheviks under Trotsky sought the destruction of religion and a world government. These were expressed Jewish objectives. The Bolsheviks murdered tens of millions of Christians and plunged many millions more into misery. The British and Americans eventually succeeded in destroying the Turkish Empire, “restoring the Jews to Palestine” and securing their access to the Orient and to oil. The Jews had their way, at a horrible cost to humanity, which we continue to pay.

One hundred years before Marx published his *Manifesto*, Hartley called for world revolution and the destruction of the Christian Churches and of European civil institutions so as to cause suffering Christians to disperse throughout the world and evangelize—just as the Roman dispersion of the Jews into Diaspora caused Jews to roam and proselytize. In Hartley’s day, many governments had both “evangelical and civil” power—the Church and the State were often one institution with two faces.

At that time, the Roman Catholic Church was one of the most powerful institutions in the world and stood in the way of the Old Testament prophecy that the “Jewish Nation” should attain political and religious hegemony, and rule the world after the other nations had been obliterated. The Catholics pretended to the Jewish throne as the elect, as the chosen of God. The Catholics asserted the doctrine that the Catholic Church is the “Mystical Body of Christ”, which has divine dominion over the nations. The Jews believed that their Messianic prophecies gave them this divine right.

Herzl believed that he would not receive the support of the Pope and the Catholic Church and he was correct. Jews also had many other reasons to hate Catholics. Romans destroyed the Jewish Nation and Rome was the seat of Catholicism. Catholics had committed numerous atrocities against Jews, including the Ghetto system and the Inquisition—the Ghetto of Rome was an especially degrading system.

In Europe, absolute hegemony had always been the goal of empires and churches—and the cause of numerous wars. Jews were by no means alone in their quest for hegemony. In addition, the Catholic Popes had sought to take Palestine in the Crusades, supposedly not in hopes of the “restoration of the Jews to Palestine”, but in the hopes of taking the Holy Land for the Christians. This made Catholicism
an obstacle to Zionism. Catholicism had long been the chief obstacle to Jewish religious hegemony. It also sought hegemony over the Christian faith, for example, in the case of the Council of Trent.

The Old Testament, the Talmud and the Cabalistic writings led Jews like the Frankists to believe that they had a right and an obligation to enslave the rest of mankind to serve them, that evil was good, and that the only means to bring about the reign of God was to destroy all competitive religions and governments and bring about absolute suffering throughout the world. These Cabalistic Dualistic sects among Jews even promoted anti-Semitism—even Blood Libel accusations—in order to promote their political agendas in an unbroken chain of revolutionaries from the Frankists to the Marxists to the Zionists. They preached reincarnation and taught that their leaders were incarnations of the Messiah. It is no coincidence that Newton, Clarke, Hartley and the other British “Christians” who rejected the divinity of Christ preached the message that Christians must destroy themselves with a world revolution and “restore the Jews to Palestine”. These treacherous men were obviously serving the interests of the Cabalistic Jews who led them.

8.7.3.1 Jewish Revolutionaries and Napoleon the Messiah Emancipate the Jews

Pragmatically, in order for the Jews to obtain emancipation throughout the world, the governments which held them as chattel would have to be overthrown. In order for the governments to be overthrown, the basic structures of society had to be destroyed so as to promote misery, gross dissatisfaction and revolution. Satisfied people tend to preserve the status quo. The last vestiges of the Holy Roman Empire and the Turkish Empire had to be eliminated in order for the Jews to obtain Palestine.

Jewish revolutionaries seek to tear down society so that the common people will have no option but to revolt. Though they pretend to work for the interests of the common people, the Jewish revolutionaries covertly do everything in their power to make the people suffer. When the revolution occurs, Jewish revolutionaries deliberately throw the nation into chaos and economic disaster. Jewish revolutionaries then use their power over the press to spread the myth that only a dictator can restore order, the order the Jews covertly and deliberately subverted. After the Jewish revolutionaries have their puppet dictator in place, they attack religion and mass murder Christians and especially attack the intellectual elite so as to ruin the genetic heritage of the Gentile peoples and prevent counter-revolution—prevent Gentile self-determination. This “revolutionary” process is the fulfillment of Judaism.

The Jacobins used pro-democracy propaganda to install the dictator Robespierre in the French Revolution. After Robespierre failed, the Jews put Napoleon, a dictator who considered himself to have been the Messiah, into power. Napoleon almost achieved the Jews goals. However, when Napoleon’s success in emancipating the Jews led to assimilation, Jewish leaders turned against him for having helped the Jews. Jewish leaders preferred oppressive segregation to assimilation.

Liberal apostate Jews began to treat Napoleon as if something of a god. On 4 April 1806, Napoleon mandated a single catechism for the entire Empire, which
included the statements that Napoleon was “the image of God on Earth” and the “the Lord’s anointed”, i.e. the “Messiah”. Napoleon instituted the Feast of St. Napoleon on 15 August 1806 in honor of Neopolas and mixed the cipher of Napoleon and Josephine with the unutterable name of Jehovah and placed the imperial eagle higher than the Ark of the Covenant on his official crest. Before Napoleon, the French Revolution had largely lost favor with Catholics and religious Jews when Robespierre attacked Judaic and Christian beliefs and instituted the Cult of the Supreme Being and pretended that he was himself a god. Napoleon, the Messiah, emancipated Jews wherever he could, tried to take Palestine for the Jews, re-instituted the Sanhedrin, laid much of the foundation for reform Judaism, etc.

The North American Review wrote in 1845,

“The performance of Racine’s tragedy of ‘Esther’ is said to have excited Napoleon’s sympathy for the Jews; and he intended at once to improve their condition, and win them to his own interests. In 1806, their usurious practices led to complaint, and serious question, whether their rights, under the decree of 1791, should not be withdrawn. Whereupon, the emperor convened at Paris an assembly of the principal French Jews, to whom he proposed questions respecting their opinions and practices, with measures for establishing their brethren throughout the kingdom in honest and useful professions. The questions were answered, for the most part, to the satisfaction of the emperor; and he called a grand sanhedrin of seventy-one members, to convert the doctrinal explanations of the first assembly into authoritative decrees; hoping that the Jews out of the kingdom, also, would send representatives, and thus Paris would be made the centre of a powerful influence to unite and control the Jews throughout the world. The sanhedrim assembled at Paris in 1807,—a truly venerable body. A few foreign deputies attended; but its authority has never been recognized out of France, nor by all in that country; where, however, it seems to have been productive of benefit, in turning many Jews from dishonest and sordid to respectable and useful employments. Indeed, the decrees of this assembly contained a submissive renunciation of many firm Judaic principles. They declared, that France was the only ‘fatherland’ of the French Jews, that intermarriage with Christians was lawful, and that no trades were prohibited.”

When Napoleon sought the “restoration of the Jews to Palestine”, Czar Alexander, under the influence of religious Jewish leadership, called Napoleon the anti-Christ and declared that he was out to destroy Christendom. Jewish leaders used their influence around the world to prevent the complete emancipation of the Jews, which they believed would lead to assimilation and the loss of their power over the Jewish People. The Holy Synod of Moscow proclaimed,

“In order to bring about a debasement of the Church he [Napoleon] has convened to Paris the Jewish synagogues, restored the dignity of the rabbis and founded a new Hebrew Sanhedrin, the same infamous tribunal which
The Jews exerted their influence in England as well as in Russia. Lewis Mayer, who desired the “restoration of the Jews” and who sought the annihilation of Catholicism, and the German, Turkish and Russian Empires, also declared that Napoleon was the anti-Christ in 1806. During Napoleon’s reign, some Jews betrayed him and encouraged all Jews to side against Napoleon and with an “anti-Semitic” Czar, because they feared that Napoleon’s emancipation of the Jews was leading to assimilation, and one must wonder if Russian anti-Semitism was the work of such Jews and if the anti-Semitism of the Czars came at the request of Jewish leaders. A powerful Jewish leader of the time, Shneur Zalman, who hated Gentiles, reasoned that,

“If Bonaparte wins, the wealth of the Jews will increase and their positions will be raised. But their hearts will be estranged from their Father in Heaven. However, if Czar Alexander wins, then although the poverty of the Jews will increase and their position will be lower, their hearts will cleave to and be bonded with their Father in Heaven.”

Napoleon III was also seen by some as the anti-Christ, who would reign over America and England and persecute and destroy Christendom. When Napoleon Bonaparte’s attempt to capture Palestine for the Jews failed, he sought to bring Jews from around the world to France—only five hundred Jews lived in Paris in 1789, and there were only 40,000 Jews in all of France. If Napoleon had defeated the British, it would have meant the hegemony of the Jews over Christendom as Hartley had desired.

Napoleon Bonaparte told Barry Edward O’Meara,

“I wanted to make them leave off usury, and become like other men. There were a great many Jews in the countries I reigned over; by removing their disabilities, and by putting them upon an equality with Catholics, Protestants, and others, I hoped to make them to become good citizens, and conduct themselves like the rest of the community. I believe that I should have succeeded in the end. My reasoning with them was, that as their rabbis explained to them that they ought not practise usury against their own tribes, but were allowed to practise it with Christians and others, that, therefore, as I had restored them to all their privileges, and made them equal to my other subjects, they must consider me like Solomon or Herod, to be the head of their nation, and my subjects as brethren of a tribe similar to theirs. Consequently, they were not permitted to deal usirously with them or me,
but to treat us as if we were of the tribe of Judah. Enjoying similar privileges to my subjects, they were, in like manner, to pay taxes, and submit to the laws of conscription, and to other laws. By this I gained many soldiers. Besides, I should have drawn great wealth to France, as the Jews were very numerous and would have flocked to a country where they enjoyed such privileges. Moreover, I wanted to establish a universal liberty of conscience and thought to make all men equal, whether Protestants, Catholics, Mohammedans, Deists, or others; so that their religion should have no influence in getting them employment under government. In fact, that it should neither be the means of serving, nor of injuring them: and that no objection should be made to a man’s getting a situation on the score of religion, provided he were fit for it in other respects. I made everything independent of religion.”

In August of 1806, the Venetian representative of the Viennese Court stated that the assembly of the Notables of France and Italy “aimed at the realization of far-reaching plans and ‘even to the gathering of the Jews in a particular Kingdom’.”

On 24 September 1806, Metternich wrote to Standion of Napoleon, the Messiah,

“The impulse has been given: the Israelites of all the lands have their eyes turned to the Messiah who seems to free them from the yoke under which they find themselves; the aim of so many sentences (as it is only that much) is not at all to give full licence to the citizens professing this religion in the lands submitted to French rule, but the desire to prove to the whole nation that its real fatherland is France.”

If France were to become the Jewish homeland, as Napoleon desired after his failure to take Palestine for the Jews, that would have made Napoleon the King of the Jews, the Jewish Messiah—the “anti-Christ”. Napoleon’s uncle, Cardinal Joseph Fesch, purportedly said to him,

“Do you want indeed to bring about the end of the world? Do you not know that the Holy Scriptures predict the end of the world for the moment when the Jews will be recognized as a corporate nation?”

Israel Jacobson published *Les premiers pas de la nation juive vers le bonheur sous des auspices du Grand Monarche Napoléon*, Paris, (1806); which treated of Napoleon as if he were the Messiah.

**8.7.3.2 Hitler Accomplishes for the Zionists What Napoleon Could Not**

Later, the Nazis, with their dictator, and the Bolsheviks, with their many dictators, sought to destroy all religions in Europe—sought to destroy Europe, itself. Hitler called for a millennium of Nazism. Much of this revolutionary and nihilistic fervor in Europe stemmed from the Reformation as a revolution against Catholic corruption.
and in this period revolutions were commonly justified based upon scripture. The Illuminati sought revolution, the elimination of private property and religion. Even more revolutionary and nihilistic was the Jewish reformatory movement of Frankism. This Jewish sect encouraged its members to join other religions in order to destroy them—to become leaders in government in order to subvert society—to practice the mafia creed of Omerta silence and to lie and deceive.

Hitler, whose political career in many ways reflects Napoleon’s and in many ways was the polar opposite of Napoleon’s though meant to fulfill the same ends Napoleon failed to achieve—Hitler tells us of his apocalyptic visions that Nature might have chosen the Jews. The pledge of a thousand year empire, ein tausendjähriges Reich, is reminiscent of the prophesy of the millennium of Christ (Revelation 20:1-7). Hitler, the Bolshevik who did what he could do to destroy Europe—Hitler, who ultimately called on the German People to admit their defeat and kill themselves at the close of the war in Europe, who wrote in Mein Kampf, after complaining of the francophilia of the Viennese press and stating that Zionism had convinced him to finally accept anti-Semitism, Hitler stated,

“Just once more — and this was the last time — fearful, oppressive thoughts came to me in profound anguish.

When over long periods of human history I scrutinized the activity of the Jewish people, suddenly there rose up in me the fearful question whether inscrutable Destiny, perhaps for reasons unknown to us poor mortals, did not with eternal and immutable resolve, desire the final victory of this little nation.

Was it possible that the earth had been promised as a reward to this people which lives only for this earth?

Have we an objective right to struggle for our self-preservation, or is this justified only subjectively within ourselves?

As I delved more deeply into the teachings of Marxism and thus in tranquil clarity submitted the deeds of the Jewish people to contemplation, Fate itself gave me its answer.

The Jewish doctrine of Marxism rejects the aristocratic principle of Nature and replaces the eternal privilege of power and strength by the mass of numbers and their dead weight. Thus it denies the value of personality in man, contests the significance of nationality and race, and thereby withdraws from humanity the premise of its existence and its culture. As a foundation of the universe, this doctrine would bring about the end of any order intellectually conceivable to man. And as, in this greatest of all recognizable organisms, the result of an application of such a law could only be chaos, on earth it could only be destruction for the inhabitants of this planet.

If, with the help of his Marxist creed, the Jew is victorious over the other peoples of the world, his crown will be the funeral wreath of humanity and this planet will, as it did millions’ of years ago, move through the ether devoid of men.

Eternal Nature inexorably avenges the infringement of her commands.
How the Jews Made the British into Zionists

Hence today I believe that I am acting in accordance with the will of the Almighty Creator: by defending myself against the Jew, I am fighting for the work of the Lord.”

Jewish Dualists believed that the millennium could be brought about by committing monumental acts of evil. They believed that by betraying the Jewish People, as Judas betrayed Jesus—Jew betrayed Jew, anti-Semitic Jews could fulfill the Jewish prophecies. They believed in Hitler.

English Protestant Zionists, vile traitors under the direction and influence of Jewish Zionist financiers, planned the destruction of European society, which they planned would result in the “restoration of the Jews to Palestine” and the downfall of Christianity—ultimately the destruction of Heaven and Earth by fire. The Socialist ideology that almost brought this about was promoted by the anti-Semite Karl Marx and his good friend, the eager assimilationist—turned anti-Semite—turned racist Zionist, Moses Hess—who, together with Ghillany, Bauer, and others, provided the anti-Semitic Socialist dogma that gave rise to Dühring and eventually to Adolf Hitler. Such Socialists had always used anti-Semitism to bring themselves into power and their goal was always to destroy the social institutions of Europe to make it ripe for revolution, which revolution would emancipate the Jews, then expel them to Palestine.

In 1749, with the English Revolution of 1688 against Catholicism in fairly recent memory, Hartley had iterated these goals in three corollaries to his 83rd Proposition in the second volume of his Observations on Man:

“C O R . 1. May not the two Captivities of the Jews, and their two Restorations, be Types of the first and second Death, and of the first and second Resurrections?

C O R . 2. Does it not appear agreeable to the whole Analogy both of the Word and Works of God, that the Jews are Types both of each Individual in particular, on one hand, and of the whole World in general, on the other? May we not therefore hope, that, at least after the second Death, there will be a Resurrection to Life eternal to every Man, and to the whole Creation, which groans, and travails in Pain together, waiting for the Adoption, and glorious Liberty, of the Children of God?

C O R . 3. As the Downfal of the Jewish State under Titus was the Occasion of the Publication of the Gospel to us Gentiles, so our Downfal may contribute to the Restoration of the Jews, and both together bring on the final Publication and Prevalence of the true Religion; of which I shall treat in the next Proposition. Thus the Type, and the Thing typified, will coincide; the First-fruits, and the Lump, be made holy together.”

Hartley called for the destruction of the Christian Temple—principally Roman Catholicism. Jews hated Romans and that hatred carried over to the Pope and Catholicism. Gustaf Dalman wrote of the Talmud, which is riddled with hateful comments,
“In the Talmud no people have a name so hated as the Romans, who destroyed the Jews’ holy city and took from them the last remnant of independence.”

In Proposition 84, Hartley calls for a Christian diaspora to serve the interests of the Jews by spreading Jewish monotheism to all the peoples of the Earth and by making it easy for the Jews to monopolize trade and take all the wealth of the Gentiles, which objectives fulfill Jewish Messianic prophecy,

“Fifthly, The Downfall of the Civil and Ecclesiastical Powers, mentioned in the 81st and 82d Propositions, must both be attended with such public Calamities, as will make Men serious, and also drive them from the Countries of Christendom into the remote Parts of the World, particularly into the East and West-Indies; whither consequently they will carry their Religion now purified from Errors and Superstitions.

Sixthly, The Restoration of the Jews, mentioned in the last Proposition, may be expected to have the greatest Effect in alarming Mankind, and opening their Eyes. This will be such an Accomplishment of the Prophecies, as will vindicate them from all Cavils. Besides which, the careful Survey of Palæstine, and the neighboring Countries, the Study of the Eastern Languages, of the Histories of the present and antient Inhabitants, &c. (which must follow this Event) when compared together, will cast the greatest Light upon the Scriptures, and at once prove their Genuineness, their Truth, and their Divine Authority.”

Hartley concludes his many fallacies by asserting that Christendom should rejoice in its own deliberate self-destruction and the annihilation of the Earth, because destroying itself proves its faith in, and the truth of, the Jews’ prophecies, by artificially and willfully bringing them about,

“One ought also to add, with St. Peter, as the practical Consequence of this Proposition, that the Dissolution of this World by Fire is the strongest Motive to an Indifference to it, and to that holy Conversation and Godliness, which may fit us for the new Heavens, and new Earth.”

The Dispensationalist “Christians” are the modern version of the Hartleys and the Newtons. They have nuclear bombs at their disposal and intend to bring about the destruction of life on Earth in the vain and suicidal hope that Jesus will fabricate them a new heaven and Earth. These religious fanatics are a menace to mankind and are under the direct control of modern Jewish leadership, who have fabricated their mythologies and promoted them. They are slaves to Israel who intend to deliberately destroy humankind. They are psychopathic and have no sympathy for others, nor respect for the self-determination of others, nor any regard for human life. They are the ideal slaves of Israel.

It is interesting that the New Testament contains in its creed the seeds of the self-
The apocalyptic book of Enoch contains many of the mythologies found in the apocalyptic aims of “Christian” Zionists, who seem to wish to stamp out the “seed of Cain”—the seed of the fair—the seed of the European Gentiles. Hartley and countless others readied Christians to joyfully accept war and their own extermination.

History’s most highly regarded theological expert on Judaism, Johannes Buxtorf alleged that Jews were readying to destroy Christianity and to take the Christians remaining after the devastation as slaves—as is prophesied in the Old Testament, in the apocalyptic books of Qumran, and in the Talmud and Cabalistic writings. Buxtorf reiterated the intentions of some Jews as told in the 14th Century Jewish author Machir of Toledo’s (this is perhaps a false name and the work may have been fabricated by Turkish Jews) Avkat Rokhel, Constantinople/Istanbul, (1516). Machir’s Avkat Rokhel was and is a very influential work, which was translated from Hebrew to Yiddish, and which has been republished many times in both Hebrew and Yiddish. The Jews wrote of Hitler and the persecutions of the Third Reich centuries before they came about. The Zionists put Adolf Hitler into power to fulfil these plans. The Jews also wrote of world government and of the league of nations following world war, centuries before they came about. The Zionists have agitated for both World Wars in order to fulfil these plans, and are today agitating for a Third World War.

The book of I Enoch taught Jews many apocalyptic lessons. It is interesting to note that being victims of oppressive laws, Jews had experience with “excessive laws, tyrannical rulers,” etc. and one is struck by how these methods were applied by Bolsheviks and Nazis under Zionist control, and are today used against the Palestinians in the illegally occupied territories. Some Jewish writers knew that such oppression could make peoples lackadaisical, defeatist and lose their will to fight back, or be involved in politics, which they would degrade into vicious combat—especially vulnerable were peoples who had been conditioned by Jewish mythology to welcome their own demise, like Christians were conditioned to exterminate themselves by vile traitors like David Hartley. Jewish writers told that chemical and biological weapons, as well as environmental degradation and psychological warfare, would decimate Gentiles and apostate Jews, while antidotes spared pious Jews, who prospered from the destruction of their neighbors. Jewish writers predicted dictators like Napoleon and Hitler who would ask their people to worship them as gods—there being no better means to defeat Roman Catholicism in Europe. Jewish writers often spoke of the extermination of assimilatory Jews, like those of Europe in the mid-Twentieth Century.

Buxtorf, a renowned expert on Judaism and the life of the Jews who were his contemporaries, and with whom he had an extensive correspondence (his son corresponded with Manasseh ben Israel), wrote in his Synagoga Judaica: Das ist Jüden Schul; Darinnen der gantz Jüdische Glaub und Glaubensubung. . . grundlich erklärt, Basel, (1603), as translated in the 1657 English edition, The Jewish Synagogue: Or An Historical Narration of the State of the Jewes, At this Day Dispersed over the Face of the Whole Earth, Printed by T. Roycroft for H. R. and
Hat a Messias was promised unto the Jews, they all with one mouth acknowledge; hereupon petitioning in their daily prayers that he would come quickly; before the hourglass of their life be run out. The only scruple is of the time when, and the state in which he shall appear.

They generally believe, that this their future Messias shall be a simple man, yet nevertheless far exceeding the whole generation of mortals in all kinds of vertues: who shall marry a wife and beget children, to sit upon the throne of his kingdom after him. When therefore the Scripture mentioneth a twofold Messias, the one plain, poor, and meek, subject to the stroke of death: the other illustrious, powerful, highly advanced and exalted: the Jews forge unto themselves two of the same sort, one which they call by the name of Messias the son of Joseph that poor and simple one, yet an experienced and valiant leader for the warrs; Another whom they entitle Messias the son of David that true Messias who is to be king of Israel, and to rule over them in their own land. About whose coming they are among themselves altogether disagreeing.

Those ancient Jews who lived before Christs incarnation, did not much miss the marke, when Elias said that the world should continue six thousand years, whereof two thousand were to be void and without force, that is, without the law of God, the other two thousand under the law: and the last under the Messias.

Their hope was therefore this, that foure thousand years after the worlds creation fully expired, their Messias should come in the flesh: in which their errour was small or none at all; for according to the vulgar account of us Christians, Christ the true Messias was borne in the 3963. year of the world, but according to the Jews computation in the year 3761, we and they differing 202 years. And now because Christ came not unto them in great power, a king of glorious state (such as were David and Solomon) to deliver them from the tyranny of that usurping Herod, and Roman cruelty, neither with a rod of iron to break in pieces and destroy their enemies: but only began his kingdom over them with the spiritual scepter of his doctrine, even for this very cause they would not receive him for the true Messias, though some few did acknowledge and embrace him, and at that time the most ancient and approved men amongst them did expect his coming: {Luk. 2.25.} thus we finde a Simeon waiting for the consolation of Israel, {lb. v. 38.} and Anna that old Prophetess speaking of him to all that hoped for deliverance in Jerusalem. The very same that the Apostle Paul witnesseth in his Epistle to
the Romans, {Rom. 11.5.} that though the Jews were most ingrateful, yet is there a remnant of them according to the election of grace. Yea, when all kingly power, sacerdotal honour and dignity was taken from them, the city Jerusalem made a ruinous heap, and their beauty the temple turned into ashes, every one now begins to suspect the time of the coming of the Messias to be past. Hence it was that in the 52. years after the destruction of the Temple, a certain proud and haughty Jew boasting that he was the true Messias, feared not to affirm himself the same of whom Balaam prophesied in these words: {Num. 24.17, 18.} I shall see him, but not now, I shall behold him, but not nigh: there shall come a star out of Jacob, and a Scepter shall rise out of Israel, and he shall smite the corners of Moab, and destroy all the children of Sheth. And Edom shall be a possession, Seir also shall be a possession for his enemies, and Israel shall do valiantly. Others understood this prophesie of the then newly begun kingdom of the Christians. But the Jews even at this day determine their Messias as yet to come, and to fulfil those things which Balaam foretold, according to their substance. That the said Jew should proclaim himself the Messias, was most grateful unto them: who presently in their own conceits can nourish hopes, that they should become the conquerours of the Romans, who a little before had destroyed their City and Temple. This Seducer following the letter of the prophesie, names himself, Ben Chocab, which is by interpretation, the son of a Star. His chief follower, who at the very first clave unto him, was Rabbi Akiiba, a man of great learning, who had under his tuition twenty four thousand Scholars, proclaiming him to be Malka Meschiccha, Christ the King. By this means much people went after him; insomuch, that he chused unto himself the City Bittera for the seat of his kingdom. But when that Adrian the Roman Emperour, had after a siege of three years and an half taken and killed this their Messias, and together with this beautiful Star had miserably slaughtered more then four hundred thousand Jews, then the remnant of so great a massacre perceiving themselves led astray by this their Star, turn Anabaptists, and call him from that day to this Barcozabh, that is, the son of a lye, a lying and bastardly Messias. Yet neverthelessse, many since have lived who would be reputed for the Messias, as you may read in a book called Schebet Jehudah*. {Schebet Jehudah, the tribe of Judah. A historical book of the many afflictions, martyrdoms of the Jews, as also of their disputes with the Christians in Spain, and Italy. It was printed at Crncovia in Germany. An. d.1591.}

The issue of all is this; that the Jews convicted in their own consciences, will they, nill they, [willy nilly] are forced to confesse that the time in which the Messias was to come, is already past.

When therefore they had despised and rejected Christ the true Messias, and no other appeared, they falsified the above mentioned tradition of Elias (which was that the Messias should come about the four thousandth year of the world) by annexing unto it this Comment; that the time was prolonged for their offences. But when at length no reason could be pretended of this long
delay, neither could they define the time of his coming: their onely evasion is, to smite with this curse the head of him that should determine a certain season for his coming, *Tippach ruchan atzman schel mechasschebhe Kitzin*,* {Sanhedrin c.ii.p.97.} Which is, *Let their soul and body burst with a swolling Rupture, who peremptorily set down the time;* that time (I say) in which the Messias is expressly for to come. Yet this not at all pondered, and nothing set by, many of them moved by the prophesies of the men of God concerning the coming of the Messias, have in their souls and consciences confessed, that the time of his coming was already past; and therefore in their writings they acknowledge that he is born indeed; but for their sins and impenitent life, not as yet revealed. And at this instant all the Jews dwelling amongst us are of the same opinion. Hereupon Rabbi Solomon Jarchi saith, that according to their ancestors, the Messias was born in that day in which Jerusalem was last of all destroyed, but where he hath so long been hid, to be uncertain. Some of them think that he lies in Paradise, bound to the womans hair, grounding upon these words in the Song of Solomon: {Cant. 7.5.} *Thy head upon thee is like Carmel, and the hair of thy head like purple, the King is bound in the Galleries.* By King understanding the Messias, and by Galleries, paradise. Rabbi Solomon follows this exposition of these ancient Rabbines. The Talmudists write, {Sanhedrin c.ii. p. 98.} that he lies in Rome under a gate among sick folks and Lepers, perswaded by the words of *Esay [Isaiah],* who saith, {Esay 53.3.} that he is one *despised and rejected of men, a man of sorrows, and acquainted with grief.* Others forge other lies and tales.

Well, let all these things fall out according to their own desire; yet they still believe he is to come. {The miracles before Christs coming.} First then before his coming shall happen ten notable miracles, by which every one shall be admonished and incited to an accurate preparation for his coming, and also be warned to conceive that he shall not come so poor and privately as Christ came. These ten miracles I mean here to present in the same words that the Rabbines have commended them to posterity, in a little book called *Abkas Rochel.* {Abkas rochel pulvis aromatarius, the author Rimchar} a little book in octavo it hath 3 parts, the first of the miracles, before the coming of the Messias, two of the soule, and the state of it after this life. The third of Moses his tradition about Mount Sinai, mans creation, &c. It was printed at Venice anno Dom. 1597.

The first miracle, God shall stirr up and produce three kings, who proving traitors to their own faith, shall also turn Apostates: so living before men as though they served the true God: yet in very deed practising nothing less; seducing silly souls, and after such a manner tormenting their consciences, that they may abjure God and their own faith, even so that many of the sinners of Israel shall utterly despair of redemption, being ready to deny God, and forsake his fear. Concerning these things Isaiah speaketh, c. 59. 14,15. *Judgment is turned away backward, and justice standeth afar off; for truth is fallen in the street, and equity cannot enter, yea truth faileth.* What? All they why shall love the truth shall flee in troops, and flying hide themselves
in the caves and holes of the earth, and shall be massacred by the great, and mighty, and tyrannical persecutors. At that time shall be no king in Israel, as it is written. {Hos. 3.4.} The children of Israel shall abide many dayes without a King, and without a Prince, and without a sacrifice, and without an Image, and without an Ephod, and without a Teraphin: There shall not be any more Rosch Ieschibhah (b) Jascbhah. [***] a Synagogue from [***] to sit or rest.} that is head of the Synagogue, no faithful teachers who may feed the people with the word of God, no merciful and holy, no famous and eminent persons shall remain. The heaven shall be shut up and food shall fail; these three kings shall enact laws so many, so burdensome, and so tyrannical, pronounce such heavie judgments upon men, that but a very few shall be left, because they had rather die, then living deny their maker. Yet these three kings by Gods ordinance and disposition shall only reign three moneths.

In the time of their reign, they shall double the ordinary tribute, so that who formerly paied only eight pieces only eight pieces, shall then pay eighty, he who formerly paied ten, shall then be forced to give an hundred. He that hath nothing at all to give, shall be punished with the loss of his head: yea also, the longer they shall reign, the greater and heavier will the burdens be which they shall impose upon the children of Israel. There shall also come certain men from the ends of the earth, so black and abominable, that if any man look upon them he will die through fear. Every one of them shall have two heads, and eight eyes, shining like a flame of fire. They shall run as nimbly and swiftly as an hart. Then shall Israel cry out, woe unto us, woe unto us, the frighted little ones cry alass alass, dear father what shall we doe? then shall the father answer, the deliverance of Israel is now at hand, and even at the door.

{The second miracle.} The second miracle, God shall make the sun to exceed in heat, that many burning feavers, plagues, and other diseases shall be scattered abroad upon the earth, by reason of which, a thousand thousand of the Gentiles and people of the world shall die daily. Hereupon, the Gentiles at length weeping, shall bitterly cry out, woe and alass whither shall we turn our selves? where shall we hide us? Thus with expedition they shall goe and dig their own graves, wish for death, and oppressed with thirst and grief, hide themselves in the Caves and Dens of the Earth. But this great heat shall be as physick and a refreshing to them that are just and good in Israel, as it is written, {Mal. 4.2.} unto you that fear my name shall the sun of righteousness arise with healing in his wings, and ye shall go forth and grow up as calves of the stall; by this sun of righteousness understanding that in the heavens. {Num. 24.23.} Balaam (say they) also prophesied of this; saying, alass who shall live when the Lord hath brought it to pass.

{The third miracle.} The third miracle, God shall make a dew of blood to fall upon the earth: which all Christians and people of the earth thinking to be watery and most delightful, shall take and drink, and drinking die. The Reprobate also in Israel who despaired of redemption, shall also die by drinking of it, but it shall not be hurtful to them who are just among the Jews,
who in true faith firmly cleaving unto God, do persevere in the same, as it is written. {Dan. 12.3.} They that be just shall shine as the brightness of the firmament, and they that turne many to righteousness, as the stars for ever and ever: again, the whole world for three dayes space shall be full of blood; according to that which is written: {Joel 2.30.} I will give signes in heaven and in earth, blood and fire and pillars of smoke.

{The fourth miracle.} The fourth miracle, God shall send a wholesome dew upon the earth. They shall drink of this who are indifferent honest: It shall serve as a salve to them who were made sick by drinking of the former, as it is written. {Hos. 14.5.} I will be as a dew to Israel, he shall grow as the lillie, and cast forth his root as Lebanon.

{The fifth miracle.} The fifth miracle. God shall turn the sune into so thick a darkness, that it shall not shine for the space of thirty dayes, as it is written, The sun shall be turned into darkness, and the moon into blood, before the great and terrible day of the Lord come. At the end of thirty dayes God shall restore its light; as it is written, {Es. 24.22.} They shall be gathered as prisoners are gathered in the pit, and shall be shut up in prison, and after many dayes they shall be visited. The Christians being sore afraid to see these things, they shall be confounded with shame, and acknowledg that all these things come to pass for Israels sake: yea, many of them shall embrace the Jewish religion: as it is written, {Jon. 2.8.} They that observe lying vanities forsake their own mercy.

{The sixth miracle.} The sixth miracle, God shall permit the kingdom of Edom (to whit that of the Romans) to bear rule over the whole world. One of whose Emperours shall reign over the whole earth nine moneths, who shall bring many great kingdoms to desolation, whose anger shall flame towards the people of Israel, exacting a great tribute from them, and so bringing them into much misery and calamity. Then shall Israel after a strange manner be brought low and perish, neither shall they have any helper: of this time Esay prophesied, {Esa. 59.16.} And he saw that there was no man, and wondered that there was no intercessor: therefore his arm brought salvation unto him. After the expiration of these nine moneths, God shall send the Messias son of Joseph, who shall come of the stock of Joseph, whose name shall be Nehemiah, the son of Husiel. He shall come with the stem of Ephraim, Benjamin and Manasses; and with one part of the sons of Gad. As soon as the Israelites shall hear of it, they shall gather unto him out of every City and nation, as it is written: {Jer. 3.14.} Turn ye backsliding children saith the Lord, for I will reign over you, I will take you one of a City, and two of a tribe, and bring you to Sion.

Then shall Messias the son of Joseph, make great war against the king of Edom, or the Pope of Rome, and being conqueror shall kill a great part of his army, and also cut the throat of the king of Edom, make desolate the Roman Monarchie, bring back some of the holy vessels to Jerusalem, which are treasured up in the house of Ælienius. Moreover the king of Egypt shall enter into league with Israel, and shall kill all the men inhabiting about Jerusalem,
Damascus, and Ascalon: which thing once noised over the whole earth, a horrid dread and astonishment shall overwhelm the inhabitants thereof.

{The Seventh miracle.} The seventh miracle. They say that at Rome there is a certain piece of marble, in shape resembling a Virgin, so framed and fashioned, not by mans workmanship, but by the Lords hand. To this Image shall all the wicked livers in the world gather themselves, and burning in lust towards it, shall commit incest with it. Hereupon, in the same marble will the Lord forme an infant, which by a certain rupture shall issue out of it. This infant shall be called Armillus Harascha, Armillus the wicked, and shall be the same which the Christians call Antichrist. His length and breth shall be tenn els, the space betwixt his eyes and the palm cross wise. His hollow eyes red, his hair yellow like gold, the soles of his feet green; and to make his deformity compleat, he shall have two heads. He coming to the wicked king of Rome, shall affirm himself to be the Messias and god of the Romans, to whom they easily give credit: and make him king over them. All the sons of Esau shall love and stick fast unto him. He shall bring under his yoke the whole Roman Monarchie, and to all Esaus offspring glorying in the name of Christian, he shall say, bring me the law which I gave unto you. Which they shall presently deliver, together with their book of Common-prayer, which he shall receive as true and legitimate, acknowledging that he gave that law and book unto them, desiring that they will beleve in him.

These things once finished, he shall send his Embassadors to Jerusalem to Nehemia the son of Husiel, and to all the Congregation of Israel; with this mandate to bring their law unto him: and confess him to be God: At the report of this, fear and wonder assault their souls: and Nehemia accompanied with three hundred thousand voluntiers of the tribe of Ephraim, carrying also the book of the law with him, shall come unto Armillus, and out of it read him this sentence, {Exod. 20.} I am the Lord thy God, thou shalt have none other Gods before me. To whom Armillus making answer, shall deny any such sentence to be extant in their law, and that therefore they ought to acknowledg him for a God, following the example of the Christians, and other people of the earth. Then shall Nehemia the son of Husiel in that instant command his followers to binde Armillus, and entering the field with thirty thousand armed Nobles, shall put to the sword two hundred thousand of his assistants. For this cause Armillus greatly enraged, shall gather together all his forces in a deep valley to fight against Israel, and to destroy no small number of Jacobs posterity. There shall Messias the son of Joseph breath his last, whom the holy Angels shall take, hide, and casket up with other Patriarks of the world. The Israelites shall be struck with such astonishment, their hearts shall fleet like water; but Armillus himself shall not know of the death of their Messias, who otherwise would not leave one of them alive.

Then shall all the Nations of earth banish the Jews out of their dominions, no way permitting them any longer to be their co-inhabitants. Moreover, such trouble and distresse shall at that time perplex the Jews, as hath not been
from the beginning of the world.

{The coming of Michael.} Then shall Michael come and fan away the wicked in Israel, as it is written; {Dan. 12.1.} At that time shall Michael stand up, the great Prince, which standeth for the children of thy people, and there shall be a time of trouble, such as never was since there was a nation even to that same time. Then the remnant shall flee into the wilderness, where God shall try and purge them after the same manner that silver and gold is tried in the Furnace. For the Lord saith, {Exek. 20.38.} I will purge out from among you the Rebels, and them that transgresse against me. And again, {Dan. 12.10.} Many shall be purified, made white, and tried: but the wicked shall do wickedly, and none of the wicked shall understand: but the wise shall understand. Then shall the whole remainder of Israel be in the wilderness for forty five days, the chief of their fare being grass, leaves, and herbs; and that Scripture shall be fulfilled in their ears, {Hos. 2.14.} I will allure her, and bring her into the wilderness, and speak comfortably unto her. The truth of this appears out of that of the Prophet, From the time that the daily sacrifice shall be taken away, and the abomination that maketh desolate, set up, there shall be a thousand two hundred and ninety dayes. Blessed is he that cometh to the thousand three hundred and five and thirty dayes. But goe thee thy way till the end be: for thou shalt rest, and stand in the lot at the end of the dayes.

Conceive that forty five being added to the precedent number of ninty, the last number of 1335 daies doth arise. In that time all the wicked in Israel shall perish; who are unworthy to be copartners in such a deliverance. Finally, Armillus invading Egypt with great power shall subdue it, as it is written: {Dan. 11.42.} The land of Egypt shall not escape. From Egypt he shall muster his force for Jerusalem, striving with might and main once more to make it a desolate heap. {Dan. 11.45.} And he shall plant the tabernacle of his palace, between the Seas, in the glorious holy mountain, yet he shall come to his end, and shall help him.

{The eighth miracle.} The eighth miracle. The Archangel Michael shall arise, and shall thrice winde a mighty trumpet, as it is written; {Jsa. 27.13.} It shall come to pass in that day, that the great trumpets shall be blowen, and they shall come that were ready to perish in the land of Assyria, and the outcasts in the land of Egypt, and shall worship the Lord in the holy mount at Jerusalem. Again, {Zech. 9.14.} The Lord God shall blow the trumpet, and shall goe with the whirlwinds of the South. At the sound of this trumpet the true Messias the son of David, and the Prophet, Elias shall appear and manifest themselves to the devout Israelites inhabiting the wilderness of Judea. Then shall they receive incouragement, the weary hands shall be lifted up, and strength shall visit the feeble knees. All the Jews also wheresoever dispersed over the whole earth shall hear the sound of the trumpet, and at last confess, that God in mercy hath visited his people, and by a plenary deliverance hath been gracious to his inheritance, and all the captives of Ashur shall be gathered together. But the sound of this trumpet shall blast the
Christians and people of the world with fear and astonishment, casting them into horrid maladies. Then shall the Jews gird up their loins, and with many a weary journey seek to revisit their Jerusalem. Messias also the son of David, together with his harbinger Elias, and all the faithfull his followers in Israel with great joy shall come into Jerusalem. So soon as this pierceth the ears of wicked Armillus: he will babble out, how long will this abject and base people thus behave themselves? and shall once more with a great army of Christians hasten to Jerusalem to give battle to to their newly inaugurated soveraign. But God shall not permit that the Israelites should fall out of the fire into the pit, but speaking unto the Messias shall say unto him, Come thou and sit at my right hand, and to the children of Israel, sit you still, hold your peace, and quietly expect that great deliverance which the Lord this day will impart unto you. Then shall the Lord rain from heaven fire and brimstone, as it is recorded, {Ezech. 38.22.} I will plead against him with pestilence, and with blood, and I will rain upon him, and upon his bands, and upon the many people that are with him, an overflowing rain, and great hailstones, fire and brimstone. Then shall Armillus with his whole army die, and the Atheistical Edomites (the Christians they mean) who laid waste the house of our God, and led us captive into a strange land, shall miserably perish; then shall the Jews be revenged upon them, as it is written, {Obad. 18} The house of Jacob shall be a fire, and the house of Joseph a flame, and the house of Esau (that is, we Christians, as the Jews interpret, whom they Christen Edomites) shall be for stubble. This stubble the Jews shall set in fire, that nothing be left to us Edomites which shall not be burnt and turned into ashes.

{The ninth miracle.} The ninth miracle. At the second blast of Michael his trumpet being long and loud, all the graves in Jerusalem shall open, and the dead arise, Messias also the son of David together with Elias the Prophet shall restore to life Messias that good son of Joseph reserved under a certain gate.

At the same time shall all the Congregation of Israel send Messias the son of David as an Ambassador to the remnant of the Jews supervising the last slaughter, dispersed here and there among the Christians and other people of the earth, to summon them to Jerusalem. Then shall the kings of the nations without delay, carry the Jews inhabiting their quarters, upon their shoulders, and in Chariots unto Sion. I think this will come to pass much about the Greek Calends. {i. never.}

{The tenth miracle.} The tenth miracle. At what time the Angel Michael shall blow the trumpet the third time, then shall God bring them forth who border upon the rivers Gosane Lachlacke, Chabore, and also inhabited the cities of Juda, and they in number infinite and immesurable, together with their infants shall enter into Moses Paradise; the earth before and behinde them shall be nothing but a flame of fire, which shall consume all which is needful for the preservation of life among the Christians and other people.

When the ten tribes of Israel shall return out of the land of their captivity, then the pillar of the cloud of the divine glory and majesty shall
encompass them, as it is written: {Micah 2.13.} the breaker up is to come before them: they have broken up, and have passed through the gate, and are gone out by it, and their king shall pass before them, and the Lord on the head of them. Moreover God shall open unto them fountains flowing out of the tree of life, wherewith he shall refresh them in their journey, lest at any time thirst should annoy them. For the Lord saith, {Jsa. 41.18.} I will open rivers in high places, and fountains in the midst of the vallies: I will make the wilderness a pool of water, and dry land springs of water. Again, {Jsa. 49.10.} They shall not hunger nor thirst, neither shall the heat nor sun smite them, for he that hath mercy on them, shall lead them, even by the springs of water shall he guide them. {The Jews ten fould comfort against the foresaid signes.} To comfort them against these ten signes foregoing the coming of the Messias, the most of which pretend great calamity and affliction to the Jews, they have a tenfold consolation. {Consol. 1.} The first is, that the Messias is certainly yet for to come: according to that of the Prophet, {Zach. 9.9.} Behold thy king cometh &c. {The 2. Cons.} The second that he shall again gather them together being dispersed over the face of the whole earth, as it is written: I will bring them from the north country, and gather them from the coasts of the earth, and with them the blinde and the lame, the women with childe, and her that travelleth with childe together, a great company shall return thither: From which place we may learn thus much, that if any went unto his grave blind or lame, the same shall God raise up cloathed with the same imperfections: that one may more easily know another, yet the Lord shall so perfectly cure the lame, that they shall skip like Roes, as the Scripture witnesseth, {Esa. 35.6} Then shall the lame man leap as an hart, and the tongue of the dumbe sing; for in the wilderness shall the waters break out, and streams in the desert. {The 3. Cons.} The third is; that God shall raise up the dead: as it is written; Many that sleep in the dust of the earth shall arise: these to life eternal, they to shame and everlasting contempt. {The 4. Cons.} The fourth is, that God shall build them up a third temple, according to that plat-form and fashion which Ezekiel hath described cap. 41. ver. 1, 2, 3. {The 5. Cons.} The fift is, that the people of Israel shall be the sole Monarchs of the whole world, their dominion stretching from one end of the earth unto the other, according to that of Essay 60.12. The nation and kingdom that will not serve thee shall perish: yea, these nations shall be utterly wasted. Yea, the whole world being turned unto the Lord shall be subject to his law, as it is recorded, {Zeph. 3.9.} For then will I turn to the people a pure language, that they may all call upon the name of the Lord, to serve him with one consent. {The 6. Cons.} The sixth is, that God at that time shall defeat and destroy all the enemies of his people (that is, the Christians) and mightily to revenge himselfe upon them: as it is written, {Ezek. 25.14.} I will lay vengeance upon
Edom by the hand of my people Israel, and they shall do in Edom according to mine anger.

{The 7. Cons.} The seventh is, that God shall take away all diseases and maladies from among the people of Israel, according to that; {Jsa. 33.24.} The inhabitants shall not say I am sick: the people that dwell therein shall be forgiven their iniquitie.

{The 8. Cons.} The eight is, God shall prolong the dayes and yeares of the life of the Israelites. So that they shall live as long as the oake or other of that kinde: {Jsa. 65.22.} for saith the lord, as the dayes of a tree are the dayes of my people, and my elect shall long enjoy the works of their hands, and againe, there shall be no more thence an infant of dayes, nor an old man that hath not filled his dayes: for the child shall die an hundred yeares old, but the Sinner being an hundred years old shall be accursed, which is as much as to say, {See Reschaim in the Talmud c. 6. p. 68.} if any die at an hundred years of age, it shall be said of him, that he died as a little infant, or in his infancy: for at that time the years of life of the Israelites shall be equal to them of the fathers from Adam to Noah, as Abenezra comments upon the place.

{Ninth Cons.} The ninth is, that God shall so clearly manifest himself to the Israelites, that they shall see him face to face. As it is recorded: {Isa. 40.5.} The glory of the Lord shall be revealed, and all flesh shall see together: because the mouth of the Lord hath spoken it. Yea, all the Lords people shall be Prophets, as it is written: It shall come to pass afterward that I will powr out my spirit upon all flesh, and your sons and your daughters shall prophesie: your old men shall dream dreams, your yong men shall see visions.

{Tenth Cons.} The last degree of comfort is, that God shall quite root out of them all imbred lusts, and inclinations unto evil, as it is written: {Ezek. 36.26.} A new heart also will I give you, and a new spirit will I put within you, and I will take away the stony heart out of your flesh, and I will give you an heart of flesh. Hithero we have delivered what we promised out of the book called Abhkas rochel, in which though it be summarily set down what the Jews beleevce concerning their Messias, as also the manner how he is to bring them back to Jerusalem: yet I think not impertinent in this place a little more largelie to declare with what solemnities their Messias shall give them entertainement in their own land, and with what happiness and felicitie they shall lead their lives under him.

{The feast which the Messias shall make unto the Jews at his coming.} When then the Messias hath gathered all the Jews together out of all the nations under heaven and from the foure winds of the earth, and hath brought them unto the land of Canaan flowing with milk and honie; then shall he cause to be prepared a sumptuous and delicate banquet, inviting and friendly welcoming unto it all the Jews with great pomp and joy inexpressible.

At this banquet shall be dished up and served in, the greatest beasts, fishes and fouls that ever God created. The worst wine that they shall drink
shall be whose grape had its growth in paradise, and hath been barrel’d up
and reserved in Adams Cellar unto that time.

{The first dish. Behemoth. Job. 4.10.} The first dish in this feast shall be
that huge oxe described in the book of Job, to be of such great strength and
magnitude, named Behemoth. This is the Rabbines affirme to be the same
oxe whereof David makes mention in his 50 Psalm and 10 verse. All the
beasts of the forrest are mine, and the cattel (Behemoth) feeding on a
thousand hills, that is to say, which every day eateth up the grass of a
thousand hills. But a man will ask what at length would have become of this
oxe, if he had lived so long, seeing he had long since eaten up all his fodder.
The Rabbines (a) [(a) Rabbi Sal: Jarchi, & Rabhuenski.] learnedly answer
that this oxe is stall-fed, and remains always in the same place, and that
whatsoever he eateth on the day grows again upon the night in the same
length and forme.

{The 2. dish. Leviathan.} The second dish adorning the table shall be that
vast whale, Leviathan, (according to the Jewish tone Pronounced Lipiasan)
who is also described in the book of Job, and mentioned in other places of
holy writ.

Concerning these two beasts there hath bin handsomly compiled this
tradition by the wit and ingenuity of the solid pated Rabbins in their Talmud,
{Babha Basra. c. 5. p. 74.} it runs thus, Rabbi Jehudah saith that what thing
soever God created in the world he created it male and female, and that
without all doubt; for he created the Leviathan yet least the he and she
Leviathan: by engendring should augment the number, and at length by there
monstrous magnitude and multitude destroy the whole world, God gelded the
male, and killed the female, reserving her in pickle to be meat for them that
are just in Judah and feared him, in the days of the Messias, as it is written:
{Jsa. 27.1} In that day will the lord with a sore and great and strong sword
punish Leviathan the piercing serpent, even Leviathan that crooked serpent,
and he shall slay the dragon that is in the sea. In the same manner he created
that great ox called Behemoth feeding on a thousand hills male and female:
yet lest by multiplying they might fill and destroy the earth, he gelded the
male and killed the female, reserving it for the Jews diet in time to come, as
it is written: {Job 40.16.19} Loe now his strength is in his loynes, and his
force in the navell of his belly, he that made him can make his sword to
approach unto him.

{The third dish. Barinchue.} The third dish in this banquet as Elias Levita
in his dictionarie named Tesbi out of the Rabbins reports, shall be that
horrible huge bird called Barinchue which killed and unboweld shall then be
rosted. Concerning this bird it is written in the Talmud {Bechoros c. ult. p.
57} she cast an Egge out of her nest by whose fall three hundred tall Cedars
were broken down, and the Egge breaking in the full drowned three score
villages. By this relation it is easie to conceive this bird to have been little
inferiour in greatnes to the forementioned oxe and fish; whence we may also
collect how glorious a dish the Messias is to make of it for his guests, and
when there are many such birds (Guls I think) found in the land of Judah, none ought to think that which is reported of this to be fabulous.

{The Crow. Babha hasra. c. 5. p. 72.} In the forementioned book of the Talmud, we read of a certain great crow which was seen of a Rabbine, worthy to be credited. The relation runs thus. Rabbi barchannah saith, At a certain time I saw a frog, which is as great as the village Akra in Hagronia, well how big was the village? It consisted of no fewer then three-score houses. Then came a mighty serpent and swallowed up this frog. Instantly upon this, a great crow flying that way picked up as a small morsel both the frog and the serpent; and taking him to flight sat upon a Tree, now think with your selves how great and strong this tree must be. To which Rabbi papa the son of Samuel making answer, unless I had been in the place, and with these mine eyes seen the very tree, I would not have beleeved it. Thus much the Talmudist. Who dare give the lie to this Rabbine? When that good man Kimchi commenting on the fifty Psalm, {The great bird. ziz.} and explaining the word Ziz hath there witnessed that Rabbi Judah the son of Simeon did avouch Ziz to be a bird of that bigness, that when he spreads abroad his wings he hides the body of the sun, and wraps the world in darkness. Furthermore, on a certain time, a certain Rabbine was upon the sea in a little ship, in the middle of which he saw a bird standing of such an height, that water came only to her knees: {Talmud in the same place.} which the Rabbine observing, bespeaks his companions that there they might wash themselves seeing the water was not deep. But a voice from heaven hindred the attempt, saying unto the Rabbine, see that thou do it not: for now seven whole years are gone and past, since a certain man let a hatchet fall in this very place, which hath been ever since a falling, and is not as yet come to the bottome. By which a man may easily gather how long legs this bird had, and how great her body ought to be in proportion to her feet. Without doubt these birds keep their residence in the wood Ela, in which, a Lion is reported to live of such an unheard of portraicture, that only to relate would strike a man with astonishment. {The great Lion Chohn. cap. 3. p. 59.} Of this Lion the Talmud thus fables. When upon a certain time the Emperor of Rome asked Rabbi Joshua the son of Hananiah, what the reason was why their God compared himself unto a Lion; and whether he was of so great strength that he could kill a Lion? the Rabbine made answer, that God did not compare himself unto an ordinary Lion, but unto such an one as lived in the wood Ela: to whom the Prince replied, shew me that Lion. Then the Rabbine by prayer obtained of God that the lion should leave the wood, and come, when hs was yet foure hundred miles distant from the Emperour, he roared so terribly, that all the women with child in Rome became abortive, and the walls of the City fell flat unto the ground. When he had come an hundred miles nearer, he the second time roared so fearfully that all the teeth of the Romanes fell out of their heads, & the Emperour falling from his throne, lay prostrate upon the earth half dead; who with vehement entreaties begs of the Rabbin to send back the Lion; which was likewise put in execution. But these fables draw us
too far from the smell of that feast which the Messias hath provided for the Jews in the land of promise.

The flesh of the foresaid Behemoth and Leviathan will not digest well without a Cup of older wine; therefore the Messias shall broach that wine and give it unto his guests, {The wine for the feast.} which was made in Paradise, and was kept from the beginning of the world to that time in Adams Cellar, as it is written: {Esa. 27.2.3.} In that day sing you unto her a vineyard of red wine. I the Lord do keep it, I do water it every moment: lest any hurt it, I will keep it night and day: again, {Psal. 75.9.} There is a cup in the hand of the Lord, and the wine thereof is red: it is full mixt; he shall pour it out, and the dregs thereof all the ungodly of the earth shall drink and suck them up.

{The sports where with the Messias will delight the Jews.} Before the supper be served in, the Messias after the manner of Kings, and Princes, and others celebrating Festivals and Marriages, shall present the Jews with pleasant sports and plaies to make them merry. He will cause Behemoth and Leviathan to meet in some spacious place, and there they shall play before the Messias to pass away the time, and for his minds refreshing, as it is written: {Job 40.20.} Surely the Mountains bring him forth food, where all the beasts of the field play. And again, {Psal. 104.26.} There go the ships, there is that Leviathan whom thou hast made to play therein. Then the oxe running hither and thither shall bend his horns against the Leviathan; which will greatly affect the Messias, according to that, {Psal. 69.32.} It will be more grateful to the Lord then a bullock that hath horns and hoofs. The Leviathan also shall come to encounter the oxe, armed with his fins as an helmet, not easie to be seen, as it is written: {Job 40.14.15.} Who can open the doors of his face, his teeth are terrible round about. His scales are his pride, shut up together as with a close seal. Here shall be the summons to the battle, and the first encounter begin most hot and furious, but to small purpose, for they being of equall strength neither can overcome the other, but at last wearied out both shall fall upon the ground. Then the Messias drawing out his sword shall slay them both, as it is written: {Jsa. 27.1.} At that day will the Lord with a sore, great and strong sword punish Leviathan.

Now comes the Cooks part, nothing but boyling and roasting: and great provision for this sumptuous supper, as it is recorded: {Esa. 25.6} The Lord of hosts shall make unto all people in this mountain a feast of fat things, of fat things full of marrow. The fish shall be served up in parcels to the guests, which done, every one shall greatly rejoyce, as it is written: {Job 41.6} shall thy companions make a banquet of him? shall they part him among the merchants.

{The marriage of the Messias} This donative supper being ended, the Messias shall marry a wife: the Scripture being witness: {Ps. 45.10.} Kings daughters were among thy honourable women: upon thy right hand stood the Queen in a vesture of gold. So the Jews themselves interpret: {Schegal [***] properly signifieth the wife of a King from [***] Shagal which is to exercise the very act of venery.} and the meaning is this, as Kimchi professeth in his
How the Jews Made the British into Zionists

1785

great gloss: Among the honourable women which the Messias shall have, shall be the daughters of Kings. For every King of the earth shall esteem himself highly graced, so that he may give his daughter in marriage unto the Messias. But the genuine and rightly so named wife of the Messias (properly signified by the word Schegal) shall be one of the most eminent beauties among the daughters of Israel; she shall sit at his right hand, without intermission abide in the Kings closet: whereas the other shall stay in the supping room, or house of the women: not approaching the King, unless it be his pleasure to send for them. In this bond of Wedlock the Messias shall beget children; after he shall die as other mortals, and his children shall sit upon his throne after him, as it is written: {Isa. 53.10.} He shall see his seed, he shall prolong his dayes, and the will of the Lord shall prosper in his hands, that is, as a Rabbine expounds it, The Messias shall live to a good old age, and at last shall be brought to his grave with great solemnity: and his son shall reign after him, and after his death his posterity shall possess his seat.

{The manner of life the Jews shall have under their Messias.} For the manner of life which the Jews shall have under their Messias. First of all the remnant of the Christians and other people which fell not by the hand of the Jews shall make hast and build the Jews houses and Cities, not for hire, but of free accord, till their ground, plant them vineyards, yea, bestow their very goods upon them; moreover Kings and Princes shall be their servants whom they have subdued. They themselves shall be cloathed in costly aray: all their Priests anointed shall be holiness to the Lord; as it is written: {Jsa. 60.10,11,12.} The sons of strangers shall build up thy walls, and their Kings shall minister unto thee: for in my wrath I smote thee, but in mercy have I had favour on thee, therefore thy gates shall be open continually, that men may bring unto thee the forces of the Gentiles, and that their Kings may be brought, for the nation and kingdom that will not serve thee shall perish, yea those nations shall be utterly wasted, and again {Jsa. 61.5,6.} strangers shall stand and feed your flocks, and all the sons of the alien shall be your plow-men, and your vine-dressers. But you shall be named the Priests of the Lord, men shall call you the Ministers of our God: you shall eat the riches of the Gentiles, and in their glory shall you boast your selves. (Oh here with hunger and thirst how are the Jews opprest? Although some of them satisfie and appease both, without the sweat of their own brows gaining many a million: for which many a poor Christian suffers toile and vexation.)

{The 2 benefit.} 2. They shall have a new and wholsome aire, as it is written: {Jsa. 65.17.} Behold I create a new heaven and a new earth, the former shall not be thought upon, by the benefit of this aire they shall enjoy their health and prolong their life, even as the men before the flood. In their hoary old age their strength and agility shall not forsake them, but remain in the same temper as in their youth, as it is written, {Psal. 92.14,15.} They who are planted in the house of our God, shall flourish in the courts of the Lord, they shall bring forth more fruit in their age, they shall be fat and well liking.
{The 3 Benefit} 3. The seed once sown shall for ever grow up, increase, and ripen of its own accord: after the manner of Vines which require but one plantation, as it is written, {Hos. 14.8.} They shall revive as wheat, flourish like a vine, his smell is like Lebanon.

Whersoever any one shall desire rain for the watering of any particular Field, Garden, or the smallest herb therein, the Lord will pour out upon that place, and on that onely, without delay: for saith the Prophet, Ask you rain of the Lord, and he shall create lightnings, and give you showres of rain. Then shall they gather their fruits and wine with great quietnesse and security, and shall not be molested by any enemy: as it is written, The Lord hath sworn by his right hand, and by the arm of his strength, {Isay 62.8,9.} I will no more give thy corn to be meat for thine enemies, and the sons of strangers shall not drink thy wine for the which thou hast laboured, but they that have gathered it shall eat it.

{The 4 Benefit} 4. No war nor rumour of war shall any more be heard in the land: and there shall be a firm and secure peace established, not only between man and man, but also between man and beast; as it is written, I will make a covenant for them in that day with the beasts of the field, with the fowls of heaven, and creeping things of the earth: I will put away the bow and the sword and war from the earth, and make them to sleep secure. And I will espouse thee unto me for ever and ever: I will marry thee in justice and judgement, in mercy and commiseration. Again, {Esay 11.17.} The Cow and the Bear shall feed: their young ones shall lie down together, and the Lion shall eat straw with the Ox. The Wolf shall lie down with the Lamb, and the Leopard with the Kid: and the Calf and the young Lion and the fatling together, and a little childe shall lead them.

{The 5 Benefit} 5. When any war or discord ariseth among the Gentiles, then the Messias shall reconcile them, and renew the league amongst them: so that there shall be no more mutiny; as it is written, {Isay 2.4} He shall judge among the nations, and rebuke many people: he shall beat their swords into plowshares, and their spears into pruning-hooks: nation shall not lift up sword against nation, nor learn war any more. Then shall the Iews live in everlasting joyes, make new marriages, sing praise and glory to God without ceasing: shall be full of the wisdom and knowledge of the Lord: as it is written, In this place of which you say that it is forsaken, shall again be heard the voice of joy, the voice of exultation, the voice of the Bride and the Bridegroom, the voice of them that say, Give thanks to the Lord of hosts. And again, the earth shall be full of the knowledge of the Lord as the sea is full of water.

Briefly, the happiness of this holy people shall at that time be so immeasurable, that neither can the heart of man conceive it, or the tongue yeeld the least expression thereof. Which things thus ordered and declared, leaving the Iews in this their prosperous estate, I will put a period to my labours, and hide the secret of their faith from the Christians; seeing I have attempted more then they themselves, if they could have ruled the matter,
would have permitted. What I have done already will not be pleasing unto them, in which I have exposed to every man’s eye the full anatomy of their life and belief.

The Christian Reader may easily perceive by that which hath been said, that the faith of the Jews and their whole religion, is not grounded upon Moses, but upon meer lies, false and forged constitutions, fables of the Rabbines, and inventions of seduced Pharisees. And that therefore it ought no more to issue out of the mouth of a Christian, that the Jewes stand for the Law of Moses, but rather with Jeremy, {Jer. 8.} that they are strong defendants of the false worship of the true God, not suffering themselves any way to be drawn from it. And with our Saviour to affirm, that {Matth. 15.5} they make the Commandments of God of none effect by their traditions; in vain they worship him, when they teach nothing but the mandates of men: honouring him with their lips, but in their hearts are far from him. In their words they profess to know God, but in their works they deny him: {Titus 1.} these are the men whom the Lord abhors, who being disobedient unto his word are unto every good work reprobate, as the Apostle Paul hath recorded. By which it is more manifest then the light of the Sun at noontide, that the punishment is now fallen heavie upon them wherewith Moses threatened them: that {Deut. 28.} the Lord should smite them with madness, blindness, and astonishment of heart, that they should grope at noon day as the blinde gropeth in darknesse. And this appears most clearly, and is more then evident from this, that they miserably pervert, and contrary to all reason with an impudent front invested with a dull ignorance expound and interpret the word of God.

O merciful God, who hast vouchsafed to impart this gracious favour unto us Christians, that we being warned by such an horrible example of the divine wrath, should with awe and reverence embrace his holy word, lest the same things should befal us, and so our Candlestick should be removed for our ingratitude, God of his mercy grant, that the Sun of his justice may alwayes shine in our hearts until perfect day, and by the illumination of his good Spirit conduct us unto all truth. Amen.”

Interestingly, Charles Taze Russell determined in 1876 that the reign of the Gentile governments would end in 1914—which is the year World War I began—and that the Jews would then take over the world. Russell supposedly made his prediction based on Scripture, and his followers spread his message widely. In an article, “Gentile Times: When Do They End?”, The Bible Examiner, Volume 21, Number 1, Whole Number 313, (October, 1876), pp. 27-28; Charles Taze Russell wrote,

Doubtless our Lord intended to communicate to His disciples some
knowledge, and possibly it was addressed more to the disciples in our day, than to the early church.

Let us then search what times the prophecy, which was in Christ, did signify. Of course, if it be one of the secret things of God, we cannot find out; but if a secret, why should Jesus mention it? If, on the contrary, it is revealed it belongs to us. Shall we guess and suppose? No: let us go to God’s treasure-house; let us search the Scriptures for the key.

Jesus does not foretell its treading under foot of the Gentiles, as Rome had her foot upon them at that time. He does tell us, however, how long it will continue so, even the disciples thought ‘that it was he which should have DELIVERED Israel.’

We believe that God has given the key. We believe He doeth nothing but he revealeth it unto His servants. Do we not find part of the key in Lev. 26:28, 33 ‘I, even I will chastise you seven times for your sins: . . . and I will bring your land into desolation . . . and will scatter you among the heathen.’ Israel did not hearken unto the Lord, but disobeyed him, and this prophecy is now being fulfilled, and has been since the days of Zedekiah, when God said, ‘Remove the diadem, take off the crown, . . . I will overturn, overturn, overturn it, . . . until He comes whose right it is, and I will give it unto Him.’ Comparing these Scriptures, we learn, that God has scattered Israel for a period of seven times, or until ‘he comes whose right’ the Government is, and puts an end to Gentile rule or government. This gives us a clue at least, as to how long until the Jews are delivered. Further, Nebuchadnezzar, king of Babylon, the head of gold, is recognized by God as the representative of the beast, or Gentile Governments. ‘A king of kings and wheresoever the children of men dwell, the beasts of the field, and the fowls of the air, hath God given into his hand.’ Dan. 2:38. God had taken the crown off Zedekiah and declared the Image, of which Nebuchadnezzar is the head, ruler of the world until the kingdom of God takes its place (smiting it on its feet); and, as this is the same time at which Israel is to be delivered, (for ‘Jerusalem shall be trodden down of the Gentiles until the times of the Gentiles are fulfilled’), we here get our second clue, viz.: these two events, noted of the Scriptures of truth—‘Times of Gentiles,’ and ‘Treading of Jerusalem,’ are parallel periods, commencing at the same time and ending at the same time; and, as in the case of Israel, their degradation was to be for seven times, so with the dominion of the Image; it lasts seven times; for, when in his pride the ‘Head of Gold’ ignored ‘The God of heaven,’ the glory of that kingdom (which God gave him, as a representative of the Image,) departed, and it took on its beastly character, which lasts seven times. Dan 4:23—and, (prefigured by the personal degradation for seven years, of Nebuchadnezzar, the representative) until the time comes when they shall acknowledge, and ‘give honor to the Most High, whose Kingdom is an everlasting Kingdom.’ Dan 4:34: for all the ends of the earth shall remember and turn unto the Lord when He is the Governor among the nations.

Our next question naturally, is, How long are seven times? Does God in
his word, furnish us any clue from which to determine the length of that period? Yes, in Revelations we learn that three and one-half times, 42 months, and 1260 prophetic days, literal years, are the same (it has for years been so accepted by the church,) and it was so fulfilled: if three and one-half times are 1260 years, seven times would be twice as much, i.e., 2520 years. At the commencement of our Christian era, 606 years of this time had passed, (70 years captivity, and 536 from Cyrus to Christ) which deducted from 2520, would show that the seven times will end in A.D. 1914; when Jerusalem shall be delivered forever, and the Jew say of the Deliverer, ‘Lo, this is our God, we have waited for Him and He will save us.’ When Gentile Governments shall have been dashed to pieces; when God shall have poured out of his fury upon the nation, and they acknowledge, him King of Kings and Lord of Lords.

But, some one will say, ‘If the Lord intended that we should know, He would have told us plainly and distinctly how long.’ But, no, brethren, He never does so. The Bible is to be a light to God’s children;—to the world, foolishness. Many of its writings are solely for our edification upon whom the ends of the world are come. As well say that God should have put the gold on top instead of in the bowels of the earth it would be too common; it would lose much of its value. So with truth; but, ‘to you it is given to know the mysteries of the kingdom.

We will ask, but not now answer, another question: If the Gentile Times end in 1914, (and there are many other and clearer evidences pointing to the same time) and we are told that it shall be with fury poured out; at time of trouble such as never was before, nor ever shall be; a day of wrath, etc., how long before does the church escape? as Jesus says, ‘watch, that ye may be accounted worthy to escape those things coming upon the world.’

Brethren, the taking by Christ of His Bride, is evidently, one of the first acts in the Judgment; for judgment must begin at the house of God.

W. Philadelphia.”

The World, of New York, wrote on 30 August 1914,

“The terrific war outbreak in Europe has fulfilled an extraordinary prophecy. For a quarter of a century past, through preachers and through press, the ‘International Bible Students,’ best known as ‘Millenial Dawners,’ have been proclaiming to the world that the Day of Wrath prophesied in the Bible would dawn in 1914. ‘Look out for 1914! has been the cry of the hundreds of traveling evangelists. ‘

Were Cabalistic Jews working with Russell and conditioning Gentiles to surrender their rights to Jews? Did Cabalistic Jews simply time the war based on the same premises as Russell used to arrive at his predictions, or was it the other way around? Cabalistic Jews have long practiced numerology.

Ben Justin Martyr alleged that Jews murdered and defamed Christians from the
very beginning of the Christian movement—as did other sources, including Biblical sources. Gustaf Dalman wrote,

“Since everyone has not the writings ofJustin at hand, we venture to offer some important extracts from them bearing on this subject. We quote in accordance with the edition of J. C. Th. Otto, Jena, 1843:—‘The Jews regard us as foes and opponents, and kill, and torture us, if they have the power. In the lately-ended Jewish war Bar Kokh’ba, the instigator of the Jewish revolt, caused Christians alone to be dragged to terrible tortures, whenever they would not deny and revile Jesus Christ [Footnote: Apology, 1. chap. 31.].’

‘The Jews hate us, because we say that Christ is already come, and because we point out that He, as had been prophesied, was crucified by them [Footnote: Ibid. chap. 36.].’—‘Therefore we pray both for you Jews and for all other men who hate us, that you place yourselves in company with us, and against those, whom His works, and the miracles now still wrought through the invoking of His Name, and His teaching, as well as the prophecies concerning Him as wholly undefiled and blameless, all unite to admonish that they should vomit forth no revilings against Jesus Christ, but believe on Him [Footnote: Dialogue with Trypho, chap. 35.].’

‘The high-priests of your nation and your teachers have caused that the name of Jesus should be profaned and reviled through the whole world [Footnote: Ibid. chap. 117].’—‘Ye have killed the Just and His prophets before Him. And now ye despise those, who hope in Him and in God, the King over all and Creator of all things, who has sent Jesus; ye despise and dishonour them, as much as in you lies, in that in your synagogues ye curse those who believe in Christ. Ye only lack the power, on account of those who hold the reins of government, to treat us with violence. But as often as ye have had this power, ye have also done this [Footnote: Ibid. chap. 16.].’

‘In your synagogues ye curse all who have become Christians, and the same is done by the other nations, who give a practical turn to the curse, in that when any one merely acknowledges himself a Christian, they put him to death [Footnote: Dialogue with Trypho, chap. 96.].’

‘Nay, ye have added thereto, that Christ taught those impious, unlawful, horrible actions, which ye disseminate as charges above all, against those who acknowledge Christ as Teacher and as the Son of God [Footnote: Ibid. chap. 108].’

‘Yet revile not the Son of God, and hearken not to the Pharisees as teachers, that after prayer ye should ill-treat the King of Israel with scoffs, as they have been taught you by the rulers of the synagogue [Footnote: Ibid. chap. 137.].’—‘As far as depends on you and the rest of mankind, each Christian is driven not only from his possession, but completely out of the world: ye permit no Christian to live [Footnote: Ibid. chap. 110.].’—‘Your hand is stretched out for ill-doing. For instead of experiencing repentance for having put Christ to death, ye hate us who through Him believe on God and the Father of all things, and ye put us to death as often as ye have the power, and ye continually curse Christ and His adherents, whereas we all pray for you as in general for all men’ (after the
One can expect that when the Jews anoint their Messiah, he will be especially vicious to Christians, because he will resent their belief that Jesus was the Messiah and not him.

In 1802, in the context of Hartley’s and Napoleon’s Zionism, Johann Gottfried Herder believed that Hartley and his ilk were trying to “restore the Jews to Palestine” in order to make the world safe for a Jewish monopolization of trade among the Continents, because Palestine itself could not provide the Jews with the great wealth they needed to fund the dominance Hartley had planned for them. If the Christians were ruined and dispersed, as Hartley planned, Judaized “Christian” settlements could provide the Jews with infrastructure around the world, and Christian armies could “civilize” and dominate lands the Jews could not, and Christian navies could secure Jewish trade. It was obvious that Hartley had called for a Christian diaspora, based on the model of the Jewish Diaspora, in order to forward the interests of the Jews, not the interests of the Christians. He wanted Christians to become Jews and then spread Judaism around the globe. Hartley, who was an agent of the Cabalistic Jews, would accomplish these ends by teaching the Christians to welcome their demise at the hands of Jewish revolutionaries.

The Jewish revolutionaries accomplished their goals in France and Poland. In 1899, Edouard Drumont wrote, *inter alia,*

“During the Revolution, [Jewish money power] was with us; then it supported Bonaparte; in 1815, it was clearly against him, and, at Waterloo, with Rothschild it fought as energetically as Wellington. [**] After having been, at its birth, the apotheosis of Power, France culminates in the apotheosis of Money. It had two masters; Napoleon, in the beginning; Rothschild, personification of the Jewish Conquest, at its decline. [**]

Already in 1875 a Jew who is mostly forgotten today but who was then
almost famous and who was, in any case, a most interesting and very curious spirit, Alexandre Weill, explained to me that France was obliged to undergo the same fate as Poland and that it would be good, in the best interests of Humanity, that the French, dispersed and countryless like the Poles, would go and spread throughout the world the general truths of civilization and progress.”

Dumont recounted in 1899, that Alexandre Weill, an elderly and supposedly prophetic man of Jewish descent, had told him that France would end up in a diaspora like Poland, which had been devastated, divided and dispersed by Frankist Jews. In fact, both Poland and France, two predominantly Catholic nations which at one time had led European culture, were battlegrounds in both World Wars—in the case of France, just as Weill and Drumont had predicted. In the early 1790’s, Poland suffered under Russian tyranny after the Frankist Jews had undermined the Polish Government. Many Polish intellectuals, philosophers, poets, artists, political theorists, etc. fled to places like France, which was embroiled in a revolution, and carried with them their sophisticated knowledge and ways. Weill looked forward to another destruction of France which he hoped would result in a similar migration of talent and wisdom—all of which recalls David Hartley’s desires that Christianity be destroyed and dispersed so as to spread Judaism around the world—which reminds one of Exodus 1:7-12,

“¶7 And the children of Israel were fruitful, and increased abundantly, and multiplied, and waxed exceeding mighty; and the land was filled with them. 8 Now there arose a new king over Egypt, which knew not Joseph. 9 And he said unto his people, Behold, the people of the children of Israel are more and mightier than we: 10 Come on, let us deal wisely with them; lest they multiply, and it come to pass, that, when there falleth out any war, they join also unto our enemies, and fight against us, and so get them up out of the land. 11 Therefore they did set over them taskmasters to afflict them with their burdens. And they built for Pharaoh treasure cities, Pithom and Raamses. 12 But the more they afflicted them, the more they multiplied and grew. And they were grieved because of the children of Israel.”

Racist Jews and Reformed Jews believed that the Diaspora of the Jews had benefitted the world by dispersing the Jews, who then spread knowledge of Judaism around the world. The Jews shattered French and Polish society, in part, so that the intellectuals of these highly advanced and sophisticated nations would travel the world spreading modernity and Jewish monotheism, which would make the way easier for Jewish infiltration of the rest of the world, which would fulfill the forecasts of the Jewish prophets who predicted the demise of the Gentiles and the rise of the Jews.

Jewish and Christian investors and merchants had long profited from trade with the colonial new world, in slaves, furs, sugar, etc. Many great fortunes that were made, were made with inside information and manipulation in the money,
commodity and stock markets—especially during wars. Rothschild made a fortune from Napoleon’s adventures. As Smedley D. Butler said, “war is a racket.” Herder wrote, in 1802, shortly after Napoleon commenced his Zionist campaigns,

“Good luck to [World Jewry], if a Messiah-Bonaparte may victoriously lead them there, good luck to them in Palestine! But it will be difficult for this richly competitive nation to live in a narrow Palestine if they cannot there take over the general middle trade of both the old and the new world. For the old world would be convenient to their land. Fine sharp-witted race, wonder of the ages! One of the brilliant glosses of their rabbis yokes together a complaining Esau and Israel [Jacob]. Both suffer from the kiss, but they cannot separate themselves.”

In the 1830’s, Godfrey Higgins suspected that Napoleon viewed himself as the Messiah of the Jews,

“To what I have said in Vol. I. p. 688, respecting Napoleon, I think it expedient to add a well-known anecdote of him. When his uncle, Cardinal Fesch, once expostulated with him, and expressed his belief that he must one day sink beneath that universal hatred with which his actions were surrounding his throne, he led his uncle to the window, and, pointing upwards, said, “Do you see yonder star?” “No sire,” was the reply. “But I see it,” answered Napoleon, and abruptly dismissed him. [Footnote: J. T. Baker, of Deptford, to Ed. of Morn. Chron., Oct. 12, 1832.] What are we to make of this? Here we have the star of Jacob, of Abraham, of Cæsar. Here we have a star, probably from the East. The whole of Napoleon’s actions in the latter part of his life bespeak mental alienation. I believe that he continued to retain expectations and hopes of restoration to the empire of the world, till the day of his death. Many circumstances unite to persuade me that he was latterly the victim of monomania. I cannot help suspecting that Napoleon was tainted with a belief that he was the promised one. [***] Victor Cousin says, “You will remark, that all great men have, in a greater or less degree, been fatalists: the error is in the form, not at the foundation of the thought. They feel that, in fact, they do not exist on their own account: they possess the consciousness of an immense power, and being unable to ascribe the honour of it to themselves, they refer it to a higher power which uses them as its instruments, in accordance with its own ends.” [Footnote: For. Quar. Review, No. XXIII. July 1833, p.202.] With the exception of the words in Italics, which I do not understand, I quite agree with M. Cousin. But how completely it bears me out in the assertion I have made, that the belief in each person that he was the great one that was for to come has led either to his success or to his destruction! It led Julian into the dessert—Napoleon to Moscow.”

Hartley and later Shaftesbury iterated themes repeated again and again by English Christian Zionists through to the time of Winston Churchill, and beyond.
The same themes reappear today in the beliefs of evangelical Dispensationalist Christian Zionists and neo-conservative Zionists in the United States. On the other end of the Protestant political spectrum, the anti-Semites followed Martin Luther’s call for the expulsion of the Jews and the destruction of Catholicism, all of which forwards the Jewish Zionist agenda.

Hartley wrote in 1749, and his work is but one of thousands of such examples of Jewish Zionist propaganda published by pseudo-Christian traitors,

"PROP. 41. The Divine Authority of the Scriptures may be inferred from the superior Wisdom of the Jewish Laws, considered in a political Light; and from the exquisite Workmanship shewn in the Tabernacle and Temple.

All these were Originals amongst the Jews, and some of them were copied partially and imperfectly by ancient Heathen Nations. They seem also to imply a Knowledge superior to the respective Times. And I believe, that profane History gives sufficient Attestation to these Positions. However, it is certain from Scripture, that Moses received the whole Body of his Laws, also the Pattern of the Tabernacle, and David the Pattern of the Temple, from God; and that Bezaleel was inspired by God for the Workmanship of the Tabernacle. Which Things, being laid down as a sure Foundation, may encourage learned Men to inquire into the Evidences from profane History, that the Knowledge and Skill to be found amongst the Jews were superior to those of other Nations at the same Period of Time, i.e. were supernatural.

[***]

SECT. II.

Of the Expectation of Bodies Politic, the Jews in particular, and the World in general, during the present State of the Earth.

PROP. 81. It is probable, that all the present Civil Governments will be overturned.

This may appear from the Scripture Prophecies, both in a direct way, i.e. from express Passages, such as those concerning the Destruction of the Image, and Four Beasts, in Daniel; of Christ’s breaking all Nations with a Rod of Iron, and dashing them in Pieces like a Potter’s Vessel, &c. and from the Supremacy and universal Extent of the Fifth Monarchy, or Kingdom of the Saints, which is to be set up.

We may conclude the same Thing also from the final Restoration of the Jews, and the great Glory and Dominion promised to them, of which I shall speak below.

And it adds some Light and Evidence to this, that all the known Governments of the World have the evident Principles of Corruption in themselves. They are composed of jarring Elements, and subsist only by the alternate Prevalence of these over each other. The Splendor, Luxury, Self interest, Martial Glory, &c. which pass for Essentials in Christian Governments, are totally opposite to the meek, humble, self-denying Spirit
of Christianity; and whichever of these finally prevails over the other, the present Form of the Government must be dissolved. Did true Christianity prevail throughout any Kingdom entirely, the Riches, Strength, Glory, &c. of that Kingdom would no longer be an Object of Attention to the Governors or Governed; they would become a Nation of Priests and Apostles, and totally disregard the Things of this World. But this is not to be expected: I only mention it to set before the Reader the natural Consequence of it. If, on the contrary, worldly Wisdom and Infidelity prevail over Christianity, which seems to be the Prediction of the Scriptures, this worldly Wisdom will be found utter Foolishness at last, even in respect of this World; the Governments, which have thus lost their Cement, the Sense of Duty, and the Hopes and Fears of a future Life, will fall into Anarchy and Confusion, and be entirely dissolved. And all this may be applied, with a little Change, to the Mahometan and Heathen Governments. When Christianity comes to be propagated in the Countries where these subsist, it will make so great a Change in the Face of Affairs, as must shake the Civil Powers, which are here both externally and internally opposite to it; and the Increase of Wickedness, which is the natural and necessary Consequence of their Opposition, will farther accelerate their Ruin.

The Dissolution of antient Empires and Republics may also prepare us for the Expectation of a Dissolution of the present Governments. But we must not carry the Parallel too far here, and suppose that as new Governments have arisen out of the old ones, resembling them in great measure, subsisting for a certain time, and then giving place to other new ones, so it will be with the present Governments. The Prophecies do not admit of this; and it may be easily seen, that the Situation of Things in the Great World is very different from what it has ever been before. Christianity must now either be proved true, to the entire Conviction of Unbelievers; or, if it be an Imposture, it will soon be detected. And whichever of these turns up, must make the greatest Change in the Face of Affairs. I ought rather to have said, that the final Prevalence and Establishment of Christianity, which, being true, cannot but finally prevail, and be established, will do this. But it may perhaps be of some Use just to put false Suppositions.

How near the Dissolution of the present Governments, generally or particularly, may be, would be great Rashness to affirm. Christ will come in this Sense also as a Thief in the Night. Our Duty is therefore to watch, and to pray; to be faithful Stewards; to give Meat, and all other Requisites, in due Season, to those under our Care; and to endeavour by these, and all other lawful Means, to preserve the Government, under whose Protection we live, from Dissolution, seeking the Peace of it, and submitting to every Ordinance of Man for the Lord’s sake. No Prayers, no Endeavours of this Kind, can fail of having some good Effect, public or private, for the Preservation of ourselves or others. The great Dispensations of Providence are conducted by Means that are either secret, or, if they appear, that are judged feeble and inefficacious. No man can tell, however private his Station may be, but his
fervent Prayer may avail to the Salvation of much People. But it is more
peculiarly the Duty of Magistrates thus to watch over their Subjects, to pray
for them, and set about the Reformation of all Matters Civil and
Ecclesiastical, to the utmost of their Power. Good Governors may promote
the Welfare and Continuance of a State, and wicked ones must accelerate its
Ruin. The sacred History affords us Instances of both Kinds, and they are
recorded there for the Admonition of Kings and Princes in all future Times.

It may not be amiss here to note a few Instances of the Analogy between
the Body Natural, with the Happiness of the Individual to which it belongs,
and the Body Politic, composed of many Individuals, with its Happiness, or
its flourishing State in respect of Arts, Power, Riches, &c. Thus all Bodies
Politick seem, like the Body Natural, to tend to Destruction and Dissolution,
as is here affirmed, through Vices public and private, and to be respted for
certain Intervals, by partial, imperfect Reformations. There is no complete
or continued Series of public Happiness on one hand, no utter Misery on the
other; for the Dissolution of the Body Politic is to be considered as its Death.
It seems as romantic therefore for any one to project the Scheme of a perfect
Government in this imperfect State, as to be in Pursuit of an universal
Remedy, a Remedy which should cure all Distempers, and prolong human
Life beyond Limit. And yet as Temperance, Labour, and Medicines, in some
Cases, are of great Use in preserving and restoring Health, and prolonging
Life; so Industry, Justice, and all other Virtues, public and private, have an
analogous Effect in respect of the Body Politic. As all the Evils, which
Individuals suffer through the Infirmitie of the mortal Body, and the
Disorders of the external World, may, in general, contribute to increase their
Happiness even in this Life, and also are of great Use to others; and as, upon
the Supposition of a future State, Death itself appears to have the same
beneficial Tendency in a more eminent Degree than any other Event in Life,
now considered as indefinitely prolonged; so the Distresses of each Body
Politick are of great Use to this Body itself, and also of great Use to all
neighbouring States; and the Dissolution of Governments have much
promoted the Knowledge of true Religion, and of useful Arts and Sciences,
all which seem, in due time and manner, intended to be entirely subservient
to true Religion at last. And this affords great Comfort to benevolent and
religious Persons, when they consider the Histories of Former Times, or
contemplate the probable Consequences of Things in future Generations.

PROP. 82

It is probable, that the present Forms of Church-Government
will be dissolved.

This Proposition follows from the forgoing. The Civil and
Ecclesiastical Powers are so interwoven and cemented together, in all
the Countries of Christendom, that if the first fall, the last must fall also.

But there are many Prophecies, which declare the Fall of the
Ecclesiastical Powers of the Christian World. And through each Church
seems to flatter itself with the Hopes of being exempted; yet it is very plain,
that the prophetical Characters belong to all. They have all left the true, pure, simple Religion; and teach for Doctrines the Commandments of Men. They are all Merchants of the Earth, and have set up a Kingdom of this World, abounding in Riches, temporal Power, and external Pomp. They have all a dogmatizing Spirit, and persecute such as do not receive their own Mark, and worship the Image which they have set up. They all neglect Christ’s Command of preaching the Gospel to all Nations, and even of going to the lost Sheep of the House of Israel, there being innumerable Multitudes in all Christian Countries, who have never been taught to read, and who are, in other respects also, destitute of the Means of saving Knowledge. It is very true, that the Church of Rome is Babylon the Great, and the Mother of Harlots, and of the Abominations of the Earth. But all the rest have copied her Example, more or less. They have all received Money, like Gehazi; and therefore the Leprosy of Naaman will cleave to them, and to their Seed for ever. And this Impurity may be considered not only as justifying the Application of the Prophecies to all the Christian Churches, but as a natural Cause for their Downfal. The corrupt Governors of the several Churches will ever oppose the true Gospel, and in so doing will bring Ruin upon themselves.

The Destruction of the Temple at Jerusalem, and of the Hierarchy of the Jews, may likewise be considered as a Type and Presage of the Destruction of that Judaical Form of Rites, Ceremonies, and human Ordinances, which takes place, more or less, in all Christian Countries.

We ought, however, to remark here,

First, That though the Church of Christ has been corrupted thus in all Ages and Nations, yet there have been, and will be, in all, many who receive the Seal of God, and worship him in Spirit, and in Truth. And of these as many have filled high Stations, as low ones. Such Persons, though they have concurred in the Support of what is contrary to the pure Religion, have, however, done it innocently, with respect to themselves, being led thereto by invincible Prejudices.

Secondly, Nevertheless, when it so happens, that Persons in high Stations in the Church have their Eyes enlightened, and see the Corruptions and Deficiencies of it, they must incur the prophetical Censures in the highest Degree, if they still concur, nay, if they do not endeavour to reform and purge out these Deformations. And though they cannot, according to this Proposition, expect intire Success; yet they may be blessed with such a Degree, as will abundantly compensate their utmost Endeavours, and rank them with the Prophets and Apostles.

Thirdly, As this Corruption and Degeneracy of the Christian Church has proceeded from the fallen State of Mankind, and particularly of those Nations to whom the Gospel was first preached, and amongst whom it has been since received; so it has, all things being supposed to remain the same, suited our Circumstances, in the best Manner possible, and will continue to do so, as long as it subsists. God brings Good out of Evil, and draws Men to himself.
in such manner as their Natures will admit of, by external Pomp and Power, by things not good in themselves, and by some that are profane and unholy. He makes use of some of their Corruptions as Means of purging away the rest. The Impurity of Mankind is too gross to unite at once with the strict Purity of the Gospel. The Roman Empire first, and the Goths and Vandals afterwards, required, as one may say, some Superstitions and Idolatries to be mixed with the Christian Religion; else they could not have been converted at all.

Fourthly, It follows from these Considerations, that good Men ought to submit to the Ecclesiastical Powers that be, for Conscience-sake, as well as to the Civil ones. They are both from God, as far as respects Inferiors. Christ and his Apostles observed the Law, and walked orderly, though they declared the Destruction of the Temple, and the Change of the Customs established by Moses. Both the Babylonians, who destroyed Jerusalem the first time, and the Romans, who did it the second, were afterwards destroyed themselves in the most exemplary Manner. And it is probable, that those who shall hereafter procure the Downfal of the Forms of Church-Government, will not do this from pure Love, and Christian Charity, but from the most corrupt Motives, and by Consequence bring upon themselves, in the End, the severest Chastisements. It is therefore the Duty of all good Christians to obey both the Civil and Ecclesiastical Powers under which they were born, i. e. provided Disobedience to God be not injoined, which is seldom the Case; to promote Subjection and Obedience in others; gently to reform and rectify, and to pray for the Peace and Prosperity of, their own Jerusalem.

PROP. 83.

It is probable, that the Jews will be restored to Palæstine.

This appears from the Prophecies, which relate to the Restoration of the Jews and Israelites to their own Land. For,

First, These have never yet been fulfilled in any Sense agreeable to the Greatness and Gloriousness of them. The Peace, Power, and Abundance of Blessings, temporal and spiritual, promised to the Jews upon their Return from Captivity, were not bestowed upon them in the Interval between the Reign of Cyrus, and the Destruction of Jerusalem by Titus; and ever since this Destruction they have remained in a desolate State.

Secondly, The Promises of Restoration relate to the Ten Tribes, as well as the Two of Judah and Benjamin. But the Ten Tribes, or Israelites, which were captivated by Salmaneser, have never been restored at all. There remains therefore a Restoration yet future for them.

Our Ignorance of the Place where they now lie hid, or Fears that they are so mixed with other Nations, as not to be distinguished and separated, ought not to be admitted as Objections here. Like Objections might be made to the Resurrection of the Body; and the Objections both to the one, and the other, are probably intended to be obviated by Ezekiel’s Prophecy concerning the dry Bones. It was one of the great Sins of the Jews to call God’s Promises in Question, on account of apparent Difficulties and Impossibilities; and the
Sadduces, in particular, erred concerning the Resurrection, because they knew not the Scriptures, nor the Power of God. However, it is our Duty to inquire, whether the Ten Tribes may not remain in the Countries where they were first settled by Salmaneser, or in some others.

Thirdly, A double Return seems to be predicted in several Prophecies.

Fourthly, The Prophets who lived since the Return from Babylon, have predicted a Return in similar Terms with those who went before. It follows therefore, that the Predictions of both must relate to some Restoration yet future.

Fifthly, The Restoration fo the Jews to their own Land seems to be predicted in the New Testament.

To the Arguments, drawn from Prophecy, we may add some concurring Evidences, which the present Circumstances of the Jews suggest.

First, then, The Jews are yet a distinct People from all the Nations amongst which they reside. They seem therefore reserved by Providence for some such signal Favour, after they have suffered the due Chastisement.

Secondly, They are to be found in all the Countries of the known World. And this agrees with many remarkable Passages of the Scriptures, which treat both of their Dispersion, and of their Return.

Thirdly, They have no Inheritance of Land in any Country. Their Possessions are chiefly Money and Jewels. They may therefore transfer themselves with the greater Facility to Palestine.

Fourthly, They are treated with Contempt and Harshness, and sometimes with great Cruelty, by the Nations amongst whom they sojourn. They must therefore be the more ready to return to their own Land.

Fifthly, They carry on a Correspondence with each other throughout the whole World; and consequently must both know when Circumstances begin to favour their Return, and be able to concert Measures with one another concerning it.

Sixthly, A great Part of them speak and write the Rabbinical Hebrew, as well as the Language of the Country where they reside. They are therefore, as far as relates to themselves, actually possessed of an universal Language and Character; which is a Circumstance that may facilitate their Return, beyond what can well be imagined.

Seventhly, The Jews themselves still retain a Hope and Expectation, that God will once more restore them to their own Land.

C o r . 1. May not the two Captivities of the Jews, and their two Restorations, be Types of the first and second Death, and of the first and second Resurrections?

C o r . 2. Does it not appear agreeable to the whole Analogy both of the Word and Works of God, that the Jews are Types both of each Individual in particular, on one hand, and of the whole World in general, on the other? May we not therefore hope, that, at least after the second Death, there will be a Resurrection to Life eternal to every Man, and to the whole Creation, which groans, and travails in Pain together, waiting for the Adoption, and glorious
Liberty, of the Children of God?

C o r . 3. As the Downfall of the Jewish State under Titus was the Occasion of the Publication of the Gospel to us Gentiles, so our Downfall may contribute to the Restoration of the Jews, and both together bring on the final Publication and Prevalence of the true Religion; of which I shall treat in the next Proposition. Thus the Type, and the Thing typified, will coincide; the First-fruits, and the Lump, be made holy together.

P r o p . 84.

The Christian Religion will be preached to, and received by, all Nations.

This appears from the express Declarations of Christ, and from many of his Parables, also from the Declarations and Predictions of the Apostles, and particularly from the Revelation. There are likewise numberless Prophecies in the Old Testament, which admit of no other Sense, when interpreted by the Events which have since happened, the Coming of Christ, and the Propagation of his Religion.

The Truth of the Christian Religion is an Earnest and Presage of the same Thing, to all who receive it. For every Truth of great Importance must be discussed and prevail at last. The Persons who believe can see no Reasons for their own Belief, but what must extend to all Mankind by degrees, as the Diffusion of Knowledge to all Ranks and Orders of Men, to all Nations, Kindred, Tongues, and People, cannot now be stopped, but proceeds ever with an accelerated Velocity. And, agreeably to this, it appears that the Number of those who are able to give a Reason for their Faith increases every Day.

But it may not be amiss to set before the Reader in one View some probable Presumptions for the universal Publication and Prevalence of the Christian Religion, even in the way of natural Causes.

First, then, The great Increase of Knowledge, literary and philosophical, which has been made in this and the Two last Centuries, and continues to be made, must contribute to promote every great Truth, and particularly those of Revealed Religion, as just now mentioned. The Coincidence of the Three remarkable Events, of the Reformation, the Invention of Printing, and the Restoration of Letters, with each other, in Time, deserves particular Notice here.

Secondly, The Commerce between the several Nations of the World is enlarged perpetually more and more. And thus the Children of this World are opening new Ways of Communication for future Apostles to spread the glad Tidings of Salvation to the uttermost Parts of the Earth.

Thirdly, The Apostasy of nominal Christians, and Objections of Infidels, which are so remarkable in these Days, not only give Occasion to search out and publish new Evidences for the Truth of Revealed Religion, but also oblige those who receive it, to purify it from Errors and Superstitions; by which means its Progress amongst the yet Heathen Nations will be much forwarded. Were we to propagate Religion, as it is now held by the several Churches, each Person would propagate his own Orthodoxy, lay needless
Impediments and Stumbling-blocks before his Hearers, and occasion endless Feuds and Dissensions amongst the new Converts. And it seems as if God did not intend, that the general Preaching of the Gospel should be begun, till Religion be discharged of its Incumbrances and Superstitions.

Fourthly, The various Sects, which have arisen amongst Christians in late Times, contribute both to purify Religion, and also to set all the great Truths of it in a full Light, and to shew their practical Importance.

Fifthly, The Downfal of the Civil and Ecclesiastical Powers, mentioned in the 81st and 82d Propositions, must both be attended with such public Calamities, as will make Men serious, and also drive them from the Countries of Christendom into the remote Parts of the World, particularly into the East and West-Indies; whither consequently they will carry their Religion now purified from Errors and Superstitions.

Sixthly, The Restoration of the Jews, mentioned in the last Proposition, may be expected to have the greatest Effect in alarming Mankind, and opening their Eyes. This will be such an Accomplishment of the Prophecies, as will vindicate them from all Cavils. Besides which, the careful Survey of Palaestine, and the neighboring Countries, the Study of the Eastern Languages, of the Histories of the present and antient Inhabitants, &c. (which must follow this Event) when compared together, will cast the greatest Light upon the Scriptures, and at once prove their Genuineness, their Truth, and their Divine Authority.

Seventhly, Mankind seem to have it in their Power to obtain such Qualifications in a natural way, as, by being conferred upon the Apostles in a supernatural one, were a principal Means of their Success in the first Propagation of the Gospel.

Thus, as the Apostles had the Power of Healing miraculously, future Missionaries may in a short time accomplish themselves with the Knowledge of all the chief practical Rules of the Art of Medicine. This Art is wonderfully simplified of late Years, has received great Additions, and is improving every Day, both in Simplicity and Efficacy. And it may be hoped, that a few theoretical Positions, well ascertained, with a moderate Experience, may enable the young Practitioner to proceed to a considerable Variety of Cases with Safety and Success.

Thus also, as the Apostles had the Power of speaking various Languages miraculously, it seems possible from the late Improvements in Grammar, Logic, and the History of the human Mind, for young Persons, by learning the Names of visible Objects and Actions in any unknown barbarous Language, to improve and extend it immediately, and to preach to the Natives in it.

The great Extensiveness of the Rabbinical Hebrew, and of Arabic, of Greek and Latin, of Slavonic and French, and of many other Languages, in their respective ways, also of the Chinese Character, ought to be taken into Consideration here.

And though we have not the Gift of Prophecy, yet that of the
Interpretation of Prophecy seems to increase every Day, by comparing the Scriptures with themselves, the Prophecies with the Events, and, in general, the Word of God with his Works.

To this we may add, that when Preachers of the Gospel carry with them the useful manual Arts, by which human Life is rendered secure and comfortable, such as the Arts of Building, tilling the Ground, defending the Body by suitable Clothing, &c. it cannot but make them extremely acceptable to the barbarous Nations; as the more refined Arts and Sciences, Mathematics, natural and experimental Philosophy, &c. will to the more civilized ones.

And it is in an additional Weight in favour of all this Reasoning, that the Qualifications here considered may all be acquired in a natural way. For thus they admit of unlimited Communication, Improvement, and Increase; whereas, when miraculous Powers cease, there is not only one of the Evidences withdrawn, but a Recommendation and Means of Admittance also.

However, far be it from us to determine by Anticipation, what God may or may not do! The natural Powers, which favour the Execution of this great Command of our Saviour’s, to preach the Gospel to all Nations, ought to be perpetual Monitors to us to do so; and as we now live in a more adult Age of the World, more will now be expected from our natural Powers. The Jews had some previous Notices of Christ’s First Coming, and good Persons were thereby prepared to receive him; however, his Appearance, and intire Conduct, were very different from what they expected; so that they stood in need of the greatest Docility and Humility, in order to become Disciples and Apostles. And it is probable, that something analogous to this will happen at Christ’s Second Coming. We may perhaps say, that some Glimmerings of the Day begin already to shine in the Hearts of all those, who study and delight in the Word and Works of God.

PROP. 85

It is not probable, that there will be any pure or complete Happiness, before the Destruction of this World by Fire.

That the Restoration of the Jews, and the universal Establishment of the true Religion, will be the Causes of great Happiness, and change the Face of the World much for the better, may be inferred both from the Prophecies, and from the Nature of the Thing. But still, that the great Crown of Glory promised to Christians must be in a State ulterior to this Establishment, appears for the following Reasons.

First, From the express Declarations of the Scriptures. Thus St. Peter says, that the Earth must be burnt up, before we are to expect a new Heaven, and new Earth, wherein dwelleth Righteousness; and St. Paul, that Flesh and Blood cannot inherit the Kingdom of God; the celestial, glorious Body, made like unto that of Christ, at the Resurrection of the Dead, being requisite for this Purpose.

Secondly, The present disorderly State of the natural World does not
permit of unmixed Happiness; and it does not seem, that this can be rectified
in any great Degree, till the Earth have received the Baptism by Fire.

But I presume to affirm nothing particular in relation to future Events. One may just ask, whether Christ’s Reign of a Thousand Years upon Earth does not commence with the universal Establishment of Christianity; and whether the Second Resurrection, the new Heavens, and new Earth, &c. do not coincide with the Conflagration.

One ought also to add, with St. Peter, as the practical Consequence of this Proposition, that the Dissolution of this World by Fire is the strongest Motive to an Indifference to it, and to that holy Conversation and Godliness, which may fit us for the new Heavens, and new Earth.”¹

Note Hartley’s statement,

“First, then, The Jews are yet a distinct People from all the Nations amongst which they reside. They seem therefore reserved by Providence for some such signal Favour, after they have suffered the due Chastisement.”

Many Christian Zionists and many Jewish Zionists tried to justify the Holocaust as “due Chastisement”. Politically powerful Dispensationalist Christians and their Jewish handlers are today actively promoting nuclear war and an apocalyptic holocaust which will kill us all, because they believe that God will create a new Earth after they have destroyed the old Earth. It is a new heaven and a new Earth which will only sustain the “elect”, the “chosen”, the Jews. Isaiah 65 states (see also: Enoch),

“1 I am sought of them that asked not for me; I am found of them that sought me not: I said, Behold me, behold me, unto a nation that was not called by my name. 2 I have spread out my hands all the day unto a rebellious people, which walketh in a way that was not good, after their own thoughts; 3 A people that provoketh me to anger continually to my face; that sacrificeth in gardens, and burneth incense upon altars of brick; 4 Which remain among the graves, and lodge in the monuments, which eat swine’s flesh, and broth of abominable things is in their vessels; 5 Which say, Stand by thyself, come not near to me; for I am holier than thou. These are a smoke in my nose, a fire that burneth all the day. 6 Behold, it is written before me: I will not keep silence, but will recompense, even recompense into their bosom, 7 Your iniquities, and the iniquities of your fathers together, saith the LORD, which have burned incense upon the mountains, and blasphemed me upon the hills: therefore will I measure their former work into their bosom. 8 Thus saith the LORD, As the new wine is found in the cluster, and one saith, Destroy it not; for a blessing is in it: so will I do for my servants’ sakes, that I may not destroy them all. 9 And I will bring forth a seed out of Jacob, and out of Judah an inheritor of my mountains: and mine elect shall inherit it, and my servants shall dwell there. 10 And Sharon shall be a fold of flocks, and the
valley of Achor a place for the herds to lie down in, for my people that have sought me. 11 But ye are they that forsake the LORD, that forget my holy mountain, that prepare a table for that troop, and that furnish the drink offering unto that number. 12 Therefore will I number you to the sword, and ye shall all bow down to the slaughter: because when I called, ye did not answer; when I spake, ye did not hear; but did evil before mine eyes, and did choose that wherein I delighted not. 13 Therefore thus saith the Lord GOD, Behold, my servants shall eat, but ye shall be hungry: behold, my servants shall drink, but ye shall be thirsty: behold, my servants shall rejoice, but ye shall be ashamed: 14 Behold, my servants shall sing for joy of heart, but ye shall cry for sorrow of heart, and shall howl for vexation of spirit. 15 And ye shall leave your name for a curse unto my chosen: for the Lord GOD shall slay thee, and call his servants by another name: 16 That he who blesseth himself in the earth shall bless himself in the God of truth; and he that sweareth in the earth shall swear by the God of truth; because the former troubles are forgotten, and because they are hid from mine eyes. 17 For, behold, I create new heavens and a new earth: and the former shall not be remembered, nor come into mind. 18 But be ye glad and rejoice for ever in that which I create: for, behold, I create Jerusalem a rejoicing, and her people a joy. 19 And I will rejoice in Jerusalem, and joy in my people: and the voice of weeping shall be no more heard in her, nor the voice of crying. 20 There shall be no more thence an infant of days, nor an old man that hath not filled his days: for the child shall die an hundred years old; but the sinner being an hundred years old shall be accursed. 21 And they shall build houses, and inhabit them; and they shall plant vineyards, and eat the fruit of them. 22 They shall not build, and another inhabit; they shall not plant, and another eat: for as the days of a tree are the days of my people, and mine elect shall long enjoy the work of their hands. 23 They shall not labour in vain, nor bring forth for trouble; for they are the seed of the blessed of the LORD, and their offspring with them. 24 And it shall come to pass, that before they call, I will answer; and while they are yet speaking, I will hear. 25 The wolf and the lamb shall feed together, and the lion shall eat straw like the bullock: and dust shall be the serpent’s meat. They shall not hurt nor destroy in all my holy mountain, saith the LORD.”

Isaiah 66:22-24 states,

“22 For as the new heavens and the new earth, which I will make, shall remain before me, saith the LORD, so shall your seed and your name remain. 23 And it shall come to pass, that from one new moon to another, and from one sabbath to another, shall all flesh come to worship before me, saith the LORD. 24 And they shall go forth, and look upon the carcases of the men that have transgressed against me: for their worm shall not die, neither shall their fire be quenched; and they shall be an abhorring unto all flesh.”
Note Hartley’s pronouncement, which became a policy of inhumanity for the Zionists, both Christian and Jewish, who allied themselves with the anti-Semites and funded the anti-Semites’ rise to political power in hopes that the persecution of assimilated Jews would force them to Zionism,

“Fourthly, They are treated with Contempt and Harshness, and sometimes with great Cruelty, by the Nations amongst whom they sojourn. They must therefore be the more ready to return to their own Land.”

Further note Hartley’s statement,

“Fifthly, The Downfal of the Civil and Ecclesiastical Powers, mentioned in the 81st and 82d Propositions, must both be attended with such public Calamities, as will make Men serious, and also drive them from the Countries of Christendom into the remote Parts of the World, particularly into the East and West-Indies; whither consequently they will carry their Religion now purified from Errors and Superstitions.”

In 1899, anti-Semite Edouard Drumont alleged that Protestants and Jews had united to corrupt and destroy the predominantly Catholic nation of France. Drumont also predicted that Jewish financiers would unite with the German Government to destroy Russia, years before Jacob Schiff boasted of his success in destroying the Russian People. Drumont also alleged that “Jews” would build up the economy of a nation only to then use corrupt influence in its thriving markets, artificially enhanced by an influx of Jewish investment capital, to deplete the nation of its wealth. He argued that Jews made money the controlling factor in society, and then corruptly obtained control over the fortunes of nations. Drumont believed that Napoleon had been put in power to serve the interests of Jewish wealth accumulation; and that when there was little left to take, the Jews turned against Napoleon, in particular, Rothschild turned against Napoleon.

Many have alleged that Jewish Liberalism was a farce that led to tyranny and absolute Jewish dominance. They further asserted that wealthy Jewish materialistic Capitalists deliberately destroyed all virtue in Gentile society, so as to turn God against the Gentile world and back towards the Jews. Anti-Semitic political movements often concluded that they, not liberal or capitalistic Jews, represented the genuine interests of the working class; which the Jews only desired to deceive and exploit. It was a pattern of general vilification of all Jews that suited the Zionists well, in that it segregated the wealthier Jews from the societies into which they were otherwise comfortably and willfully assimilating.

8.7.3.3 Zionists Develop a Strategy Which Culminates in the Nazis and the Holocaust as Means to Attain the “Jewish State”

In the 1640’s, Orthodox Ukrainian Bohdan Chmielnicki alleged that Jews and Polish Catholics had enslaved the peoples who were under Polish control. In retaliation,
Chmielnicki allegedly slaughtered large numbers of Jews. Some Jews saw this Holocaust as the punishment which signaled the coming of the Messiah. Some Jews believed that God would not allow the existence of the Temple, or send the Messiah, until the Jews had atoned for Solomon’s marriage to the Pharaoh’s daughter and subsequent idolatry (Sabbath 56b, I Kings 11); which became associated with the “sin” of assimilation. There was also a perceived need to finally atone for Aaron’s worship of the Golden Calf (Sanhedrin 102a) and the impiety of the ten Northern Tribes, and the impiety of southern tribes of Judah and Benjamin. Note that the Jews correlated a Jewish Holocaust with the redemption of Israel through the arrival of the Messiah, whose primary task was to “restore the Jews to Palestine”.

Many had predicted that the year 1666 would mark the arrival of the Messiah. For the Christians, this meant the second coming of Christ, for the Jews, the arrival of the Jewish King. After the Chmielnicki holocaust, which some saw as the sacrifice of masses of Jewish lives as an act of atonement, Shabbatai Zevi declared himself to be the Jewish Messiah and a large Messianic sect followed him. He traveled to Palestine, as a good Messiah would, and attracted a large Jewish following. While traveling through Turkey, Shabbatai Zevi was taken prisoner and was forced to feign conversion to Islam in order to save his life.

A branch of the Shabbataian sect of crypto-Jews, called the Dönmeh, formed in Turkey. They pretended to convert to Islam, but practiced Judaism in secret. For centuries this sect of crypto-Jewish Turks have bred subversive crypto-Jewish agents who have been sent around the world to prepare the way for Jewish world domination. They created a secret society in Paris and eventually led a revolt from Salonika. They were the hidden masters of the “Young Turks” and flooded Turkey with revolutionary propaganda defaming the Sultan. Their reach extended across the globe.

The Shabbataians believed that Shabbatai Zevi’s Messianic spirit passed from one Jewish King to the next in a process of Metempsychosis. They argued that the line of David was a dynasty, which would not end when any given King of the Jews died, but rather the spirit of the Messiah would leave one body of the Jewish King and enter the next, sort of like a kosher Dalai Lama. In the form of the “Young Turks”, the Dönmeh eventually succeed in overthrowing the Sultan whose ancestors had shamed Shabbatai Zevi. They also destroyed Turkish culture and committed genocide against the Armenian Christians. Shabbatai Zevi was a bizarre individual, a bit of a “flake”. He wore a bride’s dress and wedded himself to the Torah.

Jacob Frank—a Polish Jew who was born Jacob Leibowicz, or Jacob Ben Judah Leib, whose father belonged to the Messianic sect of Shabbatai Zevi—joined the Dönmeh in Turkey. Frank declared himself to be the successor of Shabbatai Zevi and the then present Messiah. Frank opposed the Talmud and convinced prominent Catholic leaders that his sect would convert Jews to Christianity. The Frankist reformation, as well as Moses Mendelssohn’s and Napoleon’s reforms, set the stage for reformed Judaism, which, it was alleged, would lead to better relations between Christians and Jews, and which would afford revolutionary Jews with a means by which they could subvert Gentile society. The Talmud, with its anti-Christian passages, had long been a source of anti-Christian and anti-Semitic tensions. Though
Ashkenazi Jews had lain greater emphasis on the Talmud than even the Pentateuch, Sephardic Jews had a greater respect for the original books of Judaism and viewed the Talmud as the mere commentary it is. The Sephardic Jews developed Cabalism as an outgrowth of original Judaism with less emphasis on the Rabbinical authority of Talmudism—unless it happened to be convenient at any given time to quote a Talmudic authority.

Just as the Rabbis used the Talmud to justify their power and authority over Jewry, the Cabalists used the anti-Gentile and anti-Christian passages of the Talmud as a weapon against the Rabbis, to usurp their authority, and to bring them into conflict with Christians. Cabalistic writings are also severally anti-Christian and anti-Gentile, and the attacks were hypocritical, but the Cabalists survived their hypocrisy by becoming crypto-Jews who pretended to Christian and Moslem conversion. The Talmud, in *Tractate Kethuboth* 111a, prevents the Jews from forcing the Messianic Era and from emigrating to Palestine in large numbers before the coming of the Messiah. The Cabalists opposed this stance and had a powerful Messianic message and model, by which they used politics and wealth accumulation to carry out the Messianic prophecies, and anointed their own false messiahs at will.

The Jewish descendants of the Frankists became leading figures in Poland. Granted special privileges by the elite of Europe, they pretended to convert to Catholicism, but the Frankist conversions to Catholicism and Islam were instead efforts to subvert both religions and the Jews secretly carried on as Jews. The Frankists had many reasons for attacking Rabbinical culture. The Rabbis opposed any “artificial” establishment of a Jewish State, and the Catholic Church would likely have ended its opposition to “the restoration of the Jews to Palestine” if the Jews professed to be Christians and accepted the “new Covenant of Christ”. The New Testament calls for a “remnant of Jews” to convert and live in Palestine.

The Frankists advocated many of the same beliefs as the Illuminati—and Communism and Bolshevism. The leadership elements of each of these groups are notable both for their disproportionate Jewish influence and for their highly perverse sexual deviancy. The Frankists believed that if they could destroy all Gentile religions, the Gentiles would be left without gods to protect them and their Jewish God would reign supreme. The Frankists also believed that evil is good and found many passages in the Old Testament to support their view that the Messiah would only be successful when evil ruled the Earth. They did everything they could to infiltrate and overthrow governments and sought world revolution. They wormed their way into the leadership of governments through pretended conversions and through intermarriage and did what they could to cause calamities, starvation and war.

Shabbatai Zevi, Jacob Frank and the Frankists had a long relationship with Turkey, as did Adolf Hitler’s Hungarian Jewish patron Moses Pinkeles, a. k. a. Ignatius Trebitsch-Lincoln, and Adam Alfred Rudolf Glauer, a. k. a. Rudolf Glandeck Freiherr von Sebottendorf, both of whom helped to put Adolf Hitler into power—there were also the genocidal Young Turks of Jewish descent, of *Dönmeh* descent, and there have been many Israeli leaders with intimate involvements in Turkey, including David Ben-Gurion.
The belief that the God of the Old Testament sponsored evil was not new. The Talmud contains passages indicating that evil must reign before the Messiah will appear. Some of the earliest Christians saw the creator God of the Old Testament as an evil force, who was supplanted by the supreme God who was the Father of Jesus. Marcion believed that Jesus was not the Messiah of the Old Testament God, who was in Marcion’s view the evil creator God who would restore the Jews, but was instead the Messiah of a good God, a supreme God who reigned over the many gods referred to in the Old Testament—for example in *Genesis* 3:5, 22,

“For God doth know that in the day ye eat thereof, then your eyes shall be opened, and ye shall be as gods, knowing good and evil [ ***] And the LORD God said, Behold, the man is become as one of us, to know good and evil: and now, lest he put forth his hand, and take also of the tree of life, and eat, and live for ever:”

and *Psalm* 82:1,

“God standeth in the congregation of the mighty; he judgeth among the gods.”

and *Jeremiah* 10:10-11,

“10 But the LORD is the true God, he is the living God, and an everlasting king: at his wrath the earth shall tremble, and the nations shall not be able to abide his indignation. 11 Thus shall ye say unto them, The gods that have not made the heavens and the earth, even they shall perish from the earth, and from under these heavens.”

Marcion believed that the Jew’s Messiah was yet to appear and Marcion shunned the Old Testament creator God as an evil force and sought to keep the Christian faith from falling into the belief that Jesus was the Messiah of the Jews. *The Catholic Encyclopedia* wrote of Marcion, among other things,

“II. DOCTRINE AND DISCIPLINE.—We must distinguish between the doctrine of Marcion himself and that of his followers. Marcion was no Gnostic dreamer. He wanted a Christianity untrammeled and undefiled by association with Judaism. Christianity was the New Covenant pure and simple. Abstract questions on the origin of evil or on the essence of the Godhead interested him little, but the Old Testament was a scandal to the faithful and a stumbling-block to the refined and intellectual gentiles by its crudity and cruelty, and the Old Testament had to be set aside. The two great obstacles in his way he removed by drastic measures. He had to account for the existence of the Old Testament and he accounted for it by postulating a secondary deity, a demiurgus, who was god in a sense, but not the supreme God; he was just, rigidly just, he had his good qualities, but he was not the
good god, who was Father of Our Lord Jesus Christ. The metaphysical relation between these two gods troubled Marcion little; of divine emanation, æons, syzygies, eternally opposed principles of good and evil, he knows nothing. He may be almost a Manichee in practice, but in theory he has not reached absolute consistency as Mani did a hundred years later. Marcion had secondly to account for those passages in the New Testament which countenanced the Old. He resolutely cut out all texts that were contrary to his dogma; in fact, he created his own New Testament, admitting but one gospel, a mutilation of St. Luke, and an Apostolicon containing ten epistles of St. Paul. The mantle of St. Paul had fallen on the shoulders of Marcion in his struggle with the Judaisers. The Catholics of his day were nothing but the Judaisers of the previous century. The pure Pauline Gospel had become corrupted and Marcion not obscurely hinted that even the pillar Apostles, Peter, James and John, had betrayed their trust. He loves to speak of ‘false apostles’, and lets his hearers infer who they were. Once the Old Testament has been completely got rid of, Marcion has no further desire for change. He makes his purely New Testament Church as like the Catholic Church as possible, consistent with his deep-seated Puritanism. The first description of Marcion’s doctrine dates from St. Justin: ‘With the help of the devil Marcion has in every country contributed to blasphemy and the refusal to acknowledge the Creator of all the world as God. He recognizes another god, who, because he is essentially greater (than the World-maker or Demiurge) has done greater deeds than he (ὅσον δήνα μείζονα τὰ μείζονα παρὰ τοῦτον πεποιηκέναι). The supreme God is ἄγαθός, good, kind; the inferior god is merely δίκαιος, just and righteous. The good God is all love, the inferior god gives way to fierce anger. Though less than the good God, yet the just god, as world-creator, has his independent sphere of activity. They are not opposed as Ormuzd and Ahriman, though the good God interferes in favour of men, for He alone is all-wise and all-powerful and loves mercy more than punishment. All men are indeed created by the Demiurge, but by special choice he elected the Jewish people as his own and thus became the god of the Jews.

His theological outlook is limited to the Bible, his struggle with the Catholic Church seems a battle with texts and nothing more. The Old Testament is true enough, Moses and the Prophets are messengers of the Demiurge, the Jewish Messias is sure to come and found a millennial kingdom for the Jews on earth, but the Jewish Messias has nothing whatever to do with the Christ of God. The Invisible, Indescribable, Good God (ἀόρατος, ἀκατάνομαστος, ἄγαθός θεός), formerly unknown to the creator as well as to his creatures, has revealed Himself in Christ. How far Marcion admitted a Trinity of persons in the Supreme Godhead is not known; Christ is indeed the Son of God, but he is also simply ‘God’ without further qualification; in fact, Marcion’s Gospel began with the words; ‘In the fifteenth year of the Emperor Tiberius God descended in Capharnaum and taught on the Sabbaths’. However daring and capricious this manipulation of
the Gospel text, it is at least a splendid testimony that in Christian circles of
the first half of the second century the Divinity of Christ was a central
dogma. To Marcion however Christ was God Manifest, not God Incarnate.
His Christology is that of the Docetæ (q.v.) rejecting the inspired history of
the Infancy, in fact any childhood of Christ at all; Marcion’s Savior is a ‘deus
ex machina’ of which Tertullian mockingly says: ‘Suddenly a Son, suddenly
Sent, suddenly Christ!’ Marcion admitted no prophecy of the Coming of
Christ whatever; the Jewish prophets foretold a Jewish Messias only, and this
Messias had not yet appeared. Marcion used the story of the three angels,
who ate, walked and conversed with Abraham and yet had no real human
body, as an illustration of the life of Christ (Adv. Marc., III, ix). Tertullian
says (ibid.) that when Apelles and seceders from Marcion began to believe
that Christ had a real body indeed, not by birth but rather collected from the
elements, Marcion would prefer to accept even a putative birth rather than a
real body. Whether this is Tertullian’s mockery or a real change in Marcion’s
sentiments we do not know. To Marcion matter and flesh are not indeed
essentially evil, but are contemptible things, a mere production of the
Demiurge, and it was inconceivable that God should really have made them
His own. Christ’s life on earth was a continual contrast to the conduct of the
Demiurge. Some of the contrasts are cleverly staged: the Demiurge sent bears
to devour children for puerile merriment (Kings)—Christ bade children come
to Him and He fondled and blessed them; the Demiurge in his law declared
lepers unclean and banished them—but Christ touched and healed them.
Christ’s putative passion and death was the work of the Demiurge, who in
revenge for Christ’s abolition of the Jewish law delivered Him up to hell. But
even in hell Christ overcame the Demiurge by preaching to the spirits in
Limbo, and by His Resurrection He founded the true Kingdom of the good
God. Epiphanius (Haer., xlii, 4) says that Marcionites believed that in Limbo
Christ brought salvation to Cain, Core, Dathan and Abiron, Esau and the
Gentiles, but left in damnation all Old Testament saints. This may have been
held by some Marcionites in the fourth century, but it was not the teaching
of Marcion himself, who had no Antinomian tendencies. Marcion denied the
resurrection of the body, ‘for flesh and blood shall not inherit the Kingdom
of God’, and denied the second coming of Christ to judge the living and the
dead, for the good God, being all goodness, does not punish those who reject
Him; He simply leaves them to the Demiurge, who will cast them into
everlasting fire.

With regard to discipline, the main point of difference consists in his
rejection of marriage, i.e. he baptized only those who were not living in
matrimony: virgins, widows, celibates, and eunuchs (Tert., ‘Adv. Marc.’, I,
xxix); all others remained catechumens. On the other hand the absence of
division between catechumens and baptized persons in Marcionite worship,
shocked orthodox Christians, but it was emphatically defended by Marcion’s
appeal to Gal., vi, 6. According to Tertullian (Adv. Marc., I, xiv) he used
water in baptism, anointed his faithful with oil and gave milk and honey to
the catechumens and in so far retained the orthodox practices, although, says Tertullian, all these things are ‘beggarly elements of the Creator.’ Marcionites must have been excessive fasters to provoke the ridicule of Tertullian in his Montanist days. Epiphanius says they fasted on Saturday out of a spirit of opposition to the Jewish God, who made the Sabbath a day of rejoicing. This however may have been merely a western custom adopted by them.

The Frankists wanted to be the Messiahs not of the creator God of the Old Testament whom they also called evil, but of Marcion’s good God, whom they recast into the ultimate and supreme God of Israel. The Frankist Jews believed that they could accomplish this end by being apostates, nihilists and deceivers, who achieved God’s will by doing evil, and who did evil by hiding their true intentions. The Messiah himself would have to be crypto-Jew who would torment other Jews—like Adolf Hitler. The Frankist Jews tried to force God to restore them to Israel as he promised to do after punishing them for their evil acts. They believed that they had to first perform said divine evil on an unprecedented scale and thereby hasten the punishment of the Jews in a horrific holocaust, which would also hasten the arrival of the Messianic Era. The Frankist sophists thereby converted the action of doing evil into a divine act of obedience to God. They set about to destroy the world as an invitation to God to punish them and begin the Messianic Age. Adolf Hitler was their apostate Messiah, who restored the Jews to Palestine by punishing the Jews and committing gross acts of deliberate evil.

These Frankist Jews quickly became the guiding force behind world leadership. Gershom Scholem encapsulated their beliefs as follows:

“1) The belief in the necessary apostasy of the Messiah and in the sacramental nature of the descent into the realm of the kelipot. 2) The belief that the ‘believer’ must not appear to be as he really is. 3) The belief that the Torah of atzilut must be observed through the violation of the Torah of beriah. 4) The belief that the First Cause and the God of Israel are not the same, the former being the God of rational philosophy, the latter the God of Religion. 5) The belief in three hypostates of the God-head, all of which have been or will be incarnated in human form.”

Scholem wrote,

“According to Frank, the ‘cosmos’ (tevel) or ‘earthly world’ (tevel ha-gashmi) as it was called by the sectarians in Salonika, is not the creation of the Good or Living God, for if it were it would be external and man would be immortal, whereas as we see from the presence of death in the world this is not at all the case.”

Scholem quotes Frankist doctrine:
"This much I tell you: Christ, as you know, said that he had come to redeem the world from the hands of the devil, but I have come to redeem it from all the laws and customs that have ever existed. It is my task to annihilate all this so that the Good God can reveal Himself. [***] Wherever Adam trod a city was built but wherever I set foot all will be destroyed, for I came into this world only to destroy and to annihilate. But what I build will last forever. [***] I did not come into this world to lift you up but rather to cast you down to the bottom of the abyss, further than this it is impossible to descend, nor can one ascend again by virtue of one’s own strength, for only the Lord can raise one up from the depths by the power of His hand."2009

Jacob Frank gave out his wife and daughter for sexual favors in order to gain converts and influence the influential. He accused his fellow Jews of ritual sacrifice for personal political gain, and otherwise tried to appeal to the mythologies and aspirations of Moslem and Christian leaders. Frank’s agents and their descendants have corrupted the Gentile world with Communist, Masonic and Illuminati-style leaders, who bought into the mythologies he promulgated, and who have done his bidding. The Hasidic Jews seem very earnest in carrying out his objectives and some practice his perversions. Frank’s ultimate goal was to destroy life on Earth, and the means to accomplish that end today exist. The Nazis and Communists, under crypto-Jewish leadership, inflicted terrible harm on humanity. For the Frankist Jews, there is still worse evil yet to be done.

It is interesting to note that Baal worshipers practiced the prostitution of women and homosexual men in their temples to gain converts and as an expression of their fertility religion, and some Jewish temples were used for Baal worship by Jews. The Gnostics also used communal women and homosexual sex to lure in converts. The dissemination of insincere Liberalism was another tactic some Zionists have used to undermine the structure of Gentile societies.

What the Italian mafia called Omerta, the code of silence, Frank called massa dumah. The Encyclopaedia Judaica writes in its article, “FRANK, JACOB, AND THE FRANKISTS,”

“The motto which Frank adopted here was massa dumah (from Isa. 21:11), taken to mean ‘the burden of silence’; that is, it was necessary to bear the heavy burden of the hidden faith in the abolition of all law in utter silence, and it was forbidden to reveal anything to those outside the fold. Jesus of Nazareth was no more than the husk preceding and concealing the fruit, who was Frank himself. Although it was necessary to ensure an outward demonstration of Christian allegiance, it was forbidden to mix with Christians or to intermarry with them, for in the final analysis Frank’s vision was of a Jewish future, albeit in a rebellious and revolutionary form, presented here as a messianic dream. [***] Frank went with his daughter to Vienna in March of 1775 and was received in audience by the empress and her son, later Joseph II. Some maintain that Frank promised the empress the assistance of his followers in a campaign to conquer parts of Turkey, and in
fact over a period of time several Frankist emissaries were sent to Turkey, working hand in glove with the Doenmeh, and perhaps as political agents or spies in the service of the Austrian government. During this period Frank spoke a great deal about general revolution which would overthrow kingdoms, and the Catholic Church in particular, and he also dreamed of the conquest of some territory in the wars at the end of time which would be the Frankist dominion.”

It is difficult to believe that it is merely a coincidence that this religion of revolution and Nihilism was heavily promoted in England at the same time in the writings of David Hartley—and can be traced back to the Cabalist Van Helmont. It was their intention to destroy and corrupt; and the Frankists relied upon passages in the Old Testament and the Lurian Cabalah to justify deceit, lying, world revolution, destruction, evil and atheism among Gentiles—passages such as Isaiah 45:7; and 59:15-16:

“I form the light, and create darkness: I make peace, and create evil: I the LORD do all these things. [***] Yea, truth faileth; and he that departeth from evil maketh himself a prey. And the LORD saw it, and it displeased him that there was no judgment. And he saw that there was no man, and wondered that there was no intercessor: therefore his arm brought salvation unto him; and his righteousness, it sustained him.”

and Job Chapter 12,

“And Job answered and said, 2 No doubt but ye are the people, and wisdom shall die with you. 3 But I have understanding as well as you; I am not inferior to you: yea, who knoweth not such things as these? 4 I am as one mocked of his neighbor, who calleth upon God, and he answereth him: the just upright is laughed to scorn. 5 He that is ready to slip with his feet is as a lamp despised in the thought of him that is at ease. 6 The tabernacles of robbers prosper, and they that provoke God are secure; into whose hand God bringeth abundantly. 7 But ask now the beasts, and they shall teach thee; and the fowls of the air, and they shall tell thee: 8 or speak to the earth, and it shall declare unto thee. 9 Who knoweth not in all these that the hand of the LORD hath wrought this? 10 In whose hand is the soul of every living thing, and the breath of all mankind. 11 Doth not the ear try words? and the mouth taste his meat? 12 With the ancient is wisdom; and in length of days understanding. 13 With him is wisdom and strength, he hath counsel and understanding. 14 Behold, he breaketh down, and it cannot be built again: he shutteth up a man, and there can be no opening. 15 Behold, he withholdeth the waters, and they dry up: also he sendeth them out, and they overturn the earth. 16 With him is strength and wisdom: the deceived and the deceiver are his. 17 He leadeth counselors away spoiled, and maketh the judges fools. 18 He looseth the bond of kings,
and girdeth their loins with a girdle. 19 He leadeth princes away spoiled, and overthroweth the mighty. 20 He removeth away the speech of the trusty, and taketh away the understanding of the aged. 21 He poureth contempt upon princes, and weakeneth the strength of the mighty. 22 He discovereth deep things out of darkness, and bringeth out to light the shadow of death. 23 He increaseth the nations, and destroyeth them: he enlargeth the nations, and straiteneth them again. 24 He taketh away the heart of the chief of the people of the earth, and causeth them to wander in a wilderness where there is no way. 25 They grope in the dark without light, and he maketh them to stagger like a drunken man.”

It was a long road for the Frankist Nihilists to the end of time, which came during, and shortly after, the Second World War. The Frankists chose Jacob Frank’s nephew, Moses Dobrushka a. k. a. Junius Frey, a. k. a. Franz Thomas von Schoenfeld, as Jacob Frank’s successor—it was a Frankist-Shabbataian tradition to change names, and give the appearance of changing religions, in order to gain the confidence of Gentiles so as to enable the Frankists to more easily destroy them and subvert their societies. Moses Dobrushka became a Jacobin, a leader of Freemasonry and a powerful influence in the French Revolution. It is interesting that Robespierre and Napoleon saw themselves as Messiahs, as had Shabbatai Zevi and Jacob Frank, and as Adolf Hitler later would. Frankist mythologies asserted that Messiahdom was a generational passage—a matter of reincarnation. Frankism primarily took root in Poland, which has been at the epicenter of the destruction of Catholic Europe.

According to Edouard Drumont, Alexandre Weill found good in the destruction and dismemberment of Poland and the planned destruction of France and diaspora of the French—recall that David Hartley had wished for the fall of Christendom and the diaspora of Christians. Drumont wrote that Weill had told him in 1875 that,

“[..]France was obliged to undergo the same fate as Poland and that it would be good, in the best interests of Humanity, that the French, dispersed and countryless like the Poles, would go and spread throughout the world the general truths of civilization and progress.”

Roman Dmowski iterated a Polish Gentile’s view of the First World War in his article *The Jews and the War* of 1924. He noted that many of the Jews who had supported the Central Powers in the beginning of the war changed sides to the Allies in early 1917. Dmowski believed in 1924 that Jews intended to make Poland a new Palestine. Great masses of Jews were deported to Poland in both world wars by both sides of the conflict. Poland was the epicenter of the Jewish Holocaust.

The initial plan was evidently to concentrate them for deportation to Palestine, which neither a majority of the Jews, nor many of the world’s nations, desired. It is interesting to note that Hitler was allegedly surprised by the reaction of the British when Germany invaded Poland in a quest for Lebensraum for Germans and for a place in which to segregate the Jews to the East and prevent their assimilation while preparing them for forced deportation to Palestine. The English had obstructed the
Nazis’ attempts to deport Jews to Palestine and then declared war on Germany when the Nazis invaded Poland—the ultimate destination for millions of Jews, many of whom perished under the crypto-Jewish Zionist Nazi leaders Adolf Eichmann and Hans Frank. After World War II, the Allies allowed the Soviet Union to take over Poland. The Soviets tried for another forty years to destroy religion in Poland—primarily Catholicism. The Jews were forced to suffer through the war in Poland so that enough Jewish blood would be spilled to justify the theft of Palestine and frighten the Jews into moving there and staying.

David Hartley’s work followed the works of Thomas Brightman, who published his *Apocalypse Apocalypseos* in 1585, and Henry Finch, who published *The Worlds Great Restauration. Or the Calling of the Ievves and (With Them) of All the Nations and Kingdomes of the Earth, to the Faith of Christ* in 1621.

The Zionists had the vocal support of prominent Protestant Christians who hoped to bring about the Apocalypse through active political intervention—as opposed to waiting for God to do what He promised to do. More modern Jewish Zionists repeated much of the rhetoric and tactics the Christian Zionists used, which was originally covertly crafted by Cabalistic Jews. It was a strange cycle, whereby Jews learned their Zionism from the Christians who had secretly learned it from Jews.

All that the modern Jewish Zionists lacked was the widespread support of Jews, which they only received after the end of the Second World War—after the Frankist Jews had done their dirty deeds. It took the Zionists two world wars and Adolf Hitler to change the Jews’ collective mind to embrace secular Zionism, which led many to realize that Zionists and their Protestant supporters had agitated for both world wars and had created and continually sponsored Adolf Hitler’s rise to power.

In 1933, Zionist Horace Mayer Kallen blamed the First World War on the Germans, and stated,

> “The formation of the League of Nations on the initiative and insistence of a great American President, Woodrow Wilson, was fruit of this War, and an explicit, if weak, acknowledgment of this interdependence. Mr. Wilson’s successor of today just as frankly acknowledges it stresses it.”

Kallen goes on to quote Zionist Franklin Delano Roosevelt’s message to the World Economic Conference and the Disarmament Conference of 16 May 1933.

Like Wilson, Roosevelt later lied to the American public in order to be elected and told them that he was against American involvement in the war in Europe. Tyler Gatewood Kent documented President Roosevelt’s secret communications to Zionist Winston Churchill beginning in October of 1939, in which Roosevelt assured Churchill that America would not be truly neutral and would rescue the British. This emboldened the British in their declaration of war on Germany, and revealed Roosevelt’s duplicity.

When this correspondence began, Neville Chamberlain was Prime Minister of England and Churchill was head of the British Navy. Roosevelt went behind Chamberlain’s back and apparently knew ahead of time that Churchill would succeed Chamberlain. Just when Kent had accumulated all the evidence needed to
prove Roosevelt a lair, and a criminal, and as Kent was preparing to send this
evidence to the American Congress; British authorities arrested him, seized his
records and in violation of his American diplomatic immunity, which they conspired
to have waived, imprisoned him for the duration of the war. Just as the American
Wilson Administration passed several laws which enabled them to imprison
dissenters, and the Roosevelt Administration used the Sedition Act to persecute its
critics; the British had in place Regulation 18B, which enabled authorities to arrest
detain anyone they wanted to keep quiet, including Captain Archibald Henry
Maule Ramsay.

Like Zionist President Wilson, Zionist President Roosevelt betrayed the
American blacks who initially helped to put him in office; and, unlike his wife
Eleanor, Franklin Delano Roosevelt opposed the anti-lynching bill. While it is
obviously a good thing that the Russians, Americans and British defeated the Nazis,
it obviously would have been a better thing if the Zionists had not caused both of the
world wars.

Zionists and their supporters often spoke of Wilson’s “New World Order”
following the “war to end all wars.” The concept of the “war to end all wars” is a
prophetic and apocalyptic one foretold in Isaiah 2:1-4:

“1 The word that Isaiah the son of Amoz saw concerning Judah and
Jerusalem. 2 And it shall come to pass in the last days, that the mountain of
the LORD’s house shall be established in the top of the mountains, and shall
be exalted above the hills; and all nations shall flow unto it. 3 And many
people shall go and say, Come ye, and let us go up to the mountain of the
LORD, to the house of the God of Jacob; and he will teach us of his ways,
and we will walk in his paths: for out of Zion shall go forth the law, and the
word of the LORD from Jerusalem. 4 And he shall judge among the nations,
and shall rebuke many people: and they shall beat their swords into
plowshares, and their spears into pruninghooks: nation shall not lift up sword
against nation, neither shall they learn war any more.”

In 1943, Zionist Rabbi Abba Hillel Silver saw this new world order of “justice”
as the allegedly just action of taking Palestine from its majority population and
giving it to the Zionists. Referring to Americans of Jewish descent, the Rabbi asked
them in 1943 to give their approval to Zionism and to pressure American politicians,

“with the same sympathy and the same understanding as the Presidents of the
United States from Wilson down, and the Congress of the United States,
helped [the Yishuv] in the earlier years.”

In 1944, while the Nazis were massacring innocent and helpless Slavs, Jews,
Gypsies, etc., Zionist David Ben-Gurion stated,

“One Degania [resident of the first communal settlement of Zionists in
Palestine] is worth more than all the ‘Yevsektzias’ [Jewish Bolsheviks who
sought to secularize Jews] and assimilationists in the world."

Ben-Gurion boasted,

“This people was the first to prophesy about ‘the end of days,’ the first to see the vision of a new human society. [***] Our small and land-poor Jewish people, therefore, lived in constant tension between the power and influence of the neighboring great empires and its own seemingly insignificant culture—a culture poor in material wealth and tangible monuments, but rich and great in its human and moral concepts and in its vision of a universal ‘end of days.’”

Christopher Sykes wrote, “[...] Zionist leaders were determined at the very outset of the Nazi disaster to reap political advantage from the tragedy.”

David Ben-Gurion stated in 1932,

“What Zionist propaganda for years and years could not do, disaster has done overnight. Palestine is today the fiery question for the Jews of East and West, and the New World as well.”

Ben-Gurion also stated,

“The disaster facing European Jewry is not directly my business.”

and,

“The First World War brought us the Balfour Declaration. The Second ought to bring us the Jewish State.”

and,

“It is the job of Zionism not to save the remnant of Israel in Europe but rather to save the land of Israel for the Jewish people and the yishuv.”

The majority of Jews did not want the desert the Zionists wanted for them, until the Nazis had mass murdered European Jews. Racist Zionist leader Chaim Weizmann stated in 1914, before the First World War began,

“We cannot take Palestine yet, even if it were given to us. Even if the great miracle had happened and we had obtained the Charter, we should have to wait for the greater miracle—for the Jews to know how to make use of this Charter.”

Weizmann admitted in 1927 that,
“We Jews got the Balfour Declaration quite unexpectedly; or, in other words, we are the greatest war profiteers. [***] The Jews, they knew, were against us; we stood alone on a little island, a tiny group of Jews with a foreign past.”

David Ben-Gurion stated,

“The First World War brought us the Balfour Declaration. The Second ought to bring us the Jewish State.”

Countless millions died as the Zionists depended on both world wars to bring them Palestine.

*The London Times* had published on the Protestant Zionist movement on 24 January 1839 on page 3, quoting extensively from *The Quarterly Review* of January, 1839,

> **THE STATE AND PROSPECT OF THE JEWS.**
> (From a Correspondent.)

> ‘What is to become of the Jews?’ is a question that must as often occur to the reflecting statesman as to the reader of the ancient prophecies. Wherever he turns his eye he beholds a people exiled and scattered, persecuted and despised, as a body ground almost to powder by the iron hand of poverty; and yet, everywhere intelligent, learned, and possessed of unbounded influence, and, however paradoxical it may sound, of immense wealth; inhabitants of all countries, but at home in none; apparently a mass of disjointed fragments, but in reality knit together in the most intimate religious and national union, and in continual and rapid communication with their brethren in all parts of the world. What, then, is to become of them? Some of the continental statesmen solve the enigma by an attempt at amalgamation, and think that the ties of religion and nationality, which have stood the wear and tear of 18 centuries, are to be rent asunder by the simple process of naturalization. Very similar is the expectation of the church of Rome and of most sectarians. Looking upon their own little communion as the church and people of God, they appropriate to themselves the promises of future glory which Hebrew prophets have announced to the Hebrew people, and think that by the process of conversion the Jews will gradually melt down and be lost in the Christian church. The great writers of the Anglican church, adopting an interpretation more worthy of their faith and their scholarship, trace out for the children of Abraham a destiny more congenial to their hitherto marvellous history, the main features of which are ably delineated in an article on Lord Lindsay’s travels in the last number of the *Quarterly Review*.

The writer, treading in the steps of Bishops Lowth, Butler, Horsley, and Van Mildert, has turned the public attention to the claims which the Jewish people still have upon the land of Israel as their rightful inheritance, and their
consequent political importance in the progress of that great struggle which has already commenced in the East, and which threatens soon to absorb the regards and energies of the old world, possibly of the new also. The subject may be new to many of our readers, but it is one deserving the solemn consideration of a people possessing an oriental empire of such vast extent. The article breathes also a spirit of kindness towards a deeply injured people, and a freedom from prejudice which does honour to the author. No people on the face of the earth has been so little understood and so grossly misrepresented as the Jewish, but no wonder, for no people ever did so much to misrepresent and caricature themselves as the Jews have done in the maxims and legends of the Talmud. A new era is, however, commencing. The Jews themselves, in London as elsewhere, are taking steps to abdicate the follies and intolerance of Rabbinism, and Christians at the same moment begin to renounce their most unchristian prejudice.

The following extracts from a journal so highly respectable as the Quarterly Review must tend to prove to the Jews that the feelings of those whose opinions are worth having are those of kindliness and good will.

After a notice of Lord Lindsay’s work, the author thus proceeds:—

‘We have alluded, in the commencement of this article, to the growing interest manifested in behalf of the Holy Land. This interest is not confined to the Christians—it is shared and avowed by the whole body of the Jews, who no longer conceal their hope and their belief that the time is not far distant when ‘the Lord shall set his hand again the second time to recover the remnant of his people which shall be left, from Assyria, and from Egypt, and from Pathros, and from Cush, and from Elam, and from Shinar, and from Hamath, and from the islands of the sea; and shall set up an ensign for the nations, and shall assemble the outcasts of Israel, and shall gather together the dispersed of Judah from the four corners of the earth.’ Isaiah xi., 11.

‘Doubtless, this is no new settlement among the children of the dispersion. The novelty of the present day does not lie in the indulgence of such a hope by that most venerable people; but in their fearless confession of the hope, and in the approximation of spirit between Christians and Hebrews, to entertain the same belief of the future glories of Israel, to offer up the same prayer, and look forward to the same consummation. To most former periods a development of religious feeling has been followed by a persecution of the ancient people of God; from the days of Constantine to Leo XII, the disciples of Christ have been stimulated to the oppression of the children of Israel; and Heaven alone can know what myriads of that suffering race fell beneath the piety of the Crusaders, as they marched to recover the sepulchre of their Saviour from the hands of the infidels. But a mighty change has come over the hearts of the Gentiles; they seek now the temporal and eternal peace of the Hebrew people; societies are established in England and Germany to diffuse among them the light of the gospel; and the increasing accessions to the parent institution in London attest the public estimation of its principles and services. * * * *

‘But a more important undertaking has already been begun by the zeal and piety of those who entertain an interest for the Jewish nation. They have designed the establishment of a church at Jerusalem, if possible on Mount Zion itself, where the
order of our service and the prayers of our liturgy shall daily be set before the faithful in the Hebrew language. A considerable sum has been collected for this purpose; the missionaries are already resident on the spot; and nothing is wanting but to complete the purchase of the ground on which to erect the sacred edifice. Mr. Nicolayson, having received ordination at the hands of the Bishop of London, has been appointed to the charge; and Mr. Pieritz, a Hebrew convert, is associated in the duty. The service meanwhile proceeds, though ‘the ark of God is under curtains;’ and a small but faithful congregation of proselytes hear daily the Evangelical verities of our church on the mount of the Holy City itself, in the language of the prophets, and in the spirit of the apostles. To anyone who reflects on this event it must appear one of the most striking that have occurred in modern days, perhaps in any days since the corruptions began in the church of Christ. It is well known that for centuries the Greek, the Romanist, the Armenian, and the Turk, have had their places of worship in the city of Jerusalem, and the latitudinarianism of Ibrahim Pasha had lately accorded that privilege to the Jews. The pure doctrines of the Reformation, as embodied and professed in the church of England, have alone been unrepresented amidst all these corruptions; and Christianity has been contemplated both by Mussulman and Jew as a system most hateful to the creed of each, a compound of mummary and image-worship.

‘It is surely of vital importance to the cause of our religion that we should exhibit it in its pure and apostolical form to the children of Israel. We have already mentioned that they are returning in crowds to their ancient land; we must provide for the converts an orthodox and spiritual service, and set before the rest, whether residents or pilgrims, a worship as enjoined by our Saviour himself, ‘a worship in spirit and in truth,’—its faith will then be spoken of through the whole world. A great benefit of this nature has resulted from the Hebrew services of the London Episcopal Chapel; it has not only afforded instruction and opportunity of worship to the converted Israelite, but has formed a point of attraction to foreign Jews on a visit to this country, and has been largely and eagerly commented on in many of the Hebrew journals published in Germany. In the purity of our worship they confess our freedom from idolatry; and in the sound of the language of Moses and the prophets, they forget that we are Gentiles. But if this be so in London, what will it be in the Holy City? They will hear the Psalms of David, in the very words that fell from his inspired lips, once more chanted on the holy hill of Zion; they will see the whole book of the law and the prophets laid before them, and hear it read at the morning and evening oblation; they will admire the church of England, with all its comprehensive fulness of doctrine, truth, and love, like a pious and humble daughter, doing final homage to that church first planted at Jerusalem, which is the mother of us all. Our soul-stirring and soul-satisfying liturgy—in Hebrew—its deep and tender devotion—the evangelical simplicity of its ritual—will form, in the mind of the Jew, an inviting contrast to the idolatry and superstition of the Latin and eastern churches; its enlarged charity will affect his heart, and its scriptural character demand his homage. It is surely a high privilege reserved to our church and nation to plant the true cross on the holy hill of Zion; to carry back the faith we thence received by the apostles; and uniting, as it were, the history, the labours, and the blood of the primitive and Protestant martyrs, ‘light such a candle in Jerusalem as by God’s blessing shall never be put out.’

‘But this privilege will not be unaccompanied by practical benefits to the character and position of our own establishment. Whatever promotes the study and
reverence of the Hebrew Scriptures promotes, in a similar degree, the honour and stability of the church of England. Her appointed orders, her liturgical services, her decent splendour, her national endowments, are ‘according to the pattern that God showed us in the Mount.’ The principle of an establishment then received the august sanction of the divine wisdom; and whether we look back to the earliest periods of the Jewish history, or forwards to the day of their future glory, as displayed in the concluding chapters of Ezekiel, we shall find that a national and established church is ever a main portion of the polity of the people of God. The arch-assailants of our Zion are well aware of this truth, and seek, therefore, to disparage the Old Testament by a contumely exclusively preferential of the New!—irreverently excluding from their ‘Christian’ catalogue the ‘Law, the Prophets, and the Psalms,’ they ascribe to the Gospels and Epistles alone the title of the Christian Scriptures! And they are wise in their generation,—perceiving, as they do, that the co-ordinate authority and mutual dependence of all parts of the written word would manifest that the Saviour of Mankind, no less in the temporal than in the spiritual necessities of his church, ‘came not destroy, but to fulfil.’

‘The growing interest manifested for those regions, the larger investment of British capital, and the confluence of British travellers and strangers from all parts of the world, have recently induced the Secretary of State for Foreign Affairs to station there a representative of our Sovereign, in the person of a vice-consul. This gentleman set sail for Alexandria at the end of last September—his residence will be fixed at Jerusalem, but his jurisdiction will extend to the whole country within the ancient limits of the Holy Land; he is thus accredited, as it were, to the former kingdom of David and the twelve tribes. The soil and climate of Palestine are singularly adapted to the growth of produce required for the exigencies of Great Britain; the finest cotton may be obtained in almost unlimited abundance; silk and madder are the staple of the country, and olive-oil is now, as it ever was, the very fatness of the land. Capital and skill are alone required: the presence of a British officer, and the increased security of property which his presence will confer, may invite them from these islands to the cultivation of Palestine; and the Jews, who will betake themselves to agriculture in no other land,* having found in the English Consul a mediator between their people and the Pasha, will probably return in greater numbers, and become once more the husbandmen of Judea and Galilee.

‘This appointment has been conceived and executed in the spirit of true wisdom. Though we cannot often commend the noble Lord’s official proceedings, we must not withhold our meed of gratitude for the act, nor of praise for the zeal with which he applied himself to great preliminary difficulties, and the ability with which he overcame them. It is truly a national service: at all times it would have been expedient, but now it is necessary. To pass over commercial advantages—which the country will best perceive in the experience of them—we may discern a manifest benefit to our political position. We have done a deed which the Jews will regard as an honour to their nation, and have thereby conciliated a body of well-wishers in every people under heaven. Throughout the East they nearly monopolize the concerns of traffic and finance, and maintain a secret but uninterrupted intercourse with their brethren in the West. Thousands visit Jerusalem in every year from all parts of the globe, and carry back to their respective bodies that intelligence which guides their conduct and influences their sympathies. So rapid and accurate is their mutual communication, that Frederick the Great confessed the earlier and superior intelligence obtained through the Jews of all affairs of moment. Napoleon knew well
the value of an Hebrew alliance, and endeavoured to reproduce in the capital of France the spectacle of the ancient Sanhedrim, which, basking in the sunshine of imperial favour, might give laws to the whole body of the Jews throughout the habitable world, and aid him, no doubt, in his audacious plans against Poland and the East. His scheme, it is true, proved abortive, for the mass of the Israelites were by no means inclined to merge their hopes in the destinies of the empire—exchange Zion for Montmartre, and Jerusalem for Paris. The few liberal unbelievers whom he attracted to his view ruined his projects with the people by their impious flattery, and averted the whole body of the nation by blending, on the 15th of August, the cipher of Napoleon and Josephine with the unutterable name of Jehovah, and elevating the imperial eagle above the representation of the ark of the covenant. A misconception, in fact, of the character of the people has vitiated all the attempts of various sovereigns to better their condition; they have sought to amalgamate them with the body of their subjects, not knowing or not regarding the temper of the Hebrews, and the plain language of Scripture, that ‘the people shall dwell alone, and shall not be reckoned among the nations.’

‘That which Napoleon designed in his violence and ambition, thinking ‘to destroy nations not a few,’ we may wisely and legitimately undertake for the maintenance of our empire. The affairs of the East are lowering on Great Britain, but it is singular and providential that we should at this moment have executed a measure which will almost assure us the co-operation of the eastern Jews, and kindle in our behalf the sympathies of nearly 2,000,000 in the heart of the Russian dominions. These hopes rest on no airy foundation; but, pleasing as they are, we cannot disguise our far greater satisfaction that, in the step just taken, in the appointment just made, England has attained the praise of being the first of the Gentile nations that has ceased to ‘to tread down Jerusalem!’ This is, indeed, no more than justice, since she was the first to set the evil and cruel example of banishing the whole people in a body from her inhospitable bosom. France next, and then Spain, aped our unchristian and foolish precedent. Spain may have exceeded us in barbarity; but we invented the oppression, and preceded her in the infliction of it.’

*Dr. Henderson says of the Polish Jews—‘Comparatively few of the Jews learn any trade, and most of those attempts which have been made to accustom them to agricultural habits have proved abortive. [Later political Zionists were anxious to persuade Jews to take up farming so as to cease to be, in their minds, “parasites”. They did not want foreign workers to live in Israel and, in their minds, pollute their gene pool and corrupt their culture. Jacob worked the field. Esau wielded the sword. Cain was a farmer who slew Abel. “Abel was a keeper of sheep.” (Genesis 4:2) The Talmud taught Jews that agricultural was the lowest form of work (Yebamoth 63a).—CJB] Some of those who are in circumstances of affluence possess houses and other immovable property; but the great mass of the people seem destined to sit loose from every local tie, and are waiting, with anxious expectation, for the arrival of the period when, in pursuance of the Divine promise, they shall be restored to what they still consider their own land. Their attachment indeed to Palestine is unconquerable.’—*Biblical Researches and Travels in Russia, 1826.*

The Zionists often attempted to draw the might of the British Empire into the Middle East, so that the British citizens could sacrifice their lives for the sake of
Israel, just as the French had done under Napoleon. The Zionists flattered and tempted the British, just as they had done to the French, with promises of Messiahdom, the Messianic Age, wealth and millions of Jewish allies against the Russians in the heart of the Russian Empire. Disraeli would later draw the British into the swamp of the Suez and Queen Victoria, the Queen of the House of David, became "Empress of India", in an effort to defend British interests from an imagined Russian and Turkish threat through the trade routes of the Middle East. While pretending to solve these "problems", the Jews created and agitated them. Zionists persuaded the British to die to take Palestine in order to curry favor with Russian Jews, and Zionists brought America into the war in exchange for the Balfour Declaration—to this day Americans are killing Moslems in pursuit of the Zionists’ perceived self-interests. As they had done to the British and French, Jews covertly and artificially create disasters for America, and then offer up greater destruction as a solution, a solution which benefits them and destroys all others.

In 1839, *The Quarterly Review* pitched Zionism to the British by appealing to their sympathies, and to their greed,

> “That which Napoleon designed in his violence and ambition, thinking ‘to destroy nations not a few,’ we may wisely and legitimately undertake for the maintenance of our Empire. The affairs of the East are lowering on Great Britain—but it is singular and providential that we should, at this moment, have executed a measure, which will almost assure us the co-operation of the Eastern Jews, and kindle, in our behalf, the sympathies of nearly two millions in the heart of the Russian dominions. [Footnote: ‘Look to their present state of suffering in Poland and Russia, where they are driven from place to place, and not permitted to live in the same street where the so-called Christians reside! It not unfrequently happens, that when one or more wealthy Jews have built commodious houses in any part of a town, not hitherto prohibited, this affords a reason for proscribing them; it is immediately enacted that no Jew must live in that part of the city, and they are forthwith driven from their houses, without any compensation for their loss being given them’ . . . . . . . ‘they are oppressed on every side, yet dare not complain; robbed and defrauded, yet obtain no redress’ . . . . . . ‘in the walk of social life, insult, and contempt, meet them at every turning.’—*Herschel’s Sketch*, p. 7.] These hopes rest on no airy foundation; but pleasing as they are, we cannot disguise our far greater satisfaction that, in the step just taken, in the appointment just made, England has attained the praise of being the first of the Gentile nations that has ceased ‘to tread down Jerusalem!’ This is, indeed, no more than justice, since she was the first to set the evil and cruel example of banishing the whole people in a body from her inhospitable bosom. France next, and then Spain, aped our unchristian and foolish precedent. Spain may have proceeded us in barbarity; but we invented the oppression, and preceded her in the infliction of it.”

The majority of Jews wanted nothing of the Protestant movement to banish them to the deserts of Palestine in the hopes that Jesus might return in the form of a Rothschild. *The London Times* published the following set of queries on 17 August
SYRIA.—RESTORATION OF THE JEWS.
(From a Correspondent.)

The proposition to plant the Jewish people in the land of their fathers, under the protection of the five Powers, is no longer a mere matter of speculation, but of serious political consideration. In a Ministerial paper of the 31st of July an article appears bearing all the characteristics of a feeler on this deeply interesting subject. However, it has been reserved for a noble lord opposed to Her Majesty’s Ministers to take up the subject in a practical and statesmanlike manner, and he is instituting inquiries, of which the following is a copy:—

QUERIES.

1. What are the feelings of the Jews you meet with respect to their return to the Holy Land?
2. Would the Jews of station and property be inclined to return to Palestine, carry with them their capital, and invest it in the cultivation of the land, if by the operation of law and justice life and property were rendered secure?
3. How soon would they be inclined and ready to go back?
4. Would they go back entirely at their own expense, requiring nothing further than the assurance of safety to person and estate?
5. Would they be content to live under the Government of the country as they should find it, their rights and privileges being secured to them under the protection of the European powers?

‘Let the answers you procure be as distinct and decided as possible: in respect as to the inquiries as to property, it will of course be sufficient that you should obtain fair proof of the fact from general report.’

The noble Lord who is instituting these inquiries has given deep attention to the matter, and is well known as the writer of an able article in the Quarterly on the subject, in December, 1838.

In connexion with this, a deeply interesting discovery has been made on the south-west shores of the Caspian, enclosed in a chain of mountains, of the remnant of the Ten Tribes, living in the exercise of their religious customs in a primitive manner, distinct from the customs of modern Judaism. The facts which distinguish them as the remnant of that branch of the Jewish family are striking and incontrovertible, and are about to be given to the world. An intrepid missionary, the Rev. Mr. Samuel, of Bombay, has made the discovery, and resided amongst this people several months, under permission from the Russian Government, who directed him to institute inquiry concerning them.”
9 THE PRIORITY MYTH

It is well known in the Physics community that Albert Einstein was a career plagiarist. Immediately after the Annalen der Physik published the Einsteins’ 1905 paper on the theory of relativity, which wanted for a single reference to the published work of the Einsteins’ predecessors, Walter Kaufmann dubbed the special theory of relativity the “Lorentz-Einstein” theory. Kaufmann was overly generous to Einstein at the expense of the Frenchman Henri Poincaré.

“The secret to creativity is knowing how to hide your sources.”—ALBERT EINSTEIN

“All this was maintained by Poincaré and others long before the time of Einstein, and one does injustice to truth in ascribing the discovery to him.”—CHARLES NORDMANN

9.1 Introduction

It is easily proven that Albert Einstein did not originate the special theory of relativity in its entirety, or even in its majority. The historic record is readily available. Ludwig Gustav Lange, Woldemar Voigt, Oliver Heaviside, Heinrich Rudolf Hertz, George Francis FitzGerald, Joseph Larmor, Hendrik Antoon Lorentz, Jules Henri Poincaré, Paul Drude, Paul Langevin, and many others, slowly developed the theory, step by step, and based it on thousands of years of recorded thought and research. Einstein may have made a few contributions to the theory, such as the relativistic equations for aberration and the Doppler-Fizeau Effect; though he also rendered an incorrect equation for the transverse mass of an electron, which, when corrected, becomes Lorentz’ equation.

Albert Einstein’s first work on the theory of relativity did not appear until 1905. There is substantial evidence that Albert Einstein did not write this 1905 paper on the “principle of relativity” alone. His wife, Mileva Einstein-Marity, may have been co-author, or the sole author, of the work.

9.2 Opinions of Einstein and “His” Work

If Albert Einstein did not originate the major concepts of the special theory of relativity, how could such a historically significant fact have escaped the attention of the world for nearly a century? The simple answer is that it did not.

Some called Einstein’s priority into question almost immediately. As early as the years 1905-1907, Max Planck, Walter Kaufmann, Paul Ehrenfest, Jakob Laub, Max von Laue, Hermann Minkowski, and Albert Einstein himself, referred to the Einsteins’ theory as being a mere interpretation and generalization of
Hendrik Antoon Lorentz’ principle of relativity, which interpretation and generalization was first accomplished by Henri Poincaré, and later became known as the “Special Theory of Relativity”.

In 1905, immediately after the appearance of the Einsteins’ first paper on the principle of relativity, which did not contain any references to previous works, Walter Kaufmann coined the term “Lorentz-Einstein” for the theory, in recognition of Lorentz’ priority,

“Finally, there is a recently published theory of electrodynamics by Mr. A. Einstein, which leads to consequences which are formally identical to those of Lorentz’ theory, and for which, therefore, the second equation applies, as well. [***] (Lorentz-Einstein) [***] The above results speak decidedly against the correctness of the Lorentzian, and, therefore, also the Einsteinian, fundamental assumption. If one considers this basic assumption as thereby disproved, then the attempt to base the whole of Physics including electrodynamics and optics on the principle of relative motion must be considered a failure.”

Kaufmann again used the phrase “Lorentz-Einstein” in 1906, and reiterated the formal identity of the two authors’ works,

“Einstein’s theory leads to the same formula as Lorentz’[.]”

“Die Einsteinsche Theorie führt zu derselben Formel wie die Lorentzsche[.]”

Max Planck stated in the early spring of 1906,

“The'principle of relativity’ recently introduced by H. A. Lorentz¹) and more generally worded by A. Einstein²)[.]”

“Das vor kurzem von H. A. Lorentz¹) und in noch allgemeinerer Fassung von A. Einstein²) eingeführte „Prinzip der Relativität“[.]”
In 1906, Planck referred to the theory of relativity as the Lorentz-Einstein theory and referenced Poincaré,

“I have only done the calculations for those two theories, which are the most developed at this point: Abraham’s [Footnote: M. Abraham, Ann. d. Phys. (4) 10, 105, 1903.], according to which the electron has the form of a rigid sphere, and Lorentz-Einstein’s [Footnote: H. A. Lorentz, Versl. Kon. Akad. v. Wet. Amsterdam 1904, S. 809. A. Einstein, Ann. d. Phys. (4) 17, 891, 1905. Also confer with H. Poincaré, C. R. 140, 1504, 1905.], according to which the ‘principle of relativity’ is rigorously valid. In order to be concise, I will dub the first theory ‘theory of the sphere’, and the second ‘theory of relativity’. [***] The Lorentz-Einstein theory is based upon the postulate that no absolute translation is provable.”

Relativistic theories were commonplace at the time. Friedrich Kottler wrote an article entitled “Gravitation and the Theory of Relativity” in 1903. Albert Einstein believed he had a right to plagiarize these ideas of Lorentz, and others, if he could put a new spin on them. He asserted this “privilege” in 1907, and note that in order for Einstein to assert that his viewpoint is “new” he must have known what the “old” viewpoint was,

“It appears to me that it is the nature of the business that what follows has already been partly solved by other authors. Despite that fact, since the issues of concern are here addressed from a new point of view, I believe I am entitled to leave out what would be for me a thoroughly pedantic survey of the literature, all the more so because it is hoped that these gaps will yet be filled by other authors, as has already happened with my first work on the principle of relativity through the kind efforts of Mr. Planck and Mr. Kaufmann.”

“Es scheint mir in der Natur der Sache zu liegen, daß das Nachfolgende zum Teil bereits von anderen Autoren klargestellt sein dürfte. Mit Rücksicht darauf jedoch, daß hier die betreffenden Fragen von einem neuen
Rather than claim independence from Lorentz’ work, in 1907, Einstein endorsed Kaufmann’s and Planck’s declarations that his work was merely an extension of Lorentz’ prior work. In 1907, Einstein wrote a review article on the principle of relativity for the *Jahrbuch der Radioaktivität und Elektronik*, and again declared that his work was an interpretation of Lorentz’ 1904 paper on electromagnetic phenomena in moving systems—though Einstein would later lie about this point.

In 1907, Einstein wrote to Johannes Stark, who edited the *Jahrbuch der Radioaktivität und Elektronik*, that the only work by Lorentz related to the special theory of relativity which he knew of was Lorentz’ 1904 paper (which contains the “Lorentz transformation”). This alone would indicate that when the Einsteins spoke of “Lorentzian electrodynamics” in their 1905 paper, they were speaking of Lorentz’ work of 1904—a position held by Prof. G. H. Keswani. However, Einstein’s statement is contradicted by a letter from Albert Einstein to Mileva Marić, written in 1901 in which Albert pledges to delve into the work of Lorentz.

Einstein stated on 19 December 1952,

“I learned of [the Michelson-Morley experiment] through H. A. Lorentz’ decisive investigation of the electrodynamics of moving bodies, with which I was acquainted before developing the special theory of relativity.”

However, Albert Einstein lied to R. S. Shankland on 4 February 1950 and stated,

“[I] had become aware of [the Michelson-Morley experiment] through the writings of H. A. Lorentz, but only after 1905 had it come to [my] attention.”

In Einstein’s famous lecture of 1922 in Kyoto, Japan, he recounts that he derived inspiration from “Michelson’s experiment”:

“While I was thinking of this problem in my student years, I came to know the strange result of Michelson’s experiment. Soon I came to the conclusion that our idea about the motion of the earth with respect to the ether is incorrect, if we admit Michelson’s null result as a fact. This was the first path which led me to the special theory of relativity.”

On 21 September 1909, Einstein stated the “principle of relativity” is the generalization of the empirical result of the Michelson experiment,
“Michelson’s experiment suggested the assumption that, relative to a coordinate system moving along with the earth, and, more generally, relative to any system in nonaccelerated motion, all phenomena proceed according to exactly identical laws. Henceforth, we will call this assumption in brief ‘the principle of relativity.’”

R. S. Shankland recorded a letter Einstein had sent him in 1952, in which Einstein stated,

“I learned of [the Michelson-Morley experiment] through H. A. Lorentz’ decisive investigation of the electrodynamics of moving bodies, with which I was acquainted before developing the special theory of relativity.”

Assuming Einstein did not intend to lie to Stark, one must further assume that when Einstein stated in the 1905 paper that,

“[T]he electrodynamic foundation of Lorentz’s theory of the electrodynamics of moving bodies is in agreement with the principle of relativity.”

Einstein must have been alluding to Lorentz’ 1904 paper, which paper he did not cite in 1905, but which paper he correctly found the most relevant of Lorentz’ writings at the time. Prof. G. H. Keswani has arrived at this same conclusion on other grounds. Keswani avers that the Einsteins’ 1905 paper’s assertion of conformity between the relativity principle and Lorentzian electrodynamics could only have referred to Lorentz’ paper of 1904, and that Lorentz’ earlier efforts were not in conformity with the principle of relativity, according to Keswani, and Max Born would seemingly have agreed,

“In the new theory of Lorentz the principle of relativity holds, in conformity with the results of experiment, for all electrodynamic events.”

Albert Einstein clearly lied when he told Carl Seelig,

“There is no doubt, that the special theory of relativity, if we regard its development in retrospect, was ripe for discovery in 1905. Lorentz had already observed that for the analysis of Maxwell’s equations the transformations which later were known by his name are essential, and Poincaré had even penetrated deeper into these connections. Concerning myself, I knew only Lorentz’ important work of 1895—‘La théorie électromagnétique de Maxwell’ [sic (1892)] and ‘Versuch einer Theorie der elektrischen und optischen Erscheinungen bewegten Körperm’—but not Lorentz’ later work, nor the consecutive investigations by Poincaré. In this sense my work of 1905 was independent.”

It is obvious that Einstein not only contradicted himself, but lied to both Johannes
Stark and Carl Seelig regarding Lorentz’ work. Einstein probably lied to Stark in 1907 in order emphasize the freshness of Lorentz’ 1904 work in 1905, thereby emphasizing the novelty of the work, and likely lied to Seelig many years later in order to emphasize the distinction of Lorentz’ earlier works from Lorentz’ 1904 paper, and hence the Einsteins’ 1905 paper, which contained the perfected form of the Lorentz Transformation the Einsteins had plagiarized from Lorentz and Poincaré. When Albert Einstein published the article Stark had requested in 1907 for the *Jahrbuch der Radioaktivität und Elektronik*, Einstein emphasized the fact that his work of 1905 was an extension of Lorentz’ 1904 paper, and that his 1907 article would heal any wounds which existed between Lorentz’ 1904 paper and the Einsteins’ 1905 paper. When the Einsteins’ 1905 paper was reproduced in the book *Das Relativitätsprinzip* in 1913 together with Lorentz’ prior work of 1895 and 1904, Arnold Sommerfeld annotated the Einsteins’ paper, which so obviously parroted Lorentz’ prior work, with the following footnote—which we know, based on the above facts, to be untrue,

> “Die im Vorhergehenden abgedruckte Arbeit von H. A. Lorentz war dem Verfasser noch nicht bekannt.”

We know from Maurice Solovine that Einstein had studiously read Poincaré’s books *Science and Hypothesis* of 1902 and *The Value of Science* of 1904, which reprinted Poincaré’s famous St. Louis lecture of 1904 and his 1898 work on relative simultaneity. We know from Einstein’s citations that he was familiar with Poincaré’s 1900 paper on the theory of Lorentz, which contained the clock synchronization procedure Einstein parroted, and which implicitly contained the formula $E = mc^2$, which Einstein also plagiarized from Poincaré. Therefore, Albert Einstein’s statement to Carl Seelig that in 1905 he was unfamiliar with Poincaré’s works, which followed from Lorentz’ work of 1892 and 1895, was a deliberate lie.

Einstein stated in a lecture in Kyoto, Japan, on 14 December 1922, that,

> “At that time I firmly believed that the electrodynamic equations of Maxwell and Lorentz were correct. Furthermore, the assumption that these equations should hold in the reference frame of the moving body leads to the concept of the invariance of the velocity of light, which, however, contradicts the addition rule of velocities used in mechanics. Why do these concepts contradict each other? I realized that this difficulty was really hard to resolve. I spent almost a year in vain trying to modify the idea of Lorentz in the hope of resolving this problem.”

Said “year in vain” was the year from Lorentz’ work of 1904 to the Einsteins’ 1905 paper, and the missing link required to “modify the idea of Lorentz” was supplied by Poincaré months before Mileva and Albert’s 1905 paper appeared in print. Poincaré corrected the defects in Lorentz’ theory, before the Einsteins, and thus rendered simultaneity fully relative from the additions of velocity perspective, perfecting the Lorentz group, and attaining full reciprocity for all inertial systems.
and the covariance of the laws of physics, without a preferred reference frame. Poincaré also went far beyond this, and asserted that gravity propagates at light speed, and introduced the four-dimensional interpretation of the Lorentz group, before Minkowski or Einstein.

This new spin on the principle of relativity for which Einstein claimed sole credit, had already been spun in the papers of Henri Poincaré, and Einstein failed to acknowledge this fact in his 1907 review article, which was the perfect opportunity for Einstein to have made amends for the sins of his wife’s and his 1905 paper, which lacked any references to, or even mention of, the work of Henri Poincaré. It appears that Einstein never gave Poincaré due credit for the extension of the principle of relativity to electrodynamics; or for the light postulate; or for the concept of; and the exposition on, relative simultaneity; or for the first covariant relativistic theory of gravity based on the presupposition that gravitational effects propagate at light speed; or for the introduction of four-dimensional space-time into the theory of relativity. Einstein was deeply indebted to Poincaré for these ideas, and failed to specifically credit him for them, though Einstein knew that they were Poincaré’s ideas, not his.

In 1908, Alfred Heinrich Bucherer published a paper titled, “The Experimental Verification of the Lorentz-Einstein Theory”. In 1909, Philipp Frank wrote of the “principle of relativity according to Lorentz” and “The Lorentzian theorem of relativity” and also employed the designation “Lorentz-Einstein”. Walther Ritz, who once coauthored a paper with Albert Einstein, spoke of the “Lorentz-Einstein Theory of Relativity”. Erich Hupka wrote of the “Lorentz-Einstein theory” and W. Heil wrote of the “Lorentz-Einstein relativity theory” in 1910. Max Born wrote in 1910 and 1911 of the “Lorentz-Einstein principle of relativity”. Richard Hiecke wrote of the “Lorentz-Einstein Theory of Relativity” in 1914. George Braxton Pegram spoke of the “Lorentz-Einstein relativity theory in 1917. The designation “Lorentz-Einstein” was quite common at least through the 1920’s, and was found in the writings of Emil Cohn, Ferdinand Lindemann, Arvid Reuterdahl, Erwin Freundlich and Hans Reichenbach, among many others. Hermann Weyl wrote of “Lorentz’s Theorem of Relativity” and of the “Lorentz-Einstein Theorem of Relativity”, in 1921.

While the theory was known most commonly as the “Lorentz-Einstein theory of relativity”, it was really Hermann Minkowski who gave the theory its sex appeal based on Poincaré’s innovations; and probably Minkowski, more than Larmor, Lorentz, Einstein and even Poincaré, created a stir for the special theory of relativity outside the small circle of theoretical physicists of the day—that is, before the media circus surrounding the eclipse observations of 1919 made Einstein internationally famous. Minkowski, in dramatic style, elevated the theory from an absurd proposition to an intriguing possibility in the eyes of many of his contemporary mathematicians, physicists and philosophers.

Minkowski acknowledged Woldemar Voigt’s priority for the “Lorentz Transformation”, the mathematical backbone of the special theory of relativity,

“In the interest of history, I want yet to add, that the transformations which
1832 The Manufacture and Sale of St. Einstein

play the main rôle in the principle of relativity were first mathematically formulated by Voigt, in the year 1887."

"Historisch will ich noch hinzufügen, daß die Transformationen, die bei dem Relativitätsprinzip die Hauptrolle spielen, zuerst mathematisch von Voigt im Jahre 1887 behandelt sind." 2083

Minkowski named Lorentz, Planck and Poincaré, together with Einstein, 2084 as the developers of the principle of relativity,

"H. A. Lorentz has found out the ‘Relativity theorem’ and has created the Relativity-postulate as a hypothesis that electrons and matter suffer contractions in consequence of their motion according to a certain law." 2085

and,

"The credit for the development of the general principle [of relativity] belongs to Einstein, Poincaré and Planck, upon whose works I shall presently expound."

"Verdienste um die Ausarbeitung des allgemeinen Prinzips haben Einstein, Poincaré und Planck, über deren Arbeiten ich alsbald Näheres sagen werde." 2086

Planck 2087 and Poincaré attributed the principle of relativity to H. A. Lorentz,

"Will not the principle of relativity, as conceived by Lorentz, impose upon us an entirely new conception of space and time and thus force us to abandon some conclusions which might have seemed established? [***] What, then, is the revolution which is due to the recent progress of physics? The principle of relativity, in its former aspect, has had to be abandoned; it is replaced by the principle of relativity according to Lorentz. It is the transformations of ‘the group of Lorentz’ which do not falsify the differential equations of dynamics. [***] No, it was the mechanics of Lorentz, the one dealing with the principle of relativity; the one which, hardly five years ago, seemed to be the height of boldness. [***] In all instances in which it differs from that of Newton, the mechanics of Lorentz endures. We continue to believe that no body in motion will ever be able to exceed the speed of light; that the mass of a body is not a constant, but depends on its speed and the angle formed by this speed with the force which acts upon the body; that no experiment will ever be able to determine whether a body is at rest or in absolute motion either in relation to absolute space or even in relation to the ether. [***] This is easy; we have only to apply Lorentz’ principle of relativity." 2088

In 1911, Max von Laue wrote of, “the principle of relativity of classical
mechanics,” and of, “the principle of relativity of the Lorentz Transformation.” Lorentz, himself, attributed the principle of relativity to Poincaré,

“For certain of the physical magnitudes which enter in the formulas I have not indicated the transformation which suits best. This has been done by Poincaré, and later by Einstein and Minkowski. [***] I have not established the principle of relativity as rigorously and universally true. Poincaré on the contrary, has obtained a perfect invariance of the electromagnetic equations, and he has formulated the ‘postulate of relativity,’ terms which he was the first to employ.”

Albert Einstein stated,

“The term relativity refers to time and space. [***] This led the Dutch professor, Lorentz, and myself to develop the special theory of relativity.”

Einstein, who knew that Lorentz had the power to end Einstein’s masquerade at any time, wrote to Lorentz,

“My feeling of intellectual inferiority with regard to you cannot spoil the great delight of [our] conversation, especially because the fatherly kindness you show to all people does not allow any feeling of despondency to arise.”

Einstein was grateful to Lorentz, for his theory and for his tact,

“Lorentz is a marvel of intelligence and exquisite tact. A living work of art! In my opinion he was the most intelligent of the theorists present”. “

At the 1953 centennial celebration of Lorentz’ birthday, Einstein stated,

“At the turn of the century, H. A. Lorentz was regarded by theoretical physicists of all nations as the leading spirit; and this with the fullest justification. No longer, however, do physicists of the younger generation fully realise, as a rule, the determinant part which H. A. Lorentz played in the formation of the basic principles of theoretical physics.”

Robert Shankland records that,

“[Einstein] repeatedly praised H. A. Lorentz and at our last meeting he told me: ‘People do not realize how great was the influence of Lorentz on the development of physics. We cannot imagine how it would have gone had not Lorentz made so many great contributions.”

Abraham Pais recounts that,
“As [Einstein] told me more than once, without Lorentz he would never have been able to make the discovery of special relativity.”

Adriaan D. Fokker wrote,

“This transposition received the name of the Lorentz transformation of co-ordinates and time. After Einstein the same theory came to be known as the theory of relativity. [***] The invariance of the laws of nature had already been postulated by [Lorentz] in 1892.**

Einstein stated in 1912,

“To fill this gap, I introduced the principle of the constancy of the velocity of light, which I borrowed from H. A. Lorentz’s theory of the stationary luminiferous ether, and which, like the principle of relativity, contains a physical assumption that seemed to be justified only by the relevant experiments (experiments by Fizeau, Rowland, etc.).**

Einstein professed in 1935, that it is the Lorentz Transformations which are fundamental in deducing the “two postulates” of special relativity, not the other way around, which means that the “postulates” are in fact corollaries, and that those who first induced the Lorentz transformation ought to be considered the founders of the special theory of relativity,

“The special theory of relativity grew out of Maxwell electromagnetic equations. So it came about that even in the derivation of the mechanical concepts and their relations the consideration of those of the electromagnetic field has played an essential role. The question as to the independence of those relations is a natural one because the Lorentz transformation, the real basis of the special relativity theory, in itself has nothing to do with the Maxwell theory”. 2099

Einstein also stated,

“This rigid four-dimensional space of the special theory of relativity is to some extent a four-dimensional analogue of H. A. Lorentz’s rigid three-dimensional æther.” 2100

and,

“I think, that the ether of the general theory of relativity is the outcome of the Lorentzian ether, through relativation.” 2101

and,
“The four men who laid the foundations of physics on which I have been able to construct my theory are Galileo, Newton, Maxwell, and Lorenz.”

Einstein’s sycophantic behavior towards Lorentz may well explain why Lorentz did not take a stronger stance against Einstein’s plagiarism. Another factor in Lorentz’ reluctance to discuss Einstein’s plagiarism may have been that Lorentz, together with Einstein, stood much to lose in a priorities dispute, and Lorentz owed much of his fame to Einstein’s promotion. Lorentz owed a great debt of acknowledgment (which he most often paid prior to Einstein’s sycophantic adoration) to Weber, Mossotti, Zöllner, Gerber, Mewes, Tisserand, Voigt, Heaviside, Hertz, FitzGerald, Poincaré and Larmor, among others—many others. That no articles from these men appeared in the 1913 book Das Relativitätsprinzip is a moral crime, one in which Hendrik Antoon Lorentz fully participated.

Lorentz, like Einstein, was a pacifist, even before World War I, and found an ally in Einstein against war and against Germany. In a letter to Einstein dated 28 October 1920, Max Born charged Lorentz with plagiarism, and with committing a gross injustice against Max Planck in order to curry favor with Lorentz’ “well-fed friends amongst the Allies”—this at a time when Germans were starving. Max Born called Lorentz dishonest and ignoble.

Beyond all of this, Lorentz shared another character flaw with Einstein—supreme arrogance. At a conference in California, Lorentz stated, near the end of his life,

“As to the second-order effect, the situation was much more difficult. The experimental results could be accounted for by transforming the co-ordinates in a certain manner from one system of co-ordinates to another. A transformation of the time was also necessary. So I introduced the conception of a local time which is different for different systems of reference which are in motion relative to each other. But I never thought that this had anything to do with the real time. This real time for me was still represented by the old classical notion of an absolute time, which is independent of any reference to special frames of co-ordinates. There existed for me only this one true time. I considered my time transformation only as a heuristic working hypothesis. So the theory of relativity is really solely Einstein’s work. And there can be no doubt that he would have conceived it even if the work of all his predecessors in the theory of this field had not been done at all. His work is in this respect independent of the previous theories.”

If he in fact uttered these words, Lorentz’ statement is not only supremely arrogant—he took it upon himself to deny the legacies of many scientists, philosophers and mathematicians (most notably Voigt who introduced “local time” before Lorentz and Lorentz knew it), knowing that his legacy was secure—Lorentz’ statement is also irrational. One usually gives the credit and honor of priority to she or he who originated the subject idea, and one does not give credit for the evolution of a theory to someone who later summarizes it.
Furthermore, Lorentz was under the gun when he made this statement, in that the special theory of relativity had been discredited by Miller, who also spoke at the gathering at which Lorentz made his statement. Lorentz was careful to distance himself from “Einstein’s theory”, while cautiously promoting himself, knowing he was widely considered the forefather of this theory, such that whether the special theory of relativity won or lost the day, Lorentz’ legacy would remain intact. It is shameful that Lorentz took credit for Voigt’s “Ortszeit” and gave Einstein credit for Poincaré’s renouncement of the concept of absolute time and the assertion of relative simultaneity, and gave Einstein undue credit for Michelson’s experimental results, if Lorentz in fact made the last of the above comments, which were published almost two years after the conference, and after Lorentz’ death. Perhaps Lorentz’ lecture notes have survived and will show that he did make the statements. Lorentz also must have known that Poincaré’s work was vastly superior to the Einsteins’.

Lorentz also had political interests in promoting Einstein. Both were pacifists and Lorentz was interested in the success of the eclipse expeditions in 1919 because he hoped it would promote the interests of rapprochement. Lorentz delighted in Einstein’s celebrity for many reasons. Lorentz wanted Einstein to come to Leyden, but Einstein knew that Lorentz would discover that Einstein had no talent. Lorentz must have known that Einstein was very well connected and had numerous important contacts in the press and in the publishing business.

Though the press claimed that Einstein was the greatest and most original thinker the world had ever seen. Einstein wrote to Lorentz on 19 January 1920,

> “Nevertheless, unlike you, nature has not bestowed me with the ability to deliver lectures and dispense original ideas virtually effortlessly as meets your refined and versatile mind. [...] This awareness of my limitations pervades me all the more keenly in recent times since I see that my faculties are being quite particularly overrated after a few consequences of the general theory stood the test.”

Paul Ehrenf Fest, who was close to Lorentz and Einstein, already knew this about Einstein and wrote to Einstein on 2 September 1919,

> “No one here expects any accomplishments, all simply want you nearby.”

In 1905 and 1906, Paul Ehrenfest considered Lorentz’ 1904 paper on special relativity and Poincaré’s Rendiconti paper on space-time as the most significant work (both historically and scientifically) on the subject of the principle of relativity. Paul Ehrenfest and his wife Tatiana attended David Hilbert’s 1905 Göttingen seminars on electron theory, which described Lorentz’ and Poincaré’s work on special relativity. They knew that Einstein did not create the theory of relativity. Paul Ehrenfest wrote to Albert Einstein on 9 December 1919,

> “I hear, for ex., that your accomplishments are being used to make propaganda, with the ‘Jewish Newton, who is simultaneously an ardent...”
Zionist’ (I personally haven’t read this yet, but only heard it mentioned). [***] But I cannot go along with the propagandistic fuss with its inevitable untruths, precisely because Judaism is at stake and because I feel myself so thoroughly a Jew.”

As for the alleged inevitability of Einstein’s hypothetical genesis of the theory of relativity sans all predecessors, Einstein wrote in late 1907,

“That the supposition made here, which we want to call the ‘principle of the constancy of the velocity of light’, is actually met in Nature, is by no means self-evident, nevertheless, it is—at least for a system of coordinates in a definite state of motion—rendered probable through its verification, which Lorentz’ theory based upon an absolutely resting æther has ascertained through experiment.”

“Daß die hier gemachte Annahme, welche wir „Prinzip von der Konstanz der Lichtgeschwindigkeit“ nennen wollen, in der Natur wirklich erfüllt sei, ist keineswegs selbstverständlich, doch wird dies — wenigstens für ein Koordinatensystem von bestimmtem Bewegungszustande — wahrscheinlich gemacht durch die Bestätigungen, welche die, auf die Voraussetzung eines absolut ruhenden Äthers gegründete Lorentzsche Theorie durch das Experiment erfahren hat.”

The “supposition” was, in Einstein’s eyes, not a self-evident truth, but an empirical observation—not a priori, but a posteriori. In fact, Einstein depended upon the Michelson-Morley result, which he later cited in this 1907 paper as compelling a change in Lorentz’ theory of 1895 and 1904, which change Einstein argues was the result of the merger of Lorentz’ theory with the principle of relativity, a merger made by Poincaré before the Einsteins. Einstein makes clear in this 1907 article that his 1905 work on the principle of relativity was an evolution of Lorentz’ 1904 paper, and Einstein told Shankland that he learned of Michelson’s experiments in Lorentz’ work, before 1905.

The so-called “Lorentz Transformation” which is contained in Lorentz’ 1904 paper, first appeared Joseph Larmor’s work before Lorentz adopted it. The theory of relativity was not a popular theory among scientists in the early part of the twentieth century, and Lorentz was likely glad to have Einstein on the team to help popularize the unpopular theory. Making much of Einstein’s plagiarism would have entailed the risk that Lorentz’ theoretical work would itself have been blackened by the scandal. Planck and Kaufmann forced Einstein to acknowledge Lorentz early on, and Lorentz’ legacy was thus secured.

Poincaré died in 1912. He is not known to have mentioned Einstein in the context of the theory of relativity in any positive sense. Of course, it would have been ludicrous for Poincaré to have referenced Einstein when describing his own work, which Einstein plagiarized. It is disappointing that Lorentz did not do more to restore Poincaré’s legacy, though he did credit Poincaré with perfecting his theory, before
Einstein and Minkowski.

While Einstein was demonstrably a sycophant, he had another side to his personality, as sycophants often do. Einstein would not hesitate to arrogantly express ruthless disdain for those who had nothing to offer him and those whom he wished to smear in order to avoid scandal and criticism. This is abundantly clear in Einstein’s letters and statements. Einstein’s smear tactics and his infamous cowardly avoidance of criticism, as well as his reticence in response to accusations of his plagiarism have already been addressed.

In 1912 Johannes Stark accused Einstein of plagiarism. Einstein did not deny the charge, but arrogantly held,

“J. Stark has written a comment on a recently published paper of mine for the purpose of defending his intellectual property. I will not go into the question of priority that he has raised, because this would hardly interest anyone, all the more so because the law of photochemical equivalence is a self-evident consequence of the quantum hypothesis.”

The “self-evident” ploy was one of Einstein and his coterie’s favorite tactics to manipulate credit for the ideas of others through fallacy of Petitio Principii. Knowing the published results others had derived, Einstein and his friends would assert the results, later, as “natural consequences” of “their” subsequent theory, which conclusions they had also irrationally presumed in their premises, as if this gave them priority for the thoughts others had published before them, because they would falsely claim that they had derived what others were forced to hypothesize. Einstein would turn the deductive synthetic scientific theories of his predecessors on their heads and argue the same theories inductively, as if that gave him the right to take credit for them. He would do this without making reference to the works of his predecessors and then would later lie and claim that he had had no knowledge of the prior works.

Einstein had a very different attitude when it came to his alleged priority. Contrary to the impression some would have us believe, that Einstein was oblivious to the issue of priority, Einstein had written to Stark on 17 February 1908,

“I find it somewhat strange that you do not recognize my priority regarding the connection between inertial mass and energy.”

Einstein and his followers often promoted the theory of relativity as if revolutionary, a supposedly unprecedented departure from all that came before it. The issue of priority was very important to Einstein and to his supporters. Had it not been, Einstein would have been more honest and forthcoming when he wrote his papers and when he described the history of the theory of relativity.

But others had not forgotten Poincaré. In 1912, shortly after Poincaré’s untimely death, Vito Volterra wrote in a tribute to Poincaré,

“But a celebrated experiment was performed by Michelson and Morley
which kept account of the terms depending on the square of the aberration, and even this experiment, as is well known, gave a negative result.

In a famous paper of 1904 Lorentz showed that this result could be explained by introducing the hypothesis that all bodies are subjected to a contraction in the direction of the motion of the earth.

This paper was the point of departure for the later investigations. The results of Poincaré, Einstein and Minkowski followed closely that of Lorentz. In 1905 Poincaré published a summary of his ideas in the ‘Comptes Rendus’ of the French Academy of Sciences. An extended memoir on the same subject appeared shortly afterwards in the ‘Rendiconti’ of Palermo.

The basic idea in this set of investigations is founded upon the principle that no experiment could show any absolute motion of the earth. That is what is called the *Postulate of Relativity*. Lorentz showed that certain transformations, called now by his name, do not change the equations that hold for an electromagnetic medium; two systems, one at rest, the other in motion, are thus the exact images each of the other, in such a way that we can give every system a motion of translation without affecting any of the apparent phenomena.

In 1913, Arthur Gordon Webster wrote in his memorial to Poincaré,

“The development of Maxwell’s electromagnetic theory that has taken place in the last twenty-five years has led to a theory that has attracted the greatest interest among mathematical physicists and has, in fact, become in certain parts of the world no less than a mania. I refer to the so-called principle of relativity, a name which was given to it first, if I am not mistaken, by Poincaré. This principle is no less than a fundamental relation between time and space, intended to explain the impossibility of determining experimentally whether a system, say the earth, is in motion or not. In an elaborate paper published in 1905 in the *Palermo Rendiconti* entitled, ‘Sur la dynamique de l’électron,’ he defines the principle of relativity by means of what he calls the Lorentz transformation. If the coordinates and the time receive the following linear transformation

\[ x' = k(x + s t), \quad t' = k(t + s x), \quad y' = ly, \]

\[ z' = lz, \quad k = \frac{1}{\sqrt{1 - s^2}} \]

the function \( x^2 + y^2 + z^2 - t^2 \) and the equations of electric propagation will remain invariant. From this follows the impossibility of determining absolute motion. Poincaré then submits the Lorentz transformation, which he shows belongs to a group, to an examination with regard to the principle of least action, which he shows holds for the principle of relativity. He further shows that by aid of certain hypotheses gravitation can be accounted for and shown
to be propagated with the velocity of light.”

In 1913, Ernst Gehrcke wrote,

“The theory of relativity is nothing but a completely novel interpretation of the theory of the electrodynamics and optics of bodies in motion, which Lorentz had already developed. The theory of relativity is *not* distinguished by the creation of substantially new equations, but by a substantially new *interpretation* of the known transformation equations of Lorentz. The arguments made against this *interpretation* condemn it, not the equations themselves, which, as was stated, are not Einstein’s, but rather Lorentz’ equations, and still stand intact today.”

“Die Relativitätstheorie ist nichts anderes, als eine völlig neuartige Interpretation einer schon von LORENTZ entwickelten Theorie der Elektrodynamik und Optik bewegter Körper. Das Charakteristikum der Relativitätstheorie besteht *nicht* in der Aufstellung wesentlich neuer Gleichungen, sondern in der Aufstellung einer wesentlich neuen *Interpretation* der bekannten Transformationsgleichungen von LORENTZ. Gegen diese *Interpretation* richten sich die gemachten Einwände, nicht gegen die Gleichungen selbst, die, wie gesagt, keine EINSTEINschen, sondern LORENTZsche Gleichungen sind und die bis heute unangegriffen dastehen.”

Alfred Arthur Robb spoke to the issue in 1914,

“Although generally associated with the names of Einstein and Minkowski, the really essential physical considerations underlying the theories are due to Larmor and Lorentz.”

Einstein had already conceded this fact in early 1911,

“In fact, there are no fundamental differences between Minkowski’s and Lorentz’s theory.”

Einstein saw the only difference between the two as being a “top down” versus “bottom up” approach to the *same* problem with the *same* results, as in inductive versus deductive reasoning of the same problem with the same solution.

Harry Bateman asserted his priority over Albert Einstein, in 1918,

“The appearance of Dr. Silberstein’s recent article on ‘General Relativity without the Equivalence Hypothesis’ encourages me to restate my own views on the subject. I am perhaps entitled to do this as my work on the subject of General Relativity was published before that of Einstein and Kottler, and appears to have been overlooked by recent writers.”
In 1920, Johannes Riem stated,

Wir kommen so zu einem nach Einsteins Meinung ganz allgemeinen Grundgesetz der Natur, dessen Aufstellung ihn nach der Behauptung der Tagespresse mit Newton auf eine Stufe stelle oder noch darüber. Dem gegenüber ist nicht scharf genug zu betonen, daß erstens sein Prinzip nicht von ihm aufgefunden ist, sondern nur erweitert, und daß ferner der Streit für und wider noch weit davon entfernt ist, ein Ende zu haben. See hat in den „Astronomischen Nachrichten“ soeben mehrere Aufsätze erscheinen lassen, die sich scharf gegen Einstein wenden, seine Leugnung des Äthers als unsinnig bezeichnen, dagegen betonen, wie die amerikanischen Physiker und Astronomen Einstein ablehnen, und Michelson selber sich dagegen verwahrt, seinen Versuch so zu deuten, wie es Einstein tut."^{2121}

Charles Nordmann averred, in 1921,

“The only time of which we have any idea apart from all objects is the
psychological time so luminously studied by M. Bergson: a time which has nothing except the name in common with the time of physicists, of science.

It is really to Henri Poincaré, the great Frenchman whose death has left a void that will never be filled, that we must accord the merit of having first proved, with the greatest lucidity and the most prudent audacity, that time and space, as we know them, can only be relative. A few quotations from his works will not be out of place. They will show that the credit for most of the things which are currently attributed to Einstein is, in reality, due to Poincaré. [***] I venture to sum up all this in a sentence which will at first sight seem a paradox: in the opinion of the Relativists it is the measuring rods which create space, the clocks which create time. All this was maintained by Poincaré and others long before the time of Einstein, and one does injustice to truth in ascribing the discovery to him.”

On 28 March 1921, The New York Times reported that Edmund Noble claimed to have anticipated the deductions Einstein made from the theory of relativity. Noble published a relativistic article in the journal The Monist in 1905, which set forth a research program for a unified field theory, a relational theory of a finite (of necessity) universe in which space and time exist only as the universe itself, etc. Though Noble does not note the fact, it is interesting that the article which follows his in The Monist was written by David Hilbert, from whom Einstein plagiarized the generally covariant field equations of gravitation of the general theory of relativity, and from whom Einstein plagiarized the unified field theory concept.

This volume of The Monist of 1905 also contains an English translation of Poincaré’s famous St. Louis lecture of 1904, which iterated so many of the essential elements of the special theory of relativity, before Einstein, and which lecture Einstein must have read when reading Poincaré’s book The Value of Science. Poincaré and Hilbert were frequent contributors to The Monist, an Open Court publication—a publishing house under the direction of Paul Carus, which helped bring Ernst Mach’s works to the English speaking audience. Monistic and Anti-Kantian philosophy defined the research program of the general theory of relativity in the Nineteenth Century. Einstein considered himself an “Anti-Kantian”, and certainly pursued the reasoning of Bolliger, who iterated “Mach’s principle” in terms of a Boscochichian dynamistic unified field theory.

On 3 April 1921, The New York Times quoted Chaim Weizmann,

“When [Einstein] was called ‘a poet in science’ the definition was a good one. He seems more an intuitive physicist, however. He is not an experimental physicist, and although he is able to detect fallacies in the conceptions of physical science, he must turn his general outlines of theory over to some one else to work out.”

Einstein told Leopold Infeld, “I am really more of a philosopher than a physicist.”

On 27 April 1921, Gertrude Besse King wrote in The Freeman of New York,
“ALADDIN EINSTEIN. The popular interest in America in Professor Einstein’s theories has astonished the professor. The public who does not know whether the theory of relativity has accounted for the alteration of mercury or of Mercury, waylays his steps, and delights, with the exception of a mere alderman or two, to do him honour. Gifted newspaper-reporters herald him as the originator of the theory of relativity, which, by the way he is not, and question him as to the ultimate nature of space, though only a mathematical physicist who is also a philosopher could understand the professor’s answers.

This general interest in an extremely difficult science is not quite what it seems. Probably Professor Einstein does not realize how sensational and cunningly he has been advertised. From the point of view of awakening popular curiosity, his press-notices could hardly have been improved. The newspapers first announced his discovery as revolutionizing science. This sounds well, but its meaning, after all, is rather vague. Then they printed a series of entertaining oddities, supposedly deducible from his hypothesis, although most of them could have been equally well deduced from the conclusions of Lorentz or Poincaré: for example, moving objects are shortened in the direction of their motion. This is a gay novelty until one learns the proportion of the reduction, which is calculated to divest the statement of interest to any but scientists. Further, our newspapers told us that if we were to travel from the earth with the speed of light, and could see the clock we left behind, it would always remain at the same moment, permanently pausing, unable to reach the next tick. But we should be unable to travel at the rate of light for a number of reasons, the most interesting and perhaps the most decisive being that such a speed would cause our mass to be infinite! Finally, our informants assert that no point in space, no moment of time can serve as a permanent base for measurement; we can measure only the relations of space, the relations of time, never absolute space or time; and even to measure space-relations, we have to take into account time! What a fascinating dervish-dance of what we used to regard as immutable fixities! Is it possible that these delicious contradictions are serious and accredited doctrines among those who know? Yet so they appear, for though Professor Einstein is always careful in stating that his hypothesis enjoys as yet only a tentative security, his methods are vouched for by the experts, his procedure is according to Hoyle, and the crowd is at liberty to gorge its appetite for marvels untroubled by the ogres of scientific orthodoxy.

Aside from the fact that Professor Einstein comes as a distinguished and somewhat mysterious foreigner to partake of our insatiable hospitality, his popular welcome is to be accounted for by the spell of wizardry that the press has cast upon his interpretations. For it is the necromancy of these strange theories, not their science, that catches the gaping crowd. Reporters are often good, practical psychologists. Instinctively they have divined the public eagerness for miracles, without grasping the factors that feed this taste. They know that most of us are essentially children still clamouring for fairy tales.
Man is congenitally restless with the prison-house of this too, too solid world. He is always looking for short-cuts to power. Since he can not find them to his mental satisfaction as once he could through the miracles and divine dispensations of the Church, or through the magic and occultism that were his legitimate resources in the Middle Ages, he now turns to the wonders of science and philosophy. Here, even in theories that he does not understand, he can find release for his cramped position, here he can taste the intoxicating freedom of a boundless universe, and renew his sense of personal potency. [. . .]

Arvid Reuterdaahl wrote in *The Bi-Monthly Journal of the College of St. Thomas*, Volume 9, Number 3, (July, 1921):

BY ARVID REUTERDAHL

HISTORICAL NOTE ON THE NEW SCIENCE.

A New Science has been born, a science in which metaphysics and philosophy find a prominent place. This statement conjures before your vision the internationally celebrated figure of Professor Dr. Albert Einstein, who was born in 1879 in the town of Ulm, Wurttemberg, Germany. Although Dr. Einstein, through his colossal and unprecedented advertising campaign, has done more than any other man to bring this New Science before the world, nevertheless, the year of birth of this new departure in scientific thought cannot be considered as coincident with the appearance, in 1905, of Dr. Einstein’s first contribution to the subject of Relativity.

On the contrary, we must look back to the year 1887 as the proper birth year of the New Science, which bids fair to inaugurate a new era in intellectual thought. In that year the famous Michelson-Morley experiment was performed at Cleveland, Ohio. At the time Dr. Albert A. Michelson was Professor of Physics at the Case School of Applied Science. Dr. Edward W. Morley was Professor of Chemistry at the same institution. The writer, because of the far reaching significance of this experiment, considers the year 1887 as marking the birth of the New Science.

THE PIONEERS OF THE NEW SCIENCE.

The New Science was, in part, foreshadowed by the work of Baron Karl von Reichenbach in the years 1844 and 1856. Reichenbach, in his various works, laid the foundation to the theory of radiation. He also held that physiological organisms exhibited characteristics of a decidedly electrical nature.

In the years 1870 and 1871, Aurel Anderssohn of Breslau, Germany, announced the theory that there is no force of attraction extant in the
universe. He maintained that gravitation, that is, universal attraction of material systems, is not due to a force but is a mutual effect produced by radiation from bodies.

Dr. Johannes Zacharias expanded the limited principle of Anderssohn into practically universal proportions. The results of the earliest work of Zacharias were presented in a lecture before the Physical Society of Breslau in the year 1882. In the hands of a capable and a prodigious worker as Zacharias the elementary suggestion of Anderssohn grew into The Mass-Pressure Theory of Electricity and Magnetism. The essential principle of this theory was publicly demonstrated in Berlin (November, 1908) by means of a colossal rotating electromagnet. The careful and exhaustive experimental work of Zacharias confirmed the vision of Anderssohn that the force of gravitation is merely fictitious.

‘Kinertia,’ during the period of time from 1877 to 1881, convinced himself that the so-called attractive force of gravitation was an illogical inference not warranted by facts. (For more complete details refer to the author’s article, ‘Kinertia Versus Einstein’ which appeared in The Dearborn Independent, April 30, 1921.) On the 27th day of June 1903, ‘Kinertia’ filed with the ‘Kgl. Preussische Akademie Der Wissenschaften’ a description of a mechanical device and an account of an experiment by which ‘gravity’ could be produced experimentally. (The writer is in possession of the original acknowledgment of the receipt of this deposition.) The ‘gravity machine’ of ‘Kinertia’, when water only is used, generates a spiral vortex in space similar to the vortex of a spiral nebulae. When lead balls are projected from the machine by means of either water or compressed air, then the balls describe elliptical orbits, like the planets, while advancing along the neutral axis of rotation. The resultant path, in the latter case, is therefore an elliptical spiral. Many years later (1911-1915 inclusive) Dr. Einstein presented this same theory to a then receptive scientific world with the result that he was subsequently proclaimed a ‘greater than Newton.’

‘Kinertia’ concludes that the effects formerly attributed to the action of a ‘force’ called gravitation are due to acceleration. He includes a dynamic principle in his concept.

It is an incontrovertible fact, therefore, that ‘Kinertia’ announced the now famous, ‘Principle Of Equivalence,’ many years before the alleged discoverer Einstein won the excessive plaudits of the over-enthusiastic scientific world. The work of ‘Kinertia,’ however, is free from the erroneous sophistical solipsism of Einstein.

Dr. J. Henry Ziegler, of Zurich, Switzerland, in the year 1902, laid the foundation of a cosmic theory in a lecture entitled, ‘Die Universelle Weltformel und ihre Bedeutung fur die wahre Erkenntnis aller Dinge.’ This theory is of basic and far reaching significance to the New Science. Ziegler’s cosmology is based upon the fundamental conception that the world is a unitary structure generated from the universal trinity of space, time and force. Ziegler does not commit the solipsistic error of Einstein by omitting the
inclusion of a genuine Absolute Principle in his system. Any cosmological theory which endeavors to construct the universe upon purely relative fundamentals leads to the ultimate verdict ‘ignorabimus’. Absolute truth becomes impossible and knowledge is merely a matter of individual opinion. Einstein’s system is of this latter type and the name ‘solipsism’ is therefore a proper and fitting designation for the Einsteinian Theory of Relativity. The significant and universal relationship of light to the physical and chemical manifestations of matter led Ziegler to regard light as an absolute essential in physical phenomena. In Ziegler’s theory we find, therefore, the root of the only absolute in Einstein’s entire system. The fact that Dr. Einstein lived in Bern, Switzerland, at the time when Ziegler’s theory of light was a topic of general discussion, leads one to justly question the extraordinary claims to originality of the founder of the Theory of Relativity.

In the same year (1902) that Dr. Ziegler first announced his theory to the world, the writer presented a brief outline of his Space-Time Potential and Theory of Interdependence. At the Inaugural Meeting of the American Electrochemical Society, held at Philadelphia, April 5, 1902, the writer presented his conclusions in a lecture entitled ‘The Atom of Electrochemistry.’

In this lecture the writer showed that the physical universe is ultimately reducible to centers of activity (action point-instants) which undergo compensating changes and displacements in conformity with the requirements of the whole cosmos regarded as a unitary, interacting, and interdependent system of multiplicity. This unitary multiplicity system is its own continuum. Action-at-a-distance between its ultimates is not only postulated as inevitably necessary between the primordial centers regarded as discrete (which is an incontrovertible fact of experience), but is also inherent in the fundamental concept of a unitary continuum whose principal constituents are space, time and interdependent interaction.

The writer, consequently, found it possible at that time (1902), to dispense with the old inconsistent ether hypothesis. Moreover, he took occasion, in this lecture, to protest against the attempts of the pangeometers to mathematically manufacture reality by conceptual extensions of actuality. The mythical edifice erected by Minkowski and Einstein, based upon the merely speculative mathematical contributions of the non-Euclideans, has not caused him to feel any necessity whatsoever to modify his views of 1902. This lecture has been fully developed in a work published by the Devin-Adair Company of New York City, bearing the title, ‘Scientific Theism Versus Materialism, The Space-Time Potential.’

The great contribution of Ziegler has afforded the writer profound pleasure. Ziegler, working independently in Switzerland, evolved the theory of the unitary triune, Space, Time, and Force. The present author developed his Space-Time Potential in the United States without being aware of the conclusions of Ziegler. The word ‘Potential’ was used merely to emphasize the fact that the Space-Time Chart is potentially receptive to the play of
energy or substance. Ziegler and the present writer are at one in their emphasis upon the dynamic element in the universe which has been so blatantly omitted in the system of Einstein.

It is with utmost pleasure that I here call particular attention to the fact that Ziegler was the first to advance a complete theory of light from the standpoint of the New Science. Einstein has nowhere in his works referred to the work of Ziegler, despite the fact that the much heralded Doctor, undoubtedly, owes a great debt to the illustrious Swiss savant.

Dr. H. Fricke completed his investigations concerning the nature of gravitation and space in the year 1914. The war delayed the publication of this work which finally appeared in 1919 under the title ‘Eine neue und einfache Deutung der Schwerkraft’. For Fricke the old ether disappears, but he replaces it with a field of force. The static or stationary ether of Lorentz gives way before the energetic and mobile medium of Fricke which, however, like space, with which it is identified, retains abiding properties. Gravitation (Schwerkraft) is regarded, in the theory of Fricke, as a continuous stream of energy which acts as a concurrent system in the equilibration of the excitant systems in the universe. Cosmic bodies exhibit outgoing radiational and ingoing gravitational fields of force and all fields of activity are, in their last analysis, moving fields of force. Dr. Einstein, who, it seems, is not in the habit of extending recognition to the deserving, has nevertheless, reluctantly admitted that this theory of Fricke is both highly significant and original. Fricke has announced a New Cosmic Law of far reaching consequences. This epoch-making law may be briefly stated as follows: In vacuous space, if we disregard all other disturbing influences, a definite temperature pertains to every gravitational field. It follows that the temperature of cosmic space does not correspond to the absolute zero, but it is proportional to the gravitational field present in each particular location. Fricke, moreover, concludes that the work done by gravitation is not only changed into heat, but, in part, appears as a directed motion of cosmic bodies.

The homogeneity of inertial resistance and gravitation is a basic principle with Fricke. In cases of inertia the medium of Fricke has a decelerating action toward ponderable masses in conformity with the same laws which govern the accelerative force in the case of gravitation. This conception plays an important role in the theory of Einstein which, however, lacks even the semblance of an explanation. The Pressure Theory of Fricke not only affords an explanation of this cosmic phenomenon but also obviates the difficulties, ably pointed out by Maxwell, in a mechanical theory of gravitation.

In the United States we find Dr. Robert T. Browne in the front rank of the new scientific movement. In his great work ‘The Mystery of Space’, Dr. Browne emphasizes the actuality of a genuine dynamic element in space. He fully appreciates the weakness and danger of the Relativistic position. For him the universe is inexplicable without an Absolute Principle.

Dr. Charles F. Brush, the world famous electrical engineer and scientist of Cleveland, Ohio; with a series of carefully conducted experiments has
challenged the investigation of the Hungarian Baron, Eötvös, performed with a torsion-balance in the year 1890. The issue involved in both investigations is the equivalence or non-equivalence of the inertial and the gravitational mass of a body. Eötvös concludes that the two are equivalent. The General Theory of Relativity of Einstein relies upon the correctness of the conclusions of Eötvös. (See, Relativity, by A. Einstein, pages 80 to 83 inclusive.)

The conclusions of Eötvös may be stated in another manner: The magnitude of the effect of gravitation does not depend upon the kind of the material. According to Eötvös, one unit of mass of bismuth should be affected in precisely the same manner as one mass unit of zinc by the gravitational influence. Dr. Brush, on the contrary, asserts that his experiments indicate that the gravitational field exerts a greater influence upon the same mass of bismuth than it does upon precisely the same mass of zinc. The inference from Dr. Brush’s experiments is that gravitation takes cognizance, as it were of those subtle differences in matter which we ordinarily group under the term ‘qualities’.

The significance of the issue here involved is almost staggering when one reflects upon its far reaching import to the New Science. The old school of science built its stupendous edifice upon the assumption of ‘sameness’ in its ultimates. Diversity is the result of differences in the number of identical ultimates. For many years the writer has been of the opinion that the physical universe cannot be constructed from mere number. On the contrary, it is my firm conviction, grounded in reason and experience, that observable diversity owes its being to genuine and individually different characteristics in the ultimate particles out of which material aggregates are formed (See author’s ‘Scientific Theism Versus Materialism, The Space-Time Potential,’ paragraph 82, page 44).

Einstein’s elaborate speculative edifice falls to the ground, if the momentous experimental results of Dr. Brush are completely substantiated. Practically all the foundation stones of Einstein’s structure are composed of unproven, volatile material.

J. G. A. Goedhart, Officer of the Royal Netherlands Navy, Retired, in his work ‘L’Orbite En Spirale Dans La Mecanique Celeste’ (The Spiral Orbit In Celestial Mechanics, Amsterdam, Netherlands, 1921) presents Six Principal Laws pertaining to the movements of celestial bodies. At this time Goedhart’s Second Law is of particular interest because of its relation to the work of ‘Kineritia’ and the alleged originality of Einstein’s conclusions. Goedhart’s Second Law is: ‘Secondary celestial bodies revolve around the centers of gravitation of planetary systems in eccentric logarithmic spiral orbits, the asymptotes of which are ellipses’.

The work of Goedhart is of unique significance to the scientific world at the present time because it proves conclusively that the spiral orbit, in the case of a planet, can be derived without recourse to the Minkowski-Einstein, four-dimensional, Space-Time speculative product.

Dr. Sten Lothigius of Stockholm, Sweden, in a brochure entitled
‘Esquisse D’Une Theorie Nouvelle De La Lumiere’ (Sketch Of a New Theory Of Light; Stockholm, 1920) presents a ‘Thread-Theory’ of light. In his theory of light Lothigius gives a more tangible significance to the usual term ‘ray of light’. For him a light-ray is a continuous and coherent structure. Along the axis of transmission undulatory crests may therefore appear without the auxiliary assistance of an ether. Referring to the hypothetical ether, Lothigius states: ‘Here lies someone who lived long although he never existed’. It would be difficult to condense a criticism of so vast a subject into fewer words.

Professor P. Lenard, the illustrious physicist, whose brilliant investigations concerning the behavior and properties of certain types of radiations or rays, formed, in part, the basis of the award of a Nobel Prize, has rendered the New Science a service of immeasurable value in stabilizing its formative tendencies during the disruptive attack of Einsteinism.

Lenard’s fearless attack on the theory of the ‘Zauberkünstler’ (Z. K.) (Einstein) has had an exceptionally wholesome influence in preserving the dignity and sanity of the scientific world.

In this connection the forceful exposures of ‘Z. K.’ by Paul Weyland, E. Gehrcke, H. Fricke, E. Guillaume, and A. Patscke, deserve particular mention.

Dr. Lenard’s work, ‘Uber Relativitätsprinzip, Äther, Gravitation,’ is of such profound import that it cannot be lightly set aside by the mere flippant gesture of Einstein.

Professor Lenard is now preparing a work, exposing the errors of Einsteinism.

Dr. Rudolf Mewes, the distinguished physicist and engineer, with his contribution, ‘Raumzeitlehre oder Relativitätstheorie in Geistes—und Naturwissenschaft und Werkkunst’, has rendered a lasting service to the New Science. His first work on Space, Time, and Relativity appeared in 1884, thus antedating Einstein by twenty one years.

Camille Flammarion, the eminent French astronomer, writing in the ‘Revue Mondiale’, calls attention to the fact that Denis Diderot was undoubtedly the first to present an outline of a theory of relativity. Flammarion repudiates the Space-Time Combination of Minkowski and Einstein.

Professor Henri Poincaré, the famous French physicist and mathematician, advisedly ignores the name of Einstein in his lectures on ‘Relativity’.

In this short resume it has been impossible to do justice to the momentous issues brought before the intellectual world by the Pioneers of the New Science. Many names have, undoubtedly, been omitted, not intentionally, however, but because of lack of first hand information.

CONTRIBUTORS TO THE THEORY OF RELATIVITY

(In Einstein’s works passing references are found to the influential contributions of Cristoffel, Riemann, Ricci, Levi-Civita, Gauss, and
Hamilton in mathematics; and to Galilei, Newton, Minkowski, and Lorentz in physics.)

In the year 1869, E. B. Christoffel laid the basis for a new type of calculus which was later used by Einstein in his speculative development of the Theory of Relativity. (See Crelle’s Journal fur die Math., Vol. LXX, 1869). Riemann developed the work of Christoffel. In the hands of Ricci and Levi-Civita these contributions took the form of the Absolute Differential Calculus, used by Einstein in his mathematical treatment of Relativity.

Certain functions developed by Sir William R. Hamilton, and known as the Hamiltonian Functions, were also used by Einstein. It would, indeed, have been difficult for Einstein to avoid the references to these men which are found in ‘Die Grundlage der allgemeinen Relativitätstheorie’, Annalen der Physik, Band 49, No. 7, 1916, (see pages 782, 799, and 804) It so happens that their names have been permanently associated with particular mathematical devices.

Professor Einstein mentions the work of Newton and Galilei, merely in passing, and by way of contrast with his own system which, by means of this delicate stratagem, is thereby made to assume far greater significance than the work of Galilei and Newton, because of its alleged inclusive universality. Einstein seems to be reasonably certain that no serious competition can arise from the graves of the great.

The great German mathematician Karl Friedrich Gauss, receives post-mortem glorification by having his name associated with the four-dimensional system of coordinates which has proved a useful instrument for Einstein.

Without the ‘Space Time’ contribution of Hermann Minkowski, the electrodynamics of Maxwell-Lorentz, and the H. A. Lorentz Transformation, the Einsteinian tower would reduce to a mere excavation. Consequently, conservative references are made, always in passing, however, to the work of these men.

ADDITIONAL BASIC CONTRIBUTIONS TO THE THEORY OF RELATIVITY.

(Einstein either advisedly ignores or is unaware of the contributions of Anderssohn, Zacharias, ‘Kinertia’, Larmor, Gerber, Palagyi, Ziegler, Reuterdahl, Mewes, Fricke, and Varicak).

Anderssohn paved the way to a new conception of gravitation (1870-1871).

Zacharias extended the principle of Anderssohn to include electrical and magnetic phenomena (1882).

‘Kinertia’ developed the Principle Of Equivalence (1877-1881) many years before its announcement by Einstein (1911-1915).

Larmor’s work, ‘Aether And Matter’, was published in the year 1900. Einstein’s dissociation of the name of Larmor from Lorentz is incomprehensible.

Paul Gerber, in the year 1898, developed a formula descriptive of the
perturbed motion of the Planet Mercury. (See, Zeitschrift fur Mathematik und Physik, 1898). Professor Dr. E. Gehrcke fully realizing the great importance of this work of Gerber, arranged for its reprinting in Annalen der Physik (1917, Vol. 52, page 415). Einstein made his calculations for the motion of the perihelion of Mercury in the year 1915.

Melchior Palagyi published, in the year 1901, a contribution entitled ‘Neue Theorie des Raumes und der Zeit’ (Engelmanns Verlag in Leipzig) which contained the essentials of the Minkowski-Einstein Space-Time conception. Minkowski’s first paper appeared in ‘Der Göttinger Mathematischen Gesellschaft,’ Nov. 5, 1907. In the following year his Cölner lecture, entitled ‘Raum und Zeit’, was delivered. This was reprinted in Annalen Der Physik, Vol. 47, No. 15, page 927; June 15, 1915.

Zeigler, in the year 1902 announced his new cosmic theory involving the unitary triune, Space, Time, and Force, together with Light as the universal, physical absolute.

Einstein’s first paper bears the date September 1905. It was written in Bern, Switzerland where Ziegler’s theory was much discussed.

The present writer’s first paper was published in the year 1902. This paper briefly outlined the basic elements of his complete work ‘Scientific Theism Versus Materialism, The Space-Time Potential’, which appeared in 1920.

The present author’s direct and simple method of calculating the deflection of light, due to the Sun, is a closer approximation to the observed ‘bending’ than the result obtained by the more indirect and involved method of Einstein. (See work cited, pages 271 and 272).

Rudolf Mewes’ contributions, when they appear in a collected form, will exert exceptional influence upon the position of Lorentz. In fact, the older works of both Mewes and Gerber will then attain unique significance.

H. Fricke, in his work (1914-1919), presented a physical basis for the Principle Of Equivalence which was arbitrarily announced by Einstein from purely speculative reasons. Fricke’s researches on the relation of heat to gravitation are certain to open fruitful fields of investigation for the New Science.

Varicak, the mathematician, was the first (1915) to point out that the Principle of Relativity leads directly to the formulae of non-Euclidean geometry. (See, Sitzungsberichte der Berliner Akademie 1915, page 847). Einstein’s fabric is woven from the fibers supplied by the metageometers.

A retrospective view of the above facts can result in but one question: What original contribution has Einstein made which warrants the, now common, verdict that he is ‘a greater than Newton’?

The Scientific American (May 14, 1921), in an unwarranted, sarcastic editorial attack on the present writer, answers this question as follows: ‘He (Einstein) has formulated mathematically and as a concrete whole ideas which have had a rather nebulous existence before him, cementing the structure with ideas to which he has himself given birth. His crowning
achievement is the precise mathematical formulation; this has never been approached or approximated in any way.’ This is surely an extraordinary claim, especially in view of the fact, that the editorial itself was called forth because the writer demanded, in the name of justice, that credit be given to the originators of those ‘nebulous’ ideas, without which the Theory of Relativity would have been an impossibility.

The case is analogous to that of the builder who appropriated sufficient bricks to build a house, and when payment was demanded, replied: ‘I have furnished the cement, which binds the bricks into a structure, therefore I owe you nothing for the bricks.’

THE ‘MAIN MEMBERS’ OF EINSTEIN’S STRUCTURE.

The relations of the ‘main members’ in Einstein’s structure may, most readily, be illustrated by a reinforced concrete arch bridge composed of two ribs or segments, hinged at the crown (center of span) and at the abutments. A reinforced concrete floor, laid in the bed of the stream, connects the two thrust-resisting abutments. The left abutment in Einstein’s arch is the Lorentz Transformation. Non-Euclidean Space-Time (Minkowski) constitutes the right abutment, and the Michelson-Morley Experiment is the connecting floor between the abutments.

The left arch rib is The Absolute Velocity of Light, while the Principle Of Equivalence constitutes the right arch rib. The three alleged experimental verifications of Einstein’s theory form the three hinges. From left to right we may think of these hinges as being, 1st, The Perturbations of the Planet Mercury; 2nd, Displacement of the Spectral Lines towards the Red; and 3rd, The Deflection of Light in a Gravitational Field.

TESTS OF THE MEMBERS.

The limited scope of this article prevents a full discussion of the structural value of the members. ‘The Fallacies Of Einstein,’ now in preparation by the writer, will consider these and other matters in detail.

RIGHT ABUTMENT.-NON-EUCLIDEAN SPACE-TIME.

It can be shown that the Minkowski-Einstein Space-Time is a mathematically camouflaged type of four-dimensional space. In the invariant form of the General Quadratic Differential, which is basic to Relativity, the last term is formed by multiplying the velocity of light by time. Velocity is reducible to length divided by time. Therefore time is eliminated from this term, leaving it as a pure spatial expression. Consequently we have here
nothing but a new version of four-dimensional space which is not a physical reality. The writer challenges the relativists and the metageometers to construct a model of the four co-ordinate axes required by this conceptual space. This demand can be satisfied in the case of three dimensional space, which is our only real space.

Conclusion.

The right abutment of Einstein’s arch bridge is merely mythical and not a physical reality. From the standpoint of engineering this verdict is sufficient to condemn the entire structure. Certainly pure science ought not to be less exacting in its demands than the applied science of engineering.

THE FLOOR - MICHELSON - MORLEY - MILLER EXPERIMENT.

This experiment involves the ether, and the possibility of relative motion between the earth and the ether. The constancy of the velocity of light was assumed in the experiment.

Known Facts.
- The motion and velocity of the earth.
- The constant velocity of light.

Unknown Facts.
- (The experiment assumed the existence of the ether. This assumption takes too much for granted.)
- Does the medium called ‘The Ether’ exist?
- Assuming the existence of the ether, then in regard to its possible motion, only two assumptions can be made: viz.,
  1st. The ether is stationary,
  2nd. The ether is in motion.

Michelson and Morley, using an interferometer, failed to detect any relative motion between the earth and the ether. Miller and Morley, with a much larger interferometer, were unable to detect any relative motion.

Sir Oliver Lodge, assuming that the ether was carried along with moving bodies, experimented with rapidly rotating discs only to obtain negative results. Both of the above possibilities proved futile in the attempt to determine the earth’s motion in respect to the ether.

At the time when these experiments were performed science was not prepared to abandon the ether because of its conceptual usefulness in explaining the phenomena of light and electro-magnetics.

In the New Science the old inconsistent ether is being replaced by interactional vehicles and interdependent activities.

Classical mechanics and the theory of relativity as held by Newton took cognizance of relative velocities computed by reference to arbitrary systems of co-ordinates. If the Michelson-Morley experiment had yielded a positive result, indicating that the earth’s velocity could be calculated in reference to a stationary ether, then the measurement of so-called ‘absolute motion’ would have been possible. The ether would then have constituted a universal and fixed reference system.

Because of the negative results of these experiments, Einstein expanded
the older notions of relativity to include these later results. He concludes therefore, that an absolute determination of uniform motion is impossible, and he holds that the ether cannot be used as a reference system by which relative uniform motion may be detected.

It should be recalled that Archimedes failed to find a fixed point in the universe. Michelson, Morley, Miller, and Lodge also failed in the more modern case of the ether. Then the voice of the Prophet of Relativity was heard crying from the house-tops, ‘There is no Absolute! Everything is conditioned and relative! Truth itself is variable!’ We listen but we are not convinced. We conclude that the relativists have sought the philosopher’s stone in vain, for they have searched for a static point in the dynamic world. They have tried to achieve the impossible. We become content then and decide to continue making observational references from ‘fixed’ points that move.

The negative result of the Michelson-Morley experiment may, with confidence, be regarded as a conclusive proof that there is no ether. If this position is entertained, then interactional vehicles, acting in conjunction with Space-Time (properly interpreted), must be introduced in order to function in the cases of light and electro-magnetic phenomena. Einstein, however, has not allowed this phase of the problem to disturb his equanimity. On the contrary, he has seized upon the Larmor-Lorentz Transformation as the only way out of the difficulty.

Conclusion.

At the present time the results of the Michelson-Morley-Miller experiments must be accepted as experimental facts. The abuse of these results by Larmor, Lorentz, and Einstein, in no way influences the previous statement. Notwithstanding its Einsteinian misapplication and abuse, the floor must certainly be pronounced as structurally safe.

The experiment actually proves that the time required for light to travel from an initial to a final observation point, in a closed vectorial configuration is independent of the path.

The result of the Michelson-Morley trial, therefore, substantiates the writer’s theory of light. (See discussion in this article under caption, ‘A New Theory Of Light.’)

LEFT ABUTMENT. THE FITZGERALD-LARMOR-LORENTZ TRANSFORMATION.

Assuming that the ether exists, Fitzgerald conceived the idea that if the material composing a body contracted along lines and planes parallel to the direction of motion through the ether, then the negative results of the Michelson-Miller experiment could be explained. According to the modern view matter is composed of electrons which are identical in size and deterministic characteristics. This is merely an arbitrary assumption which is not warranted by the great diversity manifest in the physical universe. However, the assumption, it appeared, would obviate such difficulties as would arise from the differences in the structural material of the
interferometer. Moreover, it would serve to generalize this entire class of phenomena—a generalization purchased with a sacrifice of truth.

Larmor and Lorentz, adopting the suggestion of Fitzgerald, conceived its mathematical form. The amount of the contraction in the direction of motion must be something definite. Moreover, it must agree with that space and time coefficient for moving bodies which now constitutes an important element in the left and right abutments of Einstein’s structure. The ‘plot’ was a master stroke of ingenious imagination. Since we have bound ourselves to refrain from mathematical developments in this article we are forced merely to label this Space-Time Motion expression for purposes of discussion. We shall designate it as the ‘Space-Time Coefficient.’ The writer, in his work, has referred to this expression as the Fundamental Scalar of Einstein’s Relativity. It is used in both Scalar and Vector Analysis.

With this expression known, (derived by Euclidean geometry from Space and Time considerations and not from experimental evidence) Larmor and Lorentz could readily speculatively determine the amount of the contraction in the direction of motion. If then the diameter of an electron at ‘rest’ is known, its contracted diameter could be calculated by multiplying the ‘rest-diameter’ by the Space-Time Coefficient. This is a pathetic illustration of the fact that the Relativists, whilst disclaiming any knowledge of ‘fixed’ points, persistently employ moving points (electron in this case) as ‘fixed’. They are continually cutting the eternally moving infinite chain of relativities in order to ‘fix’ a point. As a speculation their theory is interesting. Practically it cannot be consistently applied.

Knowing the mass of the electron at ‘rest’ its so-called ‘transverse mass can be speculatively determined by introducing this known mass into the Space-Time Coefficient. The ‘transverse mass’ is therefore based upon that diameter of the electron which is parallel or coincident with its direction of motion.

If we align one arm of the Michelson interferometer in the direction of the earth’s motion, then the time required by light (according to Lorentz, a type of motion in the stationary ether) to travel from a point to a mirror and back again ought to be greater than if light travels an equivalent distance (twice the sum of the distance from the point to the mirror) in a continuous and unreversed path. This statement assumes the constancy of the velocity of light. The Michelson-Morley-Miller experiment showed no difference in time. In fact the other arm of the interferometer, constructed at right angles to the first, gave the same time interval. The two arms were identical in all essential details. Moreover, no difference in the time period could be detected by swinging the interferometer on its axis into any position whatsoever.

If that interferometer arm which was parallel to the direction of the earth’s motion would only be sufficiently accommodating to always contract in length that precise amount which would compensate the theoretical excess in the time period, then all would be well, because light would then travel over a shorter path and the time-excess would disappear. The science of
mathematics is a boon to the modern school of scientific speculators. By its manipulations we can produce the most gratifying compensations and accommodations. It does not seem to be particularly important if the alleged compensations are actual physical facts. The principal issue is, the derivation of a satisfactory mathematical result.

In any event, if physical experiment should fail to cope with the situation, it must be determined mathematically and then imposed upon our long-suffering physical universe. Fortunately for Relativity, Larmor and Lorentz, in their Space-Time Coefficient, had the mathematically, built-to-order, instrument of precision which unerringly could speculatively annihilate the alleged difficulty.

Hence, if the length of that arm of the interferometer which moved in the earth’s direction of motion, was multiplied by the Space-Time Coefficient (a reduction expression) then this length would be sufficiently decreased to compensate for the supposed time-excess. This contraction theory of Larmor and Lorentz, in the hands of Einstein, became a means of producing a confusing pyrotechnic display designed to intellectually impress the masses. Serious calculations were made concerning the diminution of a human being due to motion. The poor victim, we are told, is totally unaware of the change in his dimensions because his associates are all suffering diminution in the same relative proportion. Everything in motion contracts in the same relative ratio. One cannot even physically determine the actual amount of the alleged contraction. It always eludes you. This fact is an extraordinarily ingenious protective element inserted, inadvertently perhaps, into the Theory of Relativity. Nothing can be verified experimentally. Reality has been dethroned and mathematics has become the final creator, director, judge, jury, and arbiter of the type and destiny of a physical universe which, no longer, is permitted a voice in these matters.

By way of summarizing the results of this discussion of the contraction theory, the writer desires merely to restate that which is now self-evident. The Larmor-Lorentz contraction theory is purely a mathematical device designed to meet an emergency. It has not been shown by physical experiment that an electron contracts in the manner claimed by the theory. The relativists themselves take great delight, it seems, in pointing out that, from the standpoint of their own theory the affair is beyond proof or disproof. One must conform, without murmur, to the precepts laid down in the Relativistic Koran. If this work, however, is regarded as the product of a fallible mind, then we may venture into that real world which lies beyond the confines of Relativity and there discover facts which serve, like dynamite, to cause the collapse of this speculative structure.

The experiments of Kaufmann and others have shown that the mass of an electron increases as its velocity increases. (Below a certain limiting velocity the mass remains practically constant.) As this velocity approaches the velocity of light, the mass increases towards an infinite amount. Lorentz and Einstein employed the same expression to mathematically describe this
experimentally observed increase that was used in the calculation of the contraction of the electronic diameter in the direction of its motion. The writer desires to call particular attention to the dangerous dilemma which arises from this maneuver.

*Left Horn.*

If the mass of the electron at rest is divided by the Space-Time Coefficient, in which the velocity of the electron equals that of light, then the expression indicates a resulting infinite mass for the moving electron.

It should be noted that the Kaufmann Effect is an observed fact and that the mathematical expression is merely an attempt to describe an actuality. Therefore, a true scientist, in contradistinction to a mathematical speculator, will abide by the result of an experiment whenever mathematical speculation and actual observation disagree.

*Right Horn.*

If the diameter of the electron at rest is multiplied by the Space-Time Coefficient, in which the velocity of the electron equals that of light, the expression indicates a zero value for the diameter. In other words, the electron will have no diameter at all. In the absence of any statement to the contrary on the part of the Relativists we are at liberty to assume that a similar fate befalls all lines of the electron which are parallel to the direction of motion. It follows that, if the Larmor-Lorentz contraction hypothesis is true, the mass of the electron reduces, in this case, to zero.

The two horns of this dilemma have been presented with complete recognition of a somewhat similar expression for the so-called ‘longitudinal mass.’

Between these two horns, the proper choice is apparent at once, if facts and not speculation shall be our guide. Therefore, we discard the right horn as untenable because it is incompatible with the left horn which is based upon facts. Moreover, we demand that the advocates of the contraction theory, if they desire serious consideration for their claims, prove their contentions by an experiment. We cannot accept the subterfuge that this is not possible. Whatever we accept as truthfully descriptive of the physical world must be verifiable by experimental observation. Any theory which cannot meet this requirement is not worthy of serious consideration.

The Space-Time Coefficient owes its origin in Relativity to mathematical speculations concerning Space, Time, and Motion, depicted in the terms of Euclidean geometry. Nowhere do we find even a trace, in Relativity, of its source in an actual dynamic world. It is not surprising that it is continually misapplied by the Relativists. If the Relativists had first probed for its supporting source in the physical universe, then this very origin would have served as an unerring guide in its future application. In his investigations concerning Interdependent and Independent Motion the writer has shown that its origin is grounded in the facts of dynamic action which exhibit interdependent motion. (See Scientific Theism etc., pages 273-280).

The contraction hypothesis is a flagrant case of the misapplication of a
mathematical product to physical reality. The Larmor-Lorentz contribution to the Theory of Relativity must be discarded because it is not only contrary to known facts, but it is also incapable of experimental verification.

Conclusion. The Left Abutment of Einstein’s arch is not only inadequate to withstand the thrust, but also non-existent as a genuine physical fact.

LEFT ARCH RIB. THE CONSTANCY OF THE VELOCITY OF LIGHT.

Without entering into refined particulars we may state that, ‘The Second Postulate of Einstein’s Theory’ maintains that the velocity of light, in a vacuum, is the same for all observers and is independent of the relative motion existing between the observer and the source of light.

Einstein regards this constancy of light as a necessary assumption in his theory. In this he has shown unusual caution. The reason for his prudence is that he cannot suggest even a semblance of an explanation of this glaring exception to his world-scheme of Relativity. This situation is not devoid of humor. That member in his arch which is indisputably sound he regards as a postulate. The Michelson-Morley Experiment, of course, is exempt from the previous implied criticism for the reason that the result of this experiment must be regarded, at the present time, as an experimental fact. The interpretation, however of this result, is an entirely different matter. The Relativistic version is palpably fallacious. Another test has been proposed. It is evident from the nature of the Einsteinian arch that the outcome of this proposed test can have no beneficial bearing upon the stability of Einstein’s structure.

We have already shown that the Arch fails for a negative result. It is self-evident that a positive result, being fatally inimical to the Larmor-Lorentz Contraction, is of less value, and therefore cannot prevent the collapse of the structure.

Although Einstein has failed utterly to find even a clew to that greatest of all world mysteries, The Constancy of Light, nevertheless, the New Science stands ready with a solution.

A NEW THEORY OF LIGHT.

The New Science has found it necessary to abandon the ether hypothesis in its inconsistent and antequated form. The only physically known is differential matter in motion in the sympathetic presence of the compensating integrator Space-Time. This conception is the root of the author’s Space-Time Potential in which Space and Time are regarded as the Intermutational Matrices of Reality. The writer has failed to find the word which will adequately express the thought which he desires to convey by the word ‘Intermutational.’ The idea cannot be expressed by the word ‘Interactional’ because action, in the physical universe, is always associated with matter. Space and Time are not material essences, therefore the word ‘action, in any form whatsoever, cannot properly be associated with these basic matrices of reality. The ‘inter-play’ of Space and Time, although not genuine action, nevertheless suggests action, foreshadows it from its very essence as a hope
which can be realized in the presence of dynamic substance. This is the thought which the writer has, so inadequately, attempted to express by the word ‘Intermutational.’ If there exists one characteristic in either Space or Time (real not conceptual) which is totally different and not found in the other, then Space and Time are not mere phases of a single entity Space-Time. That such distinct features exist becomes apparent upon reflection. Real Time is irreversible. Space is reversible. The limited scope of this article prohibits a detailed discussion of this phase of the subject. The mere hint, here given, is sufficient to prove that the Einsteinian single entity Space-Time is not grounded in experience. That actually existing, though shadowy phase of the ‘inter-play’ of Space and Time, which we have here termed ‘intermutation’ is impossible in a single entity Space-Time.

The writer has sought for an explanation of that greatest of all cosmic mysteries, the constancy of the velocity of light, at the very fountain-head of reality, the ‘Intermutation of Space and Time.’ An explanation cannot be found anterior to the fountain-head. The solution is therefore startling in its directness and simplicity. Only a brief exposition of the author’s theory is possible in this article.

In order to make the content of this theory clear, let us erect a straight line, in any desirable direction, in Space. We will call this line the ‘Space-Directrix.’ It is evident that we can erect an infinite number of such directrices. Erect a plane perpendicular to the Space-Directrix. Regard this plane of sufficiently great dimensions to include all elements under investigation. Consider matter as the ‘Now of Substance.’ No other conception of matter conforms with observed reality. There is a ‘Now’ and a ‘Future’ for every kern (mass-acceleration unit) of reality. The ‘Now’ can be depicted in our plane, provided that we identify our consciousness with it. When this is done we will designate our plane as the ‘Now Plane’. The ‘Future’ (substance) of every kern can be depicted as a kern-extension filament reaching beyond the Now Plane into Space. We give the name ‘Cosmic Filaments’ to all such extension filaments. This picture of the Cosmos is merely pictorially symbolic of a reality which defies the most profound attempts of finite representation. In our picture, Time is represented by the Now Plane. In the Intermutative background of the Cosmos, Time corresponds to the ‘dynamic urge’ of substance and may therefore be regarded as an Underlying Principle of Motion, which in conjunction with Space, Substance, and all the Categorical and Empirical Determinations manifest as cosmic phenomena.

With Time regarded as an Underlying Principle of Motion, the question immediately arises: ‘Have we any precise experiential knowledge of the ‘Motion’ of Time?’ The answer is close at hand. So close, indeed that it has completely escaped the notice of both science and philosophy. The writer has found the answer at the very fountain-head of existence in the matrices of Time and Space whose intermutational motion is the underlying basis of the known constancy of the velocity of light. There is, of course, a material side
to this primordial relation, but this material phase of the problem must ultimately be grounded in the intermutational matrices which form the responsive equilibrating background of all physical reality. If we refer again to the Cosmic Model, presented above, the thought here outlined becomes clear. Let the Now Plane moves in such a manner that it is continuously perpendicular to a Space-Directrix. In cosmic phenomena, such as light and gravitation, the Now Plane moves, in reference to any initial point of reference in the Space-Directrix, with a velocity of 300,000 kilometers per second. In my Space-Time Potential I have given the name ‘Kosmometer’ to this cosmic unit of length. (Scientific Theism, page 173.) The cosmic unit of time is therefore that time period (one second) which is required for the Now Plane to travel a distance of one Kosmometer along a Space-Directrix. It is understood that the Now Plane in all its positions is perpendicular to the arbitrarily selected Space-Directrix. The velocity which arises in this manner is an Absolute Cosmic Velocity because it is the constant cosmic ratio of intermutation of the matrices of Time and Space. The converse is also true. The generation of this constant cosmic ratio is possible because Time and Space are distinct, though intermutational matrices. Einstein erroneously considers Space and Time as merely subjective precipitates from the single entity Space-Time.

As the Now Plane moves with this constant velocity, it continuously intersects the Cosmic Filaments whose ‘Now Sections’ responsively adjust themselves in such relative positions and configurations which conform with their inmost interactional nature and also with the co-responsive Cosmic Mold, Space-Time. Thus it is seen that intermutational Space-Time constitutes a cosmic chart capable of (the ‘becoming-kinetic’ of substance) exhibiting deterministic future action. Herein lies the essence of the author’s use of the word Potential in his ‘Space-Time Potential.’ The entire system is thus both interacting and unitary, and individually distinct forces, regarded as entities separate from matter, have no meaning. (Thus the ‘force of gravitation’, regarded as a separate and distinct entity is meaningless.) In such a unitary system the objections usually entertained against ‘action-at-a distance,’ completely disappear.

The material side of the phenomenon of light is in perfect harmony with its intermutational aspect in Space-Time. (See Scientific Theism, pages 172, 274, 275, and 276.) Here we deal with transverse and longitudinal displacements arising during the interaction of the excitant and concurrent material systems. The ratio of the velocities of the excitant and concurrent material system is that constant velocity which is known as the velocity of light. The concurrent system is composed of gyratory groups of monons which are interactionally responsive to the presence of the constituent units of the excitant system. The latter travels in straight lines, unless subjected to the deflective interactional influence of other material systems. Normally to the direction of motion of the excitant units, the gyrational groups, constituting the concurrent system, undergo a cyclical augmentation in their
orbital radii. The result is a genuine physical light-wave which cannot be even conceived in a continuum like the ether which contains no real discrete parts.

The writer desires to point out a few of the results which follow from his theory.

1st. Cosmic Space and Time become genuine primordial realities. The Cosmic Now Plane moves with an Absolute, and known, velocity in reference to Space. The velocity of Cosmic Phenomena (light, gravitation etc.,) becomes known as a universal Cosmic Constant (that of Light).

2nd. The discrepancy between the sum of the component vectors and the resultant vector in the ordinary velocity and force triangle is completely accounted for by this theory. The truth of this assertion follows from the fact that a displacement in this Now Plane is inseparably associated with, and actually impossible without, a coordinated displacement of the Now Plane itself along a Space-Directrix. Thus for every vector which is not perpendicular to the Now Plane two components are inevitable. Here then we have the ultimate source of the vector triangle and also the root of the above mentioned discrepancy.

3rd. It follows, that in a closed vectorial configuration the time period between an initial and final point is independent of the path. Since the paths are unequal in length, it follows that the velocities also will be unequal.

In the case of the interferometer experiment, if we regard the Space-Directrix as parallel or coincident with the direction of the earth’s motion, it follows that the observed time period, referred to the Now Plane, is independent of the path of the light-ray. The time period required for a net displacement of the ray along the Space-Directrix, is the same whether the path be a curve, a continuous broken line, two adjoining hypotenuses of right triangles, or the net resultant of a simple forward and backward motion. The governing element is the initial and final position of the Now Plane in reference to the Space-Directrix.

The interpreters of the Michelson-Morley experiment have not given due consideration to the fact that light is a continuously generated phenomenon. It is a generated (dynamic) vector subject to interdependent interaction.

The writer’s theory permits variability in the velocity of both the excitant and the concurrent systems. It is only the ratio of these variable velocities which remains constant. The excitant system is actively responsive to interactional intensities. The concurrent system is continuously equilibrated and therefore exists in a neutral action phase. The excitant system is subject to acceleration in the presence of interacting fields. This obviates the dilemmas (like that arising out of the Doppler effect), difficulties, and omissions which are constitutionally inherent in Einstein’s system.

The excitant system, when passing near the Sun, will be subject to its direct interactional influence, and also to the refractive effect due to its
corona. The combined result will be a retardation of the velocity of the excitant system.

The difficulties and possibilities of observational errors involved in this class of physico-astronomical investigations are both numerous and large. Such allowances for the combined influences which can be made are consequently, rather in the nature of assumptions than precise determinations. These effects, however, cannot be ignored. It would seem that Einstein, in his calculations, has taken no cognizance whatever of these combined influences. In the writer’s calculations an attempt was made to make allowance for these disturbing effects by a reduction in the velocity of the excitant system. In the near future, comparatively accurate information may make it possible to substitute precise data for enforced assumption.

At the present time, therefore, the main significance of the writer’s calculation lies in the directness and simplicity of the method employed, together with the additional important feature that whenever reliable information is available concerning the retardational influences mentioned above, a precise determination can be made without recourse to the unnecessarily complicated, and basically erroneous, hypothesis of a curved space.

It is important to note that Cosmic phenomena involve the Cosmic Now Plane whose movement in reference to any Space-Directrix is describable in terms of the velocity of light.

The motion, however, of a discrete material system is describable in terms of a particular Now Plane which may be regarded as associated with the system.

The perfect harmonious agreement between the dynamical behavior of substance and the cooperative responsiveness of Space-Time is evident from the fact that the same vectorial relations also arise from a study of the basic dynamic laws of the universe. These dynamic relations were first developed by the writer in the year 1904. They are treated in his work under the caption, ‘Fundamental Physico-mathematical Relations of the Space-Time Potential’ (pages 261-268 inclusive). The relations which pertain to Interdependent and Independent Motion follow directly from these basic dynamic relations. (See Scientific Theism, pages 278-279 inclusive). The Interaction Coefficient for Light was developed by the writer from these dynamic relations, which were based directly upon experimental facts. The author’s Interaction Coefficient is identical in form with the Space-Time Coefficient of Larmor, Lorentz and Einstein. Not comprehending the nature of its interdependent source in both Space-Time and real dynamic action (not mathematically speculative) the Relativists misinterpreted its significance and grossly abused its use. The unsound Larmor-Lorentz Contraction hypothesis is only one of their many misapplications.

RIGHT ARCH RIB. THE PRINCIPLE OF EQUIVALENCE.

Stated briefly, the Principle Of Equivalence asserts the equivalence of
acceleration and gravitation. Einstein was not the first one to announce this Principle, even if he was the first to misinterpret it in order to link the mutilated product into his system.

Everyone grants that acceleration can be produced by mechanical means. Energy must then be expended in its production. The effects produced by acceleration mechanically-generated are precisely the same as the effects which result from its cosmic generation, generally described by the term ‘gravitation.’ The ‘dynamic urge’ in the case of gravitational acceleration is hidden in its cosmic generation. It is, however, just as much a reality as the energy which must be supplied to generate acceleration mechanically. The ‘pure acceleration’ of Einstein can therefore never be the equivalent of an actual and physically real ‘dynamic urge.’ ‘Mere motion’ is purely theoretical. The attempts of Einstein to account for physically real gravitation by means of the convenient substitute of ‘pure acceleration’ can therefore result in nothing but complete failure.

The substitution of a term, empty of dynamic being, does not warrant Einstein’s claim for Equivalence. This artifice is on par with many other similar sophistical half-truths emanating from the Father of Relativity. The affair is nothing more than a clever shift of terms in two causal series. Acceleration produced mechanically is an effect arising from the application of power. The word ‘gravitation’ invariably refers to that cosmic cause which is capable of producing gravitational acceleration as an effect. Therefore it follows, that acceleration is not equivalent to gravitation. No one has ever disputed, however, that both mechanically produced acceleration and gravitational acceleration can be discussed analytically under the general term ‘acceleration.’

Sophistical half-truths are always productive of dilemmas. If Einstein claims that cause and effect (in the case cited) are equivalent, then it follows, with equal show of sanity, that black is white, evil is good, error is truth, etc., etc. On the other hand, if Einstein claims extraordinary originality in having made the ‘astounding’ discovery that gravitational and mechanical acceleration are types of acceleration, then we must freely concede the truth of the latter statement whilst marvelling at the unparalleled audacity of the claim.

It is here pertinent to call attention again, now, however, by way of contrast, to the substantial work of Anderssohn, Zacharias, ‘Kinertia,’ Mewes, and Fricke, whose serious endeavors to probe the phenomenon of gravitation to its ultimate source, constitute lasting records in the history of science.

In the light of all this we are utterly unable to account for the wave of enthusiasm which swept the scientific world when Einstein announced ‘his great discoveries.’

**Conclusion.**

Einstein’s type of the ‘Principle Of Equivalence’ is a mere quibble and inversion of words, which is another illustration of ‘Much ado about
Nothing.’ The right arch rib must consequently be declared worthless, because of the failure of this ‘Principle’ to establish a real ‘dynamical’ equivalence.

LEFT ABUTMENT HINGE. PERTURBED MOTION OF MERCURY.

It must be admitted that this ‘hinge’ is the strongest auxiliary member in Einstein’s Arch. Dr. William H. Pickering has shown that a discrepancy of about 10% exists between the observed advance of the perihelion and the amount calculated by Einstein. (Dr. Pickering made allowance for the fact that the sun is an oblate spheroid. Einstein assumed it to be a perfect sphere.)

In this connection Jeffreys points out a serious weakness in Einstein’s theory. There is, according to Jeffreys, ‘no arbitrary constituent (in Einstein’s theory) capable of adjustment to suit empirical facts.’

Moreover, it is a significant fact that Einstein’s theory is not successfully applicable to such other well known cases of perturbation as the secular acceleration of the Moon. In fact, his theory fails utterly in universal application. This fatal weakness in Einstein’s theory has been revealed by the able work of Professor C. L. Poor.

We have previously mentioned the formula of Paul Gerber (1898) which covered this ground in a much simpler manner. Therefore, even here where the theory is the strongest, it is not indispensable. Its speculative complexity is a serious fault. Since three of the four ‘main members’ of the structure have collapsed, this auxiliary hinge cannot save the Arch of Einstein from complete destruction. This verdict is in complete harmony with Einstein’s expressed opinion concerning his own theory: ‘If any deduction from it should prove untenable, it (the theory in its entirety) must be given up. A modification of it seems impossible without destruction of the whole.’

It still remains for Einstein to admit the priority of Gerber.

Conclusion.

This hinge cannot save the Einsteinian structure. It is based upon a fallacious theory. It is not universal in its application. A simple and consistent substitute is available. Therefore this hinge must be discarded.

RIGHT ABUTMENT HINGE. DEFLECTION OF LIGHT.

As far as the results of the calculations are concerned no legitimate criticism can be presented. The percentage of error is comparatively small when the observational difficulties are considered. Here again, however, the theory is not indispensable. The deflection can be calculated with greater precision and by a more direct and simple method. Attention has already been drawn to this fact in the preceding.

This work of Einstein is, moreover, open to severe criticism on the ground of perversion of facts. The ‘bending’ of light-rays by the sun is used to strengthen the ‘Curved Space’ phase of this theory. The rays are supposed to follow the *geodesic lines* of Einstein’s Curved World-Frame, and again we lose sight, in his theory, of the genuine cause of the phenomenon. In every phase of his system we encounter a departure from the direct and simple. Repeatedly the actual causes of a phenomenon are obscured by a complex
fabric spun in the looms of speculative mathematics. So in this case Einstein prefers the devious to the direct, perversion instead of simplicity, and *unreal* curved space becomes the all-important feature of the ‘bending’ instead of the simple interactional influence of the sun upon particles of matter. The direct attack of the problem should be as follows: Light-rays are composed of matter (since matter is the only known physical reality). The Sun is a great aggregate of matter. Groups of matter interact causing mutual deflections, whose relative amounts depend upon the magnitudes of the interacting groups. Therefore, light-rays being composed of very small particles of matter will be deflected when they pass near a great mass like the Sun.

Einstein’s omission of the effects due to the Sun’s atmosphere is a serious error.

The New Science has enough problems of real import with which to grapple without accepting the *unnecessary* burdens inconsiderately created by speculative mathematics. Any theory of unnecessary complexity must be regarded as a useless burden to the New Science. We have already seen the Einsteinian Arch crumble into dust. Whatever consideration we give to the hinges must be considered merely as formal and indulgent courtesy.

*Conclusion.*

The design of this hinge is based upon erroneous assumptions. The details of construction involve unnecessary and inconsistent complexity together with serious omissions. Since a simple and consistent substitute is available, this hinge must be rejected.

CROWN HINGE. DISPLACEMENT OF SPECTRAL LINES TOWARD THE RED.

The average result of all the experiments made, fails to support Einstein’s theory. Einstein, while in the United States, publicly stated that he is willing to hazard the truth of his entire theory on the results of this experiment. Up to date the average result has been decidedly against The Theory of Relativity. It is, indeed, strange if science accepts the implied mandate of Einstein in regard to this ‘hazard.’ The risk involved in such an acceptance is enormous because the displacement is exceedingly small. Moreover, only a limited number of lines can be used in the experiment. Excessively large displacements are likely to occur because of the rapid motion in the line of sight. This excess will vitiate the entire experiment unless absolute allowance for it becomes possible.

Now Einstein is willing to risk the truth of his theory upon this slight probability of apparent experimental confirmation. It would seem that either he has the faith of one obsessed, or even now, he realizes that his theory has no basis in fact. In the latter event his proposal would tend to delay the arrival of that, for him, most potent moment when he would be forced to confess to the world that his intricately spun fabric is worthless.

Dr. Pickering points out that St. John, in an experiment conducted at Mt. Wilson, found a displacement for the cyanogen lines of only +0.0018A, whereas the displacement predicated by Einstein, from his Theory of
Relativity, should be +0.0080A. The actual discrepancy is +0.0062A which represents an excess of 344 per cent. If Einstein had genuine confidence in the alleged affirmative results obtained by Grebe, Bachem, Schwarzschild, and Evershed he would not have made, while in the United States, the public statement cited above. In his work ‘Relativity’ he refers to this experiment as follows: ‘It is an open question whether or not this effect exists . . . . . . . At all events, a definite decision will be reached during the next few years.’

He is like a man who uses the technical machinery of the courts to delay the final and inevitable verdict.

In view of the above one can but marvel at the extraordinary reception, a mounting to a triumphal ovation, which was accorded a theory, built upon a foundation of quicksand, and ‘hinging’, according to its originator, upon an experiment yet to be proved.

**Conclusion.**

This hinge must be rejected because it is not only unsafe, but also non-existent.

**SUMMARY OF RESULTS OF TESTS.**

**RIGHT ABUTMENT. NON-EUCLIDEAN SPACE-TIME.**

Non-Euclidean Space-Time is based upon unsound and erroneous departures from, and extensions of, Euclidean geometry. The Minkowski and Einstein version of four-dimensional Space-Time reduces to a type of four-dimensional space which is not a reality. Therefore, the right abutment is structurally non-existent. The Space-Time idea is not even original with Minkowski and Einstein. Palagyi, in 1901, expounded the essentials of this theory.

**THE FLOOR.-MICHELSON-MORLEY-MILLER EXPERIMENT.**

At the present time the results must be regarded as experimental facts. The significance of these results has been misconstrued by Larmor, Lorentz, and Einstein. Relativity is based upon a wrong interpretation of these results. We, however, must pronounce the floor as structurally safe.

**LEFT ABUTMENT. THE FITZGERALD-LARMOR-LORENTZ TRANSFORMATION.**

The Larmor-Lorentz contraction theory is a purely speculative mathematical device designed to meet an emergency. Its contentions have not been substantiated experimentally. Moreover, the Relativists (including Einstein) maintain that an experimental proof is impossible. Therefore we are forced to conclude that the left abutment is conceptually unsound, experimentally unverifiable, and structurally nonexistent. This transformation is not due to Einstein but is the work of Larmor and Lorentz based upon a suggestion by Fitzgerald.

**LEFT ARCH RIB. THE CONSTANCY OF THE VELOCITY OF LIGHT.**

The constancy of the velocity of light is an experimentally established fact. The left arch rib is, therefore, a sound and safe structural member. This experimental fact was not discovered by Einstein.

**RIGHT ARCH RIB. THE PRINCIPLE OF EQUIVALENCE.**
As defined by Einstein it is a mere quibble and inversion of words. It is an erroneous substitution of effect for cause, followed by a claim of ‘Equivalence’ of the reversed product and its causal source. This is a pure case of ‘Much ado about Nothing.’ The experimentally sound feature of the principle has been misinterpreted by Einstein, and as such, becomes a self-destructive member of his Arch. The discovery of the real facts, which were perverted by Einstein, are not even due to him but must be accredited to Anderssohn, Zacharias, ‘Kinertia,’ and Fricke.

LEFT ABUTMENT HINGE. PERTURBED MOTION OF MERCURY.

Here we have the best agreement of Einstein’s theory with observed facts. The unnecessary complexity of Einstein’s method of calculation, however, eliminates the result from serious consideration. This element in his unstable structure cannot save a theory which so blatantly lacks internal consistency and external verification. Einstein’s theory is here impossible because it lacks universal applicability. The priority of Gerber here removes all ground for claims to originality on the part of Einstein.

RIGHT ABUTMENT HINGE. DEFLECTION OF LIGHT.

Einstein’s calculated deflection is in comparatively close agreement with the observed amount. The calculated is less than the observed by about 11 per cent. Einstein’s deflection is twice the amount obtained by the use of Newton’s gravitational expression. Newton’s is less than the observed by about 56%. This, then, is the status of the calculations which brought Einstein into prominent opposition to Newton. Einstein has committed a serious error in neglecting to allow for the retardational effect of the Sun’s atmosphere.

We have previously mentioned that a closer approximation can be derived by simple methods founded upon the readily verifiable laws of dynamics. Therefore this attempt of Einstein is merely historically interesting. Moreover, the basic assumptions of the Einsteinian calculations are erroneous, being founded upon an untenable theory. This hinge must therefore, be removed from the world structure because it is both lacking in possible precision, and also involves unnecessary complexity in design.

THE CROWN HINGE. DISPLACEMENT OF SPECTRAL LINES TOWARD THE RED.

Einstein hazards the stability of his whole structure upon this hinge. Experimental evidence, now at hand, is decidedly damaging to Einstein’s position. He admits that his contentions have not been verified. This is borne out by his own statements, recently made, in the United States.

The proposed experiment involves extremely small displacements. Varying pressure in the solar atmosphere together with the rapid motion in the line of sight, constitute decidedly detrimental extraneous influences which increase the inevitable inaccuracy of the experiment. Therefore, whatever may be the result of this proposed experiment, its significance will be open to challenge. It is never safe to base, even a less important theory, upon such dangerous experimental ground-work.
We must therefore, even now, discard the future result of this experiment as having significant bearing upon the validity of Einstein’s theory.

In view of these facts we draw the inevitable conclusion that the crown hinge is not only unsafe but also non-existent.

CRITICAL WORKS ON EINSTEIN’S RELATIVITY.

Edouard Guillaume—La Theorie de la Relativite, Lausanne, Switzerland, 1921.

Edouard Guillaume—La Theorie De La Relativite Et Sa Signification. (Revue de Metaphysique et de Morale.)

A. N. Whitehead—An Enquiry Concerning The Principles of Natural Knowledge.

Cambridge University Press, 1919.

A. Patscke—Umsturz der Einsteinschen Relativitätstheorie.

P. Lenard is preparing a work on the errors of Einsteinism.

Rudolf Mewes—Raumzeitlehre oder Relativitätstheorie. (Berlin, 1921.
The Collected Works of Mewes dating from 1884 to 1899 inclusive.)

John T. Blankart—Relativity or Interdependence. (The Catholic World, Feb., 1921.)

The Fallacies Of Einstein. (Now in preparation.)

The writer has, in this brief article, presented facts not previously available in collected form. He will feel amply repaid for his labors if their presentation will further the cause of justice and truth.”

From the St. Paul Pioneer Press, 21 August 1921,

“REVIEWER SAYS REUTERDAHL’S NEW BOOK CLEARLY DRIVES EINSTEIN TO THE ROPES

William Wyckoff Clark of St. Paul, graduate of the University of Minnesota in its earlier days, has made a clear study of the theory of relativity, and an article by him entitled ‘Divine Relativity,’ discussing a metaphysical aspect of the theory, will appear soon in the Homolectic Magazine, a leading scientific journal. Prof. Arvid Reuterdahl is dean of the department of engineering and architecture at the College of St. Thomas, and is widely known as a scientist. He challenged Einstein to a debate, some weeks ago, but never has had a reply from him.

Prof. Reuterdahl is receiving daily letters and telegrams of
commendation of his book attacking the Einstein theory. They have come from Berlin, where Einstein is at present, from Prague, from Jugoslavia and Switzerland as well as from scientists in America.

Dr. T. J. J. See, director of the United States Naval observatory at Mare Island, Calif., writes: ‘I am glad that you have punctured Einstein’s bubble, which justifies the remark that ‘Einstein is the Doctor Cook of physical science’.’

By William Wyckoff Clark

EINSTEIN AND THE NEW SCIENCE, Dean Arvid Reuterdahl, College of St. Thomas, St. Paul.

In this article, appearing in the Journal of the College of St. Thomas and reprinted for general circulation, Dean Reuterdahl does three things creditably: First, he makes an accurate notation of the sources from which, it is claimed, Einstein acquired the various ideas composing the theory of relativity; offers a concise, vigorous and scholarly criticism of the theory; and, third, introduces an outline of his own striking and strikingly original Time-Space Potential, in so far as it is akin to relativistic principles.

The St. Paul mathematician is the most fearless and unrelenting foe of Einstein’s relativity that has, up to the present time, voiced his criticism of the theory in the English language. German and French scientists have flayed Einstein and his teachings and his methods unmercifully, but for some reason or other, those English and American scientists, who have not joined the relativistic ranks, have maintained a very polite and kindly silence anent the theory. Many of them reject it, many of them adopt the Scotch verdict of ‘not proven,’ but few indeed are they who have taken pen in hand to write for publication even the mildest sort of adverse comment. Reuterdahl, therefore, enters an almost empty field. That he does so willingly and even joyfully no one who has read the very brief comments on relativity contained in his book, ‘Scientific Theism,’ will for a moment doubt. He is a fighter, but withal fair and dignified.

Leaves Case With Jury.

Without any waving of arms or shouting of ‘plagiarist,’ ‘thief,’ ‘robber,’ Reuterdahl introduces his evidence and leaves the case with the jury. He gives the names of scientists and mathematicians, with the titles and dates of publication of their various works, periodicals, etc., from which, it is claimed, Einstein obtained the data and the very ideas composing the theory of relativity, specifying accurately the subject matter appropriated. To such an extent and so thoroughly does Reuterdahl perform this work of exhibiting ‘parallelism’ that the possibility of honest, independent origination by Einstein is made to appear very remote and the burden is clearly placed upon his friends to show any original work of value by him in connection with the theory. Practically all that the author concedes to Einstein is a limited amount of grouping of ideas and an unlimited amount of self-glorifying advertisement.

In his criticism of relativity Reuterdahl is fair and discriminating,
conceding merit to certain parts of the theory and acknowledging as authentic a number of its important postulates. He very rightly regards Minkowski’s Space-Time composite as one of the abutments on which the arch of relativity must necessarily rest. Minkowski is the man who coupled space and time together in an inseparable ‘bund,’ and then, in the ecstasy of delight over his achievement, made use of that expression which finds a place in every treatise on relativity, viz.: ‘Henceforth Space in itself and Time in itself sink into mere shadows, and only a kind of bund of the two can be maintained as self-existent.’ And it was Minkowski who worked out the process, on which all relativistic mathematics rests, in which time is treated as functionally equivalent to a fourth dimension of space.

‘High Brow’ Camp Annoyed.

The school of relativity is divided into two camps, on embracing those who frankly believe in a four-dimensional space with time actually one of the dimensions, and one embracing those who would merely assert that under certain conditions time enters the mathematics of relativity as quantitatively equivalent to a dimension of space. The latter group consider themselves the ‘high-brows’ of relativity and are much annoyed by the success which has attended the members of the other camp in conveying the impression to the public that relativity sponsors four-dimensional space.

In his consideration of the subject, Reuterdahl starts out with the new, original and highly important demonstration that Minkowski’s mathematics really gives a four-dimensional space. From page 11 I quote:

It can be shown that the Minkowski-Einstein space-time is a mathematically camouflaged type of four-dimensional space. In the invariant form of the General Quadratic Differential, which is basic to Relativity, the last term is formed by multiplying the velocity of light by time. Velocity is reducible to length divided by time. Therefore time is eliminated from this term, leaving it as a pure spatial expression. Consequently we have here nothing but a new version of four-dimensional space which is not a physical reality.

Relativists Put on Defensive.

Unless relativists are able to show that Reuterdahl is mistaken in this analysis of Minkowski’s Time-Space mathematics, the theory is left tied up with and bearing the burden of a four-dimensional space: and relativity is seriously handicapped by Reuterdahl’s initial attack.

Reuterdahl next takes up the celebrated Michelson-Morley experiment and concedes that at the present time its results must be accepted as experimental facts. He agrees with relativity in regarding the experiment as conclusive proof that there is no ether. Relativity fails to provide any substitute for the ether and thereby lays itself open to the charge of incompleteness in providing no medium for the transmission of light or other electro-magnetic waves.

Reuterdahl, however, avoids that mistake; his ‘concurrent system’ offers a satisfactory substitute for ether and one which is free from the inconsistent
and even contradictory properties ascribed by the scientists of the last generation to that medium.

Consideration is next given to the Fitzgerald-Lorentz contraction hypothesis and to the Larmor-Lorentz transformation equations. The importance of these matters to the theory of relativity amply warrants the extended space devoted to them by the writer, but his treatment is too technical to authorize an extended review of it at this time.

Reuterdahl considers the contraction theory to be a ‘purely mathematical device designed to meet an emergency.’ It has not been and cannot be confirmed by experiment; it is a ‘flagrant case of the misapplication of a mathematical product to physical reality.’

Taking up the subject of the constancy of the velocity of light, Reuterdahl accepts the second postulate of Einstein’s theory that this velocity, in a vacuum, is the same to all observers and is independent of the relative motion existing between the observer and the source of light. This is the startling postulate holding that, whether an observer were rapidly approaching a light source, or relatively at rest with it, or rapidly receding from it, in each of the three cases the waves of light would reach him with the same velocity. Paradoxical as this may seem, scientists in general accept it, although with great reluctance. In a recent letter to the writer of this review a former president of the American Academy for the Advancement of Science says:

I quite agree with you that the postulate of relativity as to constancy of the velocity of light without reference to the motion of the stars is unsatisfactory, and I hope that at some time the experimental grounds for this assumption will be found to be less compelling than seems to me to be the case at present.

Under the circumstances, therefore, Reuterdahl’s acceptance of this postulate is undoubtedly justified, especially so in view of the fact that he immediately points out the misinterpretation and misuse of the postulate by relativity.

Then follows that portion of the article which, to the philosophically inclined reader, will be found most intensely interesting, i.e., Reuterdahl’s own theory of the velocity of light together with an altogether too brief outline of his Space-Time Potential. The reviewer has tried, but without success, to contract within the space at his disposal an understandable resume of this work. Any more concise presentation of it than the author himself gives would necessarily be incomplete. An understanding of it involves an acquaintance with the author’s former work, ‘Scientific Theism.’ It is therefore with great regret that we dismiss the topic with the totally inadequate comment that Reuterdahl’s Space-Time Potential and theory of light transmission are strikingly original, scientifically and philosophically consistent and worthy of the profoundest study.

Among the most outstanding features of relativity is Einstein’s much-heralded ‘Principle of Equivalence’ between gravitation and acceleration. Reuterdahl performs a very important bit of work in showing that the
identifying of the two by relativity is a confusion of cause and effect which robs the ‘principle’ of all heuristic value, indeed of all verity. Acceleration is an ‘effect,’ one that can be produced mechanically or by the action of that ‘cosmic cause’ which we call ‘gravitation.’ But acceleration, an effect, and gravitation, a cause, can not be identical or equivalent.

We must pass over without adequate consideration Einstein’s proposed three tests for his theory, the perturbed motion of Mercury, the deflection of light and the displacement of spectral lines. Regarding the first, Reuterdahl admits the accuracy of the relativistic calculations to within about 10 per cent, but shows that the same system of computation, applied to other cases of perturbation, produces inconsistent results.

Regarding Einstein’s calculated deflection of light the author concedes its approximate correctness, a variance of about 11 per cent being shown, but points out that ‘the deflection can be calculated with greater precision and by a more direct and simple method.’

The third test, the displacement of spectral lines toward the red, not being claimed by relativity to have been confirmed, is dismissed by Reuterdahl with but little more than the passing comment that Einstein is taking long chances on resting the validity of his entire theory on this doubtful base.

‘Einstein and the New Science’ is a valuable addition to relativistic literature. Students of the subject, whether favorably inclined to the theory or otherwise, can not afford to miss reading it.”

On 24 August 1921, The New York Times reported on page 2,

“CALL FITZGERALD FATHER OF RELATIVITY. English Writer Gives Him Credit for the Genesis of the Einstein Theory. Special Cable to THE NEW YORK TIMES. LONDON, Aug. 23.—Referring to the conferring by the Royal Society of its fellowship on Dr. Robb for his work on relativity, a scientific correspondent of The Daily Chronicle says that the credit for the evolution of the theories of time and space is due to the initiative of three Irishmen: Professor G. F. Fitzgerald of Trinity College, Dublin; Sir Joseph Larmor, who is Lucasian Professor of Mathematics at Cambridge, and Dr. Robb.

Robb has admitted his indebtedness to Larmor, but, says, the correspondent, the theory of relativity owes its origin to Fitzgerald’s explanation, as far back as 1888, of Nicholson’s [sic] and Morley’s failure to detect any relative motion between earth and ether.

He showed that if all bodies contracted in the same proportion in the direction of their motion we should have no fixed standard of length, as measuring rules and all scientific instruments would likewise change their dimesions [sic]. Hence we could not ascertain the exact size of things, nor detect their motion relatively to fixed absolute space.

This was known as Fitzgerald’s contraction theory, which, in the hands of Larmor and Sovenx [sic: Lorentz?] of Leyden has led up to the remarkable theories of space and time since developed by Robb and Einstein.”
In 1921, Wolfgang Pauli set the record straight in the *Encyklopädie der mathematischen Wissenschaften*,

“The metamorphoses in physical concepts brought about by the theory of relativity was a long time in the making. As far back as 1887, Voigt observed in one of his works [***] that it is mathematically possible to introduce a time of position \( t' \) into a moving reference system, whose origin is a linear function of the spatial coordinates, while the unit of time, however, is taken to be constant. Whereby, one can assert, of course, that the wave equation

\[
\Delta \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = 0
\]

also remains valid in the moving system. [***] We now come to a review of the three works of Lorentz, Poincaré and Einstein, which contain the thoughts and developments which are the foundation of the theory of relativity. Lorentz’ work led the way. Above all, it furnished the proof that Maxwell’s equations are invariant under the transformation of coordinates [Lorentz Transformation equations deleted] provided that one at the same time suitably selects the field intensity in the primed system.\(^{2131}\)

Pauli argues that Lorentz holds priority for the proof of invariance. Pauli next addresses Poincaré’s contribution,

“The formal gaps left by Lorentz’s work were filled by Poincaré. He stated the relativity principle to be generally and rigourously valid. Since he, in common with the previously discussed authors, assumed Maxwell’s equations to hold for the vacuum, this amounted to the requirement that all laws of nature must be covariant with respect to the ‘Lorentz transformation’ [The terms ‘Lorentz transformation’ and ‘Lorentz group’ occurred for the first time in this paper by Poincaré—*notation found in the original*]. The invariance of the transverse dimensions during the motion is derived in a natural way from the postulate that the transformations which affect the transition from a stationary to a uniformly moving system must form a group which contains as a subgroup the ordinary displacements of the coordinate system. Poincaré further corrected Lorentz’s formulae for the transformations of charge density and current and so derived the complete covariance of the field equations of electron theory. We shall discuss his treatment of the gravitational problem, and his use of the imaginary coordinate \( i \text{ct} \), at a later stage (see §§ 50 and 7).\(^{2132}\)

After giving Poincaré his due credit, and acknowledging that Einstein holds no priority for the special theory of relativity, Pauli, half-heartedly, pays the seemingly obligatory homage to Einstein, the then recently emerged celebrity,
“It was Einstein, finally, who in a way completed the basic formulation of this new discipline.”

And it appears that Pauli was forced, or felt compelled, to praise Einstein with additional inappropriate and, evidently, insincere comments.

Einstein’s work was not so well-received, nor so perfect, as his present day sycophantic advocates would have us believe. Louis Essen wrote,

“...But there have always been its critics: Rutherford treated it as a joke; Soddy called it a swindle; Bertrand Russell suggested that it was all contained in the Lorentz transformation equations and many scientists commented on its contradictions. These adverse opinions, together with the fact that the small effects predicted by the theory were becoming of significance to the definition of the unit of atomic time, prompted me to study Einstein’s paper. I found that it was written in imprecise language, that one assumption was in two contradictory forms and that it contained two serious errors.”

John T. Blankart stated in 1921,

“...The ‘Kinertia’ articles offer food for thought when considered in connection with the colossal claims made by Einstein’s supporters concerning his almost super-human originality. In fact, one begins to doubt the justice of these claims and to wonder if the charges made by a fast growing group of German scientists who, like E. Gehrcke, P. Lenard, and Paul Weyland, hold that Einstein is both a plagiarist and a sophist, are not, after all, true. We have done little justice in the above to the rare dialectic skill with which Dr. Einstein has applied his intellectual anaesthesia to the minds of his readers. All intellectual obstructions have been removed, and the reader is prepared to venture forth boldly into the mysterious realm of ‘curved’ space whose geometrical properties depend upon the matter present. This most curious inference of Einstein is the master stroke in his skillful massing of inconsistent sophistries.”

Sydney T. Skidmore wrote, in 1921,

“THE MISTAKES OF DR. EINSTEIN

By SYDNEY T. SKIDMORE

...We begin this essay by saying that Einsteism is an erudite elaboration of sophistry and is closely akin to, if indeed it does not spring from, the same root as classic sophistry. The tap root of that system of philosophy developed in the fifth century before the Christian era, and consisted in a denial of the existence of objective truth. Its thought and attitude can only become intelligible from a presentation of what ‘objective truth’ is, and for this, a little tax must be imposed on the reader’s patience.

Its definition is simple enough. It consists of, and includes, the being of
all created things and their relativities. It is objective because its essence is
independent of subjective thinking which can apprehend it in part—can pick
up pebbles of it from an ocean strand—and assemble what is gathered as
knowledge. Since it inhere in the essence of created things it is coconstant
with their creation.

Creation is originate; and all created things must have a beginning. The
first creative act necessitated a ‘where’ for its occurrence, and that where has
existed ever since as a changeless objective truth. Each creative act likewise
necessitated a where, and the aggregate of all wheres, or whereness,
constitutes a changeless, undistortable, frame of objective truth to which the
term Space has been applied. Objective truth or ‘isness’ pertains to the
wheres or loci in space, and since the loci are fixed, it also pertains to the
changeless relations of loci.

The first creative act not only required a where, it also required a
when—an instant—for its occurrence. Each creative act likewise required an
instant, and the aggregate of all whens or whenness, constitutes another
frame of objective truth, to which the term Time has been applied. Unlike
loci, instants are not simultaneous, they are sequential, and their objective
truth pertains to a procession rather than to a distribution.

In each creative event, therefore, three orders of objective truth are
present, viz., cause, locus and instant. Since history is composed of events,
and experience is concerned with them, the foregoing analysis may serve to
show what the nature of objective truth is, and also that the objective truths,
cause, space and time, supply and equip the generative arena of events, i.e.,
of physical phenomena.

Objective truths are presented in every fact and may be apprehended in
all phenomena. They are not thoughts but they are thinkables, and are
cognized by each mind according to its scope. Now, because the Eleatics
failed to formulate it or define it as an abstract oneness, the Sophists denied
that it had any existence whatever.

Since abstraction plays an important part in this discussion it must
receive some attention. Abstraction consists in withdrawing attributes, or
qualities, from their home correlatives in nature, and installing them in a
psychical abode for mental contemplation. As the word stands it means the
separation of something from something; but never a separation of something
from nothing. Inception is usually the word for that. There must always be
a residue from which the final abstraction is made. The relativity of attributes
in and with a thing, although they are mentally withdrawn, is still
codestructible only with the thing itself. An abstraction of qualities does not
annihilate the residue; nor can a sound philosophy be constructed from the
relativities of attributes alone, with the residue ignored. We give the
following statement prodigious emphasis because it is so much involved in
the reasoning farther on.

*No amount of abstraction can resolve a thing to a philosophical nullity
nor psychalize it into nonexistence. The residue with its relativities still
persists as objective truth.

The relativities of abstractions by themselves are subjective, mental, and may be correct, but are usually incorrect owing to the imperfection of mental action. True science is a developed knowledge of what is as revealed by discovery in wide open objectivity, and false or pseudo science is a knowledge of what seems to be as revealed by apprehendings in the inclusions of subjective recesses.

Since the Sophists denied the existence of objective truth they could not make it an objective goal of human endeavor. They must by necessity adopt a subjective goal, such as excellence, success, or victory. Truth, with them, was inherent in triumph. Whatever prevailed was true and true because it prevailed and truth had no other significance. It is easy to understand how such a philosophy as that should become reduced by human ambition, selfishness, and deceit, to the direct degradation. The success most esteemed by the Greeks was victory in debate, and after two centuries, Sophistry became such a system of thin verbal trickery that it fell into disrepute, and a stigma attached to its name.

Wherever the supreme goal of endeavor has been placed in things other than debate; and smartness of any kind has been substituted for objective truth, as an end anywhere, sophistry works the same degradation. While it appears to be always present as an inseparable corrupter, there have been some well marked epochs in which it acquired such dominance as to shape legislation and thinking and openly display its fruits. This occurred in the ancient sophistry of Greece as such; in medieval sophistry as Scholasticism; and in modern sophistry as Commercialism, Pragmatism, and Education. In war and politics it appears respectable as Strategy. In commercialism, somewhat less so as shrewdness; while in pragmatism and education it often wears the mask of efficiency.

Objective truths are distent and gloriously free. Subjective truths are stifled in mentality and subordinate to the ends of victorious achievement. Apprehendings of objective truths are obtained from objective things and, if incorrect, they may be checked up and corrected by reference to the things. Apprehendings of subjective truths are mental constructions, apart from things, and uncorrectable since subjectivity is not apt to correct itself. If they are crazed by mental inaccuracy the relativities of such truths are incurably queered likewise.

This presentation of sophistry as a system of thought, seems necessary to establish, by comparison, the validity of the statement made in the beginning of this essay; for we shall try to show that Einsteinism is sophistry, both in its nature, and in its dialectic construction.

It is purely subjective and Protagorean in that it ignores the objective truth of all steadfastness, and all relativity of steadfastness in general being.

There are two orders of relativity; that of the steadfast with changeables; and that of changeables with each other. Einstein relativity is exclusively of the second order. We are not aware that Einstein anywhere formally denies
the existence of steadfastness as objective truth, but since it cannot be psychalized he everywhere ignores it, and all arguments for Einstein relativity are based on its non-existence; and it is Einstein relativity, with its astounding pretensions, that we are criticising.

The primary positional steadfasts in nature are the loci (points) in space. The earth and all things in it move, but space units do not. All things in the earth have a first order relativity with the points of space, and a first or second order with each other according as their motions are alike or unlike each other. Now because the points of space are ultra to experience, imperceptible and unsubjective, together with their relativities, their being is summarily denied by sophists and ignored by Einsteinism; and all semblance of steadfastness, like that of car seats in a moving car, or houses on a moving earth, have no steadfast relativity with anything; it is only subjective thinking.

Einsteinism claims to open a vast extension of physics but, if adopted and followed, it would tend to a collapse of physics because it works from a psychological rather than from a physical basis. The two are in reversion. Physics stimulates discovery by trailing the scent of objective truths occluded in the unknown. Einsteinism represses discovery by holding truth corralled within subjectivity. Even Space and Time, the fundamental containers of those objective truths which physicists are continually transferring from the unknown to the known, are said to be ‘devoid of the last vestige of physical objectivity.’ (Schlick, pages 53, 76. Eddington, page 34). [Footnote: We shall quote in this paper from Schlick’s ‘Space and Time’, and from Eddington’s ‘Space, Time and Gravitation’, because both these books are recognized as authoritative in Einstein literature and they are somewhat more definite and explicit than Einstein’s own writing.]

Physical relativities are of the first order; Einstein relativities are of the second order and pertain to the relations of fluxing events as they are observed. Words such as cause, potential, and force, which are leaders in physics are of rare occurrence in Einstein literature and when used are slipped in edgewise. The relativity of physical effects with their causes is slightly discussed, but the relativity of mental states induced in observers when differently conditioned abounds, and forms the body of argument, and the plenitude of discussion.

Another citation, which shows how completely truth is restricted to the realm of subjective apprehendency, appears in the interpretations given to the Michelson and Morley experiment.

Those investigators truly assumed that if a non-viscous static aether existed, an aether wind opposite to the earth’s motion must blow through the moving earth; and that the velocity of light would be different when moving against this wind, than when moving at right angles with it. A very delicate and crucial experiment showed that the earth’s motion had no effect whatever on the velocity of light. Now what? Something must be wrong, either with the aether belief, or with the motion of light; and the
mathematicians proceeded to explain it, as they usually do, by tinkerings at space and time. Fitzgerald and Lorenz [sic] devised that everything in the line of motion transforms and contracts, and so increased time was exactly compensated by shortened distance, and the velocity of light, as shown by simultaneous arrival, was apparently unchanged.

This saved a clumsily apprehended aether belief from Michelson and Morley extinction; but Einstein proposed a different explanation. Quite indifferent to the fate of current aether belief, he found the difficulty lurking in the relativities of motion. All things, relatively at rest in a system, maintain that relativity whether the system, as a whole, is moving or not. The motion of a system, moving relatively with objects external to it, has zero effect on the relativity of things within it. The relative direction of city streets abides when their direction from the sun changes continually. Street cars run a mile east in the same time as when running north, although the earth rushes westward one thousand one hundred miles per minute, and northward not at all. The interferometer, mirrors, and source of light, in the Michelson experiment, were all in the same Earth system and therefore the light moved between them through equal distances in equal times, whatever the direction might be. This neither proves nor disproves the existence of an aether, but it does show that if an aether exist it is of such a character that currents and whirls in it do not perceptibly affect the velocity of light. It is not an externality by which the relativity of light movement with it can be sensibly apprehended. Now, because a static aether of a particular character does not exist, the reasoning dialectically pussyfoots into an assumption that there is neither aether nor staticity. The aether is of small consequence in the case, but it is essential to Einstein relativity to put out of existence the principle of staticity as an objective truth and the ultimate physical reference basis of all motion.

Whatever may be true in metaphysics it is certainly true, that in physics such a principle does and must exist, as a physical necessity. A bird does not take the air along with it in flight; a ship does not take the ocean with it in sailing; a moving car does not take the ties of the road bed with it, and no moving thing takes space with it. Air, ocean, and ties have a static relativity with the moving objects mentioned. Whatever moves has changing relations with everything that does not move precisely as it does; and static relations with everything that does: but a truce to such platitudes. Space contains all moving things which therefore have a shifting relativity with it, because it does not move like them. It is the physical ultimate of staticity since nothing physical exists external to it to which its motion can be referred.

The changing relativity of things with the points of space or instants of time is of the first order (primary) and all changing relativity of things with each other is of the second order (casual).

Einstein relativity is exclusively of the second order. The expounders of it deny that there is any other, and back up the denial by ignoring the staticity of space; but this they cannot do without postulating something in
metaphysics external to space which does not move as space does; and this they cannot do; so, to abolish its staticity, they must abolish space itself and replace it by a subjective creation.

Staticity must be removed from the space world to permit the entrance of Einstein curios and non-Euclidian queers. While it abides lineality abides. Forms in space are outlined in it by moveless points, and are differentiated from it just as an island boundary is different from the surrounding ocean. Points of space are located by rectilinear coordinates, and all other coordinates whether Gaussian, polar, or zigzag, only serve to locate places on the surface of a form in space, like the longitude and latitude circles on the surface of a terrestrial globe. They do not locate points of space; they merely locate points with reference to other points on the surface of a form in space. Hence arises the non-Euclidian sophistry of spherics, or elliptical space, and the Einstein sophistry of space curved and twisted around material bodies, like a swaddling striate aura, and the further sophistry that bodies moving through such space are impelled by inertia along curved rather than straight lines in accordance with a ‘Principle of Least Action’ that the longest way round is the shortest way home, because straight lines would lead across curving hurdles (Eddington, page 105).

Space as such has no form whatever. It is neither curved, flat, nor otherwise. The pure forms of things (the abstract residues) are defined in space by the fixed relativity of its moveless points. This statement squarely contradicts Einsteinism. It is based on logical inferences in objective creation, while its antithesis is grown from subjective apprehensions of shifting things. Whichever is truth, the other is devoid of truth and the choice is yours.

Staticity has been discussed at some length because it illustrates the attitude of Einstein relativity towards all objective truth. Because such truths, when postulated are imperceptible and make no psychic impression, words sophistically used present them as unreals, and cause them to appear as ‘ambiguities and unnecessary thought elements’, (Schlick, page 5) which should be thrown aside as meaningless and obstructive to a path that leads not to truth but to victory; not to amendment and improvement by new tributes of knowledge; but to a revolution of fundamental concepts which throws down an older and erects a new intellectual throne.

This revolution (when achieved) is a promise of something which will cause Newton and Copernicus to seem like infantile prattlers; ‘inasmuch as the deepest foundations of our knowledge concerning physical nature have to be remodeled much more radically than after the discovery of Copernicus.’ (Schlick, page 5.)

The signs of such an approaching revolution at present are not very auspicious. While one out of twenty, or possibly fifty, of savants are filling the world with a sounding applause of it, all the rest are waiting, silent, dubious, and withholding allegiance. Still it may come; for the human world delights in sophistry and dotes on truths of its own creation. Impressionism
which is so powerful in Art may also yet prevail in Philosophy.

That Einsteinism presents a revel in such truths is made evident by Eddington in Chapter XII: ‘The conclusion is that the whole of those laws of nature which have been woven into a unified scheme—mechanics, optics, gravitation, electro-dynamics—have their origin not in any special mechanism of nature but in the workings of the mind.’

‘Give me matter and motion,’ said Descartes, ‘and I will construct the universe.’ ‘The mind reverses this,’ says Einstein. ‘Give me a world in which there are relations, and I will construct matter and motion.’ The world thus is what it is conceived to be; is what we think it is. That is precisely what Descartes and Einstein each professed to do. Both are subjectivists—sophists. One would replace the objective truths of real relations, by such queered relations as he could mentally construct from observed things, and the other would replace the objective truths of real things, by such queered things as he could mentally construct from observed relations. Both alike substitute their psychical apprehending of nature’s content, for the content itself, and then call it truth.

Recent writings in current literature suggest that many inquiries are baffled in attempts to comprehend Einsteinism. They read about it and think there must be something in it, and so there is, but it is a something not included in their somethingness. It is shapen from non-Euclidian, or what is sometimes termed meta, geometry. This consists entirely of mental constructions that are purely subjective and correspond to nothing in nature. In fact it prides itself on a disbelief or at least a disregard of the existence of objective truth, and boasts that ‘mathematicians are never so happy as when talking about something of which they know nothing.’ (Eddington, page 14.) Really it is no geometry at all, for it measures nothing and disallows all mental standards. It is a fantastic jazz of mathematical symbols, devoid of quanta, in a dance hall, floored by a parquetry of ifs, supposings, and assumptions.

The attitude of Einsteinism toward physics, and the fate of physics by occlusion in this thing, misnamed geometry, is well stated by Eddington (page 183). ‘As the geometry becomes more complex, the physics becomes simpler, until it finally almost appears that the physics has been absorbed into the geometry.’ While parading the attractive banner of a ‘New Physics’ or a ‘New Philosophy,’ Einsteinism is really nothing but a special chapter in psychology, which is offered as a new style of incubator for hatching nature’s eggs.

In popular discussion two things are mixed up in Einsteinism as if they belonged to it, but they do not. One of these is the prediction that space and time will have an end. This is nothing new. It is a philosophical deduct of long standing that whatever has a beginning is finite, and must have a boundary and an ending; and that space and time which began with creation will cease to be when created things become non-existent. The other is a scientific derivative from the electronic theory, and preceded Einstein by a
number of years. That theory changed the definition of mass from ‘quantity of matter’ in a body to ‘quantity of force’ in a body. The matter in a body is its mass or force in statu; the motion of a body is its mass or force in motu. Matter and motion together constitute the mass of a body and each is force with a modal difference. Mass and inertia are one and the same thing to which different names are given when differently apprehended.

This was all worked out physically before the time of Einstein and is no part of Einsteinism. If wonderful, it is a wonder of physical discovery and not a marvel of psychical geometry.

A peculiar feature of Einsteinism is that the crux of its doctrines is deeply submerged in mathematical obscurity. If one asks for proof he is told that it lies in mathematical profundities, quite beyond the reach of anyone other than an adept; and the unintelligible character of Einstein literature fully sustains the statement. Now the English language, with its rich vocabulary, direct idiom, and classic verbal quarries, is quite capable of expressing anything that has a meaning, and of rounding out the proof of any statement that admits proof. To understanding it is a wide open Bible; and cloistered secrets doled out by initiates for aweing the credulous are unnecessary. Proofs that vest in mathematical cryptograms are dubious. Mathematicians choose their own assumptions and, according to the assumption taken, they can prove that truth is truth; or falsehood is falsehood, or truth is falsehood, or falsehood is truth, with equal facility. Mathematics supplied cranks, cycles, and epicycles to Ptolemaic astronomy just as readily as it supplied ellipses, parabolas, and hyperbolas to Copernican. Cryptogramists follow rules of interpretation and have but slight regard for rules of philosophic sense.

A mathematician can only be trusted as far as he can be seen, or objectively checked up. Unlike space but quite like that of a political conscience, the mathematic psychology warps and twists in quaintest fashion to attain an end when left to its own devices. According to Einstein device, Space and Time are inseparable from matter. ‘Space and Time determinations will henceforth be inseparably connected with matter and will have meaning only when connected with it.’ (Schlick, page 4.) ‘Time and Space can be dissociated from matter only by abstraction, i.e., mentally; the combination or oneness of space, time, and things is alone reality; each by itself is an abstraction’ (a mental figment). (Schlick, page 6.) ‘In this way Space and Time are deprived of the last vestige of physical objectivity, to use Einstein’s words.’ (Schlick, page 53.) ‘Exactly so; Space is an abstraction of the extensional relations of matter.’ (Eddington, page 8.) What matter has extensional relations with, is not stated; if it be with other matter, the thing that sustains the relationship is not stated; and you may find out if you can, but not from Einsteinism.

Since Space and Time as thus stated are mental investitures of matter, a bunch of it when moving must either take its space and time along with it as personal property, like clothes, color, or shape; or else find it as a place
endowment wherever it goes. We would much like to know whether space
is regarded as the mental baggage of travelling matter, or is an omnipresent
mental continuum which forms a ‘oneness’ with matter wherever the matter
happens to be. We are not told which it is because that would resolve a
psychologic mystery that can be handily employed in discussion. It is
sometimes convenient to take it one way and sometimes the other.

The matter in other stars is assumed to be rather similar to that of the
earth; but it is bunched together quite differently; and that would create
different kinds of space and time. That presents no difficulty, however,
because ‘there are different kinds of possible space to choose from, no one
of which can be regarded more likely than any other.’ (Eddington, page 15.)
The difficulty becomes serious, however, if it be true that space and time are
purely mental determinations. Indeed it becomes an open question whether
or not the stars have any space or time worth mentioning. Our mental
determination of Arcturian space is restricted to a point; and unless there be
a developed mentality in Arcturus, or somewhere else, the poor star has no
space other than a point, and no time other than what is marked by star drift.
Moreover, if there be any system of physics in Arcturus, it must be quite
different from ours, unless the Arcturians have minds like ours, for,
according to Eddington, as previously quoted, ‘the laws of nature . . . have
their origin, not in any special mechanism of nature, but in the workings of
the mind.’

The vice of Einsteinism is that it transfers sense deception from ordinary
things which check it up, to space, time, motion, and energy, which do not
check it up, because their nature is ultra to experience.

From a puny bunch of relativity as psychologically impressed on
differently conditioned observers, a mathematical explosive has been
prepared for deranging established foundations of thought. A petty scheme
of psychalized relativity is given as interpretative of a grand world universe
filled with objective relativities that have not as yet been psychalized. Its
nature is purely subjective and sophistical.— Q. E. D.**2137

There were many others who publicly opposed Einstein, the theory of relativity,
and the deception of the general public by the pro-Einstein press on similar grounds,
including: Adler, 2138  Weinmann, 2139  Mohorovičić, 2140  Bergson, 2141  Guillaume, 2142
Patschke, 2143  Dingle, 2144  Dingler, 2145  Strasser, 2146  Guggenheimer, 2147  Lynch, 2148
Mackaye, 2149  Nordenson, 2150  Essen, 2151  Theimer, 2152  Gut, 2153  etc. Early bibliographies
appear in Gehrcke’s Kritik der Relativitätstheorie, Hermann Meusser, Berlin, (1924),
pp. 95-98; and in H. Israel, et al., editors., Hundert Autoren Gegen Einstein, R.
Voigtländer, Leipzig, (1931), pp. 75-78.
In 1922, Stjepan Mohorovičić acknowledged what Albert Einstein did not,

“I must point out what is little known, that the French physicist H. Poincaré
had already called attention to the fact that the Lorentz Transformations form
a group, he had already shown in 1900 (therefore 5 years before Einstein)
[Footnote: See the book, which is cited in note 22 {M. Abraham, *Theorie der Elektrizität*, Volume 2, Fourth Edition, Leipzig, Berlin, 1920}, S. 359. It appears that Poincaré did not mention Einstein even once in his lecture ‘The New Mechanics’ (Leipzig, Berlin, 1911) for this reason., how one can set clocks by means of light signals to Lorentz’ local time. [***] Therefore we must understand the method of signaling (which, as we have stressed, H. Poincaré had already applied in 1900) only as an interpretation of Lorentz’ formulas.”

“Ich muß darauf hinweisen, was weniger bekannt ist, daß schon der französische Physiker H. Poincaré darauf aufmerksam gemacht hat, daß die Lorentzschen Transformationen eine Gruppe bilden; er hat schon 1900 (also 5 Jahre vor Einstein) gezeigt [Footnote: Siehe das Buch, welches in Anmerkung 22 zitiert ist {M. Abraham, *Theorie der Elektrizität*, II. Bd. 4. Aufl. Leipzig-Berlin 1920}, S. 359. Es scheint, daß deswegen Poincaré in seinem Vortrage »Die neue Mechanik« (Leipzig-Berlin 1911) Einstein nicht einmal erwähnt.], wie man die Uhren mittels der Lichtsignale auf die Lorentzsche Ortszeit richten kann. [***] deswegen müssen wir die Methode der Signalisierung (welche — wie wir betont haben — schon H. Poincaré 1900 aufgebracht hat), nur als eine Interpretation der Lorentzschen Formeln auffassen].

Stjepan Mohorovičič acknowledged Poincaré’s priority for realizing that the Lorentz Transformations form a group. Mohorovičič cites Max Abraham’s acknowledgment of Poincaré’s priority for the clock synchronization method with light signals, and asserts that Poincaré did not mention Einstein even once in his lecture *Die neue Mechanik* (*La mécanique nouvelle = The New Mechanics*), because Einstein had plagiarized Poincaré’s method of synchronizing clocks with light signals, which method is but an interpretation of Lorentz’ “Ortszeit”, and Poincaré’s assertion of the group properties of the Lorentz Transformation.

Felix Klein had made similar assertions in a private letter to Wolfgang Pauli on 8 March 1921, that Poincaré was the first to recognize that the Lorentz Transformations form a group and that Poincaré felt an animosity towards Einstein, and this was the only explanation for the fact that Poincaré snubbed Einstein in Poincaré’s Göttingen lecture on the new mechanics. Klein wrote,

Poincaré’s silence also caught the attention of Max Born, who stated,
“One of these series of lectures was given by Henri Poincare, April 22nd-28th 1909[.] The sixth lecture had the title ‘La mécanique nouvelle.’ It is a popular account of the theory of relativity without any formulae and with very few quotations. Einstein and Minkowski are not mentioned at all, only Michelson, Abraham and Lorentz. But the reasoning used by Poincaré was just that, which Einstein introduced in his first paper of 1905, of which I shall speak presently. Does this mean that Poincaré knew all this before Einstein? It is possible, but the strange thing is that this lecture definitely gives you the impression that he is recording Lorentz’ work.”

2159

Arvid Reuterdahl also was aware that Poincaré resented Einstein,

“Professor Henri Poincaré, the famous French physicist and mathematician, advisedly ignores the name of Einstein in his lectures on ‘Relativity’.”

2160

And Johannes Riem reiterated the fact,

2161

Alexander Moszkowski was very confused by the letter of recommendation Poincaré allegedly wrote for Einstein in 1911—which letter makes no mention of the theory of relativity. Moszkowski saw this as a reversal of the animosity Poincaré demonstrated towards Einstein in Berlin in 1910. Moszkowski wrote in 1921, describing his belief that Poincaré had come to recognize the “lasting importance of
Einstein’s researches[,]” and had overcome any doubts about the accumulating number of hypotheses in the new mechanics,

“On the 13th October 1910 a memorable event took place in the Berlin Scientific Association: Henri Poincaré, the eminent physicist and mathematician, had been announced to give a lecture in the rooms of the institute ‘Urania’; an audience of rather meagre dimensions assembled. [***] It was at this lecture that we heard the name Albert Einstein pronounced for the first time. Poincaré’s address was on the New Mechanics [***] At that time, early in 1916, only a few members of the Literary Society divined who it was that was enjoying their hospitality. In the eyes of Berlin, Einstein’s star was beginning its upward course, but was still too near the horizon to be visible generally. My own vision, sharpened by the French lecture and by a friend who was a physicist, anticipated events, and already saw Einstein’s star zenith, although I was not even aware at that time that Poincaré had in the meantime overcome his doubts and had fully recognized the lasting importance of Einstein’s researches.”

Poincaré did not mention Einstein in his lecture and Moszkowski must have heard Einstein’s name from his friend. Poincaré’s resentment of Einstein had nothing to do with the ad hoc hypotheses of the new mechanics, which he attributed to Lorentz, but was instead purely a product of Einstein’s plagiarism, which fact was acknowledged by the experts Felix Klein and Stjepan Mohorovičić.

Moszkowski was simply lying to his reading audience. He knew quite well that Poincaré, himself, was the father of the new mechanics and that Einstein had plagiarized it from Poincaré, though in 1904, Poincaré had generously attributed the “new mechanics” to Lorentz, before the Einsteins had published on the subject. Poincaré famously stated in 1904,

“From all these results, if they are confirmed, would arise an entirely new mechanics, which would be, above all, characterised by this fact, that no velocity could surpass that of light, any more than any temperature could fall below the zero absolute, because bodies would oppose an increasing inertia to the causes, which would tend to accelerate their motion; and this inertia would become infinite when one approached the velocity of light.”

Moszkowski failed to emphasize the fact, which was known to him, that Poincaré was himself the father of this new mechanics and had coined the term in 1904. Poincaré did object to the growing number of ad hoc hypotheses, but Poincaré nevertheless created the special theory of relativity, and the Einsteins plagiarized the theory from him. The fact that Poincaré was aware of the fatal flaws in the theory, while the Einsteins irrationally pretended them away by deliberately confusing induction with deduction, does not change the fact that Poincaré created the theory and the Einsteins copied it directly from him. This proves that the Einsteins were not only opportunistic plagiarists, but that they were also incompetent and dishonest.
Moszkowski wrote,

“For the theory asks us to brush aside habits of thought that have claimed an hereditary position in pre-eminent minds. One of the foremost physicists, Henri Poincaré, had confessed as late as 1910 that it caused him the greatest effort to find his way into Einstein’s new mechanics. Another whole year passed before he gave up his last doubts. Then he passed with flying colours into Einstein’s camp, and recommended Einstein’s appointment to the Professorship at Zürich, in conjunction with the discoverer of radium, Madame Curie, in an exuberant letter which may add its note of appreciation here:

‘Herr Einstein,’ so wrote the great Poincaré, ‘is one of the most original minds that I have ever met. In spite of his youth he already occupies a very honourable position among the foremost savants of his time. What we marvel at in him, above all, is the ease with which he adjusts himself to new conceptions and draws all possible deductions from them. He does not cling tightly to classical principles, but sees all conceivable possibilities when he is confronted with a physical problem. In his mind this becomes transformed into an anticipation of new phenomena that may some day be verified in actual experience. . . . The future will give more and more proofs of the merits of Herr Einstein, and the University that succeeds in attaching him to itself may be certain that it will derive honour from its connexion with the young master.’”

Moszkowski simply lied when he claimed that Poincaré had a difficult time understanding the theory Poincaré himself had created. Moszkowski simply lied when he attributed the theory Henri Poincaré had created to his plagiarist friend, who promised to make him rich, Albert Einstein.

A letter of recommendation would have been a matter of course and found no counterpart in Poincaré’s published works. This alleged recommendation of Einstein was never met with public or private praise in the context of the theory of relativity, and it was Poincaré’s nature to give such praise, which he so lavished on an undeserving Lorentz at every opportunity. Moszkowski made no such attack on Poincaré until after Poincaré had died and Moszkowski, who was a career sycophant, had made it his life’s work to promote Einstein as a cult figure and in so doing promote himself and make his fortune. Alexander Moszkowski was biased and sought desperately to promote Einstein to the public. He wrote to Albert Einstein on 1 February 1917,

“Regardless of what happens, I would like to continue the ‘cult’; for you it is secondary, for me it is of paramount importance in life. Additionally, I have the encouraging feeling that, with my modest writing abilities, I may also serve the cause once in a while.”

2165
We know that Moszkowski’s book of 1921 was deliberately deceitful, because he expressed very different feelings towards Poincaré in 1916 and 1917. Moszkowski’s more immediate impression of Poincaré’s lecture, in 1911, is on record,

Though much has been made of Einstein’s allegedly kinematic versus Poincaré’s allegedly dynamic expositions of length contraction, which some assert indicates that Poincaré failed to understand the special theory of relativity, the facts are that Poincaré originated Einstein’s plagiarized “kinematic” descriptions of length contraction and Poincaré went further by attempting a dynamic exposition of length contraction. This proves that Poincaré was the greater mind of the two, with the greater insight into the problem. Physics, as opposed to purely illustrative abstraction, compels a dynamic explanation for the physical dynamic interactions of matter in relative motion. To speak in terms of space and time without referring to physical bodies is scientifically meaningless.

It was Poincaré who first provided the quadri-dimensional exposition of length contraction, which Minkowski adopted, and which Einstein opposed for some time, and further which is truly the modern method of the theory of relativity as a mathematical formalism—a method of exposition which Einstein failed to understand for years, then when Minkowski published it in a form Einstein could almost understand, Einstein still opposed it for many years. Poincaré provided the conventionalist pseudo-kinematic exposition, the operational procedure and the space-time definition of length contraction, before Einstein and Minkowski manipulated credit for his ideas; and in 1909 Mittag-Leffler wrote to Poincaré that Ivar Fredholm recognized Poincaré’s priority. The fact that Poincaré actually attempted to interject Physics back into this mathematical formalism, Metaphysics, conventionalism and operationalism, does not eradicate his proven priority for the rest of the theory, nor would a change of mind erase what he had once stated from the historic record or the minds of the plagiarists.

Those who deny Poincaré’s priority based on perceived flaws in his theories which allegedly do not render the “perfect” theory of special relativity, i.e. the Einsteins’ “two postulate” fallacy of Petitio Principii, do not deny Einstein’s priority even when it is pointed out to them that the Einsteins’ 1905 paper is not the modern form of the theory and contains numerous mistakes. These apologists for Einstein operate on a double standard. They also fail to realize that the special theory of relativity is an evolving theory and has yet to be perfected, and no arbitrary point can
be selected along this evolution and legitimately be called the first publication of the special theory of relativity.

Long before Einstein, Poincaré recognized the group properties of the Lorentz Transformation, perhaps as early as 1904, and wrote to Lorentz about his findings in a letter which is reproduced in Arthur I. Miller’s *Albert Einstein’s Special Theory of Relativity: Emergence (1905) and Early Interpretation, 1905-1911*, Addison-Wesley, Reading, Massachusetts, (1981), p. 81. Poincaré almost certainly wrote to the Einsteins, because it is highly doubtful that the Einsteins knew what a group was. Poincaré published this mathematical discovery in the *Comptes Rendus* on 5 June 1905 before the Einsteins had submitted their paper to the *Annalen der Physik*, and long before the final paper of the Einsteins was published—perhaps published with modifications. It was ludicrous for Moszkowski to claim that Poincaré failed to grasp what he had created and what Albert Einstein had openly opposed.

Olivier Darrigol stated in 1996,

“The physicist-historian and the philosopher-historian usually argue that Einstein’s new kinematics was an extremely important innovation that overthrew previous physical and philosophical concepts of time; and they tend to interpret Poincaré’s, Lorentz’s, and others’ fidelity to the ether as a failure to understand Einstein’s superior point of view. On the contrary, the social historian would argue that in 1905 Einstein’s relativity had no stabilized meaning, that it could be read and used in various manners depending on the receiving local culture, and that it acquired a precise meaning only at the end of a complex, social structuring process.”

In 1922, Ludwig Lange, who had fought so hard for so long against so many, sought, without success, for acknowledgment of his parentage of the inertial system concept, which he published some twenty years before the Einsteins’ absolutism. Lange wrote, *inter alia*,

bei seinen Fachgenossen nahezu völligdurchgesetz zu haben scheint, während in der Physikfreilich erst die Ansätze dazu wahrzunehmen sind; denn Einstein selber und sein Anhang sträuben sich aus unverständlichen Gründen immer noch dagegen, eine so bequeme und charakteristische Bezeichnungsweise anzuwenden. Nun, die Zeit wird kommen, wo man mich als den Vater jener Nomenklatur und als den sorgfältigen Analysator des Sprachgebrauches der Mechanik, der die Wichtigkeit der relativistischen Richtung für die Physik besonders früh erkannte, nach Verdienst schätzen wird.”

Friedrich Kottler, author of *Gravitation und Relativitätstheorie* in 1903, revealed on March 31st, 1922, through the prestigious, widely read and well-respected *Encyklopädie der mathematischen Wissenschaften*,

“*H. Poincaré*, Palermo Rend. Circ. Math. 21 (1906), p. 129-175, especially p. 175, Formula (14). — This work of *Poincaré’s* is dated July 23, 1905 and is the elaboration of a memorandum by the same title in the Parisian C. R. 140 (June 5, 1905), pp. 1504-8. The ‘postulate’ of relativity was enunciated here for the first time, *before Einstein.*”

In 1923, Einstein’s plagiarism became an international scandal, and some called for the revocation of his Nobel Prize. Thomas Jefferson Jackson See made a statement on 12 April 1923 picked up by the Associated Press and published in *The New York Times*,

“Professor Westin charges Einstein with downright plagiarism, saying: ‘From these facts the conclusion seems inevitable that Einstein cannot be regarded as a scientist of real note. He is not an honest investigator.’ Thus Westin protested to the Directorate of the Nobel Foundation against the reward of Einstein.”

T. J. J. See published numerous articles accusing Albert Einstein of plagiarism. See’s quote originates from Arvid Reuterda hl’s article in *The Dearborn Independent* of 6 January 1923, in which Reuterda hl gives the fuller translation,

“From these facts the conclusions seem inevitable that Einstein cannot be regarded as a scientist of real note; that he is not an honest investigator; and that no valid reason can be assigned for awarding him the Nobel premium. It behooves the Nobel directorate carefully to examine all the charges of
plagiarism made against him before taking an irrevocable step which later may be regretted.”

In 1923, Arvid Reuterda hl published two long letters in The New York Times spelling out the case against Einstein and declared,

“No unprejudiced person can deny that, in the absence of direct and incontrovertible proofs establishing his innocence, Einstein must, in view of the circumstantial evidence previously presented, stand convicted before the world as a plagiarist.”

Reuterda hl also published numerous articles accusing Einstein of plagiarism, the plagiarism of Reuterda hl’s works, as well as those of others. Reuterda hl challenged Einstein to a debate over his priority and the soundness of the theory of relativity. Reuterda hl’s challenge was heavily covered by the international press at the time. Einstein refused to accept the challenge.

Reuterda hl made public the priority of Johann Heinrich (aka J. Henri) Ziegler over Einstein. Ziegler lectured in Switzerland while Einstein lived there and while Einstein was developing his copy of Lorentz’ theory. Ziegler asserted his priority over Einstein and accused Einstein of plagiarizing his work,

“Now if it was already suspicious that the antedated ‘hypothesis’ of the constancy of the speed of light appears in Einstein’s theory, then the new Einseinian discovery of the replacement of the nonsensical ether by the integral primal atom of light and empty space must now appear to us beyond any doubt as an instance of plagiarism, though admittedly based on poor understanding. One can compare the premature, purely mathematical plagiarism to the copying of a Raphael painting by a modern cubist, where only the sharpest eye is still able to discover the resemblance with the original, but in the present case it was an attempt at an exact copy by a dull-witted incompetent.”

“War nun schon jene „Annahme“ von der Konstanz der Lichtgeschwindigkeit in Einstein’s Theorie verdächtig, so muß uns jetzt die neue Einstein’sche Entdeckung von der Ersetzbarkeit des sinnlosen Äthers durch die vollen Urlichtatome und den leeren Raum als ein ganz zweifelloses Plagiat erscheinen, aber allerdings als ein immer noch schlecht verstandenes. Das frühere, rein mathematische Plagiat kann man mit der Kopie eines Raphael’schen Gemäldes durch einen modernen Kubisten vergleichen, bei der nur schärffste Auge noch eine Ähnlichkeit mit dem Original zu entdecken vermag, das jetzige dagegen gleich auf bereits einer gut gemeinten Kopie durch einen Stümper.”

In 1927, Hans Thirring wrote,
“H. Poincaré had already completely solved the problem of time several years before the appearance of Einstein’s first work (1905). Beginning with an article in Revue de Métaphysique et de Morale which appeared in 1898 (later reprinted in his book ‘The Value of Science’ as a chapter on the concept of time), Poincaré settled the general problem of time from the physical standpoint and had already there referred to the fact that the principle of the constancy of the velocity of light serves as a basis for a definition of time. Poincaré, in his work ‘La Théorie de Lorentz et le Principe de Réaction’ [Relevant citations and quotations found in endnote^{2180}], then defined Lorentz’ local time (Fig. 23) as time, which time is to be measured with clocks synchronized by light signals.”

On 7 February 1928, The New York Times reported on page 26,

“If [Einstein] is the father of relativity, then Lorentz is its grandfather.”

In 1929, Robert P. Richardson published an extensive article on Einstein’s plagiarism in The Monist, a publication famous for publishing the works of Mach, Hilbert, Poincaré, and others, from whom Einstein plagiarized,

“Thus, with what is known as the special theory, if we consider as paramount factor not the detail work but the guiding thoughts by which this was inspired, then the father of this special relativity theory was undoubtedly Henri Poincaré. [***] In the general theory of relativity the basic thought is that of Mach, viz. the replacement in dynamics of the law of gravitation by a law of motion. But in what Einstein built upon this basis the influence of Poincaré is again manifest. [***] And in view of all these facts one does not know at which to be most astounded: the magnanimity of Poincaré who was always over-anxious that there should be recognition of the labors of those who reaped where he himself had sown, the apathy of his friends after his death, or the peculiar attitude of Einstein and his coterie, exemplified by Born of Goettingen, who refers to Poincaré as one of those who
‘collaborated’ with Einstein in the development of the relativity theory!\textsuperscript{2182}

Similar remarks are found in the writings of Haiser and Zettl.\textsuperscript{2183}

Accusations of plagiarism plagued Einstein throughout his career. The New York Times reported on 27 March 1931 on page 2 that Ira D. Edwards had attempted to sue Einstein for plagiarizing his book, which he had copyrighted in 1929. The Times reported that the suit was dismissed. It is difficult to prove accusations of plagiarism in a court of law, especially a specific instance of plagiarism, as opposed to a career-long pattern. This may be one reason why more individuals did not speak out against the plagiarist Einstein. They risked a defamation suit.

The Dictionary of Scientific Biography, in its article on Lorentz, states,

“Einstein’s 1905 special relativity paper provided Lorentz’ theory with a physical reinterpretation. [***] Einstein deduced the Lorentz transformations and other results that had first been made known through Lorentz’ and others’ electron theories. [***] Lorentz admired, but never embraced, Einstein’s 1905 reinterpretation of the equations of his electron theory. The observable consequences of his and Einstein’s interpretations were the same, and he regarded the choice between them as a matter of taste. [***] Lorentz, and Einstein too, regarded the physical space of general relativity as essentially fulfilling the role of the ether of the older electron theory.”\textsuperscript{2184}

This statement is very significant. It reveals that the ultimate “fiction” (Vaihinger’s sense of the term in his Die Philosophie des Als Ob) of both Lorentz’ and the Einsteins’ theories is the same, with any distinctions between the two theories being metaphysical (truly just semantic) and not scientific—the theories make the same predictions; and are, therefore, scientifically speaking, indistinguishable. The Einsteins’ theory is a quasi-positivistic mathematical analysis of Lorentz’ synthetic physical theory—a “dimensional disguise” for it.\textsuperscript{2185} Albert Einstein did not grasp the distinction between Metaphysics and science. He stated in 1930 that, “Science itself is metaphysics.”\textsuperscript{2186}

In this context, Hendrik B. G. Casimir stated,

“How[ever] brilliant Einstein’s conception may have been, the quantitative treatment and the accompanying concretisation of the atomic concept [by Lorentz] proved to be a greater and as to its consequences more important occurrence.”\textsuperscript{2187}

Einstein hid from the many accusations that his theory was metaphysical nonsense—an inconsistent jumble of fallacies of Petitio Principii—nothing but an excuse to plagiarize. Einstein conceded that he was overrated as a physicist, and that the cult of personality surrounding him was unjustified.\textsuperscript{2188} Einstein stated in 1921,

“The cult of individuals is always, in my view, unjustified. To be sure, nature distributes her gifts unevenly among her children. But there are plenty of the
well-endowed, thank God, and I am firmly convinced that most of them live quiet, unobtrusive lives. It strikes me as unfair, and even in bad taste, to select a few of them for boundless admiration, attributing superhuman powers of mind and character to them. This has been my fate, and the contrast between the popular estimate of my powers and achievements and the reality is simply grotesque.\textsuperscript{2189}

A meeting was arranged to discuss Vaihinger’s theory of fictions in 1920, and Einstein pledged that he would attend this meeting. Knowing that Einstein would be devoured in a debate over his mathematical fictions, which confused induction with deduction, Wertheimer and Ehrenfest helped Einstein fabricate an excuse to miss the meeting he had agreed to attend. Einstein was proven a liar.\textsuperscript{2190} He also hid from many other criticisms, and Einstein refused to answer T. J. J. See’s many charges of plagiarism,\textsuperscript{2191} and refused to debate Reuterdahl or to answer his many charges of plagiarism.\textsuperscript{2192} When Robert Drill\textsuperscript{2193} criticized the theory of relativity, Einstein tried to persuade Max Born and Moritz Schlick to not respond to the critique, but if they did so, to hide from his arguments and merely ridicule Drill with insults.\textsuperscript{2194} Einstein hid from the French Academy of Sciences.\textsuperscript{2195} Einstein hid from Cardinal O’Connell.\textsuperscript{2196} Einstein hid from Dayton C. Miller’s falsification of the special theory of relativity.\textsuperscript{2197} Einstein hid from Cartmel.\textsuperscript{2198} Miller hammered Einstein in the press over the course of many years. \textit{The New York Times Index} lists several articles in which Miller’s and William B. Cartmels’ falsifications of the special theory of relativity are discussed.\textsuperscript{2199} Einstein and Lorentz were very worried by Miller’s results and could not find fault with them.\textsuperscript{2200} Einstein told R. S. Shankland not to perform an experiment which might falsify the special theory of relativity,

\[\text{“[Einstein] again said that more experiments were not necessary, and results such as Synge might find would be ‘irrelevant.’ [Einstein] told me not to do any experiments of this kind.”}\textsuperscript{2201}

Einstein knew he was caught at the Arbeitsgemeinschaft deutscher Naturforscher meeting in the Berlin Philharmonic, and wanted to run away from Germany. Einstein desired to hide from the Bad Nauheim debate, in which he had threatened to devour his opponents.\textsuperscript{2202} then Einstein—after being talked into appearing and after much hype promoting the event which attracted thousand of visitors—then Einstein, when losing the debate, ran away during the lunch break and again wanted to run away from Germany.\textsuperscript{2203} Einstein prospered from hype and had no legitimacy as a supposed “genius”. The press rescued him again and again, while he hid. Einstein was unable to defend “his” theories in the light of strict scrutiny.

T. J. J. See wrote in \textit{The San Francisco Journal}, on 13 May 1923, in an article entitled, “Einstein a Second Dr. Cook?”:

\[\text{“The Magazine and newspaper press for the last eight years has been so filled with systematic propaganda, undoubtedly organized and directed by Einstein and his agents, that the public has become}\]
familiar with the name of Einstein and with the phrase ‘Theory of Relativity’. Not one lay person in a thousand has any idea what this all means; and as the people do not understand it, the phrases are passed on in joke, or assumed to represent something important in the higher lines of physical science. It is well known that about six years ago Einstein tried to cast a halo of glory about his head by allowing the report to go forth that not over twelve mathematicians in the world could understand his benighted theory of relativity. Of course this is preposterous, and nobody knows it better than Einstein himself. [***] In short, I have at length become convinced that Einstein is a faker, with considerable skill in deceiving the press and public, so as to ding-dong into the unthinking the idea that he is a great mathematician and philosopher, who is improving on Newton. Let us first notice the errors of Einstein, and the cunning way in which he gets away from them, owing to the layman’s inability to pin him down.”

T. J. J. See wrote in *The San Francisco Journal*, on 20 May 1923,

“No doubt is entertained by leading German physicists—like Professor Dr. E. Gehrcke, director of the Imperial Physical and Technical Institute of Berlin, and Dr. P. Lenard of Heidelberg, winner of the Nobel Prize in physics—that Einstein appropriated improperly the Newton-Soldner formula published 122 years before. Let the Einstein shouters explain these embarrassing coincidences if they can!

These unprofessional proceedings of Einstein have been a scandal in Europe for some time. The discussion rages all over Germany and, in fact, all over Europe. The revolt against Einstein extends from Spain to Russia, from Sweden to Italy. The learned and honored Professor Dr. Westin of Stockholm protested to the Nobel Foundation against any recognition of Einstein, accusing him of downright plagiarism, saying:

‘From these facts the conclusion seems inevitable that Einstein cannot be regarded as a scientist of real note; he is not an honest investigator.’

To the present day, be it said to the honor of the Royal Swedish Academy of Sciences, they refused Einstein any recognition on the theory of relativity. Is it any wonder that the Paris Academy of Sciences (October 14, 1921) came out with conspicuous proclamations by Professors Picard and Painlevé against Einsteinism, and in favor of Newtonian mechanics? It was near this time that Einstein visited Paris and sought to have the academy invite him to address the institute, though not a member of it. As this proposed proceeding was unprecedented, half a dozen leading academicians served notice on the officials of the institute that they would not have it, threatening to resign if the invitation were extended to Einstein. This put a stop to the display of Einstein planned for Paris. In fact, his reception there seems to have been quite a frost. The French are careful of the dignity of the Academy of Sciences, and in this respect they set a much better example than the Royal Society of London, which early championed Einsteinism and now is sorry for it.”
T. J. J. See wrote in *The San Francisco Journal*, on 27 May 1923, in an article entitled, “Einstein a Trickster?”

“When the Lick eclipse work was reported to [Einstein], with my criticism, April 12, 1923, he admitted to the correspondent, Karl H. von Wiegand, April 14, 1923, that:

‘In so far as precise measurement is concerned, Captain See may be said to be correct in denying that the tests proved the theory of relativity. But, he pointed out, under more favorable circumstances, even this might be removed.’

‘Einstein said he was not worried by the attack of Captain See, but would leave it to the scientific world to settle the matter. It the fate of all scientists to arouse antagonism by revolutionary theories.’ So feeble is [Einstein’s] defense.

As I had recalled the charges of plagiarism made against him by Gehrcke, Leonard and Westin, it will be seen that he does not answer these charges, but adroitly evades them. Thus it looks as if he has no defense and he wishes not to discuss it. The above statement of glittering generalities show the weakness of [Einstein’s] case—a tacit admission that he has no answer, and thus he prudently keeps still, hoping the public will forget the charges. So far as I can tell from the careful study of the whole business Einstein is a faker. Apparently he belongs in the company of Dr. Cook of Polar exploration noise and notoriety.”

William Cardinal O’Connell gave a speech on 7 April 1929, which attracted a great deal of attention. He stated, *inter alia*:

“What does all this worked-up enthusiasm about Einstein mean? It evidently is a worked-up, fictitious enthusiasm, because I have never yet met a man who understood in the least what Einstein is driving at, and I have been so impressed by this fact I very seriously doubt that Einstein himself knows really what he means. Truth is always very clear when seen with a clear eye. The fact that any theory cannot be enunciated and only succeeds in befogging the mind, is a patent proof that it is not really truth. [***] [O]ne weakness of the American public is to run after novelties which have nothing in them but their newness. The American student body is very often misled into false channels of knowledge by the sudden appearance of these glittering meteors who from time to time shoot across the horizon. And then it seems there is some sort of organized clique that boosts these sudden apparitions and as quickly disavows them and forgets them. [***] Now, for the moment, it is Einstein. Nobody knows what he is trying to reveal, but in a certain sense that adds mystery to his name[.] All this proves how careful the student youth must be in following this fanatical applause, which oftentimes is merely the outpouring of a sort of hero worship, but even as such can do endless harm to the impressionable mind of the young student.”

"*2204
Cardinal O’Connell wrote in the 12 April 1929 edition of the Boston Evening American,

“I was rather amused the very next day to see by the Transcript that my opinion of Einstein’s theory and purpose had been conveyed to Einstein himself—that not he, but Frau Einstein, said that Einstein did not wish to dispute with me about his theories and that my assertions left him cold. That struck me [***] as little convincing as his general attitude to all, even the greatest scientists of Europe and America, who face him from time to time with indisputable proof of the fact that his so-called new theory of relativity is not new at all, but that whatever there is in it of scientific value is nothing but a plagiarism of Von Soldner’s system explaining the deflection of light published as far back as about 1810. [***] Again and again Einstein has been faced with what appears to be clear proofs of plagiarism and absolute philosophic sophistry by the best minds in Germany, and his only answer to them is what he now answers, ‘he is indifferent—it leaves him cold.’

The Vatican newspaper Observatore Romano praised Cardinal O’Connell’s criticism of Einstein and the theory of relativity in an editorial on 23 May 1929. Einstein’s advocate, Albert von Brunn, boasted in 1931 that Einstein was not interested in “academic disputes” and presented this vice as if a virtue in order to excuse Einstein’s inability to answer his critics. It was typical of the pattern of Einstein’s apologists of turning Einstein’s flaws into supposed virtues, his weaknesses into supposed strengths, through misguided heroic idolatry. Von Brunn wrote,

“Some reasonable critics in philosophy and physics have allowed themselves to be called in among these ‘authors’, with whom relativist scientists need not, and actually also do not consider it beneath their dignity to cross swords. (Although Einstein himself, by nature a pure scientist, is uninterested in such academic disputes!)”

In 1931, Friedrich Jacob Kurt Geissler complained that Einstein had plagiarized his work on relativity theory, which included the relativity of time, space and simultaneity, and a relativistic analysis of mass, events and causality,

“It is completely wrong, that the expression ‘theory of relativity’ or even ‘relativity’ is inseparably tied to the name ‘Einstein’, as the immoderate advertising has accomplished with the lay public and some scholars. Newton has already expounded a great deal upon the relative and the absolute in Mathematics and in Physics. Modern physicists, like E. Mach, whose work Einstein knows quite well and uses, have written about generalizing the concepts of relative space, relative time and motion (long before Einstein, 1865, 1901 ‘The Science of Mechanics; a Critical and Historical Account of Its Development’ and later); Mansion (Paris 1863) holds that the notion of
absolute motion is senseless and that the Ptolemaic and Copernican system are kinematically equally justified. Whereas Einstein first published something on relativity from 1905 on; I, myself, had already published an interdependent general ‘feasible’ theory of relativity in space, time, etc. in 1900; he, however, does not cite my book (‘Eine mögliche Wesenserklärung. . .’).

It is interesting to look for the source of the oft heard expression, “The Einstein Myth”, which refers to the disingenuous glorification of Albert Einstein. The Minneapolis Sunday Tribune declared, on 10 April 1921, on page 11, that the “Einstein Theory of Relativity Is Branded Myth”. Arvid Reuterdahl, a fine artist, produced a card which was distributed on the occasion of the “Albert Einstein Jubilee” at the Metropolitan Opera House in New York City on 16 April 1929 with a cartoon mockingly depicting a deified Einstein and his groveling sycophants, as well as a dignified dissenting physicist rejecting Einstein, on one side of the card, which declared on the other side,

“Einstein’s message to the audience, by the Associated Press from Berlin: ‘YOU MEET TO CELEBRATE A MYTH BEARING MY NAME.’ Comment by Dissenting Scientist: ‘THE TRUEST WORDS THAT EINSTEIN EVER SAID.’”

“When I read some of Einstein’s utterances, [***] and when I see all that he says taken as final absolute truth, I wonder whether we are not victims of an Einstein myth.”
In 1979, Dean Turner and Richard Hazelett published a book exposing this myth, *The EINSTEIN Myth and the Ives Papers.* Who first referred to the “Einstein Myth” may never be known for certain, but what is certain is that the theories are mythological and Albert Einstein was a career plagiarist.

On 23 February 1929 *The New York Times* on page 15 quoted Robert Andrews Millikan on the source of Einstein’s work,

‘Einstein in 1905 generalized [the result of the Michelson-Morley experiment] by postulating that it is in the nature of the universe impossible to find the speed of the earth with respect to the ether,’ [Millikan] said. ‘This postulate rests most conspicuously upon and historically grew chiefly out of the negative result of the Michelson-Morey [sic] experiment.’”

Hans Reichenbach published an article “Einstein’s Theory Traced to Sources” on 26 January 1929 in *The New York Times* on page 3 and stated,

“This is the aim of Einstein’s new theory, which he has now completed, [A New Field Theory]. It uses as an aid a peculiar mathematical source which, in its origin, goes back to the Zurich mathematician Weyl and the English astronomer Eddington.”

*The New York Times* on 2 September 1936, in a story which begins on the front page, quoted Elie Joseph Cartan on page 16,

“It is unnecessary to recall the great services which tensor analysis has rendered to geometry and to mathematical physics. Every one is aware that Einstein’s general theory of relativity might not have been conceived had this admirable instrument of research not been created, under the name of ‘absolute differential calculus,’ by G. Ricci and T. Levi-Civita.”

Sir Edmund Whittaker in his detailed survey, *A History of the Theories of Aether and Electricity*, Volume II, (1953), included a chapter entitled “The Relativity Theory of Poincaré and Lorentz”. Whittaker thoroughly documented the development of the theory, documenting the authentic history, and demonstrated through reference to primary sources that Einstein held no priority for the vast majority of the theory. Einstein offered no counter-argument to Whittaker’s famous book, in which the following passage appeared,

“Einstein published a paper which set forth the relativity theory of Poincaré and Lorentz with some amplifications, and which attracted much attention. He asserted as a fundamental principle the constancy of the velocity of light, i.e. that the velocity of light in vacuo is the same in all systems of reference which are moving relatively to each other: an assertion which at the time was widely accepted, but has been severally criticized by later writers.”
Whittaker also wrote a biography of Einstein, in *Biographical Memoirs of Fellows of the Royal Society*, which reiterated the truth, that Einstein did not create the theory of relativity,

“The aggregate of all the transformations so obtained, combined with the aggregate of all the rotations in ordinary space, constitutes a group, to which Poincaré* gave the name the group of Lorentz Transformations.

Einstein [**] adopted Poincaré’s Principle of Relativity (using Poincaré’s name for it) as a new basis for physics and showed that the group of Lorentz transformations provided a new analysis connecting the physics of bodies in motion relative to each other. Notable results appearing in this paper for the first time were the relativist formulae for aberration and also for the Doppler effect.”

Even among Einstein’s admirers voices are heard which deny Einstein’s priority. Max Born averred that,

“Lorentz enunciated the laws according to which the measured quantities in various systems may be transformed into each other, and he proved that these transformations leave the field equations of the electron theory unchanged. This is the mathematical content of his discovery. Larmor (1900) and Poincaré (1905) arrived at similar results about the same time. It is interesting historically that the formula of transformation to a moving system, which we nowadays call Lorentz’ transformation (see vi, 2, p. 200 formula (72)), were set up by Voigt as early as 1877 [sic] in a dissertation which was still founded on the elastic theory of light. [**] In the new theory of Lorentz the principle of relativity holds, in conformity with the results of experiment, for all electrodynamical events.”

and,

“As mentioned already, Lorentz and Poincaré have succeeded in doing this by careful analysis of the properties of Maxwell’s equations. They were indeed in possession of a great deal of mathematical theory. Lorentz, however, was so attached to his assumption of an ether absolutely at rest that he did not acknowledge the physical significance of the equivalence of the infinite numbers of systems of reference which he had proved. He continued to believe that one of them represented the ether at rest. Poincaré went a step further. It was quite clear to him that Lorentz’s viewpoint was not tenable and that the mathematical equivalence of systems of reference meant the validity of the principle of relativity. He also was quite clear about the consequences of his theory.”

and,
“I have now to say some words about the work of these predecessors of Einstein, mainly of Lorentz and Poincaré. [...] H. A. Lorentz’ important papers of 1892 and 1895 on the electrodynamics of moving bodies contain much of the formalism of relativity. [...] Poincaré’s papers [...] show that as early as 1899 he regarded it as very probable that absolute motion is indetectable in principle and that no ether exists. He formulated the same ideas in a more precise form, though without any mathematics, in a lecture given in 1904 to a Congress of Arts and Science at St. Louis, U.S.A., and he predicted the rise of a new mechanics which will be characterized above all by the rule, that no velocity can exceed the velocity of light. [...] The reasoning used by Poincaré was just that, which Einstein introduced in his first paper of 1905 [...] Does this mean that Poincaré knew all this before Einstein? It is possible [...] Many of you may have looked up his paper ‘Zur Elektrodynamik bewegter Körper’ in Annalen der Physik (4), vol. 17, p. 811, 1905, and you will have noticed some peculiarities. The striking point is that it contains not a single reference to previous literature. It gives you the impression of quite a new venture. But that is, of course, as I have tried to explain, not true.”

Einstein’s friend, physicist Peter Gabriel Bergmann, asserted,

“The Dutch physicist, Hendrik Antoon Lorentz (1853-1928) contrived a theoretical scheme according to which absolute motion of physical objects, including measuring rods, should compress them in such a manner that differences in the speed of light remained undetectable by any conceivable apparatus. Jules Henri Poincaré (1854-1912), the French mathematician, suggested that the consistent failure to identify the frame representing absolute rest indicated that no such frame existed, and that Newton’s scheme of the multiplicity of inertial frames was valid after all. In 1905, Einstein combined Lorentz’ and Poincaré’s ideas into a new approach to the issue of frames of reference and so was able to explain why no experiment had uncovered the absolute motion of the earth, without contradicting Maxwell’s theory of electricity and magnetism.”

The Einsteins’ 1905 paper failed to present references to the work it “combined” of Lorentz and Poincaré. That which was “new” in the “approach” is of minor significance. Poincaré’s work was itself the combination of Lorentz’ and Poincaré’s ideas, which “combination” Mileva and Albert did not create, but simply repeated, parroting Poincaré’s earlier works, virtually verbatim.

Prof. G. H. Keswani argued that,

“As far back as 1895, Poincaré the innovator had conjectured that it is impossible to detect absolute motion. In 1900 he introduced the ‘The principle of relative motion’ which he later called by the equivalent terms ‘The law of relativity’ and ‘The principle of relativity’ in his book Science
and Hypothesis published in 1902. He further asserted in this book that there is no absolute time and that we have no intuition of the ‘simultaneity’ of two ‘events’ (mark the words) occurring at different places. In a lecture given in 1904, Poincaré reiterated the principle of relativity, described the method of synchronisation of clocks with light signals, urged a more satisfactory theory of the electrodynamics of moving bodies based on Lorentz’s ideas and predicted a new mechanics characterized by the rule that the velocity of light cannot be surpassed. This was followed in June 1905 by a mathematical paper entitled ‘Sur la dynamique de l’électron’ in which the connection between relativity (impossibility of absolute motion) and the Lorentz Transformation given by Lorentz a year earlier was recognized. In point of fact, therefore, Poincaré was not only the first to enunciate the principle, but also discovered in Lorentz’s work the necessary mathematical formulation of the principle. All this happened before Einstein’s paper appeared.”

How do we account for the striking similarity between Lorentz’ and Poincaré’s writings and Einstein’s words in both the “special” and “general” theories of relativity? Who published what, first? Was it mere coincidence that time after time Einstein repeated what Poincaré had earlier published? The record indicates that Poincaré held priority over Einstein, often by many years. Why is it that Albert’s last name is a household word and is synonymous with “relativity”, and Poincaré’s name is substantially more obscure? Einstein believed,

“The secret to creativity is knowing how to hide your sources.”

9.3 The Æther

Many criticized Einstein’s theories as metaphysical “nonsense”, as purely mathematical fictions lacking physical content. As Arthur Eddington explained,

“Let us suppose that an ichthyologist is exploring the life of the ocean. He casts a net into the water and brings up a fishy assortment. Surveying his catch, he proceeds in the usual manner of a scientist to systematise what it reveals. He arrives at two generalisations:

(1) No sea-creature is less than two inches long.
(2) All sea-creatures have gills.

These are both true of his catch, and he assumes tentatively that they will remain true however often he repeats it.

In applying this analogy, the catch stands for the body of knowledge which constitutes physical science, and the net for the sensory and intellectual equipment which we use in obtaining it. The casting of the net corresponds to observation; for knowledge which has not been or could not be obtained by observation is not admitted into physical science.

An onlooker may object that the first generalisation is wrong. ‘There are plenty of sea-creatures under two inches long, only your net is not adapted
to catch them.’ The ichthyologist dismisses this objection contemptuously.
‘Anything uncatchable by my net is ipso facto outside the scope of ichthyological knowledge, and is not part of the kingdom of fishes which has been defined as the theme of ichthyological knowledge. In short, ‘what my net can’t catch isn’t fish.’ Or—to translate the analogy—’If you are not simply guessing, you are claiming a knowledge of the physical universe discovered in some other way than by the methods of physical science, and admittedly unverifiable by such methods. You are a metaphysician. Bah!’”

The “ether”, or “æther”, is a hypothetical fluid, which may fill space and conduct electromagnetic waves such as light, and is perhaps an intervening medium between bodies, which causes gravity. Einstein tried to distinguish his work from Lorentz’ by calling the æther “superfluous”, which assertion Poincaré and countless others had long since enunciated. The existence of this “fluid” has been hotly disputed for thousands of years, but unless we deny dimension as an anthropomorphic delusion of consciousness, notional not real, 2220 “space” as extension without “material” must be something. An empty box contains something, even if we evacuate the air from it. We can give this something any name we like, but changing its name is a matter of semantics, not discovery.

One cannot speak of “propagation” without tacitly or overtly referring to a medium, and the 1905 paper speaks of “propagation”. As Sir Arthur Schuster stated,

“Einstein, in a paper of great interest and power, has developed this idea, calling his imagined law ‘The principle of relativity,’ because it stipulates—\textit{a priori}—that only the relative motion between material bodies can be detected. It is impossible for me to discuss in detail the reasoning by which this principle is justified, and an account without explanations of its consequences would lay me open to the charge that I was playing with your credulity. Suffice, therefore, it to say that strict adherers to the principle cannot admit the existence of an æther, and yet may speak of the transmission of light through space with a definite velocity. They must further accept, as a consequence of their dogma, that identical clocks placed on two bodies moving with different velocities have different rates of going and that, even on the same body, identical clocks indicate different times, when the line joining their positions lies in the direction of motion. The motion must be determined relative to another body, which is supposed to be at rest, and a clock placed on that body must serve as the ultimate standard of time. The theory appears to have an extraordinary power of fascinating mathematicians, and it will certainly take its place in any critical examination of our scientific beliefs; but we must not let the simplicity of the assumption underlying the principle hide the very slender experimental basis on which it rests at present, and more especially not lose sight of the fact, that it goes much beyond what is proved by Michelson’s experiment. In that experiment, the source of light and the mirrors which reflected the light were all connected together by rigid bodies, and their distances depended therefore
on the intensity of molecular forces. Einstein’s generalisation assumes that the result of the experiment would still be the same, if performed in a free space with the source of light and mirrors disconnected from each other but endowed with a common velocity. This is a considerable and, perhaps, not quite justifiable generalisation. I am well aware that Bucherer’s experiments with cathode rays are taken to confirm the validity of Einstein’s principle, but if we say that they are not inconsistent with it, we should probably go as far as is justifiable.”

The Einsteins were under the spell of the new school of positivism which was to become “Logical Positivism”, and which Sir Arthur Schuster would later categorize as a cowardly cop out to ignorance, and further which “Logical Positivism” Karl Popper would systematically discredit as solipsism. The Einsteins may have believed that they could disguise their piracy of Poincaré’s interpretation of Lorentz’ theory, by stating it in Poincaré’s quasi-positivistic form, without mentioning Poincaré. The Einsteins would have found references in Mach’s work to,

“Budde’s conception of space as a sort of medium.”

Schuster wrote against the emerging positivism, and the consequences of its cowardice,

“I have during these lectures contrasted on several occasions the former tendency to base our technical explanations of natural phenomena on definite models which we can visualise and even construct, with the modern spirit which is satisfied with a mathematical formula, and symbols which frequently have no strictly definable meaning. I ought to explain the distinction between the two points of view which represent two attitudes of mind, and I can do so most shortly by referring to the history of the electrodynamic theory of light, the main landmarks of which I have already pointed out in the second lecture. The undulatory theory—as it left the hands of Thomas Young, Fresnel and Stokes—was based on the idea that the æther possessed the properties of an elastic solid. Maxwell’s medium being quite different in its behaviour, its author at first considered it to be necessary to justify the possibility of its existence, by showing how, by means of fly wheels and a peculiar cellular construction, we might produce a composite body having the required properties. Although later Maxwell laid no further stress on the ultimate construction of the medium, his ideas remained definite and to him the displacements which constituted the motion of light possessed a concrete reality. In estimating the importance of the support which Maxwell’s views have received from experiment, we must distinguish between the fundamental assumptions on which Maxwell based his investigations and the mathematical formulæ which were the outcome of these investigations. It is clearly the mathematical formulæ only which are confirmed and the same formulæ might have been derived from quite
different premises. It has always been necessary, as a second step of great
discovery, to clear away the immaterial portions which are almost invariable
accessories of the first pioneer work, and Heinrich Hertz, who besides being
an experimental investigator was a philosopher of great perspicacity,
performed this part of the work thoroughly. The mathematical formula
instead of being the result embodying the concrete ideas, now became the
only thing which really mattered. To use an acute and celebrated expression
of Gustav Kirchhoff, it is the object of science to describe natural
phenomena, not to explain them. When we have expressed by an equation the
correct relationship between different natural phenomena we have gone as
far as we safely can, and if we go beyond we are entering on purely
speculative ground. I have nothing to say against this as a philosophic
doctrine, and I shall adopt it myself when lying on my death-bed, if I have
then sufficient strength to philosophise on the limitations of our intellect. But
while I accept the point of view as a correct death-bed doctrine, I believe it
to be fatal to a healthy development of science. Granting the impossibility of
penetrating beyond the most superficial layers of observed phenomena, I
would put the distinction between the two attitudes of mind in this way: One
glorifies our ignorance, while the other accepts it as a regrettable necessity.
The practical impediment to the progress of physics, of what may reluctantly
be admitted as correct metaphysics, is both real and substantial and might be
illustrated almost from any recent volume of scientific periodicals. Everyone
who has ever tried to add his mite to advancing knowledge must know that
vagueness of ideas is his greatest stumbling-block. But this vagueness which
used to be recognised as our great enemy is now being enshrined as an idol
to be worshipped. We may never know what constitutes atoms or what is the
real structure of the æther, why trouble therefore, it is said, to find out more
about them. Is it not safer, on the contrary, to confine ourselves to a general
talk on entropy, luminiferous vectors and undefined symbols expressing
vaguely certain physical relationships? What really lies at the bottom of the
great fascination which these new doctrines exert on the present generation
is sheer cowardice: the fear of having its errors brought home to it. As one
who believes that metaphysics is a study apart from physics, not to be mixed
up with it, and who considers that the main object of the physicist is to add
to our knowledge, without troubling himself much as to how that knowledge
may ultimately be interpreted, I must warn you against the temptation of
sheltering yourself behind an illusive rampart of safety. We all prefer being
right to being wrong, but it is better to be wrong than to be neither right nor
wrong.”

James Mackaye wrote in 1931,

“Einstein’s explanation is a dimensional disguise for Lorentz’s. [***] Thus
Einstein’s theory is not a denial of, nor an alternative for, that of Lorentz. It
is only a duplicate and disguise for it. [***] Einstein continually maintains
that the theory of Lorentz is right, only he disagrees with his ‘interpretation.’
Is it not clear, therefore, that in this, as in other cases, Einstein’s theory is
merely a disguise for Lorentz’s, the apparent disagreement about
‘interpretation’ being a matter of words only?”

Lorentz pointed out in 1913,

“The latter is, by the way, up to a certain degree a quarrel over words: it
makes no great difference, whether one speaks of the vacuum or of the
æther.”

“Letzteres ist übrigens bis zu einem gewissen Grade ein Streit über Worte:
es macht keinen großen Unterschied, ob man vom Vakuum oder vom Äther
spricht.”

In 1980, Friedrich Hund wrote about the general theory of relativity and the
æther,

“Man kann Einsteins Leistung als „Abschaffung des Äthers“ bezeichnen,
muß sich aber hüten, in einen Streit um Worte zu geraten. Heute, 75 Jahre
später, kennen wir auch die „allgemeine Relativitätstheorie“, die ein lokales
„Inertialfeld“ beschreibt, das was H. Weyl in seiner bildhaften Sprache den
„Trägheitskompaß“ nannte, die lorentzinvariante Einbettung des lokalen
Geschehens in die weltweite Umgebung. Wir kennen weiter kosmologische
Fakten, die isotrope Expansion des Systems der Galaxien und die isotrope
3K-Strahlung, die ein lokales spezielles Bezugssystem, Weyl’s „Sternenkompaß“, festlegen. Diese Struktur des Universums, vielleicht nur
des großen Ausschnittes aus ihm, der unserer Beobachtung zugänglich ist,
sehen wir als geschichtlich geworden an. Diese Struktur hätte H. Weyl
vielleicht Äther genannt und ihm „Kränze und Gesang geweiht.“

In 1934, Albert Einstein confirmed Mackaye’s assertions,

“Then came H. A. Lorentz’s great discovery. All the phenomena of
electromagnetism then known could be explained on the basis of two
assumptions: that the ether is firmly fixed in space—that is to say, unable to
move at all, and that electricity is firmly lodged in the mobile elementary
particles. Today his discoveries may be expressed as follows: physical space
and the ether are only different terms for the same thing; fields are physical
states of space.”

Einstein stated in 1953,

“It was here that H. A. Lorentz’ act of intellectual liberation set in. With
great logic and consistency he based his investigations on the following
hypotheses: The seat of the electromagnetic field is empty space. [***] The really essential step forward, indeed, was precisely Lorentz’ having reduced the facts to Maxwell’s equations concerning empty space, or — as it was then called — the ether. H. A. Lorentz even discovered the ‘Lorentz transformation’, so named after him, — though ignoring its group-like quality. For him, Maxwell’s equations concerning empty space applied only to a given system of co-ordinates, which, on account of its state of rest, appeared excellent in comparison to all other existing systems of co-ordinates. This was a truly paradoxical situation, since the theory appeared to restrict the inertial system more than classical mechanics. This circumstance, proving as it did quite incompatible with the empirical standpoint, simply had to lead to the special relativity theory.”

Max Abraham stated in 1908,

“The æther is empty space.”

“Der Äther ist der leere Raum.”

We know that Einstein was familiar with this line from Abraham, because Gustav Mie quoted it to him in 1920 at the Bad Nauheim discussion.

Before Abraham was Horace Seal, who, in 1899, published the following,

“All the text-books and authorities agree that the luminiferous ether fills all space and pervades all bodies, solid, gaseous, and liquid, in that space. If this is true, there is really no such thing as space as a void in which celestial objects move, but the word only remains as a term of measurement of the ether which pervades all bodies and is continuous, both in breadth, length, and depth through the whole universe. In fact, ether does not fill space, but is space, and the old measuring of space, which except among mathematicians excluded bodies moving in that space, with the discovery (an actual one) of the luminiferous ether, becomes obsolete. A possible objection to the above is, that loading the shoulders of what after all is only accepted as a convenient hypothesis with another one less perhaps acceptable, is unscientific. But even if the wave-theory of light, heat, &c., were not by now almost fully accepted as that of gravitation, the objection does not really apply, as this luminiferous theory is absolutely independent of hypothesis. It is not a successful guess, but an organized statement of facts, therefore its existence rests upon a solid foundation. [***] According to our theory a child gradually acquires rudimentary ideas of motion by marking the difference of quick and slow movements; but what he does not recognize until after years is, that when he is resting, this rest of his is not absolute rest, which is unknown, but only relative rest[.]”

Eugen Karl Dühring made similar arguments and even anticipated the general theory
of relativity in 1878.\textsuperscript{2232} Bolliger also pursued this line of thought.\textsuperscript{2233}

Without an æther, there is no logical ground for assuming light speed independence from the motion of the source. Without an æther of some sort at hypothetical “absolute rest”—at rest relative to itself, anisotropic light speed in at least one of two inertial frames of reference in motion with respect to each other would not violate the principle of relativity, but instead would be compelled by it. Therefore, the Einsteins’ two postulate myth of 1905 depends upon the premise of an æther, or absolute space, or “preferred frame of reference”.

Obviously, Einstein’s efforts to disguise his piracy through semantics and internally inconsistent Metaphysics are nonsense, for physical states compel physical substance, the æther, and Lorentz stated in 1906,

“We shall add the hypothesis that, though the particles may move, the ether always remains at rest. We can reconcile ourselves with this, at first sight, somewhat startling idea, by thinking of the particles of matter as of some local modifications in the state of the ether. These modifications may of course very well travel onward while the volume-elements of the medium in which they exist remain at rest.”\textsuperscript{2234}

Herbert Dingle derided Einstein’s numerology, his “dimensional disguise for Lorentz’s” physical theory,

“This proposal became known as the relativity theory of Lorentz, and certain features of it call for attention here. [...] Like Maxwell, who realised the necessity, if he was to satisfy his mathematical desires, of postulating a ‘displacement current’ to justify them, so Lorentz, in order to justify his transformation equations, saw the necessity of postulating a physical effect of interaction between moving matter and ether, to give the mathematics meaning. Physics still had \emph{de jure} authority over mathematics: it was Einstein, who had no qualms about abolishing the ether and still retaining light waves whose properties were expressed by formulae that were meaningless without it, who was the first to discard physics altogether and propose a wholly mathematical theory.”\textsuperscript{2235}

As Vaihinger stated,

“Pure mathematical space is a fiction. Its concept has the marks of a fiction: the idea of an extension without anything extended, of separation without things that are to be separated, is something unthinkable, absurd and impossible.”\textsuperscript{2236}

Albert Einstein, who in 1905 had called the æther “superfluous”, stated in 1920,

“To deny the ether is ultimately to assume that empty space has no physical qualities whatever. [...] Recapitulating, we may say that according to the
general theory of relativity space is endowed with physical qualities; in this sense, therefore, there exists an ether. According to the general theory of relativity space without ether is unthinkable; for in such space there not only would be no propagation of light, but also no possibility of existence for standards of space and time (measuring-rods and clocks), nor therefore any space-time intervals in the physical sense.

The eminent physicist Oliver Heaviside, in a hand-written letter to Prof. Vilhelm Bjerknes, discussed Einstein’s compulsory shift in position from claiming that the æther was superfluous to stating directly that the æther was fundamental to “Einstein’s” theories,

“I don’t find Einstein’s Relativity agrees with me. It is the most unnatural and difficult to understand way of representing facts that could be thought of. His distorted space is chaos [***] The Einstein enthusiasts are very patronizing about the ‘classical’ electromagnetics and its ether, which they have abolished. But they will come back to it by and by. [***] But you must work fairly, with the Ether, and Forces, & Momentum etc. They are the realities, without Einstein’s distorted nothingness. [***] And I really think that Einstein is a practical joker, pulling the legs of his enthusiastic followers, more Einsteinisch than he. He knows the weakness of his 2nd Theory. He only does it to annoy [***] I can’t get away from Einstein the Joker. [***] Did such a clever man as Einstein not see the significance of Poisson’s theorem? It is said that it was by noticing some of H. A. Lorentz’ formulas, and those of Minkowski, led him to the result. Well, we must believe it, if he says so, and like the silent parrot, think the more.”

In 1938, Einstein and Infeld averred, in a statement highly reminiscent of Ernst Haeckel’s Die Welträthsel of 1899,

“Our only way out seems to be to take for granted the fact that space has the physical property of transmitting electromagnetic waves, and not to bother too much about the meaning of this statement. We may still use the word ether, but only to express some physical property of space. This word ether has changed its meaning many times in the development of science. At the moment it no longer stands for a medium built up of particles. Its story, by no means finished, is continued by the relativity theory.”

Haeckel wrote,

“I. Ether fills the whole of space, in so far as it is not occupied by ponderable matter, as a continuous substance; it fully occupies the space between the atoms of ponderable matter.

II. Ether has probably no chemical quality, and is not composed of atoms. If it be supposed that it consists of minute homogeneous atoms (for instance,
indivisible etheric particles of a uniform size), it must be further supposed
that there is something else between these atoms, either ‘empty space’ or a
third, completely unknown medium, a purely hypothetical ‘interether’; the
question as to the nature of this brings us back to the original difficulty, and
so on in infinitum.

III. As the idea of an empty space and an action at a distance is scarcely
possible in the present condition of our knowledge (at least it does not help
to a clear monistic view), I postulate for ether a special structure which is not
atomistic, like that of ponderable matter, and which may provisionally be
called (without further determination) etheric or dynamic structure.\textsuperscript{2240}

Herbert Spencer addressed the root of the problem of confusing pure
Mathematics with Physics,

“To sum up this somewhat too elaborate argument:—We have seen how in
the very assertion that all our knowledge, properly so called, is Relative,
there is involved in the assertion that there exists a Non-relative. We have
seen how, in each step of the argument by which this doctrine is established,
the same assumption is made. We have seen how, from the very necessity of
thinking in relations, it follows that the Relative is itself inconceivable,
except as related to a real Non-relative. We have seen that unless a real Non-
relative or Absolute be postulated, the Relative itself becomes absolute; and
so brings the argument to a contradiction. And on contemplating the process
of thought, we have equally seen how impossible it is to get rid of the
consciousness of an actuality lying behind appearances; and how, from this
impossibility, results our indestructible belief in that actuality.”\textsuperscript{2241}

Surely, the assertion of a physical æther is a scientific hypothesis, which
recognizes the need of the real behind the relative, while the abstract set of human
rules which constitute “space-time” represent nothing real or imagined. Einstein
failed to understand the distinction between Physics and Metaphysics. He stated,

“\textquoteleft\textquoteleft I believe that physics is abstract and not obvious[.]\textquoteright\textquoteright”\textsuperscript{2242}

Carlo Giannoni saw that Einstein’s theory differed only philosophically from the
Poincaré-Lorentz theory, and Giannoni stresses the importance of the fact that
Lorentz employed the principle of relativity in his 1904 paper.\textsuperscript{2243}

\textbf{9.4 The So-Called “Lorentz Transformation”}

The mathematical transformations in relativity theory are called “Lorentz
Transformations,”\textsuperscript{2244} an appellation supplied by Emil Cohn\textsuperscript{2245} and Henri
Poincaré.\textsuperscript{2246} The record indicates that Woldemar Voigt,\textsuperscript{2247} Oliver Heaviside, George
Francis FitzGerald, Hendrik Antoon Lorentz, Joseph Larmor, Henri Poincaré, Emil
Cohn, Paul Langevin, and others, began developing the mathematical expressions
of the theory of relativity some 18 years before Einstein, and completed them before Einstein published on the subject.

9.4.1 Woldemar Voigt’s Space-Time Transformation

The “Lorentz Transformation” is not Lorentz’ transformation, as is, and was, widely known,

“Nor did Lorentz discover these equations. They were first used by Voight[***sic].”

The *Brockhaus Enzyklopädie* succinctly states,

“Voigt [***] presented (among the introduction of the term ‘Tensor’) a theory of elasticity; in the treatment of optical properties, he formulated for the first time in 1887 the formulas, which later became known through the special theory of relativity as the Lorentz-Transformation.”

In 1887, Woldemar Voigt published the following relativistic transformation of space-time coordinates:

\[
x' = x - vt, \quad y' = \frac{y}{\gamma}, \quad z' = \frac{z}{\gamma}, \quad t' = t - \frac{vx}{c^2},
\]

\[
\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}.
\]

Hermann Minkowski stated,

“Maxwell’s and Lorentz’ theory are not really opposites, but rather the rigid and the non-rigid, Zeppelin’s and Parseval’s electron. In the interest of history, I want yet to add, that the transformations which play the main rôle in the principle of relativity were first mathematically formulated by Voigt, in the year 1887. With the aid of these transformations, Voigt had already drawn conclusions at that time regarding the Doppler Effect.”

“Nicht die Maxwellsche und die Lorentzsche Theorie sind die eigentlichen Gegensätze, sondern das starre und das unstarre, das Zeppelinsche und das Parsevalsche Elektron. Historisch will ich noch hinzufügen, daß die
Transformationen, die bei dem Relativitätsprinzip die Hauptrolle spielen, zuerst mathematisch von Voigt im Jahre 1887 behandelt sind. Voigt hat damals bereits mit ihrer Hilfe Folgerungen in bezug auf das Dopplersche Prinzip gezogen.”

To which Voigt responded,

“Mr. Minkowski recalls an old work of mine. It addressed the application of the Doppler Effect to some special cases which arise due to the elastic theory of light, not the electromagnetic. It had already at that time revealed some of the consequences, which were later arrived at through the electromagnetic theory.”

“Herr Minkowski erinnert an eine alte Arbeit von mir. Es handelt sich dabei um Anwendungen des Dopplerschen Prinzips, die in speziellen Teilen auftreten, aber nicht auf Grund der elektromagnetischen, sondern auf Grund der elastischen Theorie des Lichtes. Indessen haben sich damals bereits einige derselben Folgerungen ergeben, die später aus der elektromagnetischen Theorie gewonnen sind.”

9.4.2 Length Contraction

In 1905, Mileva and Albert Einsteins asserted, without reference to prior authors,

“A rigid body which, measured in a state of rest, has the form of a sphere, therefore has in a state of motion—viewed from the stationary system—the form of an ellipsoid of revolution with the axes

\[ R \sqrt{1 - \frac{v^2}{c^2}}, R, R. \]

Thus, whereas the Y and Z dimensions of the sphere (and therefore of every rigid body of no matter what form) do not appear modified by the motion, the X dimension appears shortened in the ratio \( 1 : \sqrt{1 - \frac{v^2}{c^2}} \), i.e. the greater the value of \( v \), the greater the shortening. For \( v = c \) all moving objects—viewed from the ‘stationary’ system—shrivel up into plane figures. [Footnote: That is, a body possessing spherical form when examined at rest.] For velocities greater than that of light our deliberations become meaningless; we shall, however, find in what follows, that the velocity of light in our theory plays the part, physically, of an infinitely great velocity.”

Henri Poincaré stated, in 1904,
“From all these results, if they are confirmed, would arise an entirely new mechanics, which would be, above all, characterised by this fact, that no velocity could surpass that of light, any more than any temperature could fall below the zero absolute, because bodies would oppose an increasing inertia to the causes, which would tend to accelerate their motion; and this inertia would become infinite when one approached the velocity of light.”

Roger Joseph Boscovich argued, in 1763, in the second supplement to his *Natural Philosophy*,

“21. Again, it is to be observed first of all that from this principle of the [invariance] of those things, of which we cannot perceive the change through our senses, there comes forth the method that we use for comparing the magnitudes of intervals with one another; here, that, which is taken as a measure, is assumed to be [invariant]. Also we make use of the axiom, *things that are equal to the same thing are equal to one another*; & from this is deduced another one pertaining to the same thing, namely, *things that are equal multiples, or submultiples, of each, are also equal to one another*; & also this, *things that coincide are equal*. We take a wooden or iron ten-foot rod; & if we find that this is congruent with one given interval when applied to it either once or a hundred times, & also congruent to another interval when applied to it either once or a hundred times, then we say that these intervals are equal. Further, we consider the wooden or iron ten-foot rod to be the same standard of comparison after translation. Now, if it consisted of perfectly continuous & solid matter, we might hold it to be exactly the same standard of comparison; but in my theory of points at a distance from one another, all the points of the ten-foot rod, while they are being transferred, really change the distance continually. For the distance is constituted by those real modes of existence, & these are continually changing. But if they are changed in such a manner that the modes which follow establish real relations of equal distances, the standard of comparison will not be identically the same; & yet it will still be an equal one, & the equality of the measured intervals will be correctly determined. We can no more transfer the length of the ten-foot rod, constituted in its first position by the first real modes, to the place of the length constituted in its second position by the second real modes, than we are able to do so for intervals themselves, which we compare by measurement. But, because we perceive none of this change during the translation, such as may demonstrate to us a relation of length, therefore we take that length to be the same. But really in this translation it will always suffer some slight change. It might happen that it underwent even some very great change, common to it & our senses, so that we should not perceive the change; & that, when restored to its former position, it would return to a state equal & similar to that which it had at first. However, there always is some slight change, owing to the fact that the forces which connect the points of matter, will be changed to some slight extent, if its position is
altered with respect to all the rest of the Universe. Indeed, the same is the
case in the ordinary theory. For no body is quite without little spaces
interspersed within it, altogether incapable of being compressed or dilated;
& this dilatation & compression undoubtedly occurs in every case of
translation, at least to a slight extent. We, however, consider the measure to
be the same so long as we do not perceive any alteration, as I have already
remarked.

22. The consequence of all this is that we are quite unable to obtain a
direct knowledge of absolute distances; & we cannot compare them with one
another by a common standard. We have to estimate magnitudes by the ideas
through which we recognize them; & to take as common standards those
measures which ordinary people think suffer no change. But philosophers
should recognize that there is a change; but, since they know of no case in
which the equality is destroyed by a perceptible change, they consider that
the change is made equally.

23. Further, although the distance is really changed when, as in the case
of the translation of the ten-foot rod, the position of the points of matter is
altered, those real modes which constitute the distance being altered;
nevertheless if the change takes place in such a way that the second distance
is exactly equal to the first, we shall call it the same, & say that it is altered
in no way, so that the equal distances between the same ends will be said to
be the same distance & the magnitude will be said to be the same; & this is
defined by means of these equal distances, just as also two parallel directions
will be also included under the name of the same direction. In what follows
we shall say that the distance is not changed, or the direction, unless the
magnitude of the distance, or the parallelism, is altered.  

George Francis FitzGerald wrote, in 1889,

“I have read with much interest Messrs. Michelson and Morley’s
wonderfully delicate experiment attempting to decide the important question
as to how far the ether is carried along by the earth. Their result seems
opposed to other experiments showing that the ether in the air can be carried
along only to an inappreciable extent. I would suggest that almost the only
hypothesis that can reconcile this opposition is that the length of material
bodies changes, according as they are moving through the ether or across it,
by an amount depending on the square of the ratio of their velocity to that of
light. We know that electric forces are affected by the motion of the
electrified bodies relative to the ether, and it seems a not improbable
supposition that the molecular forces are affected by the motion, and that the
size of a body alters consequently. It would be very important if secular
experiments on electrical attractions between permanently electrified bodies,
such as in a very delicate quadrant electrometer, were instituted in some of
the equatorial parts of the earth to observe whether there is any diurnal and
annual variation of attraction,—diurnal due to the rotation of the earth being
added and subtracted from its orbital velocity; and annual similarly for its orbital velocity and the motion of the solar system.**2254

Hendrik Antoon Lorentz had averred the same in 1892,**2255 and stated, in 1895,

“The displacement would naturally bring about this disposition of the molecules of its own accord, and thus effect a shortening in the direction of motion in the proportion of 1 to in accordance with the formulæ given in the above-mentioned paragraph.”**2256

In 1904, Lorentz affirmed that,

“§ 8. Thus far we have only used the fundamental equations without any new assumptions. I shall now suppose that the electrons, which I take to be spheres of radius R in the state of rest, have their dimensions changed by the effect of a translation, the dimensions in the direction of motion becoming times and those in perpendicular directions times smaller.

In this deformation, which may be represented by each element of volume is understood to preserve its charge.”

9.4.2.1 Dynamic Length Contraction

In Lorentz’ synthetic physical theory, length contraction is a dynamic theorem following from Maxwell’s and Heaviside’s work on the dynamics of the æther.

9.4.2.2 Kinematic Length Contraction

In the Einsteins’ fallacy of Petitio Principii of 1905, a change in length is merely presupposed without any physical theory to justify it, then the precise factor is arrived at through induction from the allegedly observed invariance of light speed, which is an allegedly known empirical fact, not an a priori postulate. No one disputes that Einstein knew Lorentz’ contraction hypothesis. The Einsteins simply used the idea without crediting Lorentz, then Einstein called it a natural consequence of the “two postulates” in 1907. Since the “postulates” are empirical observations, the “natural consequences” are arrived at through induction, not deduction. In other words, the hypothesis of length contraction is more fundamental than the law of light speed invariance.

One must first propose a priori a change in length before one can derive the precise factor of it through induction from the supposed empirical fact of light speed invariance, and the so-called “natural consequence” is instead the inductively determined factor arrived at from the presupposed a priori and ad hoc hypothesis that length must change with velocity relative to the “resting system” (in the Einsteins’ 1905 paper the “resting system” is Newton’s absolute space) in order for light speed to be invariant in “moving systems” (in the Einsteins’ 1905 paper
“moving systems” are systems in motion relative to Newton’s absolute space). This presupposed change in length is more ad hoc in the Einsteins’ 1905 paper than it is in Lorentz’ synthetic theory, which attempts a dynamic exposition on it, as physics must.

It was Poincaré, not Einstein nor Minkowski, who first recognized the group properties of the Lorentz Transformation and reciprocal length contraction and who introduced a quadri-dimensional exposition on length contraction, which renders it—in terms of a mathematical quadri-dimensional space-time—a matter of cognitive perspective. Later, many would attempt to mask Einstein’s plagiarism by arguing the issue of perspective, which nowhere appeared in the Einsteins’ work of 1905, where length contraction is merely presupposed without justification, then inductively demonstrated with Poincaré’s operationalist thought experiment of clocks synchronized by light signals on the suppositions that light speed is invariant and that length must change to render it so.

9.4.3 Time Dilatation

Roger Joseph Boscovich argued, in 1763, in the second supplement to his *Natural Philosophy*:

“24. What has been said with regard to the measurement of space, without difficulty can be applied to time; in this also we have no definite & constant measurement. We obtain all that is possible from motion; but we cannot get a motion that is perfectly uniform. We have remarked on many things that belong to this subject, & bear upon the nature & succession of these ideas, in our notes. I will but add here, that, in the measurement of time, not even ordinary people think that the same standard measure of time can be translated from one time to another time. They see that it is another, consider that it is an equal, on account of some assumed uniform motion. Just as with the measurement of time, so in my theory with the measurement of space it is impossible to transfer a fixed length from its place to some other, just as it is impossible to transfer a fixed interval of time, so that it can be used for the purpose of comparing two of them by means of a third. In both cases, a second length, or a second duration is substituted, which is supposed to be equal to the first; that is to say, fresh real positions of the points of the same ten-foot rod which constitute a new distance, such as a new circuit made by the same rod, or a fresh temporal distance between two beginnings & two ends. In my Theory, there is in each case exactly the same analogy between space & time. Ordinary people think that it is only for measurement of space that the standard of measurement is the same; almost all other philosophers except myself hold that it can at least be considered to be the same from the idea that the measure is perfectly solid & continuous, but that in time there is only equality. But I, for my part, only admit in either case the equality, & never the identity.”
Joseph Larmor agreed with Boscovich and set the scale for time dilatation thereby completing the misnamed “Lorentz Transformation”, which Lorentz, Poincaré and the Einsteins later adopted.

### 9.4.4 The Final Form of the Transformation

The components of the “Lorentz Transformation” evolved as follows: From the Aristotelian-Bradwardine-Galilean Transformation,\footnote{2259} we have,

\[ x' = x - vt, \quad y' = y, \quad z' = z, \quad t' = t. \]

Voigt (1887) introduced the relativity of simultaneity,

\[ t' = t - \frac{vx}{c^2}. \]

FitzGerald (1889) introduced the scale factor of length contraction, giving mathematical voice to Boscovich’s concept,

\[ x' = x - vt, \quad y' = y, \quad z' = z, \quad t' = t - \frac{vx}{c^2}. \]

Larmor (1894-1900) introduced the scale factor of time dilatation in order to quantify the Boscovichian concept of time dilatation, and published the “Lorentz Transformation” in 1897,

\[ x' = x - vt, \quad y' = y, \quad z' = z, \quad t' = t - \frac{vx}{c^2}. \]

Lorentz, himself, acknowledged Voigt’s priority, and was uncomfortable with Poincaré’s term “Lorentz Transformation”. Lorentz wrote to Voigt,

“Of course I will not miss the first opportunity to mention, that the concerned transformation and the introduction of a local time has been your idea.”\footnote{2260}

Lorentz kept his word:

“In a paper „Über das Doppler’sche Prinzip“, published in 1887 (Gött. Nachrichten, p. 41) and which to my regret has escaped my notice all these
years, Voigt has applied to equations of the form (6) (§3 of this book) a transformation equivalent to the formulae (287) and (288). The idea of the transformations used above (and in §44) might therefore have been borrowed from Voigt and the proof that it does not alter the form of the equations for the free ether is contained in his paper.”

and,

“It was these considerations published by me in 1904, which gave rise to the dissertation by Poincaré on the dynamics of the electron, in which he has attached my name to the transformation of which I have just spoken. I am obliged to again note the observation that the same transformation itself was previously hit upon in an article from Mr. Voigt published in 1887, and I did not remove the artifice from it to the fullest extent possible. In fact, for certain of the physical magnitudes which enter in the formulas I have not indicated the transformation which suits best. This has been done by Poincaré, and later by Einstein and Minkowski. To discover the ‘transformations of relativity’, as I will call them now, . . .”

“Ce furent ces considérations publiées par moi en 1904 qui donnèrent lieu à Poincaré d’écrire son mémoire sur la Dynamique de l’électron, dans lequel il a attaché mon nom à la transformation dont je viens de parler. Je dois remarquer à ce propos que la même transformation se trouve déjà dans un article de M. Voigt publié en 1887 et que je n’ai pas tiré de cet artifice tout le parti possible. En effet, pour certaines des grandeurs physiques qui entrent dans les formules, je n’ai pas indiqué la transformation qui convient le mieux. Cela a été fait par Poincaré et ensuite par M. Einstein et Minkowski. Pour trouver les «transformations de relativité», comme je les appellerai maintenant”.

Though Lorentz denied knowledge of Voigt’s Transformation, it is quite likely Lorentz did know of it. Lorentz was keenly interested in theories which would explain Michelson’s negative result, as did Voigt’s theory which was published in the highly respected and widely read Nachrichten von der Königlichen Gesellschaft der Wissenschaften und der Georg-Augusts-Universität zu Göttingen. Given that Voigt’s Transformation differs from the “Lorentz Transformation” of modern relativity theory, some have wondered why Lorentz credited Voigt with the transformation. Prof. Wilfried Schröder published a collection of letters between Emil Wiechert and Lorentz, “Hendrik Antoon Lorentz und Emil Wiechert (Briefwechsel und Verhältnis der beiden Physiker)”, Archive for History of Exact Sciences, Volume 30, Number 2, (1984), pp. 167-187. In addition to the fact that Lorentz again denied his friend Poincaré’s legacy, Lorentz’ letters are noteworthy for their elucidation of his thought process and the development of his imperfect versions of the transformation which ill-advisedly bears his name. Schröder’s article should be read by all interested in the history of the “Lorentz Transformation”.
Among the highlights regarding Voigt’s work we find: Wiechert to Lorentz 28 November 1911,

“Nun kenne ich von Ihnen aus jener Zeit die Arbeit Arch. neerl. 25, 363, 1892, das in Leiden 1895 erschienene Buch, und die Arbeit Proc. Amsterdam 1904, p. 809. Giebt es wohl noch andere Arbeiten, die für die Relativitätstheorie in Betracht kommen?”

Lorentz to Wiechert 21 December 1911,

“In der Arbeit von 1899 benutze ich eine Substitution, die in der im Bornschen’ Referat benutzten Bezeichnungsweise folgendermaßen lautet:

\[ z' = az - bct, \quad \frac{1}{a}t' = at - \frac{b}{c}z. \]

und erst in 1904 habe ich ihre Transformation

\[ z' = az - bct, \quad t' = at - \frac{b}{c} \]

eingeführt, die sich übrigens schon viel früher bei Voigt findet (Über das Dopplersche Prinzip, Gött. Nachrichten, 1887).”

Wiechert to Lorentz 15 February 1912,

“In Ihrer Arbeit von 1899 (Archives Néerlandaises) benutzen Sie die Transformation

\[ t' = t - \frac{k^2}{c^2} \frac{w}{c} x. \]

In der Arbeit 1904 (Proceedings) lautet die Gleichung 5:

\[ t' = t - \frac{1}{k} - kl \frac{w}{c^2} x \left( \text{statt } t' = kl \left( t - \frac{w}{c^2} x \right) \right). \]

Das ist nun doch nicht die Transformation, die man als „Lorentz-Transformation“ bezeichnet. Ich vermute aber, dass es sich nur um einen Druckfehler handelt, denn die folgenden Formeln entsprechen der richtigen Formel. Dies ist doch eine richtige Ansicht?

Sie sagen, dass Prof. W. Voigt schon 1887 die Transformation benutzt habe. Es scheint mir aber, dass dieses nicht der Fall ist. W. Voigt scheint mir
für die Zeiten $t'$ und $t$ stets die gleichen Einheiten zu benutzen.”

Lorentz to Wiechert 5 March 1912,

“4. Was die Formeln von Voigt betrifft, so sind diese so wenig von oben angeführten (1) verschieden, dass man, wie mir scheint, wohl sagen kann, er habe die Rel.transformation angegeben. Die von ihm zu Grunde gelegten Differentialgleichungen behalten nämlich ihre Form, wenn man $x, y, z, t$ alle mit ein und derselben Konstante multipliziert. Man findet nun in seiner Abhandlung über das Doppler’sche Prinzip die Substitution (die Formeln 10) auf S. 45)

\[
\begin{align*}
\xi &= x - kt, \\
\eta &= qy, \\
\zeta &= qz, \\
\tau &= t - \frac{kx}{w^2}
\end{align*}
\]

wo $w$ die Fortpflanzungsgeschwindigkeit bedeutet, und

\[
q = \sqrt{1 - \frac{k^2}{w^2}}
\]

ist.

Sie bemerken zu Recht, dass $t$ und $\tau$ hier den gleichen Koeffizienten haben. Aber es kommt jetzt in der zweiten und dritten Gleichung der Koeffizient $q$ vor. Setzt man

\[
\begin{align*}
\xi &= qx', \\ 
\eta &= qy', \\ 
\zeta &= qz', \\ 
\tau &= qt'
\end{align*}
\]

so verwandeln sich die Gleichungen in

\[
\begin{align*}
x' &= \frac{1}{q} x - \frac{k}{q} t, \\ 
y' &= y, \\ 
z' &= z, \\ 
t' &= \frac{1}{q} t - \frac{k}{qw^2} x,
\end{align*}
\]

und dies hat wirklich die Gestalt von (1), wenn man $w$ mit $c$ identifiziert und

\[
a = \frac{1}{q}, \quad b = \frac{k}{q^2}
\]
setzt.”

In 1900, Joseph Larmor published the following chapter in his most famous work, the award winning essay *Aether and Matter*, which was “completed at the end of the year 1898”, and had Larmor already published the “Lorentz Transformation” in near modern form in 1897,2264

“CHAPTER XI

MOVING MATERIAL SYSTEM: APPROXIMATION CARRIED TO THE SECOND ORDER

110. The results above obtained have been derived from the correlation developed in § 106, up to the first order of the small quantity \( \frac{v}{C} \), between the equations for aetheral vectors here represented by \( \{ f', g', h' \} \) and \( \{ a', b', c' \} \) referred to the axes \( \{ x', y', z' \} \) at rest in the aether and a time \( t'' \), and those for related aetheral vectors represented by \( \{ f, g, h \} \) and \( \{ a, b, c \} \) referred to axes \( \{ x', y', z' \} \) in uniform translatory motion and a time \( t' \). But we can proceed further, and by aid of a more complete transformation institute a correspondence which will be correct to the second order. Writing as before \( t'' \) for \( t' - \frac{v}{C^2} \varepsilon x' \), the exact equations for

\( \{ f', g', h' \} \) and \( \{ a, b, c \} \) referred to the moving axes \( \{ x', y', z' \} \) and time \( t' \)

are, as above shown, equivalent to

\[
\begin{align*}
4\pi \frac{df'}{dt''} &= \frac{dc'}{dy'} - \frac{db'}{dz'} \\
4\pi \frac{dg'}{dt''} &= \frac{da'}{dz'} - \frac{dc'}{dx'} \\
4\pi \frac{dh'}{dt''} &= \frac{db'}{dx'} - \frac{da'}{dy'}
\end{align*}
\]

\[
\begin{align*}
-\left(4\pi C^2\right)^{-1} \frac{da'}{dt''} &= \frac{dh'}{dy'} - \frac{dg'}{dz'} \\
-\left(4\pi C^2\right)^{-1} \frac{db'}{dt''} &= \frac{df'}{dz'} - \frac{dh'}{dx'} \\
-\left(4\pi C^2\right)^{-1} \frac{dc'}{dt''} &= \frac{dg'}{dx'} - \frac{df'}{dy'}
\end{align*}
\]

Now write
where \( \varepsilon = \left( 1 - \frac{v^2}{C^2} \right)^{-1} \); and it will be seen that the factor \( \varepsilon \) is absorbed, so that the scheme of equations, referred to moving axes, which connects together the new variables with subscripts, is identical in form with the Maxwellian scheme of relations for the aethereal vectors referred to fixed axes. This transformation, from \( (x', y', z') \) to \( (x_1, y_1, z_1) \) as dependent variables, signifies an elongation of the space of the problem in the ratio \( \varepsilon^2 \) along the direction of the motion of the axes of coordinates. Thus if the values of \( (f_1, g_1, h_1) \) and \( (a_1, b_1, c_1) \) given as functions of \( x_1, y_1, z_1, t_1 \) express the course of spontaneous change of the aethereal vectors of a system of moving electrons referred to axes \( (x_1, y_1, z_1) \) at rest in the aether, then

\[
\begin{align*}
(f, g) &= \left( \varepsilon \frac{1}{2} f, g - \frac{v}{4\pi C^2} c, h + \frac{v}{4\pi C^2} b \right) \\
(a, b, c) &= \left( \varepsilon \frac{1}{2} a, b + 4\pi v h, c - 4\pi v g \right),
\end{align*}
\]

expressed by the same functions of the variables

\[
(\varepsilon^2 x', y', z', \varepsilon^2 t' - \frac{v}{C^2} \varepsilon^2 x'),
\]

will represent the course of change of the aethereal vectors \( (f, g, h) \) and \( (a, b, c) \) of a correlated system of moving electrons referred to axes of \( (x', y', z') \) moving through the aether with uniform translatory velocity \( (v, 0, 0) \). In this correlation between the courses of change of the two systems, we have
\[
\frac{d\left(\frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} \right)}{d\left(\frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} \right)} \text{ equal to } \frac{df_1}{dx_1} - \frac{v}{c^2} \frac{df_1}{dt_1},
\]
\[
\frac{d}{dy'} \left( g - \frac{v}{4\pi C^2} c \right) = \frac{dg_1}{dy_1},
\]
\[
\frac{d}{dz'} \left( h + \frac{v}{4\pi C^2} b \right) = \frac{dh_1}{dz_1},
\]

where
\[
\frac{dc}{dy'} - \frac{db}{dz'} = 4\pi \left( \frac{df}{dt'} - \frac{v}{C^2} \frac{df}{dx'} \right),
\]

and also
\[
\frac{df_1}{dt_1} = \frac{df}{dt'},
\]

hence
\[
\frac{df}{dx'} + \frac{dg}{dy'} + \frac{dh}{dz'} - \frac{v}{C^2} \left( \frac{df}{dt'} - \frac{v}{C^2} \frac{df}{dx'} \right)
\]
is equal to
\[
\frac{df_1}{dx_1} + \frac{dg_1}{dy_1} + \frac{dh_1}{dz_1} - \frac{v}{C^2} \frac{df}{dt'},
\]
so that, up to the order of \(\frac{v}{C^2}\) inclusive,
\[
\frac{df}{dx'} + \frac{dg}{dy'} + \frac{dh}{dz'} = \frac{df_1}{dx_1} + \frac{dg_1}{dy_1} + \frac{dh_1}{dz_1}.
\]

Thus the conclusions as to the corresponding positions of the electrons of the two systems, which had been previously established up to the first order of \(\frac{v}{C}\),

are true up to the second order when the dimensions of the moving system are contracted in comparison with the fixed system in the ratio \(\frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}\), or

\(1 - \frac{1}{2} \frac{v^2}{C^2}\), along the direction of its motion.

111. The ratio of the strengths of corresponding electrons in the two systems may now be deduced just as it was previously when the discussion was confined to the first order of \(\frac{v}{C}\). For the case of a single electron in uniform motion the comparison is with a single electron at rest, near which \(\{a_1, b_1, c_2\}\) vanishes so far as it depends on that electron: now we have in the general correlation.
\[ g = g_1 + \frac{v}{4\pi C^2} \left( c_1 + 4\pi vg \right), \]

hence in this particular case

\[ (g, h) = \epsilon(g_1, h_1), \text{ while } f = \epsilon^\frac{1}{2} f_1. \]

But the strength of the electron in the moving system is the value of the integral

\[ \int \left\{ fdy'dz' + gdx'dx' + hdx'dy' \right\} \]

closely surrounding its nucleus; that is here

\[ \epsilon^\frac{1}{2} \int \left\{ f_1 dy_1 dz_1 + g_1 dx_1 dx_1 + h_1 dx_1 dy_1 \right\}, \]

so that the strength of each moving electron is \( \epsilon^\frac{1}{2} \) times that of the correlative fixed electron. As before, no matter what other electrons are present, this argument still applies if the surface be taken to surround the electron under consideration very closely, because then the wholly preponderating part of each vector is that which belongs to the adjacent electron [Footnote: This result follows more immediately from § 110, which shows that corresponding densities of electrification are equal, while corresponding volumes are as \( \epsilon^\frac{1}{2} \) to unity.].

112. We require however to construct a correlative system devoid of the translatory motion in which the strengths of the electrons shall be equal instead of proportional, since motion of a material system containing electrons cannot alter their strengths. The principle of dynamical similarity will effect this.

We have in fact to reduce the scale of the electric charges, and therefore of

\[ \frac{df}{dx} + \frac{dg}{dy} + \frac{dh}{dz}, \]

in a system at rest in the ratio \( \epsilon^\frac{1}{2} \). Apply therefore a transformation

\[ (x, y, z) = k(x_1, y_1, z_1), \quad t = lt_1, \]
\[ (a, b, c) = \theta(a_1, b_1, c_1), \quad (f, g, h) = \epsilon^\frac{1}{2} k(f_1, g_1, h_1); \]

and the form of the fundamental circuital aethereal relations will not be changed provided \( k = l \) and \( \theta = \epsilon^\frac{1}{2} k \). Thus we may have \( k \) and \( l \) both unity and \( \theta = \epsilon^\frac{1}{2} \); so that no further change of scale in space and time is required, but only a diminution of \( (a, b, c) \) in the ratio \( \epsilon^\frac{1}{2} \).

We derive the result, correct to the second order, that if the internal forces
of a material system arise wholly from electrodynamic actions between the systems of electrons which constitute the atoms, then an effect of imparting to a steady material system a uniform velocity of translation is to produce a uniform contraction of the system in the direction of the motion, of amount \( \frac{v}{c} \) or \( 1 - \frac{v^2}{c^2} \). The electrons will occupy corresponding positions in this contracted system, but the aethereal displacements in the space around them will not correspond: if \( \{ f, g, h \} \) and \( \{ a, b, c \} \) are those of the moving system, then the electric and magnetic displacements at corresponding points of the fixed systems will be the values that the vectors

\[
e^{\frac{1}{2}} \left( \begin{array}{c} e^{\frac{1}{2}} f, \ g - \frac{v}{4\pi c^2} c, \ h + \frac{v}{4\pi c^2} b \end{array} \right)
\]

and

\[
e^{\frac{1}{2}} \left( \begin{array}{c} e^{\frac{1}{2}} a, \ b + 4\pi v h, \ c - 4\pi v g \end{array} \right)
\]

had at a time const. \( + \frac{v}{c^2} \) before the instant considered when the scale of time is enlarged in the ratio \( e^{\frac{1}{2}} \).

As both the electric and magnetic vectors of radiation lie in the wave-front, it follows that in the two correlated systems, fixed and moving, the relative wave-fronts of radiation correspond, as also do the rays which are the paths of the radiant energy relative to the systems. The change of the time variable, in the comparison of radiations in the fixed and moving systems, involves the Doppler effect on the wave-length."

In 1899, Hendrik Antoon Lorentz published his transformation in near modern form. In 1904, Hendrik Antoon Lorentz published the following transformation,

“§ 4. We shall further transform these formulae by a change of variables. Putting

\[
\frac{c^2}{e^2 - w^2} = k^2,
\]

and understanding by \( l \) another numerical quantity, to be determined further on, I take as new independent variables

\[
x' = klx, \quad y' = ly, \quad z' = lz, \]

\[
t' = \frac{l}{k} t - kl\frac{v}{e^2} x,
\]
In 1905, before the Einsteins, Poincaré published the following transformation and noted that it, together with all rotations of space, forms a group,

“The essential point, established by Lorentz, is that the equations of the electromagnetic field are not altered by a certain transformation (which I will call by the name of Lorentz) of the form:

\[ x' = kl(x + \varepsilon t), \quad y' = ly, \quad z' = lz, \quad t' = k(t + \varepsilon x), \]

where \( x, y, z \) are the coordinates and \( t \) the time before the transformation and \( x', y', z' \) and \( t' \) after the transformation. Here \( \varepsilon \) is a constant which defines the transformation,

\[ k = \frac{1}{\sqrt{1 - \varepsilon^2}}, \]

and \( l \) is an arbitrary function of \( \varepsilon \). One sees that in this transformation the \( x \)-axis plays an essential role, but one can evidently construct a transformation in which this role would be played by any arbitrary line passing through the origin. The ensemble of all these transformations together with all rotations of space, should form a group; but for this it is necessary that \( l = 1 \). One is thus forced to take \( l = 1 \), and this is a conclusion to which Lorentz was led by a different way.”

---

Prof. Anatoly Alexeivich Logunov has stressed the fact that Poincaré selflessly attributed to Lorentz, that which Poincaré had accomplished. Lorentz, alternately, and depending upon the audience, credited Poincaré and Einstein for the same innovations. Poincaré’s priority is established by the dates of publication. Prof. Logunov has also stressed that many have failed to understand the significance of Poincaré’s statements, wrongfully attributing priority to Einstein, which rightfully belongs to Poincaré. Prof. Logunov states, *inter alia*,

“Poincare writes: «The idea of Lorentz», but Lorentz never wrote such words before Poincare. [***] We see that invariance of the equations of the electromagnetic field under transformations of the Lorentz group results in the relativity principle being fulfilled in electromagnetic phenomena. In other words, the relativity principle for electromagnetic phenomena follows from the Maxwell-Lorentz equations in the form of a rigorous mathematical truth. [***] It must be underlined that, by having established the group nature of the set of all purely spatial transformations together with the Lorentz transformations, that leave the equations of electrodynamics invariant, Poincare thus discovered the existence in physics of an essentially new type of symmetry related to the group of linear space-time transformations, which
he called the Lorentz group. [***] Poincare thus introduces the physical concept of gravitational waves, the exchange of which generates gravitational forces, and supplies and estimation of the contribution of relativistic corrections to Newton’s law of gravity. For example, he shows that the terms of first order in $\frac{v}{c}$ cancel out exactly and so the relativistic corrections to Newton’s law are quantities of the order of $(\frac{v}{c})^2$. [***] It is here that such concepts as the following first appeared: the Lorentz group, invariance of the equations of the electromagnetic field with respect to the Lorentz transformations, the transformation laws for charge and current, the addition formulae of velocities, the transformation laws of force. Here, also, Poincare extends the transformation laws to all the forces of Nature, whatever their origin might be.**2267

In 1905, without reference to prior authors, Mileva and Albert Einstein wrote,

“It follows from this relation and the one previously found that $\varphi(v) = 1$, so that the transformation equations which have been found become

$$\begin{align*}
\tau &= \beta(t - vx/c^2), \\
\xi &= \beta(x - vt), \\
\eta &= y, \\
\zeta &= z,
\end{align*}$$

where $\beta = 1/\sqrt{1 - v^2/c^2}$.**2268

Given the facts that Galileo popularized the concept of the principle of relativity, Lange took from it absolute space and absolute time, Voigt introduced the relativistic transformation, and Poincaré first demonstrated relative simultaneity; why is the concept popularly referred to as “Einstein’s special theory of relativity”? Einstein contributed next to nothing to the special principle of relativity. Why are the popular misconceptions of Einstein, and his supposed discoveries; which misconceptions are fed by the scientific community and the media; and the factual historic record, itself, at odds? Is exposing the truth counter-productive, if it means the downfall of a hero and the death of a religion?

Contrary to the view of some Einstein advocates that Einstein worked in near complete isolation from both the scientific literature and the physics community, many have pointed out that Einstein had easy access to the literature at the Swiss Patent Office and was heavily immersed in the most recent physics literature of the day as a prolific reviewer of that literature for the Beiblätter zu den Annalen der Physik. Jules Leveugle has stressed the fact that Einstein and Planck were exposed to the recent writings of Poincaré and Lorentz through many sources including the Beiblätter zu den Annalen der Physik and Fortschritte der Physik. Einstein published 21 reviews in the Beiblätter in 1905.**2269 Jules Leveugle points out in his book Poincaré et la Relativité : Question sur la Science, that the Beiblätter published the
following review of Lorentz’ 1904 paper by Richard Gans, in Volume 29, Number 4, (February, 1905), pp. 168-170:

Die erste Tatsache ist durch eine neue Hypothese von FitzGerald und Lorentz erklärt worden, nämlich dadurch, daß die Dimensionen fester Körper in Richtung der Erdbewegung ein wenig kleiner werden.

3. Diese Hypothese verlangt eine Doppelbrechung des Lichtes in isotropen Körpern infolge der Erdbewegung; die Versuche ergaben ein negatives Resultat (Lord Rayleigh, Brace).

Um diese Widersprüche zu beseitigen, stellt der Verf. folgende Betrachtungen an:

Erfährt das elektromagnetische System eine konstante Geschwindigkeit \( \mathbf{w} \) in Richtung der \( x \)-Achse, und ist die Lichtgeschwindigkeit \( c \), setzen wir ferner

\[
\frac{c^2}{c^2 - w^2} = \frac{k^2}{c^2},
\]

und bilden den Raum ab durch die Transformation \( x' = kx \), \( y' = y \), \( z' = z \) und führen anstatt der Zeit \( t \) die „Ortszeit“

\[
t' = \frac{t}{k} - \frac{kwx}{c^2}
\]

ein, so erhalten wir, wenn wir anstatt der elektrischen und und magnetischen Feldstärke \( \mathbf{d} \) bez. \( \mathbf{h} \) etwas andere Vektoren \( \mathbf{d'} \) und \( \mathbf{h'} \) einführen, Gleichungen im bewegten, durch die Abbildung transformierten System, welche genau so gebildet sind, wie die Lorentzschen Gleichungen im ursprünglichen ruhenden System. Es folgt daraus, daß das Feld \( \mathbf{(d', h')} \) in aller Strenge dem Felde im ruhenden System an entsprechenden Punkten gleich ist, d. h. im elektrostatischen oder optischen Felde ist kein Einfluß irgend einer Ordnung der Bewegung zu konstatieren. Die ponderomotorischen Kräfte auf die Volumeneinheit dagegen erleiden eine kleine Änderung entsprechend der Volumänderung, es ist
\[ f'_x = f_x, \quad f'_y = \frac{f_y}{k}, \quad f'_z = \frac{f_z}{k}, \]

wo die gestrichenen Buchstaben im bewegten System gelten.

Diese Umformung gibt die Hypothese an die Hand, daß die Dimensionen der Elektronen durch die Bewegung in derselben Weise verändert werden wie der Raum durch die oben angegebene Transformation, daß aber die Ladung entsprechender Volumelemente dieselbe bleibt.

Ferner sollen auch nicht-elektrische (z. B. elastische) Kräfte dieselbe Veränderung durch die Translation erfahren, wie oben die ponderomotorischen Kräfte elektrischen Ursprungs.

Daraus folgt, daß ein Körper, der durch die Anziehungen und Abstoßungen seiner inneren Kräfte im Gleichgewicht ist, von selbst durch die Bewegung seine Dimensionen ändert, denn war im ruhenden System die resultierende Kraft 0 (also Gleichgewicht), so ist sie 0 im bewegten transformierten System (also Gleichgewicht).

So erklärt sich der Michelson und Morleysche Interferenzversuch, ferner der von Trouton und Noble über das Drehmoment eines geladenen Plattenkondensators und auch die vergeblichen Doppelbrechungsversuche von Lord Rayleigh und Brace, denn der schon früher vom Verf. (bis auf Größen zweiter Ordnung) aufgestellte Satz, daß Helligkeit, Dunkelheit, Strahl im ruhenden System Helligkeit, Dunkelheit, Strahl im bewegten transformierten entsprechen, gilt bei der jetzigen Transformation streng in Gliedern aller Ordnungen.

Die Formeln für die elektromagnetische Masse ändern sich infolge der Abplattung der Elektronen, aber stellen trotzdem die Kaufmannschen Versuche über Becquerelstrahlen mit befriedigender Genauigkeit dar, wie eingehende Zahlenrechnungen zeigen.

Gans.

Jules Leveugle notes that Felix Klein annotated Lorentz’ article “Weiterbildung der Maxwellschen Theorie. Elektronentheorie”, in Volume 2, Part 2, Chapter 14, pp. 145-280, of the *Encyklopädie der Mathematischen Wissenschaften*, with note 113:

“113) Lorentz, Amsterdam Zittingverslag Akad. v. Wet 12, 1904 (Amsterdam Proceedings, 1903-1904).”

and that Max Abraham also referred his readers to Lorentz’ 1904 paper, in Abraham’s “Die Grundhypothesen der Elektronentheorie”, *Physikalische Zeitschrift*, Volume 5, (1904), pp. 576-579:

“2) H. A. Lorentz, K. Akad. van Wetensch. te Amsterdam 1899, S. 507 und 1904, S. 809.”

and that Sommerfeld cited Lorentz’ 1904 paper in his paper, “Simplified Deduction of the Field and Forces of an Electron, Moving in Any Given Way” in the Koninklijke Akademie van Wetenschappen te Amsterdam Proceedings of the Meeting of Saturday, November 26, 1904, p. 346:

and that Grimm wrote of Lorentz’ work in *Die Fortschritte der Physik*, (1905), p. 29:

Nachdem neuerdings eine Reihe neuer Versuche gemacht worden sind, die sämtlich das Resultat hatten, daß auch ein Einfluß zweiter Ordnung der Erdbewegung nicht zu konstatieren ist, hat Verf. es als notwendig gefunden, seiner und Fitzgeralds Hypothese, daß die Dimensionen der Körper durch ihre Bewegung geändert würden, eine allgemeinere Grundlage zu geben. Er stellt zunächst die Grundgleichungen der Elektronentheorie auf für ein sich mit einer Geschwindigkeit bewegendes System, die geringer als Lichtgeschwindigkeit ist, und dann transformiert er die Gleichungen auf ein System, das gegen das erste in der Bewegungsrichtung deformiert ist. Er erhält somit Gleichungen, die ihm gestatten, die in einem Felde gegebenen Punkte bzw. Funktionen sofort auch im anderen Felde zu finden. Hiernach führt er nun die Hypothese ein, daß die Elektronen ihre Dimensionen in der Bewegung dieser Deformation entsprechend ändern, während sie in der Ruhe Kugeln sind, und daß die Kräfte, die zwischen ungeladenen Partikeln und zwischen solchen und Elektronen bestehen, in gleicher Weise wie die elektrischen Kräfte in einem elektrostatischen System durch Translation
beeinflußt werden. Es wird nun das elektromagnetische Moment eines einzelnen Elektrons berechnet und für die Arahasche quasistationäre Bewegung ergibt sich dann eine rein elektromagnetische Masse des Elektrons. Dann wird der Einfluß der Bewegung auf optische Phänomene betrachtet, wobei Verf. zu dem Schlusse kommt, daß in der Deformation \( \{ l, l, k \} \) das \( l = \text{const} \) sein muß und die Anwendung auf die übrigen neueren Versuche führt zu der allgemeinsten Hypothese, daß „die Massen aller Partikel durch die Bewegung in gleicher Weise beeinflußt werden, wie die elektromagnetischen Massen der Elektronen“. Im weiteren wird die Theorie an Kaufmanns Tabellen geprüft und gibt dabei ungefähr gleich gute Übereinstimmung, wie die Kaufmannschen Formeln. Zum Schluß wird noch der Versuch von Trouton diskutiert. Grm.”

9.4.5 Einstein’s Fudge

As is well known, numerous authors have shown errors in the Einsteins’ fallacy of *Petitio Principii*, including, among many others, Essen, Keswani, Miller, Planck, and Guillaume.

9.4.6 Einstein Begged the Question

Albert Einstein’s arguments were almost always fallacies of *Petitio Principii*. He argued well-known experimental results as if they were *a priori* first principles. Einstein would then induce, as if deducing, the well-known hypotheses of others, and deduce from these plagiarized hypotheses the same experimental results as conclusions, which he had first stated as premises. This was Einstein’s *modus operandi* for plagiarism. In the special theory of relativity, Einstein irrationally argued that light speed invariance, supposedly a well-known experimental result at the time, was an *a priori* first principle, which an empirical measurement cannot be, so that he could then induce through analysis, as if deducing in synthesis, the “Lorentz Transformation” hypotheses. Einstein then used the “Lorentz Transformation”, the true set of hypotheses of the special theory of relativity, to deduce light speed invariance as a conclusion, a conclusion which Einstein had already presumed as a premise. Einstein also employed the generalized equivalence of all inertial systems he alleged was observed in the Michelson experiments, as if it were an *a priori* principle, instead of the *a posteriori* empirical observation it was, to then “deduce” from this supposed first principle, the principle itself—Michelson’s result.

Einstein employed the same fallacious method in the general theory of relativity. Einstein irrationally asserted the well-known experimental gravitational-inertial mass equivalence of Newton, Bessel and Eötvös as if it were an “*a priori*” postulate, which an experimental result cannot be, only to arrive at it as an ultimate conclusion, a conclusion which was redundant to the premise. The quasi-positivistic analyses Einstein presented by turning the synthetic scientific theories of his predecessors on their heads have been applauded, ridiculed and often misrepresented as if they are
synthetic, which they are not.

Albert Einstein gave a lecture at King’s College in June of 1921. The London Times reported on 14 June 1921, on page 8,

“Professor Einstein said it gave him special pleasure to lecture in the capital of that country from which the most important and fundamental ideas of theoretical physics had spread throughout the world—the theories of motion and gravitation of Newton and the proposition of the electro-magnetic field on which Faraday and Maxwell built up the theories of modern physics. It might well be said that the theory of relativity formed the finishing stone of the elaborate edifice of the ideas of Maxwell and Lorentz by endeavours to apply physics of ‘fields’ to all physical phenomena, including the phenomena of gravitation.

Professor Einstein pointed out that the theory of relativity was not of any speculative origin, but had its origin solely in the endeavour to adapt the theory of physics to facts observed. It must not be considered as an arbitrary act, but rather as the result of the observations of facts, that the conceptions of space, time, and motion, hitherto held as fundamental, had now been abandoned.

Two main factors, continued Professor Einstein, have led modern science to regard time as a relative conception in so far as each inertial system had to be coupled with its own peculiar time: the law of constancy of the velocity of light in vacuo, sanctioned by the development of the sciences of electrodynamics and optics, and in connexion therewith the equivalence of all inertial systems (special principle of relativity) as clearly shown by Michelson’s famous experiment. In developing this idea it appeared that hitherto the interconnexion between direct events on the one hand, and the space coordinates and time on the other, had not been thought out with the necessary accuracy.

The theory of relativity endeavours to define more concisely the relationship between general scientific conceptions and facts experienced. In the realm of the special theory of relativity the space coordinates and time are still of an absolute nature in so far as they appear to be measurable by rigid bodies, rods, and by clocks. They are, however, relative in so far as they are dependent upon the motion peculiar to the inertial system that happens to have been chosen. According to the special theory of relativity the four-dimensional continuum, formed by the amalgamation of time and space, retains that absolute character which, according to the previous theories, was attributed to space as well as to time, each individually. The interpretation of the spatial coordinates and of time as the result of measurements then leads to the following conclusions: motion (relative to the system of coordinates) influences the shape of bodies and the working of clocks; energy and inertial mass are equivalent.

GRavitATIONAL FIELDS.

The general theory of relativity owes its origin, continued Professor
Einstein, primarily to the experimental fact of the numerical equivalence of the inertial and gravitational mass of a body; a fundamental fact for which the classical science of mechanics offered no interpretation. Such an interpretation is arrived at by extending the application of the principle of relativity to systems of coordinates accelerated with reference to one another. The introduction of systems of co-ordinates accelerated with reference to inertial systems causes the appearance of gravitational fields relative to the systems of coordinates. That is how the general theory of relativity, based on the equality of inertia and gravity, offers a theory of the gravitational field.

Now that systems of co-ordinates, accelerated with reference to one another, have been introduced as equivalent systems of co-ordinates, based on the identity of inertia and gravity, it follows that the laws governing the position of rigid bodies in the presence of gravitational fields do not conform to the rules of Euclidean geometry. The results as regards the working of clocks is analogous. These conclusions lead to the necessity of once more generalizing the theories of space and time, because it is no longer possible directly to interpret the co-ordinates of space and time by measurements with measuring rods and clocks. This generalization of metrics, which in the sphere of pure mathematics dates back to Gauss and Riemann, is based largely on the fact that the metrics of the special theory of relativity may be considered to apply in certain cases also to the general theory of relativity. In consequence, the co-ordinate system of space and time is no longer a reality in itself. Only by connecting the space and time co-ordinates with those mathematical figures which define the gravitational field can the objects which may be measured by measuring rods and by clocks be determined.

The idea of the general theory of relativity has yet another basis. As Ernst Mach has already emphasized, the Newtonian theory of motion is unsatisfactory in the following point:—if motion is regarded not from the casual but from the purely description point of view it will be found that there exists a relative motion of bodies with reference to each other. But the conception of relative motion does not of itself suffice to formulate the factor of acceleration to be found in Newton’s equations of motion. Newton was forced to introduce a fictitious physical space with reference to which an acceleration was supposed to exist. This conception of absolute space introduced by Newton \textit{ad hoc} is unsatisfactory, although it is logically correct. Mach, therefore, endeavoured so to alter the mechanical equations that the inertia of bodies is attributed to their relative motion with reference not to absolute space but with reference to the sum total of all other measurable bodies. Mach was bound to fail considering the state of knowledge at his time. But it is quite reasonable to put the problem as he did. In view of the general theory of relativity this line of thought comes more and more to the fore, because according to the theory of relativity the physical properties of space are influenced by matter.

Professor Einstein said he was of the opinion that the general theory of
relativity could only solve this problem satisfactorily by regarding the universe as spatially finite and closed. The mathematical results of the theory of relativity forced scientists to this view, if they assumed that the average density of matter within the universe was of finite, if ever so small a value.”

In 1905, Mileva Einstein-Marity and Albert Einstein coauthored a paper on the “electrodynamics of moving bodies”. Fallacies of begging the question emerge in the very introduction to the work. The Einsteins acknowledge in their introduction, that light speed invariance and the symmetry of electrodynamic phenomena were well-established phenomena. Well-known specific phenomena are not, by definition, “a priori” general concepts. However, the Einsteins asked us to abandon reason and assert specific experimental results and empirical observations, as if they were a priori general principles. In other words, the Einsteins engaged in an analysis of the problems of invariant light speed, and of the symmetry of electrodynamic phenomena in alleged violation of Maxwell’s theory, which problems faced physicists at the end of the Nineteenth Century. The Einsteins irrationally pretended that these two problems were solutions of themselves.

Henry August Rowland stated the two main problems facing the physicists of his day, on 28 October 1899, and I have italicized that which the Einsteins would later erroneously call “two assumptions”, or “postulates”:

“And yet, however wonderful [the ether] may be, its laws are far more simple than those of matter. Every wave in it, whatever its length or intensity, proceeds onwards in it according to well known laws, all with the same speed, unaltered in direction, from its source in electrified matter to the confines of the Universe, unimpaired in energy unless it is disturbed by the presence of matter. However the waves may cross each other, each proceeds by itself without interference with the others. [***] To detect something dependent on the relative motion of the ether and matter has been and is the great desire of physicists. But we always find that, with one possible exception, there is always some compensating feature which renders our efforts useless. This one experiment is the aberration of light, but even here Stokes has shown that it may be explained in either of two ways: first, that the earth moves through the ether of space without disturbing it, and second, if it carries the ether with it by a kind of motion called irrotational. Even here, however, the amount of action probably depends upon relative motion of the luminous source to the recipient telescope. So the principle of Doppler depends also on this relative motion and is independent of the ether. The result of the experiments of Foucault on the passage of light through moving water can no longer be interpreted as due to the partial movement of the ether with the moving water, an inference due to imperfect theory alone. The experiment of Lodge, who attempted to set the ether in motion by a rapidly rotating disc, showed no such result. The experiment of Michelson to detect the ethereal wind, although carried to the extreme of accuracy, also failed to detect any relative motion of the matter and the ether [Emphasis Added].”
The Einsteins turned reason on its head and called these two *a posteriori* problems, *a priori* “postulates”. The Einsteins phrased their two “postulates”, as follows:

1 (a). “Examples of a similar kind, as well as the failed attempts to find a motion of the earth relative to the ‘light medium’, lead to the supposition, that the concept of absolute rest corresponds to no characteristic properties of the phenomena not just in mechanics, but also in electrodynamics, on the contrary, for all systems of coordinates, for which the equations of mechanics are valid, the same electrodynamic and optical laws are also valid, as has already been proven for the magnitudes of the first order.”

1 (b). “The laws according to which the states of physical systems change do not depend upon to which of two systems of coordinates, in uniform translatory motion relative to each other, this change of state is referred.”

2 (a). “[L]ight in empty space always propagates with a determinate velocity \( c \) irrespective of the state of motion of the emitting body.”

2 (b). “Every ray of light moves in the ‘resting’ system of coordinates with the determinate velocity \( c \), irrespective of whether this ray of light is emitted from a resting or moving body. Such that

\[
\text{velocity} = \frac{\text{path of light}}{\text{interval of time}},
\]

where ‘interval of time’ is to be construed in the sense of the definition of § 1.”

Note that the first “postulate”, the principle of relativity, refers only to “moving systems”; and that the second “postulate”, the light “postulate”, refers only to a proposed “resting system”. Note further, that the light “postulate” refers only to a proposed source independence of light speed, but not to an observer independence, because this “postulate” assumes a prior privileged frame and medium in the 1905 paper, which the Einsteins identify as the “resting system”. The expression “resting system” was well understood at the time to refer to “absolute space” and a system of coordinates at rest relative to the “fixed stars”. The Einsteins’ paper later presumes that \( c' = c + l - v \), relative to the “resting system”.

Many assert that the Einsteins employed only these two “*a priori* postulates” in their theorization, as opposed to FitzGerald, Larmor, Lorentz, and Poincaré, who required the additional hypotheses of length contraction, time dilatation and an æther to arrive at the same formulation—long before the Einsteins. *Ad hoc* hypotheses were frowned upon at the time, due to Newton’s admonitions against them, such that
the removal of hypotheses was seen as an improvement. The two postulate myth is substantially and demonstrably false. The two postulates are not postulates, but rather are the deduced conclusions of the theory—summations of the supposedly observed phenomena of the day. The “postulates” are deducible from the more fundamental hypotheses of length contraction, time dilatation, relative simultaneity, inertial motion, an æther, etc.; and these are the actual fundamental hypotheses of the special theory of relativity.

Length contraction is not deduced from invariant light speed \textit{a priori}. It is more fundamental than light speed, which is derived from it, and is logically induced from invariant light speed \textit{a posteriori}. Length contraction is a specific factor which deduces the broad range of all velocity comparisons, not just light speed invariance, which represents but one of these comparisons and a deduced limit. The same is true of time dilatation and relative simultaneity. A wide range of hypotheses which deduce an æther and inertial motion are far more fundamental than the deduced conclusions of light speed source independence and the covariance of the laws of nature in inertial systems. It might be true that no one has yet created a fully fundamental theory to deduce these conclusions, but that does not render empirical observations \textit{a priori}, nor does it mean that the attempt to inductively arrive at a such a set of hypotheses \textit{a posteriori} is futile or detrimental. In addition, the evidence taken to justify the hypotheses which are accepted in the theory of relativity has not been rationally interpreted by the “relativists”.

After asserting the two “postulates”, the Einsteins raised a straw man argument based a \textit{non sequitur}. They asserted that the two “postulates” appeared irreconcilable with each other. If light speed is constant in the “resting system”, then how can it also be isotropic in a “moving system” in motion relative to the “resting system”? This is a manufactured dilemma, because, in some inexplicable way, the Einsteins argue that the first postulate, the principle of relativity, compels that light speed from all sources be isotropic for all systems in uniform inertial motion with each respect to each other. However, this is clearly a \textit{non sequitur}, because the principle of relativity no more compels light speed isotropy for all “moving systems”, then the principle of relativity requires that a body resting relative to one “moving system” \( k \) also rest relative to another “moving system” \( \hat{K} \), which is in motion relative to the first.

The Einsteins also raised the opposing problem. How can light speed be isotropic in the “resting system” and also be isotropic in a “moving system”? Of course, these questions presume the conclusion before it has been proven, the conclusion being that light speed from any given signal is isotropic in the “resting system” and all “moving systems”, which are in uniform translatory motion with respect to the “resting system”. This conclusion is an alleged empirical observation, which much be deduced from fundamental assertions. It is not an \textit{a priori} fundamental assertion. The Einsteins’ “postulates” are in fact the very conclusions which they seek prove. They have manufactured a fallacy of \textit{Petitio Principii}.

To knock down these straw men, the Einsteins turned the “two postulates” into one “postulate”, the ultimate conclusion which is sought. The Einsteins asserted that it is the \textit{combination} of the two postulates, not either postulate by itself, which
“deduces” $c' = c$ between the moving system and the resting system, by simply asserting in their paper that $c' = c$, before it has in any way been logically proven (there is a distinction and difference between a logical proof and an empirical observation and the union of the “two postulates” does not constitute a logical proof, but rather discloses the redundancy of the “postulates” to each other—as Louis Essen has stated, they are one alleged empirical fact summarized in two redundant ways):

“It is easy, with the help of this result, to ascertain the magnitudes $\xi, \eta, \zeta$, because one expresses by means of these equations, that light (as the principle of the constancy of the velocity of light, in conjunction with the principle of relativity, requires) also propagates with the velocity $c$ as measured in the moving system.”

After irrationally presuming this conclusion that $c' = c$, before it has in any way been logically proven, the Einsteins proceeded to pretend that they had not presumed it:

“Now, we have to prove that every ray of light propagates with the velocity $c$ as measured in the moving system, in case this is, as we have taken for granted, the case in the resting system, because we still have not offered up the proof that the principle of the constancy of the velocity of light is reconcilable with the principle of relativity.”

However, unless we presume that the “two postulates” are redundant, the combination of the two postulates results in $c' = c + \gamma - v$, not $c' = c$. If we do not presume that the “two postulates” are redundant, then the principle of relativity applies only to “moving systems” and the principle of the constancy of the velocity of light independent of the speed of the source is an æthereal principle of the “resting system” and only of the “resting system”.

In a rational approach to the problem, one must instead take the supposed empirical phenomenon of $c' = c$ as a point of departure for an a posteriori inductive analysis, not an a priori deductive synthesis, and from there induce a fundamental geometry a posteriori, which fundamental geometry then deduces the identity $c' = c$ and the covariance of the laws of physics a priori, in a synthetic scientific theory. Albert Einstein never accomplished such a theory and he politically obstructed valid criticisms of his irrationality by calling his critics “anti-Semitic” for daring to questions his fallacies of Petitio Principii. Albert Einstein stifled scientific progress with disingenuous “racial” politics and was himself a racist and a segregationist, and therefore a dangerous hypocrite.

The Einsteins averred, before any proof was offered:

“It is easy, with the help of this result, to ascertain the magnitudes $\xi, \eta, \zeta$, because one expresses by means of these equations, that light (as the
Note the non sequitur, which begs the question: That allegedly if the speed of light is \( c \) in the “resting system” the principle of relativity compels that it also be measured to be \( c \) in the “moving system”; which, without the prior hypotheses of the Lorentz Transformation, clearly is not a rational conclusion, for if I rest in the resting system, the principle of relativity does not compel that I also rest in the moving system. The detection of an æther frame only violates the principle of relativity if we assume that the æther exists and that it is at absolute rest, and then only because it would provide a means to detect one’s speed relative to that æther which has arbitrarily been identified as being at rest in absolute space, which is another straw man argument because rest relative to a light medium does not constitute of necessity “absolute rest”—without the metaphysical presumption of an æther at absolute rest, there is no special theory of relativity, despite its advocates assertions to the contrary. At any rate, the assertion that the detection of the æther frame would violate the principle of relativity is false and is a straw man argument made to justify the assumption that the æther rests. On the contrary, the only principle the detection of the æther frame would violate is the arbitrary principle that the æther frame cannot be detected, and the means of resolving this principle that the æther cannot be detected is the Lorentz Transformation, not the principle of relativity. It is the Lorentz Transformation which renders the laws of electrodynamics covariant, not the principle of relativity. The Einsteins simply confused their conclusion as an additional premise, which renders the two “postulates” redundant, or renders one postulate deducible from the other, and in no sense a postulate.

There is also a fallacy in the special theory of relativity of defining a violation of the principle of relativity in at least four different and distinct ways and then pretending that those different and distinct definitions are one definition. The principle of relativity is on the one hand defined as the invariance of the laws of nature in inertial frames of reference. It must be borne in mind that this principle of relativity treats of abstract idealizations and not physical reality and that inertial frames of reference do not exist in nature. This first principle is the principle of relativity of classical mechanics, which has the consequence of making it impossible to determine “absolute space” by means of dynamic experiments.

Though many have averred that this principle is equivalent to, or the same as, the negative assertion that it is impossible to determine the frame of absolute space by means of the laws of mechanics, or more broadly, by any means; this consequence is not the principle itself; and it might be possible someday to determine a preferred reference frame of space (as is the case with general relativity, or the “fixed stars”) without setting aside the principle of relativity. We have identified the classical principle of relativity of mechanics, and a distinct and different consequence of that principle, which is also wrongfully called the principle of relativity.
There is a third distinct and different principle of relativity introduced by Henri Poincaré, which states that the laws of electrodynamics are covariant in inertial frames of reference. This principle depends upon the presupposition of Maxwell’s laws of electrodynamics and the preferred reference frame of the æther, which provides an *a priori* basis for an inertial frame of reference and for the source independence of light speed. However, this third principle is not a logical necessity, and defines the identity of the laws of physics in a different way from the classical principle of relativity by means of a different system of velocity addition. According to the classical principle of relativity, the æther ought to be detectable, and it is only rendered undetectable by the Lorentz Transformation, not the principle of relativity.

The fourth distinct and different principle of relativity is the assertion that it is impossible to detect the frame of reference of the æther itself, which is an alleged consequence of the principle of relativity of electrodynamics, not that principle itself. The æther may have properties other than electrodynamic properties which renders its position detectable, and therefore one might be able to detect the frame of the æther without violating the principle of relativity of electrodynamics, as may be the case with “tachyons” or other such proposed phenomena.

The Einstins, following Poincaré’s example, deliberately confused logical consistency between these four different definitions, an artificial consistency obtained through the *ad hoc* Lorentz Transformation; with the assertion, which is false, that logical necessity requires that if one of these principle is true, then the other three must also be true. The only binding agent between these different definitions is the tacit presumption and arbitrary definition that the detection of light speed anisotropy would constitute, of necessity, the detection of an æther at absolute rest, which would, by abstract definition alone, constitute the detection of “absolute space”, which, by abstraction definition alone, is in principle not detectible in either definition.

This is a straw man argument and a *non sequitur* in that one can detect the medium of a sound wave without violating the principle of relativity, and the “relativists” have falsely and artificially confused the detection of a light medium with a violation of the “principle of relativity” and the detection of “absolute space”. In addition, the “relativists” have falsely assumed that the detection of a preferred frame of reference by any means violates both the principle of relativity of mechanics and the principle of relativity of electrodynamics.

There is complete logical consistency between the detection of light speed anisotropy in a frame of reference moving with respect to the æther, and the principle of relativity of mechanics; and the entirely artificial addition to the principle of relativity of mechanics of the assertion that the principle of relativity of electrodynamics forbids the detection of an æther frame is *ad hoc* and a straw man argument, which presupposes an æther at absolute rest and which cannot exist without the supposition of an an æther at absolute rest, and which depends upon the false assumption that the detection of absolute space violates the principle of relativity of mechanics. The principle of relativity of mechanics only states that the laws of mechanics are the same in all inertial reference frames, which is different from the assertion that “absolute space” is undetectable. If “absolute space” were...
detected by a “resting æther” (a definition alone), this in and of itself would not be a violation of the principle of relativity of mechanics nor the principle of relativity of electrodynamics, though it would put an end to the metaphysical myth of “space-time”.

Mileva and Albert have wrongly confused the fact that the ad hoc Lorentz Transformation renders the undetectability of the æther frame logically consist with the classical principle of relativity when it otherwise would not be, with Henri Poincaré’s irrational assertion that the principle of relativity demands of logical necessity that the light medium be undetectable; as if that artificially derived logical consistency were itself a logical necessity, when it is not—quite the contrary, without the ad hoc Lorentz Transformation the principle of relativity demands that the æther frame be detectable, or that light speed be source and observer speed dependent. All of these tacit presumptions in the special theory of relativity presume the existence of an æther at absolute rest, and not only has the special theory of relativity not rendered an æther at absolute rest superfluous, the entire theory depends upon the tacit premise of an æther at absolute rest, which is in “principle” undetectable by means of electrodynamics, though it is theoretically detectable by means of superluminal velocities, or other means.

There is a difference between arguing that a set of circumstances renders a physical entity undetectable, and arguing that a set of circumstances renders a physical entity superfluous, and the Einsteins, following Poincaré’s example, have deliberately and falsely confused undetectability with superfluousness, just as they have deliberately and falsely confused logical consistency with logical necessity. The so-called “principle” that the æther at absolute rest is undetectable is in fact a corollary to the tacitly presumed properties of that æther and incorporates the presumption of such an æther at “absolute rest” in the very definition. The “principle” is a deducible conclusion, not a fundamental premise. The fundamental premise is the existence of an æther at “absolute rest”—though even this assertion is deducible from more fundamental elements.

There is also a difference between the assertion that the resting frame of an æther arbitrarily defined as at “absolute rest” is undetectable, and the assertion that the æther as a light medium is undetectable. In all of our human observations of physical entities we depend upon our senses and our definitions, and our consciousness of an image is not the actual entity reflected in our images of the physical world. Our knowledge of the æther exists in, among other things, the presumption of the source speed independence of light speed. The æther is detectable in the special theory of relativity even though its presumed resting frame of reference remains undetectable by means of electrodynamical experiments.

In addition, the entire structure of the Lorentz Transformation is built upon the presumption of light speed anisotropy in moving frames of references, which fact is revealed by the use of the scalar $\mathbf{e}^2$. The Einsteins’ assertion of the absolute velocity of light in the “resting system” as a given axiomatic fact is an acknowledgment that the “resting system” is an æther at absolute rest, and this is how the Einsteins’ define it in Part 1, Section 1 of their paper. If light speed were not anisotropic in moving frames of reference, the Lorentz Transformation would not work, because light speed
would not then be measured to be \( c \) in a moving frame of reference by observers relatively resting in that moving frame—moving with respect to the æther. This has been adequately proven by Guillaume, Jánossy and others.\textsuperscript{2271} Prof. Friedwardt Winterberg wrote,

“According to Einstein, two clocks, \( A \) and \( B \), are synchronized if

\[
t_B = \frac{1}{2} \left( t_A^1 + t_A^2 \right)
\]

(VII.13)

where \( t_A^1 \) is the time a light signal is emitted from \( A \) to \( B \), reflected at \( B \) back to \( A \), arriving at \( A \) at the time \( t_A^2 \), and where it is assumed that the time \( t_B \) at which the reflection at \( B \) takes place is equal the arithmetic average of \( t_A^1 \) and \( t_A^2 \). Only by making this assumption does the velocity of light turn out always to be isotropic and equal to \( c \). From an absolute point of view, the following is rather true: If \( t_R \) is the absolute reflection time of the light signal at clock \( B \), one has for the out and return journeys of the light signal from \( A \) to \( B \) and back to \( A \), if measured by an observer in an absolute system at rest in the distinguished reference system:

\[
\gamma \left( t_R - t_A^1 \right) = d / c_+,
\]

(VII.14)

\[
\gamma \left( t_A^2 - t_R \right) = d / c_-
\]

where \( d \) is the distance between both clocks, and where \( c_+ \) and \( c_- \) are given by

\[
c_+ = \sqrt{c^2 - v^2 \sin^2 \psi} - v \cos \psi
\]

\[
c_- = \sqrt{c^2 - v^2 \sin^2 \psi} + v \cos \psi
\]

Adding the equations (VII.14) one obtains

\[
c \left( t_A^2 - t_A^1 \right) = 2 \gamma d \sqrt{1 - (v^2/c^2) \sin^2 \psi}
\]

(VII.15)

If an observer at rest with the clock wants to measure the distance from \( A \) to \( B \), he can measure the time it takes a light signal to go from \( A \) to \( B \) and back to \( A \). If he assumes that the velocity of light is constant and isotropic in all inertial reference systems, including the one he is in, moving together with \( A \) and \( B \) with the absolute velocity \( v \), this distance is
\[ d' = \frac{c}{2} \left( t_A^2 - t_A^1 \right) \]  \hspace{1cm} (VII.16)

and because of (VII.15)

\[ d' = \gamma d \sqrt{1 - \left( \frac{v^2}{c^2} \right) \sin^2 \psi} \]  \hspace{1cm} (VII.17)

Comparing this result with,

\[ l' = l \sqrt{1 - \left( \frac{v^2}{c^2} \right) \cos^2 \phi} = \frac{l}{\gamma \sqrt{1 - \left( \frac{v^2}{c^2} \right) \sin^2 \psi}} \]

one sees that he would obtain the same distance \( d' \), if he uses a contracted rod as a measuring stick, of Einstein’s constant light velocity postulate. The velocity of light between \( A \) and \( B \) by using a rod to measure the distance and the time it takes a light signal in going from \( A \) to \( B \) and back to \( A \), of course, will turn out to be equal to \( c \), because according to (VII.16)

\[
\frac{2d'}{t_A^2 - t_A^1} = c
\]  \hspace{1cm} (VII.18)

Rather than using a reflected light signal to measure the distance \( d' \), the observer at \( A \) may try to measure the one-way velocity of light by first synchronizing the clock \( B \) with \( A \) and then measure the time for a light signal to go from \( A \) to \( B \). However, since this synchronization procedure also uses reflected light signals, the result is the same. For the velocity he finds

\[
\frac{d}{t_B - t_A^1} = \frac{d'}{(1/2) \left( t_A^1 + t_A^2 \right) - t_A^1} = \frac{2d'}{t_A^2 - t_A^1} = c
\]  \hspace{1cm} (VII.19)

By subtracting the equations (VII.14) one finds that

\[
t_R = t_B + \left( \frac{v}{c^2} \right) ud \cos \psi
\]  \hspace{1cm} (VII.20)

which shows that from an absolute point of view the ‘true’ reflection time \( t_R \) at clock \( B \) is only then equal to \( t_B \) if \( v = 0 \). From an absolute point of view the propagation of light is isotropic only in the distinguished reference system, but anisotropic in a reference system in absolute motion against the distinguished reference system. This anisotropy remains hidden due to the
impossibility to measure the one way velocity of light. This impossibility is expressed in the Lorentz transformations themselves, containing the scalar $c^2$ rather than the vector $\mathbf{c}$, through which an anisotropic light propagation would have to be expressed.\textsuperscript{2272}

The expected anisotropy from which the transformation evolved exhibits itself in the predictions the theory makes for an interferometer constructed and calibrated in an inertial reference system $\mathbf{K}_0$ without rigid attachments, but instead assembled with rockets or automobiles at each of the relevant surfaces, which after being adjusted are then simultaneously and uniformly accelerated with respect to $\mathbf{K}_0$ then allowed to travel in inertial motion in inertial reference system $\mathbf{K}_1$, but which do not suffer a Lorentz contraction due to the lack of rigid attachments between them and the uniform manner in which they are accelerated. The special theory of relativity predicts a shift in the interference fringe pattern on the interferometer, which matches the exact result for which Michelson and Morley originally sought but did not find, and which prediction results from light speed anisotropy in at least one of the two inertial reference systems employed in the experiment.

Lajos Jánossy proved this argument,

\textsuperscript{2272} §7. Im vorigen Abschnitt haben wir gezeigt, wie man ein materialles Bezugsystem $\mathbf{K}_1$ konstruieren kann, das eine vollkommene Galileische Transformation des Systems $\mathbf{K}_0$ ist. Das System $\mathbf{K}_1$ ist jedoch ein sehr unbequemes Bezugsystem. Wir finden nämlich, daß 1. das Licht sich in $\mathbf{K}_1$ nicht isotrop ausbreitet, und 2. daß bewegte Uhren Phasenverschiebungen erleiden, auch wenn sie sehr langsam in $\mathbf{K}_1$ bewegt werden; die Phasenverschiebung verschwindet auch im Grenzfall der verschwindenden Verschiebungsgeschwindigkeit nicht.

Wir zeigen zunächst, daß diese erwähnte, unbequeme Eigenschaft in $\mathbf{K}_1$ tatsächlich auftritt.

1. Daß Licht sich in $\mathbf{K}_0$ isotrop ausbreitet, kann durch den Michelson-Morley-Versuch gezeigt werden. Betrachten wir nun ein Interferometer in $\mathbf{K}_0$, das aus vier unzusammenhängenden Teilen besteht (s. Abb. 2 [Figure deleted]): Eine halbversilberte Platte $\mathbf{P}$, zwei Spiegel $\mathbf{M}_1$ and $\mathbf{M}_2$ und ein Fernohr $\mathbf{T}$. Wenn wir das System drehen, so daß die relativen Entfernungen von $\mathbf{M}_1$, $\mathbf{M}_2$, $\mathbf{P}$ und $\mathbf{T}$ unverändert bleiben, dann wird auch das Streifensystem in $\mathbf{T}$ unverändert bleiben. Wenn wir nun die vier Teile des Systems unabhängig, aber gleichzeitig beschleunigen, dann bringen wir das Interferometer in des System $\mathbf{K}_1$. Diese Beschleunigung wird aber das Streifensystem, das man in $\mathbf{T}$ sieht, beeinflussen. Diese Beschleunigung würde in der Tat eine Streifenverschiebung hervorrufen, die in Lichtzeit
Der obige Wert der Verschiebung ist nämlich genau der, den seinerzeit Michelson und Morley erwartet hatten, aber nicht fanden. Der Unterschied zwischen dem hier beschriebenen Experiment und dem wirklichen Michelson-Morley-Experiment ist nämlich der, daß das wirkliche Interferometer nicht aus unabhängigen Bestandteilen „zusammengesetzt“ ist, sondern ein festes System bildete. Wenn die Teile unseres gedachten Interferometers durch materielle Stäbe verbunden wären, dann würden die einzelnen Teile nach Vollzug der Beschleunigung durch die in den Stäben auftretenden, elastischen Kräfte verschoben werden. Wenn wir also den elastischen Kräften freies Spiel gewähren würden, dann würden sie das Interferometer im Vergleich zum System \( K_1 \) in einer solchen Weise verzerren, daß die Verzerrung die Phasenverschiebung (13) genau kompensieren würde.

Um dies ganz klar zu machen, betrachten wir schematisch ein Interferometer, dessen vier Bestandteile auf vier Autos montiert sind. Setzen wir nun voraus, daß diese Autos gleichzeitig in der in §6 beschriebenen Weise losfahren. (Wir setzen voraus, daß die Autos so glatt fahren, daß die Interferenzstreifen während der Fahrt bestehen bleiben.) Das Interferometer, das auf diese Weise in Bewegung gesetzt worden ist, wird sicher eine Phasenverschiebung zeigen. Wir haben in §6/1 darauf hingewiesen, daß elastische Bänder, die zwischen Autos gespannt sind, in Spannung geraten, wenn die Autos sich in Bewegung setzen, weil nämlich diese Bänder sich zusammenzuziehen versuchen, aber daran verhindert werden durch die Autos. Wenn wir jetzt die Autos sich einander soweit nähern lassen, daß die elastische Spannung aufhört, dann verschieben wir damit die Spiegel genau in der richtigen Weise, um die nach der Beschleunigung aufgetretene Phasenverschiebung rückgängig zu machen. Zusammenfassend sehen wir, daß die Lichtfortpflanzung in \( K_1 \) nicht der isotrop erfolgt. Dieses Resultat setzt natürlich voraus, daß wir mit der Methode der Konstruktion von \( K_1 \), wie sie in §6 beschrieben wurde, einverstanden sind.\(^\text{2273}\)

Metaphysical four-dimensional expositions, which would obfuscate these facts with the obvious fiction of a false \textit{ad hoc} fourth dimension, are not science and depend upon an imaginary dimension to perform the mutations of physical bodies which must have a physical basis if they in fact occur. As Einstein, himself, avowed, “the real basis of the special relativity theory” is not the deduced conclusion of light speed invariance and the covariance of the laws of electrodynamics in Ludwig Lange’s “inertial systems”. As Albert Einstein later
admitted, the real set of *a priori* postulates is the *ad hoc* “Lorentz Transformation”, replete with its dreaded *ad hoc* hypotheses of length contraction and time dilatation. The Lorentz Transformation deduces all velocity comparisons, not just invariant light speed, which is a specific speed, and a derived unit, not a general and fundamental geometry. Therefore, the Lorentz Transformation is more fundamental than light speed invariance and the principle of relativity.

In the modern metaphysical theory of special relativity first developed by Henri Poincaré through the use of his pseudo-Euclidean geometry, it is space-time which is fundamental, and which provides the basis to deduce the quadri-dimensionality of numerous non-physical quantities. Space-time is not the principle of relativity, nor is it the principle of light speed invariance. Space-time is more fundamental than either and both are deducible from space-time. But it must be borne in mind that when speaking of space-time one is dealing in metaphysical quantities and qualities, not physical and measurable ones. In other words, one is pretending in lieu of a formulating a rational physical theory.

Later formulations of the special theory of relativity change the 1905 light postulate, from the Einsteins’ constant speed of light exclusively in the “resting system”, into the invariance of light speed in all of Lange’s inertial systems. But this renders the principle of relativity redundant to, or deducible from, the light “postulate”, and, therefore, not a “postulate”, *per se*, because the light “postulate” then asserts the identity of Lange’s inertial systems as light speed invariance, and the principle of relativity is already proven in the light “postulate”. On the other hand, if we pretend that the principle of relativity is the covariance of the laws of physics embracing Maxwell’s theory of the æther, given the “Lorentz Transformation” as a premise, then the second “postulate” is already incorporated in the first “postulate”.

If we are to assume that the Einsteins, in their 1905 paper, deduced, not induced, the Lorentz Transformation from invariant light speed; we would further have to fallaciously assume that empirically observed Lorentz Transformation metrics provoked the Einsteins to induce an unobserved invariant light speed and the unobserved symmetry of electrodynamic phenomena, as self-evident general truths induced *a posteriori* from empirically observed and reciprocally measured: length contraction, time dilatation, relative simultaneity and inertial relative motion between two systems devoid of any net force. Such is obviously not what happened, and such is not what is argued in the 1905 paper.

On the contrary, supposedly observed invariant light speed and the supposedly observed symmetry of electrodynamic phenomena led Voigt, FitzGerald and Larmor to scientifically induce, *a posteriori*, the general geometry of the (misnamed) “Lorentz Transformation”, which general set of hypotheses supposedly deduced all “known” phenomena in non-existent hypothetical “inertial systems”. The Einsteins pseudo-Metaphysics, their ontology of redundancy, simply disguised the more scientific, though likewise irrational, work of their predecessors, in a way which attempted to make it appear that the Einsteins had deduced that which must be induced, and had avoided hypotheses, which they had not avoided, but rather attempted to induce, through fallacies of *Petitio Principii*.

Most of the post-1905 statements of the special theory of relativity substitute a
completely different proposition for the “two postulates”. Einstein, himself, substituted one light theorem in 1907 for the “two postulates” of 1905:

“the ‘principle of the constancy of the velocity of light’ [***] for a system of coordinates in a definite state of motion [as opposed to solely in the ‘resting system’ as in 1905.]”  

which presumes the Lorentz Transformation from which this supposed “postulate” is deduced, and which presumes the tacit hypotheses of an isotropic and homogenous absolute space and “a definite state of motion” relative to that absolute space. This new light “postulate” represents, therefore, not a postulate, but a deduction, a theorem, and a phenomenon.

Einstein admitted in 1907 that this “postulate” could not be \textit{a priori}, but must instead be \textit{a posteriori}:

“That the supposition made here, which we want to call the ‘principle of the constancy of the velocity of light’, is actually met in Nature, is by no means self-evident, nevertheless, it is—at least for a system of coordinates in a definite state of motion—rendered probable through its verification, which Lorentz’ theory based upon an absolutely resting aether has ascertained through experiment.”

The so-called “postulates” are simply a restatement of supposed experimental facts, and are not postulates, but empirical facts generalized as “laws” and “theorems”. As Robert Daniel Carmichael stated:

“The experiments which we have described (and others related to them) are fundamental in the theory of relativity. The postulates in the next chapter are based on them. These postulates are in the nature of generalizations of the facts established by experiment. [***] In the next chapter we shall begin the systematic development of the theory of relativity. It will be seen that its fundamental postulates, or laws, are based on the experiments of which we have given a brief account and on others related to them. [***] The postulates, as we shall see, are simply generalizations of experimental facts; and, unless an experiment can be devised to show that these generalizations are not legitimate, it is natural and in accordance with the usual procedure in science to accept them as ‘laws of nature.’”

There is an obnoxious pun in Carmichael’s argument related to the use of the word “generalization”. The generalization expressed is that: what happens in experiment $A$ must happen in experiment $B$, given like conditions; and \textit{not} that the like results of experiments $A$ and $B$ are general principles, \textit{per se}. The “laws of nature” incorporate general principles to deduce the generalized experimental results, and there is an absolute distinction between the general principles and the generalization of experimental results, which the general principles must deduce. Carmichael blurs
the distinction with a pun.

Hendrik Antoon Lorentz questioned Albert Einstein’s “method” of pretending that induction is deduction:

“Einstein simply postulates what we have deduced, with some difficulty and not altogether satisfactorily, from the fundamental equations of the electromagnetic field. [***] I have not availed myself of his substitutions, only because the formulae are rather complicated and look somewhat artificial”.

We soon discover in the introduction of the Einsteins’ 1905 paper a clear statement of the fallacious objective of their entire paper:

“These two assumptions are sufficient in order to arrive at a simple and consistent electrodynamics of moving bodies, taking as a basis Maxwell’s theory for resting bodies.”

Is Maxwell’s theory for resting bodies a third postulate? One of the “two assumptions”, the first “postulate”, is that the laws electrodynamics of moving bodies be consistent among systems of reference in uniform translatory motion with respect to the “resting system”. Of course, the reasoning presented is circular, first assuming via the first “postulate” that the laws of electrodynamics are consistent, then arguing that this mandated consistency, as a premise, deduces consistency as a conclusion. It is the first of many circular arguments found in the Einsteins’ 1905 paper. How are we to determine that which constitutes an “inertial system”, other than circularly, as in: An inertial system is one in which there is no net force acting on the system; i.e. there is no net force acting on a system, when it is in inertial motion?

Maxwell’s theory for resting bodies is Maxwell’s theory of the medium, a privileged frame, the æther. However, the Einsteins alleged that the æther was “superfluous” to their theory. The Einsteins irrationally wrote with the same pen that the æther was superfluous, while assuming it and its laws and properties as a basis for “their” theory.

In the introduction to the 1905 paper, we are being primed to venture forth from Maxwell’s theorems for bodies resting in the æther, so that we can return to them, *Petitio Principii*, as the covariant laws of moving bodies, while being asked to pretend that the æther is superfluous, so that we aren’t too shocked when simultaneity is claimed to be relative, again, *Petitio Principii*, via an impossible light signal clock synchronization operation which is itself based on the unproven assumption of light speed invariance, or $c' = c$, which premise of light speed invariance is also the conclusion of the theory. The unproven conclusion is redundant to the unproven premise. The Lorentz Transformations are then plagiarized as if from nowhere to save the day and provide the proof which otherwise does not exist, and which begins from the true postulates of length contraction, time dilatation, relative simultaneity, inertial motion, the æther, etc.
For example, Albert Einstein stated in 1949:

“[T]he following postulate is [***] sufficient for a solution [***] 
L[ight]-principle holds for all inertial systems (application of the special 
principle of relativity to the L[ight]-principle) [***] With the help of the 
Lorentz transformations the special principle of relativity can be expressed 
thus: The laws of nature are invariant with respect to 
Lorentz-transformations”.

Compare Albert Einstein’s later statement to Willem de Sitter’s statement of 
1911:

“The principle of relativity can be enunciated as the postulate that the 
transformations, with respect to which the laws of nature shall be invariant, 
are ‘Lorentz-transformations.’”

Einstein, ever the plagiarist, stated in 1952:

“The whole content of the special theory of relativity is included in the 
postulate: The laws of Nature are invariant with respect to the Lorentz 
transformations.”

Einstein disclosed his modus operandi for manipulating credit for the synthetic 
scientific theories of others, when he stated in 1936:

“There is no inductive method which could lead to the fundamental concepts 
of physics. Failure to understand this fact constituted the basic philosophical 
error of so many investigators of the nineteenth century. [***] Logical 
thinking is necessarily deductive; it is based upon hypothetical concepts and 
axioms. How can we expect to choose the latter so that we might hope for a 
confirmation of the consequences derived from them? The most satisfactory 
situation is evidently to be found in cases where the new fundamental 
hypotheses are suggested by the world of experience itself.”

This is a clear statement by Einstein that he would have science deduce a thing 
from itself, taking the world of experience as a hypothesis, only to deduce the world 
of experience as an effect, of itself. Albert Einstein avowed that,

“[A]ll knowledge of reality starts from experience and ends in it. [***] 
[E]xperience is the alpha and omega of all our knowledge of reality.”

Of course, Mileva and Albert were forced to present the real hypotheses, which they 
stuck in the middle of their arguments by way of induction, or an attempt at 
induction, which analyses they attempted to disguise as deductions from a priori 
principles, but which “a priori principles” were well-known summations of physical
Einstein wanted people to believe that it is irrelevant that his predecessors induced the theories he later copied, because Einstein just invented them, *sua sponte*, irrationally, after he had read them, and therefore deserved credit for them. Einstein stated,

“Invention is not the product of logical thought, even though the final product is tied to a logical structure.”

Einstein stated, together with Infeld:

“Physical concepts are free creations of the human mind, and are not, however it may seem, uniquely determined by the external world.”

This was a philosophy they took over from Henri Poincaré.

Certainly, the two “postulates” of the theory of relativity were not, “free creations of the human mind,” but were, instead, summations of the empirical observations of the well-known phenomena of the day framed with the familiar concepts of the day. What Infeld and Einstein meant by “free” is difficult to fathom, and it is simply repetitive to say that creations of the mind are creations of the mind. Einstein’s vague notions are perhaps the result of his plagiarizing Newton, Mach, Pearson, and others, on the principle of logical economy and watering down what they had written with Einstein’s simplistic and naïve talk. If “free” is to mean unrestricted in any sense, no human mind is “free”. We are limited in our concepts, experience, and scope, and we are socialized, indoctrinated and inculcated into certain beliefs.

Despite Einstein’s assertions to the contrary, there is no mutual exclusion between being creative and being logical. A true scientist can create logical hypotheses through creative induction, even though Albert Einstein lacked the talent needed to do it for himself.

It is the Lorentz Transformation which is the product of creative inductive logic, with its hypotheses of length contraction, time dilatation and relative simultaneity, and which is the fundamental postulation of the special theory of relativity. Invariant light speed and the covariance of the laws of physics, were observed, not induced, and are deducible from the Lorentz Transformation, the laws of physics, and the definition of inertial motion, which are more fundamental in the special theory of relativity than invariant light speed. Speed must be composed of the more fundamental elements of distance and duration. Speed is a derived unit. Therefore, the synthesis of the special theory of relativity comes in deducing invariant light speed from the hypotheses of an isotropic and homogenous space, Maxwell’s theory of the medium, the theory of inertial motion, and the hypotheses of length contraction, time dilation and relative simultaneity. This is precisely the conclusion Einstein was obliged to admit in 1935:

“The special theory of relativity grew out of the Maxwell electromagnetic equations. So it came about that even in the derivation of the mechanical
concepts and their relations the consideration of those of the electromagnetic field has played an essential role. The question as to the independence of those relations is a natural one because the Lorentz transformation, the real basis of the special relativity theory[. . .]”

To argue, as the Einsteins did argue in 1905, that invariant light speed and the mandated identity of Lange’s inertial systems deduces invariant light speed and the mandated identity of Lange’s inertial systems, is to argue in fallacies of *Petitio Principii*, which is precisely what the Einsteins did do, in an attempt to hide their plagiarism of the induced hypotheses of Boscovich, Voigt, FitzGerald and Larmor.

9.5 The “Two Postulates”

The two postulates, are not in fact postulates, but are instead summations of well-known empirical facts; which are deducible from more fundamental principles, and even from each other. Henry August Rowland stated the two “postulates” on October 28th, 1899,

“And yet, however wonderful [the ether] may be, its laws are far more simple than those of matter. Every wave in it, whatever its length or intensity, proceeds onwards in it according to well known laws, all with the same speed, unaltered in direction, from its source in electrified matter to the confines of the Universe, unimpaired in energy unless it is disturbed by the presence of matter. However the waves may cross each other, each proceeds by itself without interference with the others. [***] To detect something dependent on the relative motion of the ether and matter has been and is the great desire of physicists. But we always find that, with one possible exception, there is always some compensating feature which renders our efforts useless. This one experiment is the aberration of light, but even here Stokes has shown that it may be explained in either of two ways: first, that the earth moves through the ether of space without disturbing it, and second, if it carries the ether with it by a kind of motion called irrotational. Even here, however, the amount of action probably depends upon relative motion of the luminous source to the recipient telescope. So the principle of Doppler depends also on this relative motion and is independent of the ether. The result of the experiments of Foucault on the passage of light through moving water can no longer be interpreted as due to the partial movement of the ether with the moving water, an inference due to imperfect theory alone. The experiment of Lodge, who attempted to set the ether in motion by a rapidly rotating disc, showed no such result. The experiment of Michelson to detect the ethereal wind, although carried to the extreme of accuracy, also failed to detect any relative motion of the matter and the ether [*Emphasis Added*].”

9.5.1 The “Principle of Relativity”
Boscovich wrote of length contraction, time dilatation, relative simultaneity, and the “Principle of Invariance” resulting from these long ago in the 1700’s.\textsuperscript{2291} Stallo, Streintz, Everett and Lange stressed the principle of relativity. The term “principle of relativity” was not original to the Einsteins. It was, in fact, a common term long before they entered the scene. It was found in German in: Lange,\textsuperscript{2292} Stallo,\textsuperscript{2293} Violle,\textsuperscript{2294} Poincaré,\textsuperscript{2295} and the German translation, with notes by Felix Hausdorff,\textsuperscript{2296} of Huyghens’ Seventeenth Century seminal paper on relativity theory, “Über die Bewegung der Körper durch den Stoss / Über die Centrifugalkraft”; all before 1905. The term also appeared in many other languages, and was used by many other authors prior to 1905. Poincaré frequently iterated his electrodynamics-based “principle of relativity” long before the Einsteins repeated the same principle. Rowland had expressed it by 1900 and Maxwell in 1872.

Though it was an ancient notion, Galileo Galilei made the principle of relativity of mechanics famous,

“When you have observed all these things carefully (though there is no doubt that when the ship is standing still everything must happen in this way), have the ship proceed with any speed you like, so long as the motion is uniform and not fluctuating this way and that. You will discover not the least change in all the effects named, nor could you tell from any of them whether the ship was moving or standing still.”\textsuperscript{2297}

Boscovich argued in 1763 in the second supplement to his \textit{Natural Philosophy},

“§ II

\textit{Of Space & Time, as we know them}

18. We have spoken, in the preceding Supplement, of Space & Time, as they are in themselves; it remains for us to say a few words on matters that pertain to them, in so far as they come within our knowledge. We can in no direct way obtain a knowledge through the senses of those real modes of existence, nor can we discern one of them from another. We do indeed perceive, by a difference of ideas excited in the mind by means of the senses, a determinate relation of distance & position, such as arises from any two local modes of existence; but the same idea may be produced by innumerable pairs of modes or real points of position; these induce the relations of equal distances & like positions, both amongst themselves & with regard to our organs, & to the rest of the circumjacent bodies. For, two points of matter, which anywhere have a given distance & position induced by some two modes of existence, may somewhere else on account of two other modes of existence have a relation of equal distance & like position, for instance if the distances exist parallel to one another. If those points, we, & all the circumjacent bodies change their real positions, & yet do so in such a manner that all the distances remain equal & parallel to what they were at the start, we shall get exactly the same ideas. Nay, we shall get the same ideas, if, while the magnitudes of the distances remain the same, all their directions are
The Priority Myth

turned through any the same angle, & thus make the same angles with one another as before. Even if all these distances were diminished, while the angles remained constant, & the ratio of the distances to one another also remained constant, but the forces did not change owing to that change of distance; then if the scale of forces is correctly altered, that is to say, that curved line, whose ordinates express the forces; then there would be no change in our ideas.

19. Hence it follows that, if the whole Universe within our sight were moved by a parallel motion in any direction, & at the same time rotated through any angle, we could never be aware of the motion or the rotation. Similarly, if the whole region containing the room in which we are, the plains & the hills, were simultaneously turned round by some approximately common motion of the Earth, we should not be aware of such a motion; for practically the same ideas would be excited in the mind. Moreover, it might be the case that the whole Universe within our sight should daily contract or expand, while the scale of forces contracted or expanded in the same ratio; if such a thing did happen, there would be no change of ideas in our mind, & so we should have no feeling that such a change was taking place.

20. When either objects external to us, or our organs change their modes of existence in such a way that that first equality or similitude does not remain constant, then indeed the ideas are altered, & there is a feeling of change; but the ideas are the same exactly, whether the external objects suffer the change, or our organs, or both of them unequally. In every case our ideas refer to the difference between the new state & the old, & not to the absolute change, which does not come within the scope of our senses. Thus, whether the stars move round the Earth, or the Earth & ourselves move in the opposite direction round them, the ideas are the same, & there is the same sensation. We can never perceive absolute changes; we can only perceive the difference from the former configuration that has arisen. Further, when there is nothing at hand to warn us as to the change of our organs, then indeed we shall count ourselves to have been unmoved, owing to a general prejudice for counting as nothing those things that are nothing in our mind; for we cannot know of this change, & we attribute the whole of the change to objects situated outside of ourselves. In such manner any one would be mistaken in thinking, when on board ship, that he himself was motionless, while the shore, the hills & even the sea were in motion.

Newton stated, in the fifth corollary to his *Principia*,

“**Corollary V.**

*The motions of bodies included in a given space are the same among themselves, whether that space is at rest, or moves uniformly forwards in a right line without any circular motion.*

For the differences of the motions tending towards the same parts, and
the sums of those that tend towards contrary parts, are at first (by supposition) in both cases the same; and it is from those sums and differences that the collisions and impulses do arise with which the bodies mutually impinge one upon another. Wherefore (by Law 2.) the effects of those collisions will be equal in both cases; and therefore the mutual motions of the bodies among themselves in the one case will remain equal to the mutual motions of the bodies among themselves in the other. A clear proof of which we have from the experiment of a ship: where all motions happen after the same manner, whether the ship is at rest, or is carried uniformly forwards in a right line."**2299

J. D. Everett expressly stated the principle of relativity at least as early as 1883, in anticipation of Lange,

"We cannot even assert that there is any such thing as absolute rest, or that there is any difference between absolute rest and uniform straight movement of translation."**2300

and, in 1895, Everett asserted the principle of relativity as a negative assertion,

"[T]here is no test by which we can distinguish between absolute rest and uniform velocity of translation".**2301

As Joseph Larmor noted in 1898, and as G. H. Keswani and C. W. Kilmister clarified,**2302 James Clerk Maxwell stated the principle of relativity of electromagnetism in 1873 in his *Treatise on Electricity and Magnetism* §§ 600, 601,

"On the Modification of the Equations of Electromotive Intensity when the Axes to which they are referred are moving in Space.

600.] Let \( x', y', z' \) be the coordinates of a point referred to a system of rectangular axes moving in space, and let \( x, y, z \) be the coordinates of the same point referred to fixed axes.

Let the components of the velocity of the origin of the moving system be \( u, v, w \) and those of its angular velocity \( \omega_1, \omega_2, \omega_3 \) referred to the fixed system of axes, and let us choose the fixed axes so as to coincide at the given instant with the moving ones, then the only quantities which will be different for the two systems of axes will be those differentiated with respect to the time. If \( \frac{\partial x}{\partial t} \) denotes a component velocity at a point moving in rigid connexion with the moving axes, and \( \frac{dx}{dt} \) and \( \frac{dx'}{dt} \) those of any moving point, having the same instantaneous position, referred to the fixed and the moving axes respectively, then
\[
\frac{dx}{dt} = \frac{\delta x}{\delta t} + \frac{dx'}{dt},
\]

with similar equations for the other components.

By the theory of the motion of a body of invariable form,

\[
\begin{align*}
\frac{\delta x}{\delta t} &= u + \omega_2 z - \omega_3 y, \\
\frac{\delta y}{\delta t} &= v + \omega_3 x - \omega_1 z, \\
\frac{\delta z}{\delta t} &= w + \omega_1 y - \omega_2 x.
\end{align*}
\]

Since \( F \) is a component of a directed quantity parallel to \( x \), if \( \frac{dF'}{dt} \) be the value of \( \frac{dF}{dt} \) referred to the moving axes, it may be shewn that

\[
\frac{dF'}{dt} = \frac{dF}{dx} \frac{\delta x}{\delta t} + \frac{dF}{dy} \frac{\delta y}{\delta t} + \frac{dF}{dz} \frac{\delta z}{\delta t} + G \omega_3 - H \omega_2 + \frac{dF}{dt}.
\]

Substituting for \( \frac{dF}{dy} \) and \( \frac{dF}{dz} \) their values as deduced from the equations (A) of magnetic induction, and remembering that, by (2),

\[
\frac{d}{dx} \frac{\delta x}{\delta t} = 0, \quad \frac{d}{dx} \frac{\delta y}{\delta t} = \omega_3, \quad \frac{d}{dx} \frac{\delta z}{\delta t} = -\omega_2,
\]

we find

\[
\frac{dF'}{dt} = \frac{dF}{dx} \frac{\delta x}{\delta t} + F \frac{d}{dx} \frac{\delta x}{\delta t} + \frac{dG}{dx} \frac{\delta y}{\delta t} + \frac{dG}{dx} \frac{\delta y}{\delta t} + \frac{dH}{dx} \frac{\delta z}{\delta t} + H \frac{d}{dx} \frac{\delta z}{\delta t} - c \frac{\delta y}{\delta t} + b \frac{\delta z}{\delta t} + \frac{dF}{dt}.
\]

If we now put

\[
-\psi' = F \frac{\delta x}{\delta t} + G \frac{\delta y}{\delta t} + H \frac{\delta z}{\delta t},
\]

(6)
\[
\frac{dF'}{dt} = -\frac{d\Psi'}{dx} - c\frac{\delta y}{\delta t} + b\frac{\delta z}{\delta t} + \frac{dF}{dt}. \quad (7)
\]

The equation for \( P \), the component of the electromotive intensity parallel to \( x \), is, by (B),

\[
P = c\frac{dy}{dt} - b\frac{dz}{dt} - \frac{dF}{dt} - \frac{d\Psi}{dx}, \quad (8)
\]

referred to the fixed axes. Substituting the values of the quantities as referred to the moving axes, we have

\[
P' = c\frac{dy'}{dt} - b\frac{dz'}{dt} - \frac{dF'}{dt} - \frac{d(\Psi + \Psi')}{dx}, \quad (9)
\]

for the value of \( P \) referred to the moving axes.

601.] It appears from this that the electromotive intensity is expressed by a formula of the same type, whether the motions of the conductors be referred to fixed axes or to axes moving in space, the only difference between the formulæ being that in the case of moving axes the electric potential \( \Psi \) must be changed into \( \Psi + \Psi' \).

In all cases in which a current is produced in a conducting circuit, the electromotive force is the line-integral

\[
E = \int \left( P \frac{dx}{ds} + Q \frac{dy}{ds} + R \frac{dz}{ds} \right) ds, \quad (10)
\]

taken round the curve. The value of \( \Psi \) disappears from this integral, so that the introduction of \( \Psi' \) has no influence on its value. In all phenomena, therefore, relating to closed circuits and the currents in them, it is indifferent whether the axes to which we refer the system be at rest or in motion. See Art. 668.”

Maxwell wrote in his *Matter and Motion*,

“18. **Absolute Space**

Absolute space is conceived as remaining always similar to itself and immovable. The arrangement of the parts of space can no more be altered than the order of the portions of time. To conceive them to move from their places is to conceive a place to move away from itself.

But as there is nothing to distinguish one portion of time from another except the different events which occur in them, so there is nothing to distinguish one part of space from another except its relation to the place of
material bodies. We cannot describe the time of an event except by reference to some other event, or the place of a body except by reference to some other body. All our knowledge, both of time and place, is essentially relative. When a man has acquired the habit of putting words together, without troubling himself to form the thoughts which ought to correspond to them, it is easy for him to frame an antithesis between this relative knowledge and a so-called absolute knowledge, and to point out our ignorance of the absolute position of a point as an instance of the limitation of our faculties. Anyone, however, who will try to imagine the state of a mind conscious of knowing the absolute position of a point will ever after be content with our relative knowledge.

102. RELATIVITY OF DYNAMICAL KNOWLEDGE

Our whole progress up to this point may be described as a gradual development of the doctrine of relativity of all physical phenomena. Position we must evidently acknowledge to be relative, for we cannot describe the position of a body in any terms which do not express relation. The ordinary language about motion and rest does not so completely exclude the notion of their being measured absolutely, but the reason of this is, that in our ordinary language we tacitly assume that the earth is at rest.

As our ideas of space and motion become clearer, we come to see how the whole body of dynamical doctrine hangs together in one consistent system.

Our primitive notion may have been that to know absolutely where we are, and in what direction we are going, are essential elements of our knowledge as conscious beings.

But this notion, though undoubtedly held by many wise men in ancient times, has been gradually dispelled from the minds of students of physics.

There are no landmarks in space; one portion of space is exactly like every other portion, so that we cannot tell where we are. We are, as it were, on an unruled sea, without stars, compass, soundings, wind, or tide, and we cannot tell in what direction we are going. We have no log which we can cast out to take a dead reckoning by; we may compute our rate of motion with respect to the neighbouring bodies, but we do not know how these bodies may be moving in space.”

Poincaré stated the principle of relativity of electrodynamics in 1895,

“Experience reveals an abundance of facts, which can be summed up in the following formula: it is impossible to make manifest the absolute motion of matter, or, more correctly, the relative motion of ponderable matter with reference to the æther; the only thing which can be observed is the motion of ponderable matter with reference to ponderable matter.”

“L’expérience a révélé une foule de faits qui peuvent se résumer dans la
formule suivante: il est impossible de rendre manifeste le mouvement absolu de la matière, ou mieux le mouvement relatif de la matière pondérable par rapport à l’éther; tout ce qu’on peut mettre en évidence, c’est le mouvement de la matière pondérable par rapport à la matière pondérable.”

In 1899, Poincaré declared the principle of relativity to be rigorously valid,

“This strange property would appear to be a veritable ‘fudging factor’ given by nature to prevent the detection of the absolute movement of the Earth by optical phenomena. I find that unsatisfactory, and I feel a duty to express my feelings: I look upon it as very probable that the optical phenomena depend only on the relative movements of the material source of light, related bodies or optical apparatus; and then not only with the quantities close to the order of the square or the cube of aberration, but rigorously. As the experiments become more exact, this principle will be checked with greater precision. [***] a well made theory should enable us to demonstrate the principle in one fell swoop in all its rigor.”

“Cette étrange propriété semblerait un véritable «coup de pouce» donné par la nature pour éviter que le mouvement absolu de la terre puisse être révélé par les phénomènes optiques. Cela ne saurait me satisfaire et je crois devoir dire ici mon sentiment: je regarde comme très probable que les phénomènes optiques ne dépendent que des mouvements relatifs des corps matériels en présence, sources lumineuses ou appareils optiques et cela non pas aux quantités près de l’ordre du carré ou du cube de l’aberration, mais rigoureusement. A mesure que les expériences deviendront plus exactes, ce principe sera vérifié avec plus de précision. [***] une théorie bien faite devrait permettre de démontrer le principe d’un seul coup dans toute sa rigueur.”

In 1900, Poincaré declared,

“I do not believe, in spite of Lorentz, that more exact observations will ever make evident anything else but the relative displacements of material bodies. [***] No; the same explanation must be found for the two cases, and everything tends to show that this explanation would serve equally well for the terms of the higher order, and that the mutual destruction of these terms will be rigorous and absolute.”

Poincaré reiterated the principle of relativity in 1902 in his book La Science et l’Hypothèse, E. Flammarion, Paris, (1902); and we know from Solovine’s accounts that Einstein had read Poincaré’s book,

“The Principle of Relative Motion.—Sometimes endeavours have been made to connect the law of acceleration with a more general principle. The
movement of any system whatever ought to obey the same laws, whether it is referred to fixed axes or to the movable axes which are implied in uniform motion in a straight line. This is the principle of relative motion; it is imposed upon us for two reasons: the commonest experiment confirms it; the consideration of the contrary hypothesis is singularly repugnant to the mind."

Poincaré’s 1904 principle of relativity states, and we know from Solovine’s accounts that Einstein had read this lecture, which was reprinted as Chapters 7 and 8 of Poincaré’s book *La Valeur de la Science*, E. Flammarion, Paris, (1904),

“The principle of relativity, according to which the laws of physical phenomena should be the same, whether for an observer fixed, or for an observer carried along in a uniform movement of translation; so that we have not and could not have any means of discerning whether or not we are carried along in such a motion." Poincaré stated, in 1905, before the Einsteins,

“It appears at first sight that the aberration of light and other related optical phenomena would furnish us a means of determining the absolute motion of the earth, that is, its motion relative to ether rather than relative to the stars; there are no such phenomena. The experiments in which one takes account only of the first power of aberration have been unsuccessful, and one knows the reasons for that. But Michelson, having thought of an experiment in which one could measure effects depending on the second power of aberration, was equally unsuccessful. It appears that this impossibility of demonstrating the absolute motion of the earth is a general law of nature.”

In 1908, Poincaré reaffirmed the principle of relativity,

“The Principle of Relativity [***] Whatever be the means employed there will never be disclosed anything but relative velocities; I mean the velocities of certain material bodies with reference to other material bodies. [***] We have seen above the reasons which impel us to regard the principle of relativity as a general law of nature.”

It was Lorentz, who properly phrased the *corollary of relativity* in 1904,

“It would be more satisfactory, if it were possible to show, by means of certain fundamental assumptions, and without neglecting terms of one order of magnitude or another, that many electromagnetic actions are entirely independent of the motion of the system.”

The Einsteins wrote, in 1905, without reference to previous authors,
“Examples of a similar kind, as well as the failed attempts to find a motion of the earth relative to the ‘light medium’, lead to the supposition, that the concept of absolute rest corresponds to no characteristic properties of the phenomena not just in mechanics, but also in electrodynamics. On the contrary, for all systems of coordinates, for which the equations of mechanics are valid, the same electrodynamic and optical laws are also valid, as has already been proven for the magnitudes of the first order.”

and,

“The laws according to which the states of physical systems change do not depend upon to which of two systems of coordinates, in uniform translatory motion relative to each other, this change of state is referred.”

9.5.2 The “Light Postulate”

The Einsteins asserted the “light postulate”, in 1905, without reference to previous authors,

“[L]ight in empty space always propagates with a determinate velocity \( c \) irrespective of the state of motion of the emitting body.”

“Every ray of light moves in the ‘resting’ system of coordinates with the determinate velocity \( c \), irrespective of whether this ray of light is emitted from a resting or moving body. Such that

\[
\text{velocity} = \frac{\text{path of light}}{\text{interval of time}},
\]

where ‘interval of time’ is to be construed in the sense of the definition of § 1.”

The references in Lorentz’ and Poincaré’s works to this velocity are too numerous to repeat. In the Einsteins’ 1905 paper, this velocity is the absolute velocity of light in its medium, absolute space. Einstein stated in 1912,

“To fill this gap, I introduced the principle of the constancy of the velocity of light, which I borrowed from H. A. Lorentz’s theory of the stationary luminiferous ether, and which, like the principle of relativity, contains a physical assumption that seemed to be justified only by the relevant experiments (experiments by Fizeau, Rowland, etc.).”

We know that Einstein believed in absolute space, the “reference frame of the vacuum”, the “resting system”,

“Then I tried to discuss the Fizeau experiment on the assumption that the
Lorentz equations for electrons should hold in the frame of reference of the moving body as well as in the frame of reference of the vacuum as originally discussed by Lorentz.

Lorentz pointed out in 1913,

“The latter is, by the way, up to a certain degree a quarrel over words: it makes no great difference, whether one speaks of the vacuum or of the æther.”

“Letzteres ist übrigens bis zu einem gewissen Grade ein Streit über Worte: es macht keinen großen Unterschied, ob man vom Vakuum oder vom Äther spricht.”

Lorentz, who knew the Einsteins’ theory well, would not have alleged that it made no difference to speak of vacuum as opposed to æther, if Einstein had discounted absolute space, a “resting system” in which light propagates independently of the speed of the source. Both Sommerfeld and Pauli also recognized that the “resting system” of the Einsteins’ 1905 paper was simply another appellation for Lorentz’ æther, with absolute celeritas being an æther concept. Einstein described the light postulate as an æthereal idea to Peter A. Bucky. Pauli stated, regarding celeritas in absolute space, that,

“There is no question of a universal constancy of the velocity of light in vacuo, if only because it has the constant value $c$ only in Galilean systems of reference. On the other hand its independence of the state of motion of the light source obtains equally in the general theory of relativity. It proves to be the true essence of the old æther point of view.”

And Sommerfeld held it up as,

“The only valid remnant of the ether concept”

We discover in “Part I” of the Einsteins’ 1905 paper, that the “resting system” of the light postulate signifies absolute space, the “reference frame of the vacuum” a. k. a. the “æther”, as Albrecht Fölsing has noted,

“To that end he proceeds from a ‘system at rest,’ the customary three-dimensional Euclidean space with Cartesian coordinates, in which the movement of a body is described by its coordinates as a function of time. This is so conventional that many readers must have asked themselves why it was even mentioned. [***] For the ‘system at rest’ for which these observations were initially made, it may be stated ‘in accordance with experience’—i. e., in line with Maxwell-Lorentz theory—that the velocity of light in a vacuum is a universal constant. [***] To be sure, Einstein is using
almost ‘prerelativist’ terminology by referring, throughout this section, to a
system ‘at rest’ in which the rod, either at rest or in motion, is observed.
While this formulation lets the background of Lorentzian theory—a
motionless ether—shine through, it also leads to complications in which even
an attentive reader can lose the thread.”

Philipp Frank makes clear that Einstein effectively adopted Lorentz’ æther, and
certainly adopted Lorentz’ light postulate of the “resting system”,

“This law [***] may be called the *relativity principle of mechanistic physics.*
It is a deduction from the Newtonian laws of motion and deals only with
relative motions and not, as Newton’s laws proper, with absolute motion. In
this form it is a positive assertion, but it can also be formulated in a negative
way, thus: It is impossible by means of experiments such as those described
above to differentiate one inertial system from another. [***] Besides this
‘principle of relativity,’ Einstein needed a second principle dealing with the
interaction of light and motion. He investigated the influence of the motion
of the source of light on the velocity of light emitted by it. From the
standpoint of the ether theory, it is self-evident that it makes no difference
whether or not the source of light moves; light considered as mechanical
vibration in the ether is propagated with a constant velocity with respect to
the ether. [***] Dropping the ether theory of light, Einstein had to
reformulate this law into a statement about observable facts. There is one
system of reference, \( F \) (the fundamental system), with respect to which light
is propagated with a specific speed, \( c \). No matter with what velocity the light
source moves with respect to the fundamental system (\( F \)), the light emitted
is propagated with the same specific velocity (\( c \)) relative to \( F \). This statement
is usually called the ‘principal [sic] of the constancy of the speed of
light.’”

Immanuel Kant and Carl Neumann reawoke an interest in the Newtonian concept
of absolute space, and Hobbes had suggested that the æther far from major bodies
is quiescent—a belief that held sway among many at least as late as Lorentz, Larmor
and Volkmann. Thomas Young argued that the æther rests. Neumann argued that
absolute space is definable through a body, which is taken to be at absolute rest, the
so-called “body Alpha”. Fresnel proposed that the æther only participates in the
motion of bodies to a limited degree and rests outside of ponderable bodies. Many
like Larmor, Lorentz, Volkmann, Maxwell, Heaviside, Hertz, Volterra and Drude
believed that Young and Fresnel’s resting æther signified Neumann’s “body Alpha”,
an absolute space endowed with special properties, as opposed to an absolute space
of true vacuum, and they used the same nomenclature of “resting system” and
“moving system” which the Einsteins used without distinctions and to mean absolute
space and motion relative to it. Michelson set out to find the relative motion of the
Earth in the supposedly still sea of æther, but wrecked on the static shores of his
interferometer.
The Einsteins again and again refer to a “Resting System” with “resting” rods, clocks and observers and an empirically observed absolute speed of light and an absolute time in the “resting system”; and they asserted $c \pm v$ in the “moving system”. The nomenclature of the day, which stemmed from Newton, Maxwell, Larmor and Lorentz, among many others, was clearly that the “resting system” was a system of coordinates at rest with respect to the fixed stars, and not any and all inertial systems. Einstein wrote to Mach on 25 June 1913, “relative to the fixed stars (‘Restsystem’)”,  which confirms Frank’s analysis of Einstein’s thought process.

In 1911, Albert Einstein again confirmed that it was his essential belief that the “resting system” is Lorentz’ æther at rest with respect to itself and with respect to the “fixed stars”, as expressed ontologically as “absolute space”,

“[W]e will extract from Lorentz’s theory of the stationary luminiferous ether the following aspects most essential to us. What is the physical meaning of the statement that there exists a stationary luminiferous ether? The most important content of this hypothesis can be expressed as follows: There exists a reference system (called in Lorentz’s theory ‘a system at rest relative to the ether’) with respect to which every light ray propagates in a vacuum with the universal velocity $c$. This ought to hold independently of whether the light-emitting body is in motion or at rest.”

The detection of an æther frame in no sense violates the principle of relativity unless the æther is defined to be at absolute rest—whatever that “absolute rest” should ultimately be interpreted to mean.

Max Abraham wrote in 1904,

“The electromagnetic theory addresses the absolute motion of light, which light issues forth in every direction with the same velocity ($c$)”

“Die elektromagnetische Theorie spricht von einer absoluten Bewegung des Lichtes, die nach jeder Richtung hin mit derselben Geschwindigkeit ($c$) erfolgt”

The absolute velocity of light was stated numerous times in history, for example, as an observed empirical result, by Cassini and Roemer (ca. 1676) and Bradley (ca. 1729).

Maxwell created his theorem of the velocity of light as a dynamic process in its medium. W. Stanley Jevons wrote in the 1870’s,

“In a first subclass we may place the velocity of light or heat undulations, the numbers expressing the relation between the lengths of undulations, and the rapidity of the undulations, these numbers depending only on the properties of the ethereal medium, and being probably the same in all parts of the universe.”
Willem de Sitter stated in his famous paper of 1911,

“The principle of relativity can be enunciated as the postulate that the transformations, with respect to which the laws of nature shall be invariant, are ‘Lorentz-transformations.’”

Einstein, ever the plagiarist, stated in 1952:

“The whole content of the special theory of relativity is included in the postulate: The laws of Nature are invariant with respect to the Lorentz transformations.”

The Einsteins argued, in 1905, that the æther is “superfluous”, without reference to prior authors,

“The introduction of a ‘luminiferous ether’ will prove to be superfluous inasmuch as the view here to be developed will not require an ‘absolutely stationary space’ provided with special properties”.

Johann Heinrich Ziegler gave widely-discussed lectures in Switzerland, in which he sought to abolish the concept of the æther. Ziegler directly accused Einstein of plagiarism. Ziegler wrote, in 1902,

“Und doch ist diese Annahme nichts anderes als ein greifbarer Unsinn. Der den Raum oder die Stofflosigkeit überall erfüllende stofflose Stoff, genannt Weltäther, ist ein unbegreiflicher Begriff, und alle Lehren, welche auf ihm beruhen, sind genau ebenso unvollkommen und trägerisch, wie die Grundlage. Keine der Wellenbewegungen, die man jenem wesenlosen Ding andichtet, um die Fortpflanzung des Lichtes zu erklären, ist wirklich vorhanden. Es sind dies bloß mathematische Fiktionen, die ausschließlich in der Einbildung der Physiker vorhanden sind, gerade wie jener phantomhafte Stoff selbst, der bald dem bewegten Wasser, bald einem geschlagenen, gespannten Seil ähnliche Schwingungen ausführen soll.”

Lorentz stated in 1895,

“It does not suit my purpose to examine more thoroughly such speculations, or to express presumptions about the nature of the æther. I merely wish, as far as possible, to free myself of all preconceived notions regarding this substance and not to ascribe to it, for example, any of the qualities of ordinary liquids and gasses. Should it be shown, that a description of the phenomena is best arrived at through the assumption of absolute permeability, then one must surely in the meantime adopt this sort of hypothesis, and leave it to further research, if possible, to open up a deeper understanding to us.
It stands to reason, that there can be no question of the absolute rest of the æther; the phrase would not even have made sense. When I concisely state, the æther rests, it is only meant that one part of this medium does not displace the other, and that all perceptible motions of the heavenly bodies are relative motions in reference to the æther.”

Dass von absoluter Ruhe des Aethers nicht die Rede sein kann, versteht sich wohl von selbst; der Ausdruck würde sogar nicht einmal Sinn haben. Wenn ich der Kürze wegen sage, der Aether ruhe, so ist damit nur gemeint, dass sich der eine Theil dieses Mediums nicht gegen den anderen verschiebe und dass alle wahrnehmbaren Bewegungen der Himmelskörper relative Bewegungen in Bezug auf den Aether seien.”

Joseph Larmor wrote, in 1900,

“At the same time all that is known (or perhaps need be known) of the aether itself may be formulated as a scheme of differential equations defining the properties of a continuum in space, which it would be gratuitous to further explain by any complication of structure; though we can with great advantage employ our stock of ordinary dynamical concepts in describing the succession of different states thereby defined.”

In 1900, Paul Drude stated,

“The velocity of light in space [***] independent of what is understood by a light vector. [***] The conception of an ether absolutely at rest is the most simple and the most natural,—at least if the ether is conceived to be not a substance but merely space endowed with certain physical properties.”

Poincaré asserted in 1900,

“Does our ether actually exist? We know the origin of our belief in the ether. If light takes several years to reach us from a distant star, it is no longer on the star, nor is it on the earth. It must be somewhere, and supported, so to speak, by some material agency.
The same idea may be expressed in a more mathematical and more abstract form.\textsuperscript{2333}

Maxwell stated,

“This are some of the already discovered properties of that which has often been called vacuum, or nothing at all. They enable us to resolve several kinds of action at a distance into actions between contiguous parts of a contiguous substance. Whether this resolution is of the nature of explication or complication, I must leave to the metaphysicians.\textsuperscript{2334}

Poincaré also asserted in 1889 that,

“Whether the ether exists or not matters little—let us leave that to the metaphysicians; what is essential for us is, that everything happens as if it existed, and that this hypothesis is found to be suitable for the explanation of phenomena. After all, have we any other reason for believing in the existence of material objects? That, too, is only a convenient hypothesis; only, it will never cease to be so, while some day, no doubt, the ether will be thrown aside as useless.\textsuperscript{2335}

Poincaré likened the æther to “Shinola”,

“What is meant by the ether? In France or in Germany, it is little more than a system of differential equations; provided that these equations are internally consistent and account for the observed facts, one won’t worry if the picture which they suggest is more or less strange or unprecedented. On the other hand, W. Thomson immediately tries to carve out the figure of a familiar substance which has a greater likeness to the æther, it appears that it is \textit{scotch shoe wax}, which is to say, a very tough species of shoemaker’s wax.”

“Que dire de l’éther? En France ou en Allemagne, ce n’est guère qu’un système d’équations différentielles; pourvu que ces équations n’impliquent pas contradiction et rendent compte des faits observés, on ne s’inquiétera pas si l’image qu’elles suggèrent est plus ou moins étrange ou insolite. W. Thomson, au contraire, cherche tout de suite quelle est la matière connue qui ressemble le plus à l’éther; il paraît que c’est le \textit{scotch shoe wax}, c’est-à-dire une espèce de poix très dure.”\textsuperscript{2336}

Poincaré stated,

“[If the ether] is able to explain everything, this is because it does not enable us to foresee anything; it does not enable us to decide between the different possible hypotheses, since it explains everything beforehand. It therefore
becomes useless.”

In 1901, Cohn averred,

“Like Maxwell and Hertz we address a chemically and physically homogenous medium as an entity, which is also completely characterized at all points electromagnetically by the same value of some constants. This type of medium fills each element of our space; it is perhaps a certain ponderable substance, or it may also be the vacuum. In light of this, we will avoid continuing to speak of an ‘aether’.”

Faraday argued, in April of 1846,

“The point intended to be set forth for consideration of the hearers was, whether it was not possible that the vibrations which in a certain theory are assumed to account for radiation and radiant phænomena may not occur in the lines of force which connect particles, and consequently masses of matter together; a notion which as far as it is admitted, will dispense with the æther, which, in another view, is supposed to be the medium in which these vibrations take place.

You are aware of the speculation which I some time since uttered respecting that view of the nature of matter which considers its ultimate atoms as centres of force, and not as so many little bodies surrounded by forces, the bodies being considered in the abstract as independent of the forces and capable of existing without them. In the latter view, these little particles have a definite form and a certain limited size; in the former view such is not the case, for that which represents size may be considered as extending to any distance to which the lines of force of the particle extend: the particle indeed is supposed to exist only by these forces, and where they are it is. The consideration of matter under this view gradually led me to look at the lines of force as being perhaps the seat of the vibrations of radiant phænomena.

[[*]]

The view which I am so bold as to put forth considers, therefore, radiation as a high species of vibration in the lines of force which are known
to connect particles and also masses of matter together. It endeavours to dismiss the æther, but not the vibration. The kind of vibration which, I believe, can alone account for the wonderful, varied, and beautiful phenomena of polarization, is not the same as that which occurs on the surface of disturbed water, or the waves of sound in gases or liquids, for the vibrations in these cases are direct, or to and from the centre of action, whereas the former are lateral. It seems to me, that the resultant of two or more lines of force is in an apt condition for that action which may be considered as equivalent to a lateral vibration; whereas a uniform medium, like the æther, does not appear apt, or more apt than air or water.

The occurrence of a change at one end of a line of force easily suggests a consequent change at the other. The propagation of light, and therefore probably of all radiant action, occupies time; and, that a vibration of the line of force should account for the phenomena of radiation, it is necessary that such vibration should occupy time also. I am not aware whether there are any data by which it has been, or could be ascertained whether such a power as gravitation acts without occupying time, or whether lines of force being already in existence, such a lateral disturbance of them at one end as I have suggested above, would require time, or must of necessity be felt instantly at the other end.

As to that condition of the lines of force which represents the assumed high elasticity of the æther, it cannot in this respect be deficient: the question here seems rather to be, whether the lines are sluggish enough in their action to render them equivalent to the æther in respect of the time known experimentally to be occupied in the transmission of radiant force.

The æther is assumed as pervading all bodies as well as space: in the view now set forth, it is the forces of the atomic centres which pervade (and make) all bodies, and also penetrate all space. As regards space, the difference is, that the æther presents successive parts or centres of action, and the present supposition only lines of action; as regards matter, the difference is, that the æther lies between the particles and so carries on the vibrations, whilst as respects the supposition, it is by the lines of force between the centres of the particles that the vibration is continued.

Faraday’s ideas were very influential. William Kingdon Clifford speculated in the year of his death and of Einstein’s birth, 1879, that light may be naught but flickering “space”,

“In order to explain the phenomena of light, it is not necessary to assume anything more than a periodical oscillation between two states at any given point of space.”

Karl Pearson noted, as second editor and annotator of Clifford’s The Common Sense of the Exact Sciences in 1884-1885,
“The most notable physical quantities which vary with position and time are heat, light, and electro-magnetism. It is these that we ought peculiarly to consider when seeking for any physical changes, which may be due to changes in the curvature of space. If we suppose the boundary of any arbitrary figure in space to be distorted by the variation of space-curvature, there would, by analogy from one and two dimensions, be no change in the volume of the figure arising from such distortion. Further, if we assume as an axiom that space resists curvature with a resistance proportional to the change, we find that waves of ‘space-displacement’ are precisely similar to those of the elastic medium which we suppose to propagate light and heat. We also find that ‘space-twist’ is a quantity exactly corresponding to magnetic induction, and satisfying relations similar to those which hold for the magnetic field. It is a question whether physicists might not find it simpler to assume that space is capable of a varying curvature, and of a resistance to that variation, than to suppose the existence of a subtle medium pervading an invariable homaloidal space.”

In 1934, Einstein repeated Clifford’s idea without an attribution, which idea appeared before Lorentz’ theory appeared.

“Then came H. A. Lorentz’s great discovery. All the phenomena of electromagnetism then known could be explained on the basis of two assumptions: that the ether is firmly fixed in space—that is to say, unable to move at all, and that electricity is firmly lodged in the mobile elementary particles. Today his discoveries may be expressed as follows: physical space and the ether are only different terms for the same thing; fields are physical states of space.”

9.6 Relative Simultaneity

The concept of relative simultaneity appears repeatedly in the Nineteenth Century as a French conception, inspired perhaps by Fizeau and Flammarion, furthered by Bergson in his Time and Free Will, an Essay on the Immediate Data of Consciousness and by Guyau and Fouillée in Genèse de l’idée de Temps, and brought to fruition in Poincaré’s The Measurement of Time of 1898, and La Théorie de Lorentz at le Principe de Réaction of 1900, and Science and Hypothesis of 1902, and his 1904 St. Louis lecture, The Principles of Mathematical Physics—all of which Albert Einstein is known to have read. However, it was the Croatian Jesuit Boscovich who had the profoundest, and prior, insight regarding relative simultaneity.

Einstein claimed that he arose from bed once and wondered if events were absolutely simultaneous. Was Einstein reading Poincaré, who had already expressly written that events are not absolutely simultaneous, in bed, before Einstein fell asleep? We know that Einstein had read Poincaré’s work on relative simultaneity before allegedly dreaming about it. Einstein also told an Eureka-like story of his
enlightenment of the special theory of relativity—a story which is suspiciously similar to Archimedes’ story. He was compelled to invent these childish fairy tales of his divine inspiration, as if they accounted for his “research”, because there is no record of his having developed the theory, while there is a substantial record of others having published it before him.

9.6.1 Isotropic Light Speed

The equating of light speed to length and time was placed in the consciousness of physicists by Roemer, whose calculations of light’s finite speed underpin the definition of simultaneity in modern physics. Fizeau defined space as isotropic with respect to light speed and assumed that:

\[ c = \frac{2AB}{t' - t} \]

where \( c = \text{celeritas} \), the wave speed of light, \( AB \) is the length of the path of light from point \( A \) to point \( B \), and \( t' - t \) is the time interval of the round trip path of light moving from \( A \) to \( B \) and reflected back to \( A \).

Fizeau thereby presented a new circular definition of time. Poincaré demonstrated that, since \( c \) was supposedly a universal constant between systems in relative motion to each other, this new circular definition of time rendered simultaneity relative and that the presumption of an isotropic light speed was the presumption of a measurement of time. Time was previously defined by the circular definition of uniform motion supplied by Galileo, where equal \( \text{spaces} \) are defined to be traversed in equal \( \text{times} \). It is interesting to note that Gotthold Ephraim Lessing contrasted painting, sculpture and poetry in terms of events and time.

9.6.2 The “Aarau Question”

James Clerk Maxwell inspired Albert Abraham Michelson’s experiments. Maxwell wrote an article on “Ether” in the Encyclopedia Britannica in 1878 and published a thought experiment Einstein later repeated as if a novel idea,

“If we consider what is going on at different points in the axis of a beam of light at the same instant, we shall find that if the distance between the points is a multiple of a wave-length the same process is going on at the two points at the same instant, but if the distance is an odd multiple of half a wave-length the process going on at one point is the exact opposite of the process going on at the other.

Now, light is known to be propagated with a certain velocity \((3 \times 10^{10} \text{ centimetres per second in vacuum, according to Cornu})\). If, therefore, we suppose a movable point to travel along the ray with this velocity, we shall find the same process going on at every point of the ray as the moving point reaches it. If, lastly, we consider a fixed point in the axis of the beam, we shall observe a rapid alternation of these opposite processes, the interval of time between similar processes being the time light takes to travel a wave-length.”
Einstein, late in life, told a story of his supposed fantasy in 1895 of traveling at light speed, the so-called “Aarau Question”. This story is used as an example of Einstein’s supposed independence from Lorentz. It was one of Einstein’s many “Eureka!” stories. Einstein, however, began to study Lorentz in 1895, and his work in 1905 was not independent of Lorentz, but instead did little more than reiterate it. Albert Einstein stated,

“After ten years of reflection such a principle resulted from a paradox upon which I had already hit at the age of sixteen: If I pursue a beam of light with the velocity c (velocity of light in a vacuum), I should observe such a beam of light as a spatially oscillatory electromagnetic field at rest. [***] One sees that in this paradox the germ of the special theory of relativity is already contained.”

However, this fantasy was the subject of the novel Lumen, which was popular among physicists of Einstein’s day, and with which Einstein was intimately familiar long before he fabricated his “Eureka!” story. One might even say that Einstein was an expert on the story of Lumen. Mr. Tobinkin noted that Einstein was an avid reader of fiction,

“After such a period of concentration, Einstein often rests himself by reading fiction.”

Alexander Moszkowski recounted a conversation he had with Einstein, in which Einstein essentially agreed with Lenard’s objections to the general principle of relativity and Oskar Kraus’ objections to the special theory of relativity, which Einstein publicly condemned, and Moszkowski reveals that Einstein knew Flammarion’s story of Lumen very well before he fabricated the Aarau myth in an attempt to take credit for Lorentz’ theory,

"A CONVERSATION held during April 1920 destroyed an illusion which had become dear to me. It concerned the fantastic figure, ‘Lumen,’ conceived as an actual human being, imagined as endowed with an extraordinary power of motion and keenness of sight. Mr. Lumen is supposed to be the invention of the astronomer Flammarion, who produced him in the retort of fancy, as Faust produced Homunculus, to use him to prove the possibility of very remarkable happenings, in particular, the reversal of Time.

Einstein declared outright ‘Firstly, Lumen is not due to Flammarion, who has derived him from other sources; and secondly, Lumen can in no way be used as a means of proving things.’

MOSZKOWSKI: ‘It is at least very interesting to operate with him. Lumen is supposed to have a velocity greater than that of light. Let us assume this as given, then the rest follows quite logically. If, for example, he leaves the earth on the day of a great event, such as the battle of Waterloo, and— May
I trace out this example, at the risk of tiring you?

Einstein: Do repeat it, and act as if you were telling something entirely new. It is clear that the Lumen-story gives you great amusement, so please talk quite freely. But I cannot forgo the privilege of showing later how the whole adventure and its consequences must be demolished.

M.: Well then, the person, Lumen, sets off at the end of the battle of Waterloo to make an excursion into space with a speed of 250,000 miles per second. He thus catches up all the light-rays that left the field of battle and moved in his direction. After an hour he will already have attained a lead of about twenty minutes. This lead will be gradually increased, so that at the end of the second day he will no longer be seeing the end of the battle, but the beginning. What has Lumen been seeing in the meantime? Clearly he has been observing events happening in the reverse direction, as in the case of a cinematograph which is exhibiting pictures backwards. He saw the projectiles leaving the objects they had struck, and returning into the mouths of the cannon. He saw the dead come to life, arise, and arrange themselves into battalion order. He would thus arrive at an exactly opposite view of the passing of time, for what he observes is as much his experience as what we observe is ours. If he had seen all the battles of history and, in fact, all events happening in the reverse order, then in his mind ‘before’ and ‘after’ would be interchanged. That is, he would experience time backwards; what are causes to us would be effects to him, and our effects would be his causes; antecedents and consequents would change places, and he would arrive at a causality diametrically opposite to our own. He would be quite as justified in adopting his view of the happening of things, according to his experiences, and of the causal nexus as it appears to him, as we are justified in adopting ours.

Einstein: And the whole story is mere humbug, absurd, and based on false premises, leading to entirely false conclusions.

M.: But it is only to be taken as an imaginary experiment that plays with fantastic impossibilities to direct our ideas on to the relativity of time by a striking illustration. Did not Henri Poincaré adduce this extreme example to discuss the ‘reversal’ of time?

Einstein: You may rest assured that Poincaré, even if he used this example as an entertaining digression in his lectures, took the same view of Lumen as I do. It is not an imaginary experiment: it is a farce, or, to express it more bluntly, it is a mere swindle! These experiences and topsy-turvy perceptions have just as little to do with the relativity of time, such as it is taught by the new mechanics, as have the personal sensations of a man, to whom time seems long or short according as he experiences pain or pleasure, amusement or boredom. For, in this case, at least the subjective sensation is a reality, whereas Lumen cannot have reality because his existence is based on nonsense. Lumen is to have a speed greater than that of light. This is not only an impossible, but a foolish assumption, because the theory of relativity has shown that the velocity of light cannot be exceeded. However great the
accelerating force may be, and for however long it may act, it cannot cause this limit to be transcended. Lumen is supposed to be equipped with the organ of sight, that is, he is supposed to have a corporal existence. But the mass of a body becomes infinitely great when it reaches the velocity of light, so that it is quite absurd to go beyond this stage. It is admissible to operate with impossibilities in imagination, that is, with things that contradict our practical experience, but not with absolute nonsense. That is why the other adventure of Lumen, in which he jumps to the moon, is also an absurdity. In this, he is supposed to leap with a speed greater than light, and, when he reaches the moon, to turn round instantaneously, with the result that he sees himself jumping from the moon to the earth backwards! This jump is logically meaningless; and if we try to make deductions of an optical nature from such a nonsensical assumption, we deceive ourselves.

M.: Nevertheless, I should claim extenuating circumstances for this case on the ground that I am enlisting the help of the conception of impossibility. A journey even at a speed of only 1000 miles per second is impossible for a man or a homunculus.

EINSTEIN: Yes, according to our experience, if we measure it against facts. We cannot state definitely that a journey into the universe at an enormous yet limited velocity is absolutely impossible. Within the indicated bounds every play of thought that is argued correctly is allowable.

M.: Now, suppose that I strip Lumen of all bodily organs and take him as being a pure creature of thought, entirely without substance. A velocity greater than that of light can be imagined, even if it cannot be realized physically. If, for example, we think of a lighthouse with a revolving light, and consider a beam of light about 600 miles long, which rotates 200 times per second. Then we could represent to ourselves that the light at the circumference of this beam travels with a speed of nearly 760,000 miles per second.

EINSTEIN: As for that, I can give you a much better example of the same thing. We need only imagine that the earth is poised in space, motionless, and non-rotating. This is physically admissible. Then the most distant stars, as judged by us, would describe their paths with almost unlimited velocities. But this projects us right out of the world of reality into a pure fiction of thought, which, if followed to its conclusion, leads to the most degenerate form of imagination, namely, to pathological individualism. It is in these realms of thought that such perversities as the reversal of time and causality occur.

M.: Dreams, too, are confined to the individual. Reality constrains all human beings to exist in one and the same world, whereas, in dreams, each one has his own world with a different kind of causality. Nevertheless, dreams are a positive experience, and signify a reality for the dreamer. Even for waking reality it would be easy to construct cases in which the causal relationship is shattered. Suppose a person who has grown up in a confined retreat, such as Kaspar Hauser, looks in a mirror for the first time in his life.
As he knows nothing of the phenomena of optical reflexion, he sees in it a new, objective world that gives a shock to, or even subverts, his own idea of causality in so far as it may have become developed in him. Lumen sees himself jump backwards, whereas Kaspar Hauser sees himself performing gestures on the wrong side of his body; should it not be possible to draw a reasonable parallel between these two cases?

Einstein: Quite impossible. However you set about it, your Lumen will inevitably come to grief on the conception of time. Time, denoted in physical expressions by the symbol ‘t,’ may, indeed, be given a negative value in these equations so that an event may be calculated in the reverse direction. But then we are dealing with pure matters of calculation, and in this case we must not allow ourselves to be drawn into the erroneous belief that time itself may travel negatively that is, retrogressively. This is the root of the misapprehension: that what is allowable and indeed necessary in calculations is confused with what may be thought possible in Reality. [Footnote: Perhaps an analogy will serve to make this clear. Suppose that a certain quantity of some foodstuff is consumed by \( \frac{1}{10} \) head of population. The false inference would be that a population is possible which has \( \frac{1}{10} \) heads! In the same way the statistics may be quite correct in arriving at the figure \( \frac{1}{5} \) suicides, but if we leave the realms of calculation, then the \( \frac{1}{5} \) suicide loses its meaning entirely.] Whoever seeks to derive new knowledge from the excursions of a creature like Lumen into space, confuses the time of an experience with the time of the objective event; but the former can have a definite meaning only if it is founded on a proper causal relation of space and time. In the above imaginary experiment the order of the experiences in time is the reverse of that of the events. And as far as causality is concerned, it is a scientific conception that relates only to events ordered in space and time, and not to experiences. In brief, the experiments with Lumen are swindles.

M.: I must resign myself to giving up these illusions. I must frankly confess that I do so with a certain sadness, for such bold flights of constructive fancy exert a powerful attraction on me. At one time I was near outdoing Lumen by assuming a Super-Lumen, who was to traverse all worlds at once with infinite velocity. He would then be in a position to take a survey of the whole of universal history at a single glance. From the nearest star, Alpha Centauri, he would see the earth as it was four years ago; from the Pole Star, as it was forty years ago; and from the boundary of the Milky Way, as it was four thousand years ago. At the same moment he could choose a point of observation that would enable him to see the First Crusade, the Siege of Troy, the Flood, and also the events of the present day simultaneously.

Einstein: And this flight of thought, which, by the way, has been indulged in repeatedly by others too, has much more sense in it than the
former one, because you may make an abstraction which disregards speed altogether. It is only a limiting case of reflection.\textsuperscript{2355}

Moszkowski had written in 1911,

\begin{quote}
\end{quote}

and then proceeded to explore his view of the story’s relevance to the problem of relativity.

Contrary to hypothesis that Einstein only required thought experiments to deduce the theory of relativity and that his work was independent of Lorentz’, Einstein himself admitted in 1921,

\begin{quote}
“There has been a false opinion widely spread among the general public,’ [Einstein] said, ‘that the theory of relativity is to be taken as differing radically from the previous developments in physics from the time of Galileo and Newton—that it is violently opposed to their deductions. The contrary is true. Without the discoveries of every one of the great men of physics, those who laid down preceding laws, relativity would have been impossible to conceive and there would have been no basis for it. Psychologically, it is impossible to come to such a theory at once without the work which must be done before. The four men who laid the foundations of physics on which I have been able to construct my theory are Galileo, Newton, Maxwell, and Lorenz.”\textsuperscript{2357}
\end{quote}

Moszkowski again wrote of his fascination with Lumen in 1916 and 1917.\textsuperscript{2358} As Moszkowski correctly pointed out, Poincaré not only knew Flammarion’s story of Lumen, he used it in his lectures. In Poincaré’s lecture on “chance”, which was, \textit{in all probability}, the inspiration for Einstein’s statement that “God does not play dice,” Poincaré stated:

\begin{quote}
“So we have, then, the reverse of what we found in the preceding examples, great differences in the cause and small differences in the effect. Flammarion once imagined an observer moving away from the earth at a velocity greater than that of light. For him time would have its sign changed, history would be reversed, and Waterloo would come before Austerlitz. Well, for this observer effects and causes would be inverted, unstable equilibrium would no longer be the exception; on account of the universal
irreversibility, everything would seem to him to come out of a kind of chaos in unstable equilibrium, and the whole of nature would appear to him to be given up to chance. [***] But we have not come to the end of paradoxes. I recalled just above Flammarion’s fiction of the man who travels faster than light, for whom time has its sign changed. I said that for him all phenomena would seem to be due to chance. This is true from a certain point of view, and yet, at any given moment, all these phenomena would not be distributed in conformity with the laws of chance, since they would be just as they are for us, who, seeing them unfolded harmoniously and not emerging from a primitive chaos, do not look upon them as governed by chance.

What does this mean? For Flammarion’s imaginary Lumen, small causes seem to produce great effects; why, then, do things not happen as they do for us when we think we see great effects due to small causes? Is not the same reasoning applicable to his case?

Let us return to this reasoning. When small differences in the causes produce great differences in the effects, why are the effects distributed according to the laws of chance? Suppose a difference of an inch in the cause produces a difference of a mile in the effect. If I am to win in case the effect corresponds with a mile bearing an even number, my probability of winning will be \( \frac{1}{2} \). Why is this? Because, in order that it should be so, the cause must correspond with an inch bearing an even number. Now, according to all appearance, the probability that the cause will vary between certain limits is proportional to the distance of those limits, provided that distance is very small. If this hypothesis be not admitted, there would no longer be any means of representing the probability by a continuous function.

Now what will happen when great causes produce small effects? This is the case in which we shall not attribute the phenomenon to chance, and in which Lumen, on the contrary, would attribute it to chance. A difference of a mile in the cause corresponds to a difference of an inch in the effect. Will the probability that the cause will be comprised between two limits \( n \) miles apart still be proportional to \( n \)? We have no reason to suppose it, since this distance of \( n \) miles is great. But the probability that the effect will be comprised between two limits \( n \) inches apart will be precisely the same, and accordingly it will not be proportional to \( n \), and that notwithstanding the fact that this distance of \( n \) inches is small. There is, then, no means of representing the law of probability of the effects by a continuous curve. I do not mean to say that the curve may not remain continuous in the \textit{analytical} sense of the word. To \textit{infinitely small} variations of the abscissa there will correspond infinitely small variations of the ordinate. But \textit{practically} it would not be continuous, since to \textit{very small} variations of the abscissa there would not correspond very small variations of the ordinate. It would become impossible to trace the curve with an ordinary pencil: that is what I mean.

What conclusion are we then to draw? Lumen has no right to say that the probability of the cause (that of \textit{his} cause, which is our effect) must
necessarily be represented by a continuous function. But if that be so, why have we the right? It is because that state of unstable equilibrium that I spoke of just now as initial, is itself only the termination of a long anterior history. In the course of this history complex causes have been at work, and they have been at work for a long time. They have contributed to bring about the mixture of the elements, and they have tended to make everything uniform, at least in a small space. They have rounded off the corners, levelled the mountains, and filled up the valleys. However capricious and irregular the original curve they have been given, they have worked so much to regularize it that they will finally give us a continuous curve, and that is why we can quite confidently admit its continuity.

Lumen would not have the same reasons for drawing this conclusion. For him complex causes would not appear as agents of regularity and of levelling; on the contrary, they would only create differentiation and inequality. He would see a more and more varied world emerge from a sort of primitive chaos. The changes he would observe would be for him unforeseen and impossible to foresee. They would seem to him due to some caprice, but that caprice would not be at all the same as our chance, since it would not be amenable to any law, while our chance has its own laws. All these points would require a much longer development, which would help us perhaps to a better comprehension of the irreversibility of the universe."

The story of Lumen, written by the famous astronomer Camille Flammarion, is filled with the positivistic dogma Einstein would later promote throughout his career. It was first published many decades before Einstein claimed credit for the story, before Einstein was even born, and discusses not only travel at luminal and superluminal velocities, but the complete relativity of simultaneity, time and space, and the use of light speed as a measurement of relative distance, time and simultaneity.

As a small example from Lumen,

"{The magnifying power of time. [Notes in "{}" are margin notes found in the original.]} It is this: If you set out from the Earth at the moment that a flash of lightning bursts forth, and if you travelled for an hour or more with the light, you would see lightning as long as you continued to look at it. This fact is established by the foregoing principles. But if, instead of travelling exactly with the velocity of light, you were to travel with a little less velocity; note the observation that you might make. I will suppose that this voyage away from the Earth, during which you look at the lightning, lasts a minute. I will suppose also, that the lightning lasts a thousandth part of a second. You will continue to see the lightning during 60,000 times its duration. In our first supposition this voyage is identical with that of light. Light has occupied 60,000 tenths of seconds to go from the Earth to the point in space where you are. Your voyage and that of light have co-existed. Now if instead of flying with just the same velocity as light, you had flown a little less quickly, and
if you had employed a thousandth part of a second more to arrive at the same point, instead of always seeing the same moment of the lightning, you would have seen, successively, the different moments which consulted the total duration of the lightning, equal to 1000 parts of a second. In this whole minute you would have had time to see first the beginning of the flash of lightning, and could analyse the development of it, the successive phases of it, to the very end. You may imagine what strange discoveries one could make in the secret nature of lightning, increased 60,000 times in the order of its duration, what frightful battles you would have time to discover in the flames! what pandemonium! what unlucky atoms! what a world hidden by its volatile nature from the imperfect eyes of mortals!

{Vision of the analysing eye.}

If you could see by your imagination sufficiently, to separate and count the atoms which constitute the body of a man, that body would disappear before you, for it consists of thousands of millions of atoms in motion, and to the analysing eye it would be a nebula animated by the forces of gravitation. Did not Swedenborg imagine that the universe by which he was surrounded, seen as a whole, was in the form of an immense man? That was anthropomorphism. But there are analogies everywhere. What we know most certainly is, that things are not what they appear to be, either in space or in time. But let us return to the delayed flash of lightning.

When you travel with the velocity of light, you see constantly the scene which was in existence at the moment of your departure. If you were carried away for a year, at the same rate, you would have before your eyes the same event for that time. But if, in order to see more distinctly an event which would have taken only a few seconds, such as the fall of a mountain, an avalanche, or an earthquake, you were to delay, to see the commencement of the catastrophe (in slackening a little, your steps on those of light), you would see the progress of the catastrophe, its first moment, its second, and so on successively, in thus nearly following the light, you would only see the end after an hour of observation. The event would last for you an hour instead of a few seconds. You would see the rocks, or the stones suspended in the air, and could thus ascertain the mode of production of the phenomenon, and its incidental delays. Already your terrestrial scientific knowledge enables you to take instantaneous photographs of the successive aspects of rapid phenomena, such as lightning, a meteor, the waves of the sea, a volcanic eruption, the fall of a building, and to make them pass before you graduated in accordance with their effect on the retina. Similarly you can, on the contrary, photograph the pollen of a flower, through each stage of expansion to its completion in the fruit, or the development of a child from its birth to maturity, and project these phases upon a screen, depicting in a few seconds the life of a man, or a tree.

Somewhat similar stories to the story of Lumen are told by Comte Didier de Chousy, Ignis; Aaron Bernstein, Naturwissenschaftliche Volksbücher, (confer: F.
Gregory, “The Mysteries and Wonders of Natural Science: Bernstein’s Naturwissenschaftliche Volkbücher and the Adolescent Einstein”, in J. Stachel and D. Howard, Editors, Einstein: The Formative Years 1879-1909, Birkhäuser, Boston, (2000), pp. 23-41; John Venn, “Our Control of Space and Time”, Mind, Volume 6, Number 21, (January, 1881), pp. 18-31; and Hudson Maxim, confer: “Hudson Maxim’s Anticipations of Einstein”, Current Opinion, Volume 71, (November, 1921), pp. 636-638. The story of Dr. Faustus of the 1500's, as translated into English by P. F. Gent in 1592, also tells of travel through the heavens at the speed of thought, presents a Copernican view of the solar system, anticipates satellite images of the weather, etc. The book of Enoch also contains somewhat similar stories, as do stories of Mohammed’s flight with the angel Gabriel.

Johann Christoph Friedrich von Schiller wrote, in the Eighteenth Century:

Die Große der Welt

Die der schaffende Geist einst aus dem Chaos schlug,
Durch die schwebende Welt flieg’ ich des Windes Flug,
   Bis am Strande
   Ihrer Wogen ich lande,
Anker werf’, wo kein Hauch mehr weht
Und der Markstein der Schöpfung steht.
Sterne sah ich bereits jugendlich auferstehn,
Tausendjährigen Gangs durchs Firmament zu gehn,
   Sah sie spielen
   Nach den lockenden Zielen;
Irrrend suchte mein Blick umher,
Sah die Räume schon—sternenleer.
Anzufeuern den Flug weiter zum Reich des Nichts,
Steur’ ich muthiger fort, nehme den Flug des Lichts,
   Neblicht träuber
   Himmel an mir vorüber,
Weltysteme, Fluthen im Bach,
Strudeln dem Sonnenwanderer nach.
Sieh, den einsamen Pfad wandelt ein Pilger mir
Rasch entgegen—»Halt an! Waller, was suchst du hier?«
   »Zum Gestade
   Seiner Welt meine Pfade!
Segle hin, wo kein Hauch mehr weht
Und der Markstein der Schöpfung steht!«
»Steh! du segelst umsonst—vor dir Unendlichkeit!«
»Steh! du segelst umsonst—Pilger, auch hinter mir!—
Senke nieder,
   Adlergedank’, dein Gefieder!
Kühne Seglerin, Phantasie,
Wirf ein muthloses Anker hie.«
9.6.3 Light Signals and Clock Synchronization

There is a common misconception enunciated in numerous histories, that Albert Einstein was the first person to propose the relativity of simultaneity. It is often alleged that the paper, “Zur Elektrodynamik bewegter Körper”, *Annalen der Physik*, Series 4, Volume 17, (1905), pp. 891-921, at 892-895, contained the first proposal of a clock synchronization method employing observers and light signals. Given the absence of references in Einstein’s work, it has been further assumed by some that the revised thought-experiment regarding a midpoint and relative simultaneity, which appeared in Einstein’s 1916 work, “Die Relativität der Gleichzeitigkeits”, *Über die spezielle und die allgemeine Relativitätstheorie*, Chapter 9, Friedr. Vieweg & Sohn, Braunschweig, (1917), pp. 16-19, was also an original idea. The historic record proves otherwise. Einstein’s thought experiments related to the relativity of simultaneity were first stated by Henri Poincaré, Daniel F. Comstock and Robert Daniel Carmichael.

Of course, Einstein’s parroting of Poincaré’s ideas did not go completely unnoticed. Poincaré, who was a very gracious person—he even allegedly wrote an undeserving Einstein a recommendation, never mentioned Einstein in the context of the theory of relativity in a positive way. In 1922, Stjepan Mohorovičić acknowledged what Einstein did not,

“...Ich muß darauf hinweisen, was weniger bekannt ist, daß schon der französische Physiker H. Poincaré darauf aufmerksam gemacht hat, daß die Lorentzschen Transformationen eine Gruppe bilden; er hat schon 1900 (also 5 Jahre vor Einstein) gezeigt [Footnote: Siehe das Buch, welches in Anmerkung 22 zitiert ist {M. Abraham, *Theorie der Elektrizität*. II. Bd. 4. Aufl. Leizig-Berlin 1920}, S. 359. Es scheint, daß deswegen Poincaré in seinem Vortrage »Die neue Mechanik« (Leipzig-Berlin 1911) Einstein nicht einmal erwähnt.), wie man die Uhren mittels der Lichtsignale auf die Lorentzsche Ortszeit richten kann. [***] Dessenwegen müssen wir die Methode der Signalisierung (welche — wie wir betont haben — schon H. Poincaré 1900 aufgebracht hat), nur als eine Interpretation der Lorentzschen Formeln auffassen.”

“...I must point out what is little known, that the French physicist H. Poincaré had already called attention to the fact that the Lorentz Transformations form a group, he had already shown in 1900 (therefore 5 years before Einstein) [Footnote: See the book, which is cited in note 22 {M. Abraham, *Theorie der Elektrizität*. Volume 2, Fourth Edition, Leipzig, Berlin, 1920}, S. 359. It appears that Poincaré did not mention Einstein even once in his lecture ‘The New Mechanics’ (Leipzig, Berlin, 1911) for this reason.], how one can set clocks by means of light signals to Lorentz’ local time. [***] Therefore we must understand the method of signaling (which, as we have stressed, H. Poincaré had already applied in 1900) only as an interpretation of Lorentz’ formulas.”
Stjepan Mohorovičić acknowledged Poincaré’s priority for realizing that the Lorentz Transformations form a group. Mohorovičić cites Max Abraham’s acknowledgment of Poincaré’s priority for the clock synchronization method with light signals, and asserts that Poincaré did not mention Einstein even once in his lecture *Die neue Mechanik (La mécanique nouvelle = The New Mechanics)*, because Einstein had plagiarized Poincaré’s method of synchronizing clocks with light signals, which method is but an interpretation of Lorentz’ “Ortszeit”, and Einstein had plagiarized Poincaré’s assertion of the group properties of the Lorentz Transformation.

Felix Klein had made similar statements in a private letter to Wolfgang Pauli on 8 March 1921, that Poincaré first recognized that the Lorentz Transformations form a group and that Poincaré felt an animosity towards Einstein, and this was the only explanation for the fact that Poincaré did not mention Einstein in Poincaré’s Göttingen lecture on the new mechanics. Klein wrote,

Poincaré’s silence also caught the attention of Max Born, who stated,

“One of these series of lectures was given by Henri Poincare, April 22nd-28th 1909[.] The sixth lecture had the title ‘La mécanique nouvelle.’ It is a popular account of the theory of relativity without any formulae and with very few quotations. *Einstein* and *Minkowski* are not mentioned at all, only *Michelson*, *Abraham* and *Lorentz*. But the reasoning used by Poincaré was just that, which *Einstein* introduced in his first paper of 1905, of which I shall speak presently. Does this mean that Poincaré knew all this before Einstein? It is possible, but the strange thing is that this lecture definitely gives you the impression that he is recording Lorentz’ work.”

Arvid Reuterdael also was aware that Poincaré resented Einstein,

“Professor Henri Poincaré, the famous French physicist and mathematician, advisedly ignores the name of Einstein in his lectures on ‘Relativity’.”

And Johannes Riem reiterated the fact,

“Neben dieser Aufklärung durch die Presse ging dann eine wissenschaftliche Bekämpfung Einsteins, vor allem durch den Mathematiker und Ingenieur Reuterdael am St. Thomas College, der selbst schon vor Einstein über Relativität gearbeitet und Einstein zu einer öffentlichen Aussprache

Quellenmäßig wird dann von Reuterdahl gezeigt, wie bedeutende Gelehrte die Einsteinsche Fassung der Relativitätstheorie als falsch bekämpfen und ganz andere Überlegungen an die Stelle setzen, wie Lenard, Gehrcke, Fricke, Mewes es tun. Endlich untersucht er das Einsteinsche Gebäude selbst auf seine Zusammensetzung, seine Grundlagen und Haltbarkeit, und findet, daß es ein Spiel mit Worten und Begriffen ist, denen in der Physik nichts tatsächliches entspricht. Es wäre sehr lohnend, die kleine Schrift von 26 Seiten zu übersetzen.**

Charles Nordmann stated, in 1921,

“The only time of which we have any idea apart from all objects is the psychological time so luminously studied by M. Bergson: a time which has nothing except the name in common with the time of physicists, of science.

It is really to Henri Poincaré, the great Frenchman whose death has left a void that will never be filled, that we must accord the merit of having first proved, with the greatest lucidity and the most prudent audacity, that time and space, as we know them, can only be relative. A few quotations from his works will not be out of place. They will show that the credit for most of the things which are currently attributed to Einstein is, in reality, due to Poincaré. [***] I venture to sum up all this in a sentence which will at first sight seem a paradox: in the opinion of the Relativists it is the measuring rods which create space, the clocks which create time. All this was maintained by Poincaré and others long before the time of Einstein, and one does injustice to truth in ascribing the discovery to him.”**

Wolfgang Pauli wrote, in 1921,

“The formal gaps left by Lorentz’s work were filled by Poincaré. He stated the relativity principle to be generally and rigourously valid. Since he, in common with the previously discussed authors, assumed Maxwell’s equations to hold for the vacuum, this amounted to the requirement that all laws of nature must be covariant with respect to the ‘Lorentz transformation’ [Footnote: The terms ‘Lorentz transformation’ and ‘Lorentz group’ occurred for the first time in this paper by Poincaré.]. The invariance of the transverse
dimensions during the motion is derived in a natural way from the postulate that the transformations which affect the transition from a stationary to a uniformly moving system must form a group which contains as a subgroup the ordinary displacements of the coordinate system. Poincaré further corrected Lorentz’s formulae for the transformations of charge density and current and so derived the complete covariance of the field equations of electron theory. We shall discuss his treatment of the gravitational problem, and his use of the imaginary coordinate $ict$, at a later stage (see §§ 50 and 7).”

In 1927, Hans Thirring wrote,

“There. Poincaré had already completely solved the problem of time several years before the appearance of Einstein’s first work (1905). Beginning with an article in Revue de Métaphysique et de Morale which appeared in 1898 (later reprinted in his book ‘The Value of Science’ as a chapter on the concept of time), Poincaré settled the general problem of time from the physical standpoint and had already there referred to the fact that the principle of the constancy of the velocity of light serves as a basis for a definition of time. Poincaré, in his work ‘La Théorie de Lorentz et le Principe de Réaction’ (Arch. Néerland. (2) Vol. 5. 1900, Lorentz-Festschrift), then defined Lorentz’ local time (Fig. 23) as time, which time is to be measured with clocks synchronized by light signals.”

Herbert Spencer argued that time, space and simultaneity are purely relative, at least as early as the 1860's,

“§ 93. But now what are we to say about the pure relations of Co-existence, of Sequence, and of Difference; considered apart from amounts of Space, of Time, and of Contrast? Can we say that the relation of Co-existence, conceived simply as implying two terms that exist at the same time, but are not specified in their relative positions, has anything answering to it beyond
consciousness? Can we say that out of ourselves there is such a thing as Succession, corresponding to the conception we have of one thing coming after another, without reference to the time between them? And can we say that what we know as Difference, apart from any particular degree of it, has objective unlikeness as its cause?

The reply is that we cannot frame ideas of Co-existence, of Sequence, and of Difference, without there entering into them ideas of quantity. Though we have examined apart the compound relations of these orders, into which consciousness of quantity avowedly enters; and though, in above defining the simple relations of these orders, the avowed contemplation of quantity is excluded; yet, on looking closely into the matter, we find that a tacit recognition of quantity is always present. Co-existence cannot be thought of without some amount of space. Sequence cannot be thought of without some interval of time. Difference cannot be thought of without some degree of contrast. Hence what has been said above respecting these relations in their definitely-compound forms, applies to them under those forms which, by a fiction, we regard as simple. All the proofs of relativity that held where the conceived quantities were large, hold however small the conceived quantities become. And as the conceived quantities cannot disappear from consciousness without the relations themselves disappearing, it follows inevitably that the relativities hold of the relations themselves in their ultimate elements. We are thus forced to the conclusion that the relations of Co-existence, of Sequence, and of Difference, as we know them, do not obtain beyond consciousness.

Let us simplify the matter by reducing derivative relations to the fundamental relation; and we shall then see more clearly the truth of this apparently-incredible proposition.

Every particular relation of Co-existence involves a cognition of some difference in the positions of the things co-existing; resolvable, ultimately, into differences of relative position towards self. And differences of relative position can be known only through differences between the states of consciousness accompanying the disclosure of the positions. But while positions in Space, and co-existing objects occupying them, are known through relations of Difference between the feelings accompanying disclosure of them; they are known through relations of Likeness, in respect of their order of presentation. The relation of Co-existence, which is that out of which all Space-conceptions are built, is one in which neither term is first or last: the terms exhibit equality in their order—no difference in their order.

Phenomena occurring in succession, like those occurring simultaneously, are known as occupying different positions in consciousness. Intervals between them are distinguished by differences in the feelings that arise in passing over the intervals; and where the intervals are alike, they are so classed from the absence of such differences. But while the relations among phenomena in Time are known as such or such through conceptions of Difference and No-difference yielded by comparisons of them, they are
known as alike in this, that their terms are unequal in order of presentation—differ in their order.

Thus all Space-relations and Time-relations—all relations of Co-existence and Sequence, are known through relations of Difference and No-difference. Sequence is Difference of order; Co-existence is No-difference of order. Hence we have at last to deal with the relations of Difference and No-difference. And our entire consciousness being built up of feelings which present these relations, both in themselves and in the secondary feelings constituting consciousness of their order, the whole question of the relativity of relations among feelings is reducible to the question of the relativity of the relation of Difference. This is readily demonstrable.

The sole elements, and the indissoluble elements, of the relation are these:—A feeling of some kind; a feeling coming next to it, which, being distinguishable as another feeling, proves itself to be not homogeneous with the first; a feeling of shock, more or less decided, accompanying the transition. This shock, which arises from the difference of the two feelings, becomes the measure of that difference—constitutes by its occurrence the consciousness of a relation of difference, and by its degree the consciousness of the amount of difference. That is, the relation of Difference as present in consciousness is nothing more than a change in consciousness. How, then, can it resemble, or be in any way akin to, its source beyond consciousness? Here are two colours which we call unlike. As they exist objectively, the two colours are quite independent—there is nothing between them answering to the change which results in us from contemplating first one and then the other. Apart from our consciousness they are not linked as are the two feelings they produce in us. Their relation as we think it, being nothing else than a change of our state, cannot possibly be parallel to anything between them, when they have both remained unchanged.

Poincaré later spoke in very similar terms to Spencer’s arguments. Wilhelm Bölsche wrote, in 1896,

In 1874, Richard A. Proctor wrote,

“We learn by view of the heavens that twenty years ago Sirius was shining with such and such brightness; that a hundred years ago some other star was shining with its degree of luster, and so on; but the star depths are never revealed to us exactly as they are at the moment, or exactly as they were at
any moment. Yet this is merely due to the imperfection of our senses. We judge by the light of these objects, and this light travels at such and such a rate. It is conceivable that creatures might have a sense enabling them to judge by some other form of action, exerted by the stars, as for instance by the action of gravity. If gravity were the action thus effective, the information conveyed respecting the universe would be far more nearly contemporaneous, since the action of gravity certainly travels many times faster than light, even if it does not travel with infinite velocity as some philosophers suppose.”

This was a view that would later lead to lingering doubts about the special theory of relativity with respect to the speed of gravity and with respect to “tachyons”. Rudolf Lämmler posed the critical question to Einstein in 1911 and Einstein responded,

“If gravitation were to propagate with a (universal) superluminal velocity, this would suffice to bring down the principle of relativity once and for all. If it propagated infinitely fast, this would provide us with a means to determine the absolute time.”

Poincaré returned to Proctor’s Sirius, seriously attacking the notions of absolute space, time and simultaneity. Poincaré wrote, and notice that he provides cause with an alibi for effect,

“[I]t is possible to say that a ray of light is also one of our instruments. [***] One event takes place on Earth, another on Sirius; how shall we know whether the first occurs before, at the same time, or after the second? This can be so only as the result of a convention. [***] In this new mechanics there is no effect which is transmitted instantaneously; the maximum speed of transmission is that of light. Under these conditions it can happen that event A (as a consequence of the mere consideration of space and time) could be neither the effect nor the cause of event B if the distance between the places where they take place is such that light cannot travel in sufficient time from place B to place A nor from place A to place B.”

James Thomson stated the principle of relativity and pointed out the difficulty of “ascertaining simultaneity of occurrences in distant places” in 1884, which difficulty we attempt to resolve with light signals,

“There is no distinction known to men, among states of existence of a body which can give reason for any one state being regarded as a state of absolute rest in space, and any other being regarded as a state of uniform rectilinear motion. Men have no means of knowing, nor even of imagining, any one length rather than any other, as being the distance between the place occupied by the centre of a ball at present, and the place that was occupied
by that centre at any past instant; nor of knowing or imagining any one direction, rather than any other, as being the direction of the straight line from the former place to the new place, if the ball is supposed to have been moving in space. The point of space that was occupied by the centre of the hall at any specified past moment is utterly lost to us as soon as that moment is past, or as soon as the centre has moved out of that point, having left no trace recognizable by us of its past place in the universe of space.

There is then an essential difficulty as to our forming a distinct conception either of rest or of rectilinear motion through unmarked space.

We have besides no preliminary knowledge of any principle of chronometry, and for this additional reason we are under an essential preliminary difficulty as to attaching any clear meaning to the words *uniform rectilinear motion* as commonly employed, the uniformity being that of equality of spaces passed over in equal times.

If two balls are altering their distance apart, we cannot suppose that they are both at rest. One, at least, must be in motion.

Men have very good means of knowing in some cases, and of imagining in other cases, the distance between the points of space simultaneously occupied by the centres of two balls; if, at least, we be content to waive the difficulty as to imperfection of our means of ascertaining or specifying, or clearly idealising, simultaneity at distant places. For this we do commonly use signals by sound, by light, by electricity, by connecting wires or bars, and by various other means. The time required in the transmission of the signal involves an imperfection in human powers of ascertaining simultaneity of occurrences in distant places. It seems, however, probably not to involve any difficulty of idealising or imagining the existence of simultaneity. Probably it may not be felt to involve any difficulty comparable to that of attempting to form a distinct notion of identity of place at successive times in unmarked space.

In 1885 in a Mach-like argument, Edmund Montgomery set the stage for Poincaré’s notion of relative simultaneity,

“An unsophisticated mind would think it obvious beyond controversy that, in spite of the lapse in time of all our feelings, there consciously appears within our mental presence, ready-made and persistently enduring, an unmistakably extended universe with all its parts simultaneously subsisting. [***] But how to consolidate by memory or otherwise into simultaneous extension and actual presence successive moments of ever-fleeting time, irretrievably dwindled away into the past—this is a task which transcends all thinkable possibility. [***] Time has to be somehow metamorphosed into space, inwardness into outwardness. From a lapsing succession of sensations, forming a series of unextended feelings, the permanent and simultaneous expanse of the outer world has to be constructed.”
G. Windred gave a brief history of theories of time and space, “The History of Mathematical Time: II”, *Isis*, Volume 20, Number 1, (November, 1933), pp. 192-219; which highlights some of the important contributions of Challis, Herschel, Whewell, Shadworth H. Hodgson, Airy, and others, towards Poincaré’s notion of relative simultaneity. Windred quotes Hodgson’s statement, “Time has one dimension—length[,]” and quotes astronomers to show that they recognized the need to correctly position events relative to time, given that we depend upon signals with a finite speed to observe these events.

In 1887, Woldemar Voigt published the following relativistic transformation of space-time coordinates:

\[ x' = x - \frac{v}{c} t, \quad y' = \frac{v}{y} y, \quad z' = \frac{v}{y} z, \quad t' = t - \frac{v}{c^2} x \]

where \( y = \sqrt{\frac{1}{1 - \frac{v^2}{c^2}}} \)

Poincaré asserted that Lorentz’ (Voigt’s) “position time” was “time” and that simultaneity is relative, in 1898, and we know from Solovine’s accounts that Einstein had read this paper, which was reprinted as Chapter 2 of Poincaré’s book *La Valeur de la Science*, E. Flammarion, Paris, (1904); and which was referred to in Poincaré’s book *La Science et l’Hypothèse*, E. Flammarion, Paris, (1902);

“XII

But let us pass to examples less artificial; to understand the definition implicitly supposed by the savants, let us watch them at work and look for the rules by which they investigate simultaneity.

I will take two simple examples, the measurement of the velocity of light and the determination of longitude.

When an astronomer tells me that some stellar phenomenon, which his telescope reveals to him at this moment, happened nevertheless fifty years ago, I seek his meaning, and to that end I shall ask him first how he knows it, that is, how he has measured the velocity of light.

He has begun by supposing that light has a constant velocity, and in particular that its velocity is the same in all directions. That is a postulate without which no measurement of this velocity could be attempted. This postulate could never be verified directly by experiment; it might be contradicted by it if the results of different measurements were not concordant. We should think ourselves fortunate that this contradiction has not happened and that the slight discordances which may happen can be readily explained.

The postulate, at all events, resembling the principle of sufficient reason, has been accepted by everybody; what I wish to emphasize is that it furnishes
us with a new rule for the investigation of simultaneity, entirely different from that which we have enunciated above.

This postulate assumed, let us see how the velocity of light has been measured. You know that Roemer used eclipses of the satellites of Jupiter, and sought how much the event fell behind its prediction. But how is this prediction made? It is by the aid of astronomic laws, for instance Newton’s law.

Could not the observed facts be just as well explained if we attributed to the velocity of light a little different value from that adopted, and supposed Newton’s law only approximate? Only this would lead to replacing Newton’s law by another more complicated. So for the velocity of light a value is adopted, such that the astronomic laws compatible with this value may be as simple as possible. When navigators or geographers determine a longitude, they have to solve just the problem we are discussing; they must, without being at Paris, calculate Paris time. How do they accomplish it? They carry a chronometer set for Paris. The qualitative problem of simultaneity is made to depend upon the quantitative problem of the measurement of time. I need not take up the difficulties relative to this latter problem, since above I have emphasized them at length.

Or else they observe an astronomic phenomenon, such as an eclipse of the moon, and they suppose that this phenomenon is perceived simultaneously from all points of the earth. That is not altogether true, since the propagation of light is not instantaneous; if absolute exactitude were desired, there would be a correction to make according to a complicated rule.

Or else finally they use the telegraph. It is clear first that the reception of the signal at Berlin, for instance, is after the sending of this same signal from Paris. This is the rule of cause and effect analyzed above. But how much after? In general, the duration of the transmission is neglected and the two events are regarded as simultaneous. But, to be rigorous, a little correction would still have to be made by a complicated calculation; in practise it is not made, because it would be well within the errors of observation; its theoretic necessity is none the less from our point of view, which is that of a rigorous definition. From this discussion, I wish to emphasize two things: (1) The rules applied are exceedingly various. (2) It is difficult to separate the qualitative problem of simultaneity from the quantitative problem of the measurement of time; no matter whether a chronometer is used, or whether account must be taken of a velocity of transmission, as that of light, because such a velocity could not be measured without measuring a time.

XIII

To conclude: We have not a direct intuition of simultaneity, nor of the equality of two durations. If we think we have this intuition, this is an illusion. We replace it by the aid of certain rules which we apply almost always without taking count of them.

But what is the nature of these rules? No general rule, no rigorous rule;
a multitude of little rules applicable to each particular case.

These rules are not imposed upon us and we might amuse ourselves in inventing others; but they could not be cast aside without greatly complicating the enunciation of the laws of physics, mechanics and astronomy.

We therefore choose these rules, not because they are true, but because they are the most convenient, and we may recapitulate them as follows: ‘The simultaneity of two events, or the order of their succession, the equality of two durations, are to be so defined that the enunciation of the natural laws may be as simple as possible. In other words, all these rules, all these definitions are only the fruit of an unconscious opportunism.’

Circa 1899, Poincaré clarified the fact that he saw no distinction between “time” and “local time”,

“Allow me a couple of remarks regarding the new variable \( t' \): it is what Lorentz calls the local time. At a given point \( t \) and \( t' \) will not defer but by a constant, \( t' \) will, therefore, always represent the time, but the origin of the times being different for the different points serves as justification for his designation.”

“Disons deux mots sur la nouvelle variable \( t' \): c’est ce que Lorentz appelle le temps locale. En un point donné \( t \) et \( t' \) ne différeront que par une constante, \( t' \) représentera donc toujours le temps mais l’origine des temps étant différente aux différents points: cela justifie sa dénomination.”

In his article on “Ether” for the Encyclopædia Britannica, Maxwell proposed thought experiments which may have inspired Poincaré’s definition of relative simultaneity,

“Relative motion of the æther.—We must therefore consider the æther within dense bodies as somewhat loosely connected with the dense bodies, and we have next to inquire whether, when these dense bodies are in motion through the great ocean of æther, they carry along with them the æther they contain, or whether the æther passes through them as the water of the sea passes through the meshes of a net when it is towed along by a boat. If it were possible to determine the velocity of light by observing the time it takes to travel between one station and another on the earth’s surface, we might, by comparing the observed velocities in opposite directions, determine the velocity of the æther with respect to these terrestrial stations. All methods, however, by which it is practicable to determine the velocity of light from terrestrial experiments depend on the measurement of the time required for the double journey from one station to the other and back again, and the increase of this time on account of a relative velocity of the æther equal to
that of the earth in its orbit would be only about one hundred millionth part of the whole time of transmission, and would therefore be quite insensible."\textsuperscript{2386}

In 1900, Poincaré stated,

“In order for the compensation to occur, the phenomena must correspond, not to the true time $t$, but to some determined local time $t'$ defined in the following way.

I suppose that observers located at different points synchronize their watches with the aid of light signals; which they attempt to adjust to the time of the transmission of these signals, but these observers are unaware of their movement of translation and they consequently believe that the signals travel at the same speed in both directions, they restrict themselves to crossing the observations, sending a signal from $A$ to $B$, then another from $B$ to $A$. The local time $t'$ is the time determined by watches synchronized in this manner.

If in such a case $V = \frac{1}{\sqrt{K}}$ is the speed of light, and $v$ the translation of the Earth, that I imagine to be parallel to the positive $x$ axis, one will have:

\[
t' = t - \frac{vx}{v^2},
\]

"Pour que la compensation se fasse, il faut rapporter les phénomènes, non pas au temps vrai $t$, mais à un certain temps local $t'$ défini de la façon suivante.

Je suppose que des observateurs placés en différents points, règlent leurs montres à l’aide de signaux lumineux; qu’ils cherchent à corriger ces signaux du temps de la transmission, mais qu’ignorant le mouvement de translation dont ils sont animés et croyant par conséquent que les signaux se transmettent également vite dans les deux sens, ils se bornent à croiser les observations, en envoyant un signal de $A$ en $B$, puis un autre de $B$ en $A$. Le temps local $t'$ est le temps marqué par les montres ainsi réglées.

Si alors $V = \frac{1}{\sqrt{K}}$ est la vitesse de la lumière, et $v$ la translation de la Terre que je suppose parallèle à l’axe des $x$ positifs, on aura:

\[
t' = t - \frac{vx}{v^2}.\]

We know that Einstein had read this paper.\textsuperscript{2388}

In 1902 in his book \textit{La Science et l’Hypothèse}, E. Flammarion, Paris, (1902); Poincaré asserted, and we know, from Solovine’s accounts,\textsuperscript{2389} that Einstein had read this work of Poincaré’s,
“1. There is no absolute space, and we only conceive of relative motion; and yet in most cases mechanical facts are enunciated as if there is an absolute space to which they can be referred.

2. There is no absolute time. When we say that two periods are equal, the statement has no meaning, and can only acquire a meaning by a convention.

3. Not only have we no direct intuition of the equality of two periods, but we have not even direct intuition of the simultaneity of two events occurring in two different places. I have explained this in an article entitled ‘Mesure du Temps.’ [Footnote: Revue de Métaphysique et de Morale, t. vi., pp. 1-13, January, 1898.]”

Philipp Frank stressed the influence Poincaré had on Einstein. Einstein once stated,

“The reading of Hume, along with Poincaré and Mach, had some influence on my development.”

In Lisbeth and Ferdinand Lindemann’s German translation; Wissenschaft und Hypothese, B. G. Teubner, Leipzig, (1904), pp. 286-289; of Poincarés 1902 work, La Science et l’Hypothèse; the Lindemanns included the following notation:

“43) S. 92. In der citierten Abhandlung [“la Mesure du temps”, Revue de Métaphysique et de Morale, t. VI, p. 1-13 (janvier 1898).] kommt Poincaré zu folgenden Schlüssen:

„Wir haben keine direkte Anschauung von der Gleichzeitigkeit zweier Zeitdauern, ebensowenig von der Gleichheit. — Wir behelfen uns mit gewissen Regeln, die wir beständig anwenden, ohne uns davon Rechenschaft zu geben. — Es handelt sich dabei um eine Menge kleiner Regeln, die jedem einzelnen Falle angepaßt sind, nicht um eine allgemeine und strenge Regel. — Man könnte dieselben auch durch andere ersetzen, aber man würde dadurch das Aussprechen der Gesetze in der Physik, Mechanik und Astronomie außerordentlich umständlich machen. — Wir wählen also diese Regeln nicht, weil sie wahr, sondern weil sie bequem sind, und wir können sie in folgendem Satze zusammenfassen: Die Gleichzeitigkeit zweier Ereignisse oder die Ordnung ihrer Aufeinanderfolge und die Gleichheit zweier Zeitdauern müssen so definiert werden, daß der Ausspruch der Naturgesetze möglichst einfach wird; mit anderen Worten: Alle diese Regeln und Definitionen sind nur die Frucht eines unbewußten Opportunismus.“

Newton (dessen Anschauung man z. B. bei Mach reproduziert findet; Die Mechanik in ihrer Entwicklung, 2. Anfl., Leipzig 1889, S. 207) setzte die Existenz einer „absoluten Zeit“ voraus; d’Alembert, Locke u. a. hoben den relativen Charakter aller Zeitmaße hervor; vgl. die historischen Angaben bei A. Voss in dem Artikel über die Prinzipien der rationellen Mechanik (Enzyklopädie der math. Wissenschaften, IV, 1). Nach de Tilly’s Angabe (Sur divers points de la philosophie des sciences
definiert z. B. Lobatschewsky die Zeit als eine „Bewegung, welche geeignet ist, die anderen Bewegungen zu messen“. Auch eine solche Definition setzt voraus, daß es eine Bewegung gibt, die zum Messen der (also aller) anderen Bewegungen geeignet ist; und wann ist eine Bewegung „geeignet“, als Maß anderer zu dienen? Vielleicht kann die folgende analytische Erörterung hier zur Klärung beitragen.

Wir betrachten z. B. das Fallgesetz eines schweren Punktes auf der Erdoberfläche; dasselbe ist bekanntlich durch die Differentialgleichung:

\[ \frac{d^2 z}{dt^2} = -g \]

vollständig dargestellt, wenn \( z \) eine vertikal nach oben gemessene Koordinate, \( t \) die Zeit, \( g \) die Beschleunigung der Schwere bedeutet. Führen wir nun ein anderes Zeitmaß \( \tau \) ein, so wird \( \tau \) eine Funktion von \( t \) sein:

\[ \tau = \Phi(t), \quad t = \Phi'(\tau), \]

und die Gleichung (1) nimmt, wenn wir \( \tau \) einführen, folgende Gestalt an:

\[ \left[ \frac{1}{\Phi'(\tau)} \right]^2 \left( \frac{d^2 z}{d\tau^2} - \frac{dz}{d\tau} \Phi''(\tau) \right) = -g, \]

wo \( \Phi' \) und \( \Phi'' \) den ersten und zweiten Differentialquotienten der Funktion \( \Phi(\tau) \) nach \( \tau \) bezeichnen. Die einfache Form der Gleichung (1) beruht also wesentlich auf der Wahl eines für die Gesetze des Falles „geeigneten“ Zeitmaßes; jede andere Art der Zeitmessung würde zu wesentlich komplizierterem Ansätze führen; dadurch ist die Zeit \( t \) vor der Zeit \( \tau \) ausgezeichnet. Dieses Zeitmaß wird praktisch durch eine Uhr, etwa eine Pendeluhr, gegeben; die Bewegung des Pendels wird selbst wieder durch die Fallgesetze bedingt; wir messen also in (1) eine Fallerscheinung durch eine andere Fallerscheinung, und deshalb ist die Einfachheit des Resultates nicht auffällig. Anders ist es, wenn wir eine durch eine Feder getriebene Uhr anwenden; hier ist es eine nicht selbstverständliche Tatsache, daß das Zeitmaß für das Ablaufen der Feder zur Beobachtung des freien Falles geeignet ist; immerhin wird der richtige und gleichmäßige Gang der Federuhr nur durch Vergleichung mit einer Pendeluhr reguliert, und dadurch wird dieses Zeitmaß auf das vorhergehende reduziert. Auf die gewählte Zeiteinheit, die der Rotation der Erde um ihre Achse entlehnt ist, kommt es hierbei nicht an; wir bestimmen allerdings die Länge des Sekundenpendels nach dieser Einheit, könnten aber auch mit gleichem Erfolg umgekehrt eine beliebig gewählte Pendellänge zur Definition der Einheit verwenden. Anders
ist es, wenn man zu kosmischen Problemen übergeht. Die Bewegung eines Planeten \((x, y)\) um die im Anfangspunkte stehende Sonne mit der Masse \(m'\) wird durch die Gleichungen

\[
\frac{d^2x}{dt^2} = -\frac{m'x}{r^3}, \quad \frac{d^2y}{dt^2} = -\frac{m'y}{r^3}
\]

definiert, welche das Newtonische Gravitationsgesetz darstellen \(r = \sqrt{x^2 + y^2}\). Erfahrungsgemäß genügt auch hier dasselbe Zeitmaß, das beim freien Falle eingeführt wurde; denn alle aus den Gleichungen (3) zu ziehenden Folgerungen stimmen (auch wenn man die Störungen der anderen Planeten berücksichtigt) hinreichend mit den Beobachtungen überein, so daß man keine Veranlassung hat, eine andere Zeit \(\tau\) einzuführen und die obige Transformation anzuwenden. Analog verhält es sich mit allen bekannten Erscheinungen; es genügt immer, die Komponenten der Beschleunigung durch die Ausdrücke \(\frac{d^2x}{dt^2}, \frac{d^2y}{dt^2}, \frac{d^2z}{dt^2}\) zu messen, und es ist überflüssig, die allgemeineren Ausdrücke

\[
\left\{\frac{d^2x}{dt^2} - \frac{dx}{d\tau} \frac{\Phi''(\tau)}{\Phi'(\tau)^2}\right\} \frac{1}{\Phi'(\tau)^2}, \text{ etc.}
\]

statt dessen einzuführen. In diesem Sinne kann man erwartungsweise von einer absoluten Zeit sprechen, d. h. einer Zeit, die zur Beschreibung aller bisher beobachteten Erscheinungen gleichmäßig bequem ist, allerdings mit dem Vorbehalt, diese Vorstellung der absoluten Zeit sofort aufzugeben, wenn nun Tatsachen oder feinere Beobachtung alter Tatsachen dazu führen sollten, für irgendeine Erscheinung durch eine Funktion \(\Phi(\tau)\) ein neues Zeitmaß \(\tau\) einzuführen, so daß für diese Erscheinung die Beschleunigung durch \(\frac{d^2s}{d\tau^2}\) statt durch \(\frac{d^2s}{dt^2}\) dargestellt wird (d. h. das Produkt aus Masse und Beschleunigungs komponente \(\frac{d^2x}{dt^2}\) sich als Funktion des Ortes des bewegten Punktes und anderer fester oder bewegter Punkte darstellen läßt). Aber auch dann würde man wohl versuchen, die entstehende Schwierigkeit durch Modifikation der anderen Annahmen, eventuell durch Hinzufügung weiterer fingerter Punkte und Kräfte (vgl. weiterhin die analogen Erörterungen auf S. 95 ff. beim Trägheitsgesetz) zu beseitigen, ehe man sich entschließt, bei verschiedenen Erscheinungen verschiedene Zeitmaße anzuwenden. Durch diese Überlegung kommt man zu wesentlich derselben
Auffassung, welche Poincaré a. a. O. mit dem Worte Opportunismus charakterisiert.”

Again, in 1904, Poincaré asserted that simultaneity is relative, and elaborated on the light synchronization thought experiment Einstein copied in 1905 without citation to Poincaré’s prior works. We know from Solovine’s accounts that Einstein had read Poincaré’s paper, which was reprinted as Chapters 7 and 8 of Poincaré’s book *La Valeur de la Science*, E. Flammarion, Paris, (1904). Poincaré stated in 1904,

“We come to the principle of relativity: this not only is confirmed by daily experience, not only is it a necessary consequence of the hypothesis of central forces, but it is imposed in an irresistible way upon our good sense, and yet it also is battered.

Consider two electrified bodies; though they seem to us at rest, they are both carried along by the motion of the earth; an electric charge in motion, Rowland has taught us, is equivalent to a current; these two charged bodies are, therefore, equivalent to two parallel currents of the same sense and these two currents should attract each other. In measuring this attraction, we measure the velocity of the earth; not its velocity in relation to the sun or the fixed stars, but its absolute velocity.

I well know what one will say, it is not its absolute velocity that is measured, it is its velocity in relation to the ether. How unsatisfactory that is! Is it not evident that from the principle so understood we could no longer get anything? It could no longer tell us anything just because it would no longer fear any contradiction.

If we succeed in measuring anything, we would always be free to say that this is not the absolute velocity in relation to the ether, it might always be the velocity in relation to some new unknown fluid with which we might fill space.

Indeed, experience has taken on itself to ruin this interpretation of the principle of relativity; all attempts to measure the velocity of the earth in relation to the ether have led to negative results. This time experimental physics has been more faithful to the principle than mathematical physics; the theorists, to put in accord their other general views, would not have spared it; but experiment has been stubborn in confirming it.

The means have been varied in a thousand ways and finally Michelson has pushed precision to its last limits; nothing has come of it. It is precisely to explain this obstinacy that the mathematicians are forced today to employ all their ingenuity.

Their task was not easy, and if Lorentz has gotten through it, it is only by accumulating hypotheses. The most ingenious idea has been that of local time.

Imagine two observers who wish to adjust their watches by optical signals; they exchange signals, but as they know that the transmission of light
is not instantaneous, they take care to cross them.

When the station B perceives the signal from the station A, its clock should not mark the same hour as that of the station A at the moment of sending the signal, but this hour augmented by a constant representing the duration of the transmission. Suppose, for example, that the station A sends its signal when its clock marks the hour 0, and that the station B perceives it when its clock marks the hour \( t \). The clocks are adjusted if the slowness equal to \( t \) represents the duration of the transmission, and to verify it, the station B sends in its turn a signal when its clock marks 0; then the station A should perceive it when its clock marks \( t \). The time-pieces are then adjusted. And in fact, they mark the same hour at the same physical instant, but on one condition, which is that the two stations are fixed. In the contrary case the duration of the transmission will not be the same in the two senses, since the station A, for example, moves forward to meet the optical perturbation emanating from B, while the station B flies away before the perturbation emanating from A. The watches adjusted in that manner do not mark, therefore, the true time, they mark what one may call the local time, so that one of them goes slow on the other. It matters little since we have no means of perceiving it. All the phenomena which happen at A, for example, will be late, but all will be equally so, and the observer who ascertains them will not perceive it since his watch is slow; so as the principle of relativity would have it, he will have no means of knowing whether he is at rest or in absolute motion. \( ^{2394} \)

Einstein reiterated Poincaré’s clock synchronization procedures, without acknowledging that Poincaré had stated them first. From Mileva and Albert Einstein’s 1905 co-authored paper,

“1. KINEMATICAL PART

§ 1. Definition of Simultaneity

Consider a system of coordinates, in which the Newtonian mechanical equations are valid. In order to put the contradistinction from the [moving] systems of coordinates to be introduced later into words, and for the exact definition of the conceptualization, we call this system of coordinates the ‘resting system’.

If a material point is at rest relatively to this system of co-ordinates, its position can be defined relatively thereto by the employment of rigid standards of measurement and the methods of Euclidean geometry, and can be expressed in Cartesian co-ordinates.

If we wish to describe the motion of a material point, we give the values of its co-ordinates as functions of the time. Now we must bear carefully in mind that a mathematical description of this kind has no physical meaning unless we are quite clear as to what we understand by ‘time.’ We have to take into account that all our judgments in which time plays a part are always judgments of simultaneous events. If, for instance, I say, ‘That train arrives
here at 7 o’clock,’ I mean something like this: ‘The pointing of the small hand of my watch to 7 and the arrival of the train are simultaneous events.’

[Footnote: We shall not here discuss the inexactitude which lurks in the concept of simultaneity of two events at approximately the same place, which can only be removed by an abstraction.]

It might appear possible to overcome all the difficulties attending the definition of ‘time’ by substituting ‘the position of the small hand of my watch’ for ‘time.’ And in fact such a definition is satisfactory when we are concerned with defining a time exclusively for the place where the watch is located; but it is no longer satisfactory when we have to connect in time series of events occurring at different places, or—what comes to the same thing—to evaluate the times of events occurring at places remote from the watch.

We might, of course, content ourselves with time values determined by an observer stationed together with the watch at the origin of the co-ordinates, and co-ordinating the corresponding positions of the hands with light signals, given out by every event to be timed, and reaching him through empty space. But this co-ordination has the disadvantage that it is not independent of the standpoint of the observer with the watch or clock, as we know from experience. We arrive at a much more practical determination along the following line of thought.

If at the point A of space there is a clock, an observer at A can determine the time values of events in the immediate proximity of A by finding the positions of the hands which are simultaneous with these events. If there is at the point B of space another clock in all respects resembling the one at A, it is possible for an observer at B to determine the time values of events in the immediate neighbourhood of B. But it is not possible without further assumption to compare, in respect of time, an event at A with an event at B. We have so far defined only an ‘A time’ and a ‘B time.’ We have not defined a common ‘time’ for A and B, for the latter cannot be defined at all unless we establish by definition that the ‘time’ required by light to travel from A to B equals the ‘time’ it requires to travel from B to A. Let a ray of light start at the ‘A time’ $t_A$ from A towards B, let it at the ‘B time’ $t_B$ be reflected at B in the direction of A, and arrive again at A at the ‘A time’ $t_A'$.

In accordance with definition the two clocks synchronize if

$$t_B - t_A = t_A' - t_B.$$

We assume that this definition of synchronism is free from contradictions, and possible for any number of points; and that the following relations are universally valid:—

1. If the clock at B synchronizes with the clock at A, the clock at A synchronizes with the clock at B.

2. If the clock at A synchronizes with the clock at B and also with the
clock at C, the clocks at B and C also synchronize with each other.

Thus with the help of certain imaginary physical experiments we have settled what is to be understood by synchronous resting clocks located at different places, and have evidently obtained a definition of ‘simultaneous,’ or ‘synchronous,’ and of ‘time.’ The ‘time’ of an event is that which is given simultaneously with the event by a resting clock located at the place of the event, this clock being synchronous, and indeed synchronous for all time determinations, with a specified stationary clock.

We set forth, according to present experience, that the magnitude

\[
\frac{2AB}{t'_A - t_A} = c,
\]

is a universal constant (the velocity of light in empty space).

It is essential to have time defined by means of resting clocks in the resting system, and the time now defined being appropriate to the resting system we call it ‘the time of the resting system.’

Albert Einstein believed he had a right to plagiarize, if he could put a new spin on an old idea. He asserted this “privilege” in 1907, “It appears to me that it is the nature of the business that what follows has already been partly solved by other authors. Despite that fact, since the issues of concern are here addressed from a new point of view, I believe I am entitled to leave out what would be for me a thoroughly pedantic survey of the literature, all the more so because it is hoped that these gaps will yet be filled by other authors, as has already happened with my first work on the principle of relativity through the commendable efforts of Mr. Planck and Mr. Kaufmann.”

Daniel F. Comstock proposed a new approach to Poincaré’s idea of “relative simultaneity”, in 1910, in his popular exposition on the theory of relativity, which was cited by Robert Daniel Carmichael and Paul Carus, before Einstein manipulated credit for Comstock’s idea,

“The whole principle of relativity may be based on an answer to the question: When are two events which happen at some distance from each other to be considered simultaneous? The answer, ‘When they happen at the same time,’ only shifts the problem. The question is, how can we make two events happen at the same time when there is a considerable distance between them. Most people will, I think, agree that one of the very best practical and simple ways would be to send a signal to each point from a point half-way between them. The velocity with which signals travel through space is of course the characteristic ‘space velocity,’ the velocity of light.
Two clocks, one at $A$ and the other at $B$, can therefore be set running in unison by means of a light signal sent to each from a place midway between them.

Now suppose both clock $A$ and clock $B$ are on a kind of sidewalk or platform moving uniformly past us with velocity $v$. In Fig. 1 (2) is the moving platform and (1) is the fixed one, on which we consider ourselves placed. Since the observer on platform (2) is moving uniformly he can have no reason to consider himself moving at all, and he will use just the method we have indicated to set his two clocks $A$ and $B$ in unison. He will, that is, send a light flash from $C$, the point midway between $A$ and $B$, and when this flash reaches the two clocks he will start them with the same reading.

To us on the fixed platform, however, it will of course be evident that the clock $B$ is really a little behind clock $A$, for, since the whole system is moving in the direction of the arrow, light will take longer to go from $C$ to $B$ than from $C$ to $A$. Thus the clock on the moving platform which leads the other will be behind in time.

Now it is very important to see that the two clocks are in unison for the observer moving with them (in the only sense in which the word ‘unison’ has any meaning for him), for if we adopt the first postulate of relativity, there is no way in which he can know that he is moving. In other words, he has just as much fundamental right to consider himself stationary as we have to consider ourselves stationary, and therefore just as much right to apply the midway signal method to set his clocks in unison as we have in the setting of our ‘stationary clocks.’ ‘Stationary’ is, therefore, a relative term and anything which we can say about the moving system dependent on its motion, can with absolutely equal right be said by the moving observer about our system.

We are, therefore, forced to the conclusion that, unless we discard one of the two relativity postulates, the simultaneity of two distant events means a different thing to two different observers if they are moving with respect to each other.

The fact that the moving observer disagrees with us as to the reading of his two clocks as well as to the reading of two similar clocks on our ‘stationary’ platform, gives us a complete basis for all other differences due to point of view.

A very simple calculation will show that the difference in time between the two moving clocks is [Footnote: The time it takes light to go from $C$ to
The Priority Myth

\[ B = \frac{1}{2} \left( \frac{1}{V - \nu} \right) \] and the time to go from \( C \) to \( A \) is \( \frac{1}{2} \left( \frac{1}{V + \nu} \right) \). The difference in these two times is the amount by which the clocks disagree and this difference becomes, on simplification, the expression given {immediately below}.]

\[ 1 / \sqrt{\beta} / (1 - \beta^2) \]

where
\[ l = \text{distance between clocks } A \text{ and } B; \]
\[ v = \text{velocity of moving system}; \]
\[ V = \text{velocity of light}; \]
\[ \beta = v / V. \]

The way in which this difference of opinion with regard to time between the moving observer and ourselves leads to a difference of opinion with regard to length also may very easily be indicated as follows:

Suppose the moving observer desires to let us know the distance between his clocks and says he will have an assistant stationed at each clock and each of these, at a given instant, is to make a black line on our platform. He will, therefore, he says, be able to leave marked on our platform an exact measure of the length between his clocks and we can then compare it at leisure with any standard we choose to apply.

We, however, object to this measure left with us, on the ground that the two assistants did not make their marks simultaneously and hence the marks left on our platform do not, we say, represent truly the distance between his clocks. The difference is readily shown in Fig. 2, where \( M \) represents the black mark made on our platform at a certain time by the assistant at \( A \), and \( N \) that made by the assistant at \( B \) at a later time. The latter assistant waited, we say, until his clock read the same as clock \( A \), waited, that is, until \( B \) was \( \text{at } B' \); and then made the mark \( N \). The moving observer declares, therefore, that the distance \( MN \) is equal to the distance \( AB \), while we say that \( MN \) is greater than \( AB \).

Again it must be emphasized that, because of the first fundamental postulate, there is no universal standard to be applied in settling such a difference of opinion. Neither the standpoint of the ‘moving’ observer nor our standpoint is wrong. The two merely represent two different sides of reality. Any one could ask: What is the ‘true’ length of a metal rod? Two
observers working at different temperatures come to different conclusions as to the ‘true length.’ Both are right. It depends on what is meant by ‘true.’ Again, asking a question which might have been asked centuries ago, is a man walking toward the stern of an east bound ship really moving west? We must answer ‘that depends’ and we must have knowledge of the questioner’s view-point before we can answer yes or no.

A similar distinction emerges from the principle of relativity. What is the distance between the two clocks? Answer: that depends. Are we to consider ourselves with the clock system when we answer, or passing the clocks with a hundredth the velocity of light or passing the clocks with a tenth the velocity of light? The answer in each case must be different, but in each case may be true.

It must be remembered that the results of the principle of relativity are as true and no truer than its postulates. If future experience bears out these postulates then the length of the body, even of a geometrical line, in fact the very meaning of ‘length,’ depends on the point of view, that is, on the relative motion of the observer and the object measured. The reason this conclusion seems at first contrary to common sense is doubtless because we, as a race, have never had occasion to observe directly velocities high enough to make such effects sensible. The velocities which occur in some of the newly investigated domains of physics are just as new and outside our former experience as the fifth dimension.”

Citing Comstock’s above quoted work, Robert Daniel Carmichael wrote in 1912,

“§ 9. Simultaneity of Events Happening at Different Places.—Let us now assume two systems of reference $\mathcal{S}$ and $\mathcal{S}'$ moving with a uniform relative velocity $v$. Let an observer on $\mathcal{S}'$ undertake to adjust two clocks at different places so that they shall simultaneously indicate the same time. We will suppose that he does this in the following very natural manner: [Footnote: Compare Comstock, Science, N. S., 31 (1900): 767-772.] Two stations $A$ and $B$ are chosen in the line of relative motion of $\mathcal{S}$ and $\mathcal{S}'$ and at a distance $d$ apart. The point $C$ midway between these two stations is found by measurement.

The observer is himself stationed at $C$ and has assistants at $A$ and $B$. A single light signal is flashed from $C$ to $A$ and to $B$, and as soon as the light ray reaches each station the clock there is set at an hour agreed upon beforehand.
The observer on $S'$ now concludes that his two clocks, the one at $A$ and the other at $B$, are simultaneously marking the same hour; for, in his opinion (since he supposes his system to be at rest), the light has taken exactly the same time to travel from $C$ to $A$ as to travel from $C$ to $B$.

Now let us suppose that an observer on the system $S$ has watched the work of regulating these clocks on $S'$. The distances $CA$ and $CB$ appear to him to be

$$\frac{1}{2} d \sqrt{1 - \beta^2}$$

instead of $\frac{1}{2} d$. Moreover, since the velocity of light is independent of the velocity of the source, it appears to him that the light ray proceeding from $C$ to $A$ has approached $A$ at the velocity $c + v$, where $c$ is the velocity of light, while the light ray going from $C$ to $B$ has approached $B$ at the velocity $c - v$. Thus to him it appears that the light has taken longer to go from $C$ to $B$ than from $C$ to $A$ by the amount

$$\frac{1}{2} \frac{d}{c - v} \sqrt{1 - \beta^2} - \frac{1}{2} \frac{d}{c + v} \sqrt{1 - \beta^2} = \frac{v d}{c^2} \sqrt{1 - \beta^2}.$$ 

But since $\beta = v / c$ the last expression is readily found to be equal to

$$\frac{v}{c^2} \cdot \frac{d}{\sqrt{1 - \beta^2}}.$$ 

Therefore, to an observer on $S$ the clocks on $S'$ appear to mark different times; and the difference is that given by the last expression above.

Thus we have the following conclusion:

**Theorem VII.** Let two systems of reference $S$ and $S'$ have a uniform relative velocity $v$. Let an observer on $S'$ place two clocks at a distance $d$ apart in the line of relative motion of $S$ and $S'$ and adjust them so that they appear to him to mark simultaneously the same time. Then to an observer on $S$ the clock on $S'$ which is forward in point of motion appears to be behind in point of time by the amount

$$\frac{v}{c^2} \cdot \frac{d}{\sqrt{1 - \beta^2}},$$

where $c$ is the velocity of light and $\beta = v / c$ (MVLR).
It should be emphasized that the clocks on $S'$ are in agreement in the only sense in which they can be in agreement for an observer on that system who supposes (as he naturally will) that his own system is at rest—notwithstanding the fact that to an observer on the other system there appears to be an irreconcilable disagreement depending for its amount directly on the distance apart of the two clocks.

According to the result of the last theorem the notion of simultaneity of events happening at different places is indefinite in meaning until some convention is adopted as to how simultaneity is to be determined. In other words, there is no such thing as the absolute simultaneity of events happening at different places.”

Albert Einstein, who sought a “new point of view” from plagiarizing Poincaré’s (1900/1904) method of clock synchronization with light signals, instead plagiarized Comstock’s (1910) and Carmichael’s (1912) work in Einstein’s book of 1916,

“THE RELATIVITY OF SIMULTANEITY

Up to now our considerations have been referred to a particular body of reference, which we have styled a ‘railway embankment.’ We suppose a very long train travelling along the rails with the constant velocity $v$ and in the direction indicated in Fig. 1. People travelling in this train will with advantage use the train as a rigid reference-body (co-ordinate system); they regard all events in reference to the train. Then every event which takes place along the line also takes place at a particular point of the train. Also the definition of simultaneity can be given relative to the train in exactly the same way as with respect to the embankment. As a natural consequence, however, the following question arises:

Are two events (e. g. the two strokes of lightning $A$ and $B$) which are simultaneous with reference to the railway embankment also simultaneous relatively to the train? We shall show directly that the answer must be in the negative.

When we say that the lightning strokes $A$ and $B$ are simultaneous with respect to the embankment, we mean: the rays of light emitted at the places $A$ and $B$, where the lightning occurs, meet each other at the mid-point $M$ of the length $A-M$ of the embankment. But the events $A$ and $B$ also correspond to positions $A$ and $B$ on the train. Let $M'$ be the mid-point of the distance $A-M$ on the travelling train. Just when the flashes [Footnote: As judged from the embankment.] of lightning occur, this point $M'$ naturally coincides with
the point $M$, but it moves towards the right in the diagram with the velocity $v$ of the train. If an observer sitting in the position $M'$ in the train did not possess this velocity, then he would remain permanently at $M$, and the light rays emitted by the flashes of lightning $A$ and $B$ would reach him simultaneously, i.e. they would meet just where he is situated. Now in reality (considered with reference to the railway embankment) he is hastening towards the beam of light coming from $B$, whilst he is riding on ahead of the beam of light coming from $A$. Hence the observer will see the beam of light emitted from $B$ earlier than he will see that emitted from $A$. Observers who take the railway train as their reference-body must therefore come to the conclusion that the lightning flash $B$ took place earlier than the lightning flash $A$. We thus arrive at the important result:

Events which are simultaneous with reference to the embankment are not simultaneous with respect to the train, and *vice versa* (relativity of simultaneity). Every reference-body (co-ordinate system) has its own particular time; unless we are told the reference-body to which the statement of time refers, there is no meaning in a statement of the time of an event.

Now before the advent of the theory of relativity it had always tacitly been assumed in physics that the statement of time had an absolute significance, i.e. that it is independent of the state of motion of the body of reference. But we have just seen that this assumption is incompatible with the most natural definition of simultaneity; if we discard this assumption, then the conflict between the law of the propagation of light *in vacuo* and the principle of relativity (developed in Section VII) disappears.

We were led to that conflict by the considerations of Section VI, which are now no longer tenable. In that section we concluded that the man in the carriage, who traverses the distance $w$ *per second* relative to the carriage, traverses the same distance also with respect to the embankment *in each second* of time. But, according to the foregoing considerations, the time required by a particular occurrence with respect to the carriage must not be considered equal to the duration of the same occurrence as judged from the embankment (as reference-body). Hence it cannot be contended that the man in walking travels the distance $w$ relative to the railway line in a time which is equal to one second as judged from the embankment.

Moreover, the considerations of Section VI are based on yet a second assumption, which, in the light of a strict consideration, appears to be arbitrary, although it was always tacitly made even before the introduction of the theory of relativity.

This chapter “by Einstein” has often been criticized as being “absolutist” and “Lorentzian” (as has his 1905 paper on relative simultaneity). One understands why it was written in the fashion that it was, when one reads the absolutist source material by Carmichael, which Einstein plagiarized to produce it.

Einstein’s book *Relativity: The Special and the General Theory* contains many other examples of his plagiarism, among them Appendix One, “Simple Derivation
of the Lorentz Transformation”, is suspiciously similar to Lorentz’ *Das Relativitätsprinzip: Drei Vorlesungen gehalten in Teylers Stiftung zu Haarlem*, which was first published in 1913, and which Einstein reviewed for *Die Naturwissenschaften* in 1914.\textsuperscript{2402}

Einstein also reiterated Lorentz’ work on the Fresnel coefficient of drag in Einstein’s “Theorem of the Addition of the Velocities. The Experiment of Fizeau”, Chapter 13. While Einstein credits Lorentz, he credits his older works and attempts to draw a distinction between his analysis and Lorentz’ synthesis, but Lorentz makes clear in his 1913 lecture that he is fulfilling the principle of relativity. Einstein also fails to cite Laub and Laue’s work in this area, with which he was intimately familiar.\textsuperscript{2403} This misled some to conclude that Einstein’s statements about the Fresnel coefficient of drag were original. In private correspondence in 1919, Einstein wrote to Pieter Zeeman, “The derivation of the latter from the kinematics of the special theory of relativity was first provided by Laue.”\textsuperscript{2404}

Chapter 20 of *Relativity: The Special and the General Theory*, “The Equality of Inertial and Gravitational Mass as an Argument for the General Postulate of Relativity”, as Arvid Reuterdahl noted, parrots “Kinertia”.\textsuperscript{2405} Einstein also fails to acknowledge Poincaré’s contributions of the principle of relativity of electrodynamics and of four-dimensional space-time. Einstein’s popular book effectively relegated Poincaré’s legacy with respect to the theory of relativity to a hushed scandal.

Another of Albert Einstein’s “Eureka!” stories was his “happiest thought in life”—the principle of equivalence. It was no more original to Einstein than the “Aarau question” or the concept of, and exposition on, relativity of simultaneity.

\subsection*{9.7 Conclusion}

In the mid-1880’s, Ludwig Lange argued for the principle of relativity based on the empirical dynamics of inertial motion, as opposed to the ontological kinematic definitions based on absolute space and absolute time of Galileo, Newton and Neumann\textsuperscript{,2406} which absolutist notions lingered in the Einsteins’ absolutist theory of 1905. In 1887, Woldemar Voigt gave the principle a new mathematical form based on a new concept of time—the mathematical form of the special theory of relativity. Joseph Larmor (1894-1900) and George Francis FitzGerald (1889) changed scale factors from Voigt’s transformation, producing the “Lorentz Transformation”, before Hendrik Antoon Lorentz. In 1898, Poincaré argued that simultaneity is relative, based on his light synchronization procedure, which presumes that light speed is invariant in Lange’s “inertial systems”.

In 1887, Woldemar Voigt\textsuperscript{2407} published the following relativistic transformation,
In 1901, Albert Einstein wrote to Mileva Marić on 28 December 1901,

“I now want to buckle down and study what Lorentz and Drude have written on the electrodynamics of moving bodies. Ehrat must get the literature for me.”

In 1899, Lorentz published a paper setting forth the “Lorentz Transformation” within a scale factor, “Simplified Theory of Electrical and Optical Phenomena in Moving Bodies”. In 1904, Lorentz published the transformation named in his honor. Einstein owned a copy of Drude’s Lehrbuch der Optik of 1900, which featured Lorentz’ theories.

Emil Cohn cited Lorentz’ 1904 paper in his 1904 paper on the electrodynamics of moving systems. Einstein had a copy of Cohn’s paper containing a citation to Lorentz’ 1904 paper with the “Lorentz Transformation” and Einstein cited it in 1907 in the direct context of Lorentz’ 1904 paper. Einstein was eager to read everything Lorentz published on the subject. In 1913, Lorentz’ 1904 article and the Einstein’s 1905 article were republished together in the book Das Relativitätsprinzip.

The Einsteins’ 1905 paper, which contained no references, so obviously plagiarized Lorentz’ prior work, that an un plausible note was added in the book to deny the obvious, which note claimed that Einstein did not know of Lorentz’ prior work. No notes were added to give Poincaré credit for the clock synchronization method by light signal that the Einsteins’ plagiarized, though Einstein had cited Poincaré’s 1900 paper containing this procedure in 1906, before the 1913 republication of the 1905 paper. Poincaré had died in 1912, and Lorentz and Einstein did not wait long to steal from him his legacy, publishing a book titled after his idea, without presenting any of his work in it—work with which both Lorentz and Einstein were intimately familiar.
10 “SPACE-TIME” OR IS IT “TIME-SPACE”?

The ancients expressed “space-time” theories thousands of years ago. Albert Einstein did not introduce the idea of space-time into the theory of relativity, rather it was Henri Poincaré who first propounded the special theory of relativity in its modern four-dimensional form. When Minkowski adopted Poincaré’s quadri-dimensional theory, Einstein opposed the idea, and did not adopt it until much later.

“As I’ve already said, it is not possible to conceive of more than three dimensions. However, a brilliant wit with whom I am acquainted considers duration a fourth dimension, and that the product of time multiplied by solidity would, in some sense, be a product of four dimensions.”—D’ALEMBERT

“This rigid four-dimensional space of the special theory of relativity is to some extent a four-dimensional analogue of H. A. Lorentz’s rigid three-dimensional æther.”—ALBERT EINSTEIN

10.1 Introduction

Popular myth has it that Albert Einstein originated the concept of “space-time”. However, not only did Einstein not originate the idea of “space-time”, he vigorously opposed it for quite some space of time. In fact, space-time theories have been quite common in folk-lore, philosophy, mathematics, religion, science, science fiction, psychology, and are even inherent in some languages.

Secondary literature expressly referring to such theories before Einstein adopted the view includes that of: D’Alembert, Klügel, Cranz and Wölffing.

10.2 The Ancients and “Space-Time”

The relational image of time to space and motion is an ancient conception. Consider Anaximander’s philosophy (ca. 611-546 B.C.), which speaks of the absolute world
of “space-time”, and hints at “Mach’s principle”,

“Anaximander, then, was the hearer of Thales. Anaximander was son of Praxiadas, and a native of Miletus. This man said that the originating principle of existing things is a certain constitution of the Infinite, out of which the heavens are generated, and the worlds therein; and that this principle is eternal and undecaying, and comprising all the worlds. And he speaks of time as something of limited generation, and subsistence, and destruction. This person declared the Infinite to be an originating principle and element of existing things, being the first to employ such a denomination of the originating principle. But, moreover, he asserted that there is an eternal motion, by the agency of which it happens that the heavens [Or, ‘men.’] are generated; but that the earth is poised aloft, upheld by nothing, continuing (so) on account of its equal distance from all (the heavenly bodies)."

As John Elof Boodin, Karl Popper and Dean Turner noted, “space-time”, as a concept, as a quadri-dimensional statue, harkens back to the ancients, to Parmenides and the Eleatics,

“For what is different from being does not exist, so that it necessarily follows, according to the argument of Parmenides, that all things that are are one and this is being.”

Paul Carus had already noted in 1912, that:

“Many who have watched the origin and rise of the new movement are startled at the paradoxical statements which some prominent physicists have made, and it is remarkable that the most materialistic sciences, mechanics and physics, seem to surround us with a mist of mysticism. The old self-contradictory statements of the Eleatic school revive in a modernized form, and common sense is baffled in its attempt to understand how the same thing may be longer and shorter at the same time, how a clock will strike the hour later or sooner according to the point of view from which it is watched; and the answer of this most recent conception of physics to the question, How is this all possible? is based on the principle of the relativity of time and space.”

Popper wrote,

“At the same time I realized that such myths may be developed, and become testable; that historically speaking all — or very nearly all — scientific theories originate from myths, and that a myth may contain important anticipations of scientific theories. Examples are Empedocles’ theory of evolution by trial and error, or Parmenides’ myth of the unchanging block universe in which nothing ever happens and which, if we add another
dimension, becomes Einstein’s block universe (in which, too, nothing ever happens, since everything is, four-dimensionally speaking, determined and laid down from the beginning)."^{2485}

When Minkowski, in 1908, uttered the infamous words,

“Henceforth space by itself, and time by itself, are doomed to fade away into mere shadows, and only a union of the two will preserve an independent reality,”^{2486}

his words were not only unoriginal, they were trite, and more archaic, than arcane. Anton Reiser (Rudolf Kayser) proclaimed,

“The universe becomes a four-dimensional continuum in the time-space sense of Minkowski. Physical occurrences are now represented by three spatial coördinates as well as by one time coördinate, or in other words, there is no Becoming, only Being.”^{2487}

One is left to wonder how “the universe Becomes a four-dimensional continuum”, if “there is no Becoming, only Being.”

Hermann Weyl stated,

“The great advance in our knowledge described in this chapter consists in recognising that the scene of action of reality is not a three-dimensional Euclidean space but rather a four-dimensional world, in which space and time are linked together indissolubly. However deep the chasm may be that separates the intuitive nature of space from that of time in our experience, nothing of this qualitative difference enters into the objective world which physics endeavours to crystallise out of direct experience. It is a four-dimensional continuum, which is neither ‘time’ nor ‘space’. Only the consciousness that passes on in one portion of this world experiences the detached piece which comes to meet it and passes behind it, as history, that is, as a process that is going forward in time and takes place in space.”^{2488}

and

“The objective world simply is, it does not happen. Only to the gaze of my consciousness, crawling upward along the lifeline of my body, does a section of the world come to life as a fleeting image in space which continuously changes in time.”^{2489}

Ebenezer Cunningham wrote,

“With Minkowski space and time become particular aspects of a single four-dimensional concept; the distinction between them as separate modes of
correlating and ordering phenomena is lost, and the motion of a point in time is represented as a stationary curve in four-dimensional space. The whole history of a physical system is laid out as a changeless whole.”

and,

“1. The main objections urged against the Principle of Relativity are [***] (iii) that time and space are such immediate objects of perception that the artificial view which it adopts of them cannot in any sense correspond to reality.

2. In respect of the last difficulty little can be said to meet the natural shrinking which the observer of natural phenomena feels from such a calculus as Minkowski’s, in which we seem to lose sight of the most obvious distinction between time and space as essentially different modes of ordering events.

It must be remarked, however, that an essential part in the practice of the calculus is the final process of interpreting the analytical result in terms of the ordinary modes of thought. There is perhaps an analogy to be drawn between the analysis which lays out the whole history of phenomena as a single whole, and the things in themselves, the natural phenomena apart from the human intelligence, for which consciousness of time and space does not exist, the laws of which, when expressed for instance by means of a principle of least action, consist in a relation between the whole aggregate of configurations which their history contains; in which, so far as they are mechanically determinate, the past and the future are interchangeable. Such a view of the universe is inseparable from a mechanical determinism in which the future is unalterably determined by the past and in which the past can be uniquely inferred from the present state of the universe. It is the view of an intelligence which could comprehend at one glance the whole of time and space.

But the limitations of the human mind resolve this changeless whole into its temporal and spatial aspects, and the past and future of the physical world is the past and future of the intelligence perceiving it. Only to a being outside the physical universe, free from participation in its phenomena, is time a meaningless term. The human consciousness and the physical universe are inseparably parts of a greater whole. They run parallel to one another, and the brain cannot do otherwise than order physical and external events relative to the internal sequences of its own consciousness.

It is by such a process of correlation that any analytical scheme of relations is constructed for the description of natural processes. When this has been carried out, it is claimed for it that it, at any rate approximately, contains within it the whole history of those processes for the mind to grasp as one whole. Thus the very act of formulating a set of equations which make the present state of the system to contain implicitly within it the whole history, past and to be, is one step, and that the largest, towards eliminating
the peculiar characteristic of time as a product of the inner consciousness from its place in physical relations. It is but a small step further to the timeless universe of Minkowski.

It is in fact the sole aim of theoretical physics to distinguish between and disentangle one from the other those factors in perceived events which are dependent upon human consciousness and those which are completely independent of it. The achievements of the past in this direction are quite sufficient to warrant further and continuous effort. That the mind should be able to conceive such a daring project and to progressively realize it, seems almost in itself sufficient to indicate that the resolution of its own workings into a chain of physically determinate processes is one incapable of complete realization.”

Milić Čapek opposed this mystical “myth of the frozen passage.”

It was a great injustice to attribute priority for this Eleatic stance to Minkowski. Charles Howard Hinton justified the classical principle of relativity in four-dimensions in 1880. It is irrational to assert that the principle of relativity compels invariant light speed, on the same grounds that it is irrational to assert that the principle of relativity requires that if I rest in inertial system $A$, I also rest in inertial system $B$, which is in motion relative to inertial system $A$.

In 1882, Gustav Teichmüller presented an Eleatic space-time theory—H. N. Gardiner explained in 1902,

“The most precise elucidation, and perhaps the most original development of the subjectivistic doctrine of time since Kant, may probably be ascribed to Teichmüller (Met., 192 ff.). Teichmüller conceives time as entirely a perspective order given to objects by a timeless, substantial ego, and duration as a mere immanent measuring of that order. According to this, if we abstract from the perspective nature of consciousness and the comparison, through memory and expectation, of part of its ideal content with other parts, all chronological arrangement and temporal duration disappear. The bare concept of time, he says, has in it nothing of magnitude, just as the concept ‘mammal’ has in it nothing of the specific nature of tiger, sheep, and elephant. Further, the determination of magnitude in the realm of time is purely relative. Hence the duration of the world has no absolute magnitude, nor has any given time-interval, a day or a second. The objective time-order is a perspective view, like every other. It is the product of scientific thinking, based on comparison of individual consciousnesses and aided by language. It is the order of history, and this order is true, but also, like every other content of scientific truth, timeless. A real order of actual activities corresponds to the perspective order, but this is to be ultimately conceived as a technical system. As all determination of duration is relative, we cannot say that the future is separated by any time-interval actually given from the present or the past. Indeed, taken absolutely, the whole series of the world’s phenomena must be regarded as being all together at once. But only an
absolute consciousness could so intuite it.

The standing objection to the doctrine thus or similarly expressed is that it denies the metaphysical reality of change. This objection is urged in various forms. It is said, for example, that if time is merely a form of intuition or a perspective ordering of phenomena, then the world is really a changeless unity, and consequently not only is all effort on our part to determine in any degree the course of things illusory, but past and future are contemporaneous—Nero is still burning Rome and the unborn babe now lives—which is absurd. Again, it is urged, positively, that change, and therefore time, which is the form of change, is real. For at least, it is argued, the succession of ideas is real, since it is only as ideas that phenomena can properly be said to exist at all. If, however, the succession of ideas is held to be phenomenal, the reply is that while this may be true if ‘ideas’ are taken as ‘objects,’ yet it is not true of the necessarily successive series of synthetic acts whereby their succession is presented. But not only, the argument continues, is change real in the subject, it is also real in external things; for the specific changes and the specific order of change appearing in objects, as they are certainly not due to a mere a priori form of the subject, imply a real succession in things themselves. Some writers appeal directly to the ‘trans-subjective’ nature of consciousness. Much of this criticism, however loses its force when it is pointed out that the form of change, as such, is not time at all. Aristotle already distinguished between motion and time as number of motion. Time is a certain arrangement and measure of motion, a further determination of the content. It would be quite possible, therefore, to hold to any amount of real change and yet to regard the temporal view of such change as subjective. But the conception of a subject indifferently related to series of changes which it arranges in temporal order cannot, of course, be ultimate.\textsuperscript{2493}

In the years 1884-1894, Rudolf Mewes worked on the laws of causality based on nature and matter in “space-time”. Palágyi added the German nomenclature, and more precise mathematical formalism; and he also iterated the principle of relativity as a quadri-dimensional Eleatic ideal of a motionless, spaceless and timeless world, in 1901, stating, \textit{inter alia},

“However, it would also be, in reality, a spaceless conception of the world, since all points of this four-dimensional space would be given to us at the same time and it would not take up any length of time to grasp this four-dimensional world in all its parts. The four-dimensional conception of space would accordingly actually signify the complete removal of the spatiotemporalness of the world.”

“Es wäre aber im Grunde genommen auch ein raumloses Auffassen der Welt, da alle Punkte dieses vierdimensionalen Raumes uns gleichzeitig gegeben wären und es keine Zeitdauer in Anspruch nehmen dürfte, diese
This belief system is truly archaic. Ueberweg, writing about the ancient Eleatics, penned these words before Einstein was born:

"§ 18. Xenophanes, of Colophon, in Asia Minor (born 569 B.C.), who removed later to Elea, in Lower Italy, combats in his poems the anthropomorphitic and anthropopathic representations of God presented by Homer and Hesiod, and enunciates the doctrine of the one, all-controlling God-head. God is all eye, all ear, all intellect; untroubled, he moves and directs all things by the power of his thought. [***] That the God of Xenophanes is the unity of the world is a supposition that was early current. We do not find this doctrine expressed in the fragments which have come down to us, and it remains questionable whether Xenophanes pronounced himself positively in this sense, in speaking of the relation of God to the world, or whether such a conception was not rather thought to be implied in his teachings by other thinkers, who then expressed it in the phraseology given above. In the (Platonic?) dialogue, Sophistes (p. 242), the leading interlocutor, a visitor from Elea, says: 'The Eleatic race among us, from Xenophanes and even from still earlier times, assume in their philosophical discourses that what is usually called All, is One [***]. The 'still earlier' philosophers are probably certain Orphists, who glorified Zeus as the all-ruling power, as beginning, middle, and end of all things. Aristotle says, Metaph., I. 5: 'Xenophanes, the first who professed the doctrine of unity—Parmenides is called his disciple—has not expressed himself clearly concerning the nature of the One, so that it is not plain whether he has in mind an ideal unity (like Parmenides, his successor) or a material one (like Melissus); he seems not to have been at all conscious of this distinction, but, with his regard fixed on the whole universe, he says only that God is the One.' [***]

§ 19. Parmenides of Elea, born about 515—510 B.C. (so that his youth falls in the time of the old age of Xenophanes), is the most important of the Eleatic philosophers. He founds the doctrine of unity on the conception of being. He teaches: Only being is, non-being is not; there is no becoming. That which truly is exists in the form of a single and eternal sphere, whose space it fills continuously. Plurality and change are an empty semblance. The existent alone is thinkable, and only the thinkable is real. Of the one true existence, convincing knowledge is attainable by thought; but the deceptions of the senses seduce men into mere opinion and into the deceitful, rhetorical display of discourse respecting the things, which are supposed to be manifold and changing.—In his (hypothetical) explanation of the world of appearance, Parmenides sets out from two opposed principles, which bear to each other, within the sphere of appearance, a relation similar to that which exists
between being and non-being. These principles are light and night, with which the antithesis of fire and earth corresponds. [***] Truth consists in the knowledge that being is, and non-being can not be; deception lies in the belief that non-being also is and must be. [***] The predicate being belongs to thought itself; that I think something and that this, which I think, is (in my thought), are identical assertions; non-being—that which is not—can not be thought, can, so to speak, not be reached, since every thing, when it is thought, exists as thought; no thought can be non-existent or without being, for there is nothing to which the predicate being does not belong, or which exists outside of the sphere of being.—In this argumentation Parmenides mistakes the distinction between the subjective being of thought and an objective realm of being to which thought is directed, by directing his attention only to the fact that both are subjects of the predicate being. [***] Not the senses, which picture to us plurality and change, conduct to truth, but only thought, which recognizes the being of that which is, as necessary, and the existence of that which is not, as impossible. [***] Much severer still than his condemnation of the naïve confidence of the mass of men in the illusory reports of the senses, is that with which Parmenides visits a philosophical doctrine which, as he assumes, makes of this very illusion (not, indeed, as illusion, in which sense Parmenides himself proposes a theory of the sensible, but as supposed truth) the basis of a theory that falsifies thought, in that it declares non-being identical with being. It is very probable that the Heraclitean doctrine is the one on which Parmenides thus animadverts, however indignantly Heraclitus might have resented this association of his doctrine with the prejudice of the masses, who do not rise above the false appearances of the senses; [***] Parmenides (in a passage of some length, given by Simpl., Ad Phys., fol. 31 a b) ascribes to the truly existent all the predicates which are implied in the abstract conception of being, and then proceeds further to characterize it as a continuous sphere, extending uniformly from the center in all directions—a description which we are scarcely authorized in interpreting as merely symbolical, in the conscious intention of Parmenides. That which truly is, is without origin and indestructible, a unique whole, only-begotten, immovable, and eternal; it was not and will not be, but is, and forms a continuum. [***] For what origin should it have? How could it grow? It can neither have arisen from the non-existent, since this has no existence, nor from the existent, since it is itself the existent. There is, therefore, no becoming, and no decay [***]. The truly existent is indivisible, everywhere like itself, and ever identical with itself. It exists independently, in and for itself [***], thinking, and comprehending in itself all thought; it exists in the form of a well-rounded sphere [***]. The Parmenidean doctrine of the apparent world is a cosmogony, suggesting, on the one hand, Anaximander’s doctrine of the warm and the cold as the first-developed contraries and the Heraclitean doctrine of the transformations of fire, and, on the other, the Pythagorean opposition of ‘limit’ and ‘the unlimited’ [***], and the Pythagorean doctrine of contraries generally. It is
founded on the hypothesis of a universal mixture of warm and cold, light and dark. The warm and light is ethereal fire, which, as the positive and efficient principle, represents within the sphere of appearance the place of being; the cold and dark is air and its product, by condensation [***], earth. The combining or 'mixing' of the contraries is effected by the all-controlling Deity [***] at whose will Eros came into existence as first, in time, of the gods [***]. That which fills space and that which thinks, are the same; how a man shall think, depends on the 'mixture' of his bodily organs; a dead body perceives cold and silence [***]. If the verse in the long fragment,[***], could be amended (as is done by Gladisch, who seeks in it an analogue to the Maja of the Hindus) so as to read: [***], Parmenides would appear as having explained the plurality and change attested by the senses, as a dream of the one true existence. But this conjecture is arbitrary; and the words cited in the Soph., p. 242: [***], as also the doctrine of the Megarians concerning the many names of the One, which alone really exists, confirm the reading [***] of the MSS. The sense of the passage is therefore: ‘All the manifold and changing world, which mortals suppose to be real, and which they call the sum of things, is in reality only the One, which alone truly is.’ In the philosophy of Parmenides no distinction is reached between appearance, or semblance, and phenomenon. The terms being and appearance remain with him philosophically unreconciled; the existence of a realm of mere appearance is incompatible with the fundamental principle of Parmenides.

§ 20. Zeno of Elea (born about 490—485 B. C.) defended the doctrine of Parmenides by an indirect demonstration, in which he sought to show that the supposition of the real existence of things manifold and changing, leads to contradictions. In particular, he opposed to the reality of motion four arguments: 1. Motion can not begin, because a body in motion can not arrive at another place until it has passed through an unlimited number of intermediate places. 2. Achilles can not overtake the tortoise, because as often as he reaches the place occupied by the tortoise at a previous moment, the latter has already left it. 3. The flying arrow is at rest; for it is at every moment only in one place. 4. The half of a division of time is equal to the whole; for the same point, moving with the same velocity, traverses an equal distance (i.e., when compared, in the one case, with a point at rest, in the other, with a point in motion) in the one case, in half of a given time, in the other, in the whole of that time. [***] In the (Platonic?) dialogue Parmenides, a prose writing [***] of Zeno is mentioned, which was distributed into several series of argumentations [***], in each of which a number of hypotheses [***] were laid down with a view to their reductio in absurdum, and so to the indirect demonstration of the truth of the doctrine that Being is One. It is probably on account of this (indirect) method of demonstration from hypotheses, that Aristotle [***] called Zeno the inventor of dialectic [***]. If the manifold exists, argues Zeno [***], it must be at the same time infinitely small and infinitely great; the former, because its last divisions are without magnitude, the latter, on account of the infinite number
of these divisions. (In this argument Zeno leaves out of consideration the inverse ratio constantly maintained between magnitude and number of parts, as the division advances, whereby the same product is constantly maintained, and he isolates the notions of smallness and number, opposing the one to the other.) In a similar manner Zeno shows that the manifold, if it exists must be at the same time numerically limited and unlimited. Zeno argues, further, against the reality of space. If all that exists were in a given space, this space must be in another space, and so on in infinitum. Against the veracity of sensuous perception, Zeno directed the following argument: If a measure of millet-grains in falling produce a sound, each single grain and each smallest fraction of a grain must also produce a sound; but if the latter is not the case, then the whole measure of grains, whose effect is but the sum of the effects of its parts, can also produce no sound. (The method of argumentation here employed is similar to that in the first argument against plurality.) The arguments of Zeno against the reality of motion have had no insignificant influence on the development of metaphysics in earlier and later times. Aristotle answers the two first with the observation that the divisions of time and space are the same and equal for both time and space are continuous; that a distance divisible in infinitum can therefore certainly be traversed in a finite time, since the latter is also in like manner divisible in infinitum, and the divisions of time correspond with the divisions of space; the infinite in division is to be distinguished from the infinite in extent; his reply to the third argument is, that time does not consist of single indivisible points (conceived as discontinuous) or of ‘nows’. In the fourth argument he points out what Zeno, as it seems, had but poorly concealed, viz., the change of the standard of comparison. It can be questioned whether the Aristotelian answers are fully satisfactory for the first three arguments (for in the fourth the paralogism is obvious). Bayle has attacked. Hegel defends Aristotle against Bayle. Yet Hegel himself also sees in motion a contradiction; nevertheless, he regards motion as a real fact. Herbart denies the reality of motion on account of the contradiction which, in his opinion, it involves.

§ 21. Melissus of Samos attempts by a direct demonstration to establish the truth of the fundamental thought of the Eleatic philosophy, that only the One is. By unity, however, he understands rather the continuity of substance than the notional identity of being. That which is, the truly existent, is eternal, infinite, one, in all points the same or ‘like itself,’ unmoved and passionless. If nothing were, argues Melissus, how were it then even possible to speak of it, as of something being? But if any thing is, then it has either become or is eternal. In the former case, it must have arisen either from being or from non-being. But nothing can come from non-being; and being can not have arisen from being, for then there must have been being, before being came to be (became). Hence being did not become; hence it is eternal. It will also not perish; for being can not become non-being, and if
being change to being, it has not perished. Therefore it always was and always will be. As without genesis, and indestructible, being has no beginning and no end; it is, therefore, infinite. (It is easy to perceive here the leap in argumentation from temporal infinity to the infinity of space, which very likely contributed essentially to draw on Melissus Aristotle’s reproach of feebleness of thought.) As infinite, being is One; for if it were dual or plural, its members would mutually limit each other, and so would not be infinite. As one, being is unchangeable; for change would pluralize it. More particularly, it is unmoved; for there exists no empty space in which it can move, since such a space, if it existed, would be an existing nothing; and being can not move within itself for then the One would become a divisum, hence manifold. Notwithstanding the infinite extension which Melissus attributes to being, he will not have it called material, since whatever is material has parts, and so can not be a unity.

Ocellus Lucanus also had a space-time theory thousands of years before Einstein:

“OCELLUS LUCANUS
ON THE UNIVERSE.

CHAP. I.

Ocellus Lucanus has written what follows concerning the Nature of the Universe; having learnt some things through clear arguments from Nature herself, but others from opinion, in conjunction with reason [Footnote: See Additional Notes, (A.)], it being his intention [in this work] to derive what is probable from intellectual perception.

It appears, therefore, to me, that the Universe is indestructible and unbegotten, since it always was, and always will be; for if it had a temporal beginning, it would not have always existed: thus, therefore, the universe is unbegotten and indestructible; for if some one should opine that it was once generated, he would not be able to find anything into which it can be corrupted and dissolved, since that from which it was generated would be the first part of the universe; and again, that into which it would be dissolved would be the last part of it.

But if the universe was generated, it was generated together with all things; and if it should be corrupted, it would be corrupted together with all things. This, however, is impossible [Footnote: The universe could not be generated together with all things, for the principle of it must be unbegotten; since everything that is generated, is generated from a cause; and if this cause was also generated, there must be a progression of causes ad infinitum, unless the unbegotten is admitted to be the principle of the universe. Neither, therefore, can the universe be corrupted together with all things; for the
principle of it being unbegotten is also incorruptible; that only being corruptible, which was once generated.]. The universe, therefore, is without a beginning, and without an end; nor is it possible that it can have any other mode of subsistence.

To which may be added, that everything which has received a beginning of generation, and which ought also to participate of dissolution, receives two mutations; one of which, indeed, proceeds from the less to the greater, and from the worse to the better; and that from which it begins to change is denominated generation, but that at which it at length arrives, is called acme. The other mutation, however, proceeds from the greater to the less, and from the better to the worse: but the termination of this mutation is denominated corruption and dissolution.

If, therefore, the whole and the universe were generated, and are corruptible, they must, when generated, have been changed from the less to the greater, and from the worse to the better; but when corrupted, they must be changed from the greater to the less, and from the better to the worse. Hence, if the world was generated, it would receive increase, and would arrive at its acme; and again, it would afterwards receive decrease and an end. For every nature which has a progression, possesses three boundaries and two intervals. The three boundaries, therefore, are generation, acme, and end; but the intervals are, the progression from generation to acme, and from acme to the end.

The whole, however, and the universe, affords, as from itself, no indication of a thing of this kind; for neither do we perceive it rising into existence, or becoming to be, nor changing to the better and the greater, nor becoming at a certain time worse or less; but it always continues to subsist in the same and a similar manner, and is itself perpetually equal and similar to itself.

Of the truth of this, the orders of things, their symmetry, figurations, positions, intervals, powers, swiftness and slowness with respect to each other; and, besides these, their numbers and temporal periods, are clear signs and indications. For all such things as these receive mutation and diminution, conformably to the course of a generated nature: for things that are greater and better acquire acme through power, but those that are less and worse are corrupted through imbecility of nature.

I denominate, however, the whole and the universe, the whole world; for, in consequence of being adorned with all things, it has obtained this appellation; since it is from itself a consummate and perfect system of the nature of all things; for there is nothing external to the universe, since whatever exists is contained in the universe, and the universe subsists together with this, comprehending in itself all things, some as parts, but others as supervenient.

Those things, therefore, which are comprehended in the world, have a congruity with the world; but the world has no concinnity with anything else, but is itself co-harmonized with itself. For all other things have not a
consume or self-perfect subsistence, but require congruity with things external to themselves. Thus animals require a conjunction with air for the purpose of respiration, but sight with light, in order to see; and the other senses with something else, in order to perceive their peculiar sensible object. A conjunction with the earth also is necessary to the germination of plants. The sun and moon, the planets, and the fixed stars, have likewise a coalescence with the world, as being parts of its common arrangement. The world, however, has not a conjunction with anything else than itself.

Further still [Footnote: Critolaus, the Peripatetic, employs nearly the same arguments as those contained in this paragraph, in proof of the perpetuity of the world, as is evident from the following passage, preserved by Philo, in his Treatise Περὶ Ἀφθορίας Κόσμου, “On the Incorruptibility of the World”: τὸ αἰτίων αὐτῷ τὸν υπάρχειν, αὖσον εστι̇ ἄλλα καὶ τὸ αἰτίων αὐτῷ τῷ αὐξώμενῳ, αὐξώμενον εστι̇ν. εἰ δὲ τούτῳ, καὶ τὸ αἰτίων αὐτῷ τῷ υπάρχειν, αἰδὸν εστι̇ν. αἰτίος δὲ ο ἡκοσμίως αὐτῷ τῷ υπάρχειν, εἰγε καὶ τοῖς ἀλλοῖς αὐπασι̇ν. αἰδός ο ἡκοσμίως εστι̇ν. ἢ. ἢ. “That which is the cause to itself of good health, is without disease. But, also, that which is the cause to itself of a vigilant energy, is sleepless. But if this be the case, that also which is the cause to itself of existence, is perpetual. The world, however, is the cause to itself of existence, since it is the cause of existence to all other things. The world, therefore, is perpetual.” Everything divine, according to the philosophy of Pythagoras and Plato, being a self-perfect essence, begins its own energy from itself, and is therefore primarily the cause to itself of that which it imparts to others. Hence, since the world, being a divine and self-subsistent essence, imparts to itself existence, it must be without non-existence, and therefore must be perpetual.], what has been said will be easily known to be true from the following considerations. Fire, which imparts heat to another thing, is itself from itself hot; and honey, which is sweet to the taste, is itself from itself sweet. The principles likewise of demonstrations, which are indicative of things unapparent, are themselves from themselves manifest and known. Thus, also, that which becomes to other things the cause of self-perfection, is itself from itself perfect; and that which becomes to other things the cause of preservation and permanency, is itself from itself preserved and permanent. That, likewise, which becomes to other things the cause of concinnity, is itself from itself co-harmonized; but the world is to other things the cause of their existence, preservation, and self-perfection. The world, therefore, is from itself perpetual and self-perfect, has an everlasting duration, and on this very account becomes the cause of the permanency of the whole of things.

In short, if the universe should be dissolved, it would either be dissolved into that which has an existence, or into nonentity. But it is impossible that it should be dissolved into that which exists, for there will not be a corruption of the universe if it should be dissolved into that which has a being; for being is either the universe, or a certain part of the universe. Nor can it be dissolved into nonentity, since it is impossible for being either to be produced from
non-beings, or to be dissolved into nonentity. The universe, therefore, is incorruptible, and can never be destroyed.

If, nevertheless, some one should think that it may be corrupted, it must either be corrupted from something external to, or contained in the universe, but it cannot be corrupted by anything external to it; for there is not anything external to the universe, since all other things are comprehended in the universe, and the world is the whole and the all. Nor can it be corrupted by the things which it contains, for in this case it will be requisite that these should be greater and more powerful than the universe. This, however, is not true [Footnote: i. e. It is not true that the universe can contain anything greater and more powerful than itself.], for all things are led and governed by the universe, and conformably to this are preserved and co-adapted, and possess life and soul. But if the universe can neither be corrupted by anything external to it, nor by anything contained within it, the world must therefore be incorruptible and indestructible; for we consider the world to be the same with the universe [Footnote: Philo Judæus, in his before-mentioned Treatise Περὶ Αρχαιοτάτου Κόσμου, has adopted the arguments of Ocellus in this paragraph, but not with the conciseness of his original.].

Further still, the whole of nature surveyed through the whole of itself, will be found to derive continuity from the first and most honourable of bodies, attenuating this continuity proportionally, introducing it to everything mortal, and receiving the progression of its peculiar subsistence; for the first and most honourable bodies in the universe, revolve according to the same, and after a similar manner. The progression, however, of the whole of nature, is not successive and continued, nor yet local, but subsists according to mutation.

Fire, indeed, when it is congregated into one thing, generates air, but air generates water, and water earth. From earth, also, there is the same circuit of mutation, as far as to fire, from whence it began to be changed. But fruits, and most plants that derive their origin from a root, receive the beginning of their generation from seeds. When, however, they bear fruit and arrive at maturity, again they are resolved into seed, nature producing a complete circulation from the same to the same.

But men and other animals, in a subordinate degree, change the universal boundary of nature; for in these there is no periodical return to the first age, nor is there an antiperistasis of mutation into each other, as there is in fire and air, water and earth; but the mutations of their ages being accomplished in a four-fold circle [Footnote: This four-fold mutation of ages in the human race, consists of the infant, the lad, the man, and the old man, as is well observed by Theo of Smyrna. See my Theoretic Arithmetic, p. 189.], they are dissolved, and again return to existence; these, therefore, are the signs and indications that the universe, which comprehends [all things], will always endure and be preserved, but that its parts, and such things in it as are supervenient, are corrupted and dissolved.

Further still, it is credible that the universe is without a beginning, and
without an end, from its figure, from motion, from time, and its essence; and, therefore, it may be concluded that the world is unbegotten and incorruptible: for the form of its figure is circular; but a circle is on all sides similar and equal, and is therefore without a beginning, and without an end. The motion also of the universe is circular, but this motion is stable and without transition. Time, likewise, in which motion exists is infinite, for this neither had a beginning, nor will have an end of its circulation. The essence, too, of the universe, is without egression into any other place, and is immutable, because it is not naturally adapted to be changed, either from the worse to the better, or from the better to the worse. From all these arguments, therefore, it is obviously credible, that the world is unbegotten and incorruptible. And thus much concerning the whole and the universe.

---

CHAP. II.

Since, however, in the universe, one thing is generation, but another the cause of generation; and generation indeed takes place where there is a mutation and an egression from things which rank as subjects; but the cause of generation then subsists where the subject matter remains the same: this being the case, it is evident that the cause of generation possesses both an effective and motive power, but that the recipient of generation is adapted to passivity, and to be moved.

But the Fates themselves distinguish and separate the impassive part of the world from that which is perpetually moved [or mutable] [Footnote: In the original, τὸ τοῦ κόσμου καὶ τὸ αἰτία, which is obviously erroneous. Nogarola, in his note on this passage, says, "Melius arbitror si legatur ἀπαθεῖς, καὶ αἰτιῶν, ut sit sensus, semper patibilem, et semper mobilem partem distinguunt ac separat." But though he is right in reading ἀπαθεῖς for ἀπαθεῖς, he is wrong in substituting ἀπαθεῖς for ἀπαθεῖς, for Ocellus is here speaking of the distinction between the celestial and sublunary region, the former of which is impasse, because not subject to generation and corruption, but the latter being subject to both these is perpetually mutable.]. For the course of the moon is the isthmus of immortality and generation. The region, indeed, above the moon, and also that which the moon occupies, contain the genus of the gods; but the place beneath the moon is the abode of strife and nature; for in this place there is a mutation of things that are generated, and a regeneration of things which have perished.

In that part of the world, however, in which nature and generation predominate, it is necessary that the three following things [Footnote: Aristotle, in his treatise on Generation and Corruption, has borrowed what Ocellus here says about the three things necessary to generation. See my translation of that work.] should be present. In the first place, the body which yields to the touch, and which is the subject of all generated natures. But this
will be an universal recipient, and a signature of generation itself having the same relation to the things that are generated from it, as water to taste, silence to sound [Footnote: In the original, καὶ ψόφος πρὸς σιγῆν, instead of which it is necessary to read καὶ σιγῆ πρὸς ψόφον, conformably to the above translation. See the Notes to my translation of the First Book of Aristotle’s Physics, p. 73, &c., in which the reader will find a treasury of information from Simplicius concerning matter. But as matter is devoid of all quality, and is a privation of all form, the necessity of the above emendation is immediately obvious.], darkness to light, and the matter of artificial forms to the forms themselves. For water is tasteless and devoid of quality, yet is capable of receiving the sweet and the bitter, the sharp and the salt. Air, also, which is formless with respect to sound, is the recipient of words and melody. And darkness, which is without colour, and without form, becomes the recipient of splendour, and of the yellow colour and the white; but whiteness pertains to the statuary’s art, and to the art which fashions figures from wax. Matter, however, has a relation in a different manner to the statuary’s art; for in matter all things prior to generation are in capacity, but they exist in perfection when they are generated and receive their proper nature. Hence matter [or a universal recipient] is necessary to the existence of generation.

The second thing which is necessary, is the existence of contrarieties, in order that mutations and changes in quality may be effected, matter for this purpose receiving passive qualities, and an aptitude to the participation of forms. Contrariety is also necessary, in order that powers, which are naturally mutually repugnant, may not finally vanquish, or be vanquished by, each other. But these powers are the hot and the cold, the dry and the moist.

Essences rank in the third place; and these are fire and water, air and earth, of which the hot and the cold, the dry and the moist, are powers. But essences differ from powers; for essences are locally corrupted by each other, but powers are neither corrupted nor generated, for the reasons [or forms] of them are incorporeal.

Of these four powers, however, the hot and the cold subsist as causes and things of an effective nature, but the dry and the moist rank as matter and things that are passive [Footnote: Thus also Aristotle, in his Treatise on Generation and Corruption, θερμὸν δὲ καὶ ψύχον, καὶ ψύχον, τὰ μὲν τῷ πυρηνικῷ εἶναι, τὰ δὲ τῷ παθητικῷ λέγεται. i. e. “With respect to heat and cold, dryness and moisture, the two former of these are said to be effective, but the two latter passive powers.”]; but matter is the first recipient of all things, for it is that which is in common spread under all things. Hence, the body, which is the object of sense in capacity, and ranks as a principle, is the first thing; but contrarieties, such as heat and cold, moisture and dryness, form the second thing; and fire and water, earth and air, have an arrangement in the third place. For these change into each other; but things of a contrary nature are without change.

But the differences of bodies are two: for some of them indeed are
primary, but others originate from these: for the hot and the cold, the moist and the dry, rank as primary differences; but the heavy and the light, the dense and the rare, have the relation of things which are produced from the primary differences. All of them, however, are in number sixteen, viz, the hot and the cold, the moist and the dry, the heavy and the light, the rare and the dense, the smooth and the rough, the hard and the soft, the thin and the thick, the acute and the obtuse. But of all these, the touch has a knowledge, and forms a judgement; hence, also, the first body in which these differences exist in capacity, may be sensibly apprehended by the touch.

The hot and the dry, therefore, the rare and the sharp, are the powers of fire; but those of water are, the cold and the moist, the dense and the obtuse; those of air are, the soft, the smooth, the light, and the attenuated; and those of earth are, the hard and the rough, the heavy and the thick.

Of these four bodies, however, fire and earth are the transcendencies and summits [or extremities] of contraries. Fire, therefore, is the transcendency of heat, in the same manner as ice is of cold: hence, if ice is a concretion of moisture and frigidity, fire will be the fervour of dryness and heat. On which account, nothing is generated from ice, nor from fire [Footnote: The substance of nearly the whole of what Ocellus here says, and also of the two following paragraphs, is given by Aristotle, in his Treatise on Generation and Corruption.].

Fire and earth, therefore, are the extremities of the elements, but water and air are the media, for they have a mixed corporeal nature. Nor is it possible that there could be only one of the extremes, but it is necessary that there should be a contrary to it. Nor could there be two only, for it is necessary that there should be a medium, since media are opposite to the extremes.

Fire, therefore, is hot and dry, but air is hot and moist; water is moist and cold, but earth is cold and dry. Hence, heat is common to air and fire; cold is common to water and earth; dryness to earth and fire; and moisture to water and air. But with respect to the peculiarities of each, heat is the peculiarity of fire, dryness of earth, moisture of air, and frigidity of water. The essences, therefore, of these remain permanent, through the possession of common properties; but they change through such as are peculiar, when one contrary vanquishes another.

Hence, when the moisture in air vanquishes the dryness in fire, but the frigidity in water, the heat in air, and the dryness in earth, the moisture in water, and vice versa, when the moisture in water vanquishes the dryness in earth, the heat in air, the coldness in water, and the dryness in fire, the moisture in air, then the mutations and generations of the elements from each other into each other are effected.

The body, however, which is the subject and recipient of mutations, is a universal receptacle, and is in capacity the first tangible substance.

But the mutations of the elements are effected, either from a change of earth into fire, or from fire into air, or from air into water, or from water into
earth. Mutation is also effected in the third place, when that which is contrary in each element is corrupted, but that which is of a kindred nature, and connascent, is preserved. Generation, therefore, is effected, when one contrariety is corrupted. For fire, indeed, is hot and dry, but air is hot and moist, and heat is common to both; but the peculiarity of fire is dryness, and of air moisture. Hence, when the moisture in air vanquishes the dryness in fire, then fire is changed into air.

Again, since water is moist and cold, but air is moist and hot, moisture is common to both. The peculiarity however of water is coldness, but of air heat. When, therefore, the coldness in water vanquishes the heat in air, the mutation from air into water is effected.

Further still, earth is cold and dry, but water is cold and moist, and coldness is common to both; but the peculiarity of earth is dryness, and of water moisture. When, therefore, the dryness in earth vanquishes the moisture in water, a mutation takes place from water into earth.

The mutation, however, from earth, in an ascending progression, is performed in a contrary way; but an alternate mutation is effected when one whole vanquishes another, and two contrary powers are corrupted, nothing at the same time being common to them. For since fire is hot and dry, but water is cold and moist; when the moisture in water vanquishes the dryness in fire, and the coldness in water the heat in fire, then a mutation is effected from fire into water.

Again, earth is cold and dry, but air is hot and moist. When, therefore, the coldness in earth vanquishes the heat in air, and the dryness in earth, the moisture in air, then a mutation from air into earth is effected.

But when the moisture of air corrupts the heat of fire, from both of them fire will be generated; for the heat of air and the dryness of fire will still remain. And fire is hot and dry.

When, however, the coldness of earth is corrupted, and the moisture of water, from both of them earth will be generated. For the dryness of earth, indeed, will be left, and the coldness of water. And earth is cold and dry.

But when the heat of air, and the heat of fire are corrupted, no element will be generated; for the contraries in both these will remain, viz, the moisture of air and the dryness of fire. Moisture, however, is contrary to dryness.

And again, when the coldness of earth, and in a similar manner of water, are corrupted, neither thus will there be any generation; for the dryness of earth and the moisture of water will remain. But dryness is contrary to moisture. And thus, we have briefly discussed the generation of the first bodies, and have shown how and from what subjects it is effected.

Since, however, the world is indestructible and unbegotten, and neither received a beginning of generation, nor will ever have an end, it is necessary that the nature which produces generation in another thing, and also that which generates in itself, should be present with each other. And that, indeed, which produces generation in another thing, is the whole of the region above
the moon; but the more proximate cause is the sun, who, by his accessions and recessions, continually changes the air, so as to cause it to be at one time cold, and at another hot; the consequence of which is, that the earth is changed, and everything which the earth contains.

The obliquity of the zodiac, also, is well posited with respect to the motion of the sun, for it likewise is the cause of generation. And universally this is accomplished by the proper order of the universe; so that one thing in it is that which makes, but another that which is passive. Hence, that which generates in another thing, exists above the moon; but that which generates in itself, has a subsistence beneath the moon; and that which consists of both these, viz, of an ever-running divine body, and of an ever-mutable generated nature, is the world.

CHAP. III.

The origin, however, of the generation of man was not derived from the earth, nor that of other animals, nor of plants; but the proper order of the world being perpetual, it is also necessary that the natures which exist in it, and are aptly arranged, should, together with it, have a never-failing subsistence. For the world primarily always existing, it is necessary that its parts should be co-existent with it: but I mean by its parts, the heavens, the earth, and that which subsists between these; which is placed on high, and is denominated aerial; for the world does not exist without, but together with, and from these.

The parts of the world, however, being consubsistent, it is also necessary that the natures, comprehended in these parts, should be co-existent with them; with the heavens, indeed, the sun and moon, the fixed stars, and the planets; but with the earth, animals and plants, gold and silver; with the place on high, and the aerial region, pneumatic substances and wind, a mutation to that which is more hot, and a mutation to that which is more cold; for it is the property of the heavens to subsist in conjunction with the natures which it comprehends; of the earth to support the plants and animals which originate from it; and of the place on high, and the aerial region, to be consubsistent with all the natures that are generated in it.

Since, therefore, in each division of the world, a certain genus of animals is arranged, which surpasses the rest contained in that division; in the heavens, indeed, the genus of the gods, but in the earth men, and in the region on high demons;— this being the case, it is necessary that the race of men should be perpetual, since reason truly induces us to believe, that not only the [great] parts of the world are consubsistent with the world, but also the natures comprehended in these parts.

Violent corruptions, however, and mutations, take place in the parts of the earth; at one time, indeed, the sea overflowing into another part of the earth; but at another, the earth itself becoming dilated and divulsed, through wind or water latently entering into it. But an entire corruption of the
arrangement of the whole earth never did happen, nor ever will.

Hence the assertion, that the Grecian history derived its beginning from the Argive Inachus, must not be admitted as if it commenced from a certain first principle, but that it originated from some mutation which happened in Greece; for Greece has frequently been, and will again be, barbarous, not only from the migration of foreigners into it, but from nature herself, which, though she does not become greater or less, yet is always younger, and with reference to us, receives a beginning.

And thus much has been sufficiently said by me respecting the whole and the universe; and further still, concerning the generation and corruption of the natures which are generated in it, and the manner in which they subsist, and will for ever subsist; one part of the universe consisting of a nature which is perpetually moved, but another part of a nature which is always passive; and the former of these always governing, but the latter being always governed.

CHAP. IV.

Concerning the generation of men, however, from each other, after what manner, and from what particulars, it may be most properly effected, law, and temperance and piety at the same time cooperating, will be, I think, as follows. In the first place, indeed, this must be admitted,—that we should not be connected with women for the sake of pleasure, but for the sake of begetting children.

For those powers and instruments, and appetites, which are subservient to copulation, were imparted to men by Divinity, not for the sake of voluptuousness, but for the sake of the perpetual duration of the human race. For since it was impossible that man, who is born mortal, should participate of a divine life, if the immortality of his genus was corrupted; Divinity gave completion to this immortality through individuals, and made this generation of mankind to be unceasing and continued. This, therefore, is one of the first things which it is necessary to survey,—that copulation should not be undertaken for the sake of voluptuous delight.

In the next place, the co-ordination itself of man should be considered with reference to the whole, viz, that he is a part of a house and a city, and (which is the greatest thing of all) that each of the progeny of the human species ought to give completion to the world. [Footnote In the original, επειτα δὲ καὶ τὴν αυτὴν τῷ ανθρώπῳ συνταξίν πρὸς τὸ ὅλον, ὅτι μέρος ύπάρχων οὐκού τε καὶ πολέως, καὶ τὸ μεγίστον κόσμου, συμπλήρωσιν οφείλει το ἀπογενομένον τὸν ἑκαστὸν, κ. τ. λ. Here, for καὶ τὸ μεγίστον κόσμου, συμπλήρωσιν, κ. τ. λ., it is requisite to read, conformably to the above translation, καὶ τὸ μεγίστον, κόσμου συμπλήρωσιν, κ. τ. λ. Nogarola, in his version, from not perceiving the necessity of this emendation, has made Ocellus say that man is the greatest part of the universe; for his translation is as follows: “Mox eandem hominis constitutionem ad universam
referendam, quippe qui non solum domûs et civitatis, verum etiam mundi maxima habetur pars,” &c.], if it does not intend to be a deserter either of the domestic, or political, or divine Vestal hearth.

For those who are not entirely connected with each other for the sake of begetting children, injure the most honourable system of convention. But if persons of this description procreate with libidinous insolence and intemperance, their offspring will be miserable and flagitious, and will be execrated by gods and demons, and by men, and families, and cities.

Those, therefore, who deliberately consider these things, ought not, in a way similar to irrational animals, to engage in venereal connections, but should think copulation to be a necessary good. For it is the opinion of worthy men, that it is necessary and beautiful, not only to fill houses with large families, and also the greater part of the earth [Footnote: This observation applies only to well regulated cities, but in London and other large cities, where the population is not restricted to a definite number, this abundant propagation of the species is, to the greater part of the community, attended with extreme misery and want. Plato and Aristotle, who rank among the wisest men that ever lived, were decidedly of opinion, that the population of a city should be limited. Hence, the former of these philosophers says, “that in a city where the inhabitants do not know each other, there is no light, but profound darkness;” and the latter, “that as 10,000 inhabitants are too few for a city, so 100,000 are too many.”], (for man is the most mild and the best of all animals,) but, as a thing of the greatest consequence, to cause them to abound with the most excellent men.

For on this account men inhabit cities governed by the best laws, rightly manage their domestic affairs, and [if they are able] impart to their friends such political employments as are conformable to the polities in which they live, since they not only provide for the multitude at large, but [especially] for worthy men.

Hence, many err, who enter into the connubial state without regarding the magnitude of [the power of] fortune, or public utility, but direct their attention to wealth, or dignity of birth. For in consequence of this, instead of uniting with females who are young and in the flower of their age, they become connected with extremely old women; and instead of having wives with a disposition according with, and most similar to their own, they marry those who are of an illustrious family, or are extremely rich. On this account, they procure for themselves discord instead of concord; and instead of unanimity, dissention; contending with each other for the mastery. For the wife who surpasses her husband in wealth, in birth, and in friends, is desirous of ruling over him, contrary to the law of nature. But the husband justly resisting this desire of superiority in his wife, and wishing not to be the second, but the first in domestic sway, is unable, in the management of his family, to take the lead.

This being the case, it happens that not only families, but cities, become miserable. For families are parts of cities, but the composition of the whole
and the universe derives its subsistence from parts [Footnote: For whole, according to the philosophy of Pythagoras and Plato, has a triple subsistence; since it is either prior to parts, or consists of parts, or exists in each of the parts of a thing. But a whole, prior to parts, contains in itself parts causally. The universe is a whole of wholes, the wholes which it comprehends in itself (viz, the inerratic sphere, and the spheres of the planets and elements) being its parts. And in the whole which is in each part of a thing, every part according to participation becomes a whole, i. e. a partial whole.]. It is reasonable, therefore, to admit, that such as are the parts, such likewise will be the whole and the all which consists of things of this kind.

And as in fabrics of a primary nature the first structures co-operate greatly to the good or bad completion of the whole work; as, for instance, the manner in which the foundation is laid in building a house, the structure of the keel in building a ship, and in musical modulation the extension and remission of the voice; so the concordant condition of families greatly contributes to the well or ill establishment of a polity.

Those, therefore, who direct their attention to the propagation of the human species, ought to guard against everything which is dissimilar and imperfect; for neither plants nor animals, when imperfect, are prolific, but to their fructification a certain portion of time is necessary, in order that when the bodies are strong and perfect, they may produce seeds and fruits.

Hence, it is necessary that boys, and girls also while they are virgins, should be trained up in exercises and proper endurance, and that they should be nourished with that kind of food, which is adapted to a laborious, temperate, and patient life.

Moreover, there are many things in human life of such a kind, that it is better for the knowledge of them to be deferred for a certain time. Hence, it is requisite that a boy should be so tutored, as not to seek after venereal pleasures before he is twenty years of age, and then should rarely engage in them. This, however, will take place, if he conceives that a good habit of body, and continence, are beautiful and honourable.

It is likewise requisite that such legal institutes as the following should be taught in Grecian cities, viz. that connection with a mother, or a daughter, or a sister, should not be permitted either in temples, or in a public place; for it is beautiful and advantageous that numerous impediments to this energy should be employed.

And universally, it is requisite that all preternatural generations should be prevented, and those which are attended with wanton insolence. But such as are conformable to nature should be admitted, and which are effected with temperance, for the purpose of producing a temperate and legitimate offspring.

Again, it is necessary that those who intend to beget children, should providentially attend to the welfare of their future offspring. A temperate and salutary diet, therefore, is the first and greatest thing which should be attended to by him who wishes to beget children; so that he should neither be
filled with unseasonable food, nor become intoxicated, nor subject himself to any other perturbation, from which the habits of the body may become worse. But, above all things, it is requisite to be careful that the mind, in the act of copulation, should be in a tranquil state: for, from depraved, discordant, and turbulent habits, bad seed is produced.

It is requisite, therefore, to endeavour, with all possible earnestness and attention, that children may be born elegant and graceful, and that when born, they should be well educated. For neither is it just that those who rear horses, or birds, or dogs, should, with the utmost diligence, endeavour that the breed may be such as is proper, and from such things as are proper, and when it is proper [Footnote: In the original, ὠς δὲ, καὶ ἐξ ὕν δὲ, καὶ ὅτε δὲ, a mode of diction which frequently occurs in Aristotle, and from him in Platonic writers.]; and likewise consider how they ought to be disposed when they copulate with each other, in order that the offspring may not be a casual production; —but that men should pay no attention to their progeny, but should beget them casually; and when begotten, should neglect both their nutriment and their education: for these being disregarded, the causes of all vice and depravity are produced, since those that are thus born will resemble cattle, and will be ignoble and vile.

**OCELLUS LUCANUS ON LAWS.**

**A FRAGMENT PRESERVED BY STOBÆUS, ECLOG. PHYS.**

**LIB. 1. CAP. 16.**

Life, connectedly—contains in itself bodies; but of this, soul is the cause. Harmony comprehends, connectedly, the world; but of this, God is the cause. Concord binds together families and cities; and of this, law is the cause. Hence, there is a certain cause and nature which perpetually adapts the parts of the world to each other, and never suffers them to be disorderly and without connection. Cities, however, and families, continue only for a short time; the progeny of which, and the mortal nature of the matter of which they consist, contain in themselves the cause of dissolution; for they derive their subsistence from a mutable and perpetually passive nature. For the destruction

[Footnote: In the original, ἀπογενεσίς; but the true reading is doubtless ἀπωλέσια, and Vizzanus has in his version interitus. What is here said by Ocellus is in perfect conformity with the following beautiful lines of our admirable philosophic poet, Pope, in his Essay on Man:

“All forms that perish other forms supply;
By turns they catch the vital breath and die;
Like bubbles on the sea of matter born,
They rise, they break, and to that sea return.”]

of things which are generated, is the salvation of the matter from which they are generated. That nature, however, which is perpetually moved [Footnote: i. e. The celestial region.] governs, but that which is always passive [Footnote: i. e. The sublunary region.] is governed; and the one is in capacity prior, but the other posterior. The one also is divine, and possesses reason and intellect, but the other is generated, and is irrational and mutable.**2496

10.3 Einstein and “Space-Time”

Albert Einstein stated,

“This rigid four-dimensional space of the special theory of relativity is to some extent a four-dimensional analogue of H. A. Lorentz’s rigid three-dimensional æther.”**2497

and,

“I think, that the ether of the general theory of relativity is the outcome of the Lorentzian ether, through relativation.”**2498

Henri Poincaré provided the “four-dimensional analogue”**2499 to Lorentz’ æther in 1905 and relativized the “Lorentzian ether” in 1895, long before Hermann Minkowski or Albert Einstein manipulated credit for his work. The Einsteins’ 1905 paper contains no four-dimensional analogue, and is, therefore, a theory of the “unrelativized Lorentzian æther”, per se. Though Einstein credited Minkowski with the quadri-dimensional analogue,

“And now let me say just a few words about the highly interesting mathematical elaboration that the theory has undergone, thanks, mainly, to the sadly so prematurely deceased mathematician Minkowski,”**2500

in fact, Minkowski was well aware of Poincaré’s earlier work, before Minkowski recited it in 1907, as if it were his own.**2501 Max Born recounts that,

“My first encounter with the difficulties of this orthodox creed happened in 1905, the year which we celebrate today, in a seminar on the theory of electrons, held not by a physicist but by a mathematician, HERMANN MINKOWSKI. My memory of these long bygone days is of course blurred, but I am sure that in this seminar we discussed what was known at this period about the electrodynamics and optics of moving systems. We studied papers by HERTZ, FITZGERALD, LARMOR, LORENTZ, POINCARE, and others but also got an inkling of MINKOWSKI’s own ideas which were published only two years later.”**2502
and,

“In 1905 I was a student in Göttingen and attended a seminar conducted by the mathematicians David Hilbert and Hermann Minkowsky. They dealt with the electrodynamics and optics of moving bodies — the subject that was Einstein’s point of departure for the theory of relativity. We studied papers by H. A. Lorentz, Henri Poincaré, G. F. Fitzgerald, Larmor and others, but Einstein was not mentioned. [***] When I mentioned Minkowsky’s contributions to the seminars in Göttingen, which already contained the germ of his four-dimensional representation of the electromagnetic field, published in 1907-8, Reiche and Loria told me about Einstein’s paper and suggested that I should study it.”

and,

“The result was that in the same year (I have forgotten whether simultaneously or in consecutive terms) two advanced seminars were held on mathematical physics: one by Klein and Runge on elasticity, the other by Hilbert and Minkowski on electromagnetic theory. It was the latter which fascinated me. We studied the papers of Lorentz, Poincaré and others on the difficulties which the theories of the electromagnetic ether had run into as a result of Michelson’s celebrated experiment. [***] One day Reiche asked me whether I knew a paper by a man named Einstein on the principle of relativity. He said Planck considered it most important. I had not heard of it, but when I learned that it had something to do with the fundamental principles of electrodynamics and optics which years ago had fascinated me in Hilbert’s and Minkowski’s seminar, I agreed at once to join Reiche in studying it.”

The nature of these lectures at the Göttingen Academy and their historical importance is treated by Jules Leveugle, Reid and Pyenson. Both Hilbert and Minkowski failed to give Lorentz and Poincaré due credit for their contributions to the development of the theory of relativity, and the contributions of Hilbert and Minkowski have likewise since been underrated or forgotten by others.

Roberto Marcolongo, also, in 1906, published a four-dimensional analysis of the Poincaré-Lorentz theory of relativity, before Minkowski. Einstein’s brief evaluation exclusively cites work which was accomplished by Poincaré before Minkowski copied it, but Einstein nowhere mentions Poincaré or Marcolongo. Mehmke’s work is significant and preceded Poincaré’s. Richard Hargreaves and Harry Bateman also deserve mention, for their development of the special and the general theories of relativity. In this same lecture, followed by a discussion which is on record, Einstein shamelessly parroted Poincaré’s enquiries into the nature of simultaneity and his clock synchronization procedures, without citing Poincaré; and Einstein failed to correct those who credited Einstein with the ideas he repeated, which he knew were not his own.
Harry Bateman wrote of Hargreaves contributions,

“§ 2. In the year 1908 two very important papers on electromagnetic theory were published. One of these was Minkowski’s paper on the electrodynamical equations for moving bodies,¹ a paper which soon influenced mathematical thought very considerably and received world wide attention. The other paper was by Mr. Richard Hargreaves, of Southport, England, and was entitled ‘Integral forms and their connection with physical equations.’ This paper which is perhaps the more important of the two, contains two new presentations of the principles of electromagnetism in terms of space-time integrals. This at once places the time coördinate on the same level as the other coördinates and suggests the idea of space-time vectors just as in Minkowski’s work. The chief importance of Mr. Hargreaves’ work lies, however, in the fact that it throws light at once upon the nature of the solutions of the electromagnetic equations and that the principles are presented in a form which is independent of the choice of the space and time coördinates. The last circumstance enables one to obtain the transformations of the theory of relativity in a simple and natural manner and makes it easy to obtain the invariants by a simple application of the methods of the absolute calculus of Ricci and Levi Civita.”²

Consider the psychological import of the attitude of some later writers toward those who actually originated the ideas compared to their attitude toward the heroes “Einstein” and “Minkowski”, who merely parroted what others had pioneered,

“All the main ideas, of course, are due to Einstein and Minkowski. [***] It may be mentioned that the historical order of appearance of the ideas of our subject, as so often happens, has been quite different from the order which seems natural and in which we have presented them. First the formulas of transformation involving space coordinates and time were introduced by Lorentz without, however, giving to them the meaning they now have. In Lorentz’s theory there exists one universal time \( t \), and other times \( t' \) play only an auxiliary part. The credit for taking the decisive step recognizing the fact that all these variables are on the same footing is due to Einstein (1905). The four-dimensional point of view, after some preliminary work had been done by Poincaré and Marcolongo, was introduced most emphatically by Minkowski in 1908.”³

One must wonder how Minkowski “introduced” in 1908, that which was already extant in Poincaré’s work of 1905, and in Marcolongo’s work of 1906. It was Poincaré who first attacked Lorentz’ and Larmor’s distinction between local time and time, beginning in 1898, and eliminated said distinction long before 1905—which distinction was not even present in Voigt’s formulation of 1887. Olivier Darrigol stated in 1996,
“The physicist-historian and the philosopher-historian usually argue that Einstein’s new kinematics was an extremely important innovation that overthrew previous physical and philosophical concepts of time; and they tend to interpret Poincaré’s, Lorentz’s, and others’ fidelity to the ether as a failure to understand Einstein’s superior point of view. On the contrary, the social historian would argue that in 1905 Einstein’s relativity had no stabilized meaning, that it could be read and used in various manners depending on the receiving local culture, and that it acquired a precise meaning only at the end of a complex, social structuring process.”

There was no novelty in asserting time as a fourth dimension in 1908. In 1907, Victoria Welby wrote,

“Or we may, if we like, compare our ‘present’ to the sweep of our outlook from horizon to horizon, and the great mind’s area of vision to the broad land- or sea-scape from a high mountain. But then the present moment must be seen as dimensional. It must give us the cube, the volume, the solid. It must be the true analogue of what from the highest vantage point attainable is the range and content of our bodily vision. The Future, then, to begin with, becomes that which is yet below a given horizon; if you will, the antipodes to the Present whereon we stand. But see what follows. For the Past, that is the world already explored by Man on his great journey through the life-country, has thus sunk below the horizon behind us; the Future is the world waiting for him, ready for the Columbus of the race, *the Copernicus of Time*. When that Time-Explorer appears he will know how to set forth on his voyage of exploration, and will bring us evidence that his discoveries are not conjectural nor fantastic. He will show that the prophet actually sees and gives us here and now, what the ordinary man merely predicts, foretells and guesses at, as far away; and that if we will learn to use his means and use them with his energy, we too may go forth into ‘new continents’ of Time and colonise the ‘future’ at our will.”

In 1906, Cassius J. Keyser wrote,

“Herewith is immediately suggested the generic concept of dimensionality: *if an assemblage of elements of any given kind whatsoever, geometric or analytic or neither, as points, lines, circles, triangles, numbers, notions, sentiments, hues, tones, be such that, in order to distinguish every element of the assemblage from all the others, it is necessary and sufficient to know exactly n independent facts about the element, then the assemblage is said to be n-dimensional in the elements of the given kind*. It appears, therefore, that the notion of dimensionality is by no means exclusively associated with that of space but on the contrary may often be attached to the far more generic concept of assemblage, aggregate or manifold. For example, duration, the total aggregate of time-points, or instants, is a simple or one-fold assemblage.
In 1902, Walter Smith observed, 

“The first thing to be noticed in regard to time is its spatial character. This statement is not a mere paradox. When a succession of events is thought of, the events are ranged in spatial order. We speak of time as long or short; we speak of the distant past and the near future, or of the receding past and the coming years; we ‘look before and after.’ These expressions are not simply figures of speech; they indicate what forms are present in consciousness when a temporal succession is referred to. Nor does this spatial form of the temporal series mean merely that images originally intuited in space are reproduced with this spatial character. If the images simply arise and dissolve in what seems to be one space, there is little if any perception of time; when the sense of time is present, the images of the past recede into the distance. It is very important to note this feature of the time-concept. It has received too little attention from students of the mind. Kant speaks of time as a line; and psychologists are learning to regard time as a projection at right angles to the plane of the present. But that this spatiality is essential to the time-concept has not been, in general, recognized. To F. A. Lange¹ belongs the credit of having given it due emphasis.”

With respect to psychologists and their equating of time with space, G. F. Stout stated in 1902,

“Psychologists generally hold the same type of theory for the two cases of space and time cognition, and the indications of individual views given under Extension (q. v.) hold largely also for time.”

Herbert Spencer wrote extensively on space and time in his works on psychology. Henry Longueville Mansel wrote in the “Psychology” section of his Metaphysics, “Much of what has been said of space is applicable of time also.”

Neither Minkowski, nor the Einsteins, nor Poincaré, hold priority on the concept of four-dimensional space-time. In 1894, H. G. Wells wrote about it in a popular novel, The Time Machine, long before Minkowski claimed priority,

“‘Can a cube that does not last for any time at all, have a real existence?’ Filby became pensive. ‘Clearly,’ the Time Traveller proceeded, ‘any real body must have extension in four directions: it must have Length, Breadth, Thickness, and—Duration. But through a natural infirmity of the flesh, which I will explain to you in a moment, we incline to overlook this fact. There are really four dimensions, three of which we call the three planes of Space, and a fourth, Time. There is, however, a tendency to draw an unreal distinction between the former three dimensions and the latter, because it happens that our consciousness moves intermittently in one direction along the latter from
2034  The Manufacture and Sale of St. Einstein

the beginning to the end of our lives.'"

An article by “S.” had appeared in *Nature*, Volume 31, Number 804, (26 March 1885), p. 481, titled, “Four-Dimensional Space”, which presented the concepts of “time-space”, “four-dimensional solid” (“sur-solid”, after Des Cartes), “time area”, and “time-line”; which later became “space-time” (“Zeit-Raum” is a confusing pun in German with the word “Zeitraum”). It was used for quite some time in the theory of relativity but has largely died out. Rudolf Mewes was using the term “Space-Time” at least as early as 1889 and Palágyi used the “Raumzeit” combination in 1901, “absolute world”, and “world-line”. Here is the work of 1885, which appeared some 23 years before Minkowski’s derivative lecture on the same subject:

**“Four-Dimensional Space**

**Possibly** the question, What is the fourth dimension? may admit of an indefinite number of answers. I prefer, therefore, in proposing to consider Time as a fourth dimension of our existence, to speak of it as a fourth dimension rather than the fourth dimension. Since this fourth dimension cannot be introduced into space, as commonly understood, we require a new kind of space for its existence, which we may call time-space. There is then no difficulty in conceiving the analogues in this new kind of space, of the things in ordinary space which are known as lines, areas, and solids. A straight line, by moving in any direction not in its own length, generates an area; if this area moves in any direction not in its own plane it generates a solid; but if this solid moves in any direction, it still generates a solid, and nothing more. The reason of this is that we have not supposed it to move in the fourth dimension. If the straight line moves in its own direction, it describes only a straight line; if the area moves in its own plane, it describes only an area; in each case, motion in the dimensions in which the thing exists, gives us only a thing of the same dimensions; and, in order to get a thing of higher dimensions, we must have motion in a new dimension. But, as the idea of motion is only applicable in space of three dimensions, we must replace it by another which is applicable in our fourth dimension of time. Such an idea is that of successive existence. We must, therefore, conceive that there is a new three-dimensional space for each successive instant of time; and, by picturing to ourselves the aggregate formed by the successive positions in time-space of a given solid during a given time, we shall get the idea of a four-dimensional solid, which may be called a sur-solid. It will assist us to get a clearer idea, if we consider a solid which is in a constant state of change, both of magnitude and position; and an example of a solid which satisfies this condition sufficiently well, is afforded by the body of each of us. Let any man picture to himself the aggregate of his own bodily forms from birth to the present time, and he will have a clear idea of a sur-solid in time-space.

Let us now consider the sur-solid formed by the movement, or rather, the
successive existence, of a cube in time-space. We are to conceive of the cube, and the whole of the three-dimensional space in which it is situated, as floating away in time-space for a given time; the cube will then have an initial and a final position, and these will be the end boundaries of the sur-solid. It will therefore have sixteen points, namely, the eight points belonging to the initial cube, and the eight belonging to the final cube. The successive positions (in time-space) of each of the eight points of the cube, will form what may be called a time-line; and adding to these the twenty-four edges of the initial and final cubes, we see that the sur-solid has thirty-two lines. The successive positions (in time-space) of each of the twelve edges of the cube, will form what may be called a time area; and, adding these to the twelve faces of the initial and final cubes, we see that the sur-solid has twenty-four areas. Lastly, the successive positions (in time-space) of each of the six faces of the cube, will form what may be called a time-solid; and, adding these to the initial and final cubes, we see that the sur-solid is bounded by eight solids. These results agree with the statements in your article. But it is not permissible to speak of the sur-solid as resting in ‘space,’ we must rather say that the section of it by any time is a cube resting (or moving) in ‘space.’ S. March 16

The author of “Four-Dimensional Space” is named as “S.”, who may have been Simon Newcomb. Wells’ The Time Machine includes the following passage,

“It is simply this. That Space, as our mathematicians have it, is spoken of as having three dimensions, which one may call Length, Breadth, and Thickness, and is always definable by reference to three planes, each at right angles to the others. But some philosophical people have been asking why three dimensions particularly—why not another direction at right angles to the other three?—and have even tried to construct a Four-Dimension geometry. Professor Simon Newcomb was expounding this to the New York Mathematical Society only a month or so ago. You know how on a flat surface, which has only two dimensions, we can represent a figure of a three-dimensional solid, and similarly they think that by models of thee dimensions they could represent one of four—if they could master the perspective of the thing. See?”

A bibliography of Newcomb’s works on the fourth-dimension is to be found in the endnote. However, Newcomb does not seem to be a believer in time as a fourth dimension—so the mysterious “S.” may well have been someone else, “S.” Tolver Preston, perhaps? James E. Beichler believes that James Joseph Sylvester was the
mysterious “S.”

Before Wells, in 1881, in a work which reminds one of Camille Flammarion’s *Lumen*, John Venn wrote,

“These requirements seem reducible to the two following—regard being had to the nature of our faculties and the general conditions under which we have to employ them: power to move about as freely as we may wish in space or time, and power to enlarge space and time to any extent we may need. [***

Let us begin with the former, *viz.*, our power of locomotion (the reader will observe that we are obliged to use, in many cases, space-words for time-ideas, and *vice versa*, from inadequacy in ordinary terminology). What our powers in this respect as regards space, every one knows. Within very small limits we can move ourselves, or the objects with which we are concerned, up and down and about, in three dimensions, as we please. Within wider limits, *viz.*, that of the surface of the globe, we are restricted to two dimensions. Beyond that again we are hampered still further by being confined to one dimension only, our motion along that even being quite beyond our own control. [***]

Now this state of powerlessness represents almost exactly our relation to events in respect of time. We are bound, as we all know, to go steadily forwards: we have no power to stand still, go sideways or backwards. [***] What we want is the power to stop still and to go backwards whenever we please. [***] What we want in fact is a microscope with a double set of stage-screws; one set to move the stage about as is now done, in respect of space, and the other to move it about in a similar way in respect of time. [***] Physical speculators have not unfrequently indulged in fanciful modes of attaining the equivalent of such a power as that just indicated. Since light travels with finite velocity, we are at liberty to conceive an object moving so fast as to outstrip it. Suppose a human eye receding from our system into space with a velocity greater than that of light, and occasionally pausing for a moment so as to permit the rays from the objects which it was leaving behind to overtake it and record their impression. We should then invert, so far as that eye was concerned, the relative course of events, and this would be, so far as all visual considerations are applied, precisely that regression into past time which is desired.”

Charles Howard Hinton queried as to what might be the fourth dimension in 1880, and argued that time constitutes a fourth dimension resulting in an Eleatic universal state of being, without cause or effect,

“And in the first place, a being in four dimensions would have to us exactly the appearance of a being in space. A being in a plane would only know solid objects as two dimensional figures—the shapes namely in which they intersected his plane. So if there were four-dimensional objects, we should only know them as solids—the solids, namely, in which they intersect our space. Why, then, should not the four-dimensional beings be ourselves, and
our successive states the passing of them through the three-dimensional space to which our consciousness is confined?

Let us consider the question in more detail. And for the sake of simplicity transfer the problem to the case of three and two dimensions instead of four and three.

Suppose a thread to be passed through a table cloth. It can be passed through in two ways. Either it can be pulled through, or it can be held at both ends, and moved downwards as a whole. Suppose a thread to be grasped at both ends, and the hands to be moved downwards perpendicularly to the tablecloth. If the thread happens to be perpendicular to the tablecloth it simply passes through it, but if the thread be held, stretched slanting wise to the tablecloth, and the hands are moved perpendicularly downwards, the thread will, if it be strong enough, make a slit in the tablecloth.

If now the tablecloth were to have the faculty of closing up behind the thread, what would appear in the cloth would be a moving hole.

Suppose that instead of a tablecloth and a thread, there were a straight line and a plane. If the straight line was placed slanting wise in reference to the plane and moved downwards, it would always cut the plane in a point, but that point of section would move on. If the plane were of such a nature as to close up behind the line, if it were of the nature of a fluid, what would be observed would be a moving point. If now there were a whole system of lines sloping in different directions, but all connected together, and held absolutely still by one framework, and if this framework with its system of lines were as a whole to pass slowly through the fluid plane at right angles to it, there would then be the appearance of a multitude of moving points in the plane, equal in number to the number of straight lines in the system. The lines in the framework will all be moving at the same rate—namely, at the rate of the framework in which they are fixed. But the points in the plane will have different velocities. They will move slower or faster according as the lines which give rise to them are more or less inclined to the plane. A straight line perpendicular to the plane will, on passing through, give rise to a stationary point. A straight line that slopes very much inclined to the plane will give rise to a point moving with great swiftness. The motions and paths of the points, would be determined by the arrangement of the lines in the system. It is obvious that if two straight lines were placed lying across one another like the letter X, and if this figure were to be stood upright and passed through the plane, what would appear would be at first two points. These two points would approach one another. When the part where the two strokes of the X meet came into the plane, the two points would become one. As the upper part of the figure passed through, the two points would recede from one another.

If the lines be supposed to be affixed to all parts of the framework, and to loop over one another, and support one another, [figure deleted] it is obvious that they could assume all sorts of figures, and that the points on the plane would move in very complicated paths. The annexed figure represents
a section of such a framework. Two lines $XX$ and $YY$ are shown, but there must be supposed to be a great number of others sloping backwards and forwards as well as sideways.

Let us now assume that instead of lines, very thin threads were attached to the framework: they on passing through the fluid plane would give rise to very small spots. Let us call the spots, atoms, and regard them as constituting a material system in the plane. There are four conditions which must be satisfied by these spots if they are to be admitted as forming a material system such as ours. For the ultimate properties of matter (if we eliminate attractive and repulsive forces, which may be caused by the motions of the smallest particles), are—1, Permanence; 2, Impenetrability; 3, Inertia; 4, Conservation of energy.

According to the first condition, or that of permanence, no one of these spots must suddenly cease to exist. That is, the thread which by sharing in the general motion of the system gives rise to the moving point, must not break off before the rest of them. If all the lines suddenly ended this would correspond to a ceasing of matter.

2. Impenetrability.—One spot must not pass through another. This condition is obviously satisfied. If the threads do not coincide at any point, the moving spots they give rise to cannot.

3. Inertia.—A spot must not cease to move or cease to remain at rest without coming into collision with another point. This condition gives the obvious condition with regard to the threads, that they, between the points where they come into contact with one another, must be straight. A thread which was curved would, passing through the plane, give rise to a point which altered in velocity spontaneously. This the particles of matter never do.

4. Conservation of energy.—The energy of a material system is never lost, it is only transferred from one form to another, however it may seem to cease. If we suppose each of the moving spots on the plane to be the unit of mass, the principle of the conservation of energy demands that when any two meet, the sum of the squares of their several velocities before meeting shall be the same as the sum of the squares of their velocities after meeting. Now we have seen that any statement about the velocities of the spots in the plane is really a statement about the inclinations of the threads to the plane. Thus the principle of the conservation of energy gives a condition which must be satisfied by the inclinations of the threads of the plane. Translating this statement, we get in mathematical language the assertion that the sum of the squares of the tangents of the angles the threads make with the normal to the plane remains constant.

Hence, all complexities and changes of a material system made up of similar atoms in a plane could result from the uniform motion as a whole of a system of threads.

We can imagine these threads as weaving together to form connected shapes, each, complete in itself, and these shapes as they pass through the
fluid plane give rise to a series of moving points. Yet, inasmuch as the threads are supposed to form consistent shapes, the motion of the points would not be wholly random, but numbers of them would present the semblance of moving figures. Suppose, for instance, a number of threads to be so grouped as to form a cylinder for some distance, but after a while to be pulled apart by other threads with which they interlink. While the cylinder was passing through the plane we should have in the plane a number of points in a circle. When the part where the threads deviated came to the plane, the circle would break up by the points moving away. These moving figures in the plane are but the traces of the shapes of threads as those shapes pass on. These moving figures may be conceived to have a life and a consciousness of their own.

Or if it be irrational to suppose them to have a consciousness when the shapes of which they are momentary traces have none, we may well suppose that the shapes of threads have consciousness, and that the moving figures share this consciousness, only that in their case it is limited to those parts of the shapes that simultaneously pass through the plane. In the plane, then, we may conceive bodies with all the properties of a material system moving and changing, possessing consciousness. After a while it may well be that one of them becomes so disassociated that it appears no longer as a unit, and its consciousness as such may be lost. But the threads of existence of such a figure are not broken, nor is the shape which gave it origin altered in any way. It has simply passed on to a distance from the plane. Thus nothing which existed in the conscious life on the plane would cease. There would in such an existence be no cause and effect, but simply the gradual realisation in a superficies of an already existent whole. There would be no progress, unless we were to suppose the threads as they pass to interweave themselves in more complex shapes.

Can a representation such as the preceding be applied to the case of the existence in space with which we have to do? Is it possible to suppose that the movements and changes of material objects are the intersections with a three-dimensional space of a four-dimensional existence? Can our consciousness be supposed to deal with a spatial profile of some higher actuality?

It is needless to say that all the considerations that have been brought forward in regard to the possibility of the production of a system satisfying the conditions of materiality by the passing of threads through a fluid plane, holds good with regard to a four-dimensional existence passing through a three-dimensional space. Each part of the ampler existence which passed through our space would seem perfectly limited to us. We should have no indication of the permanence of its existence. Were such a thought adopted, we should have to imagine some stupendous whole, wherein all that has ever come into being or will come co-exists, which, passing slowly on, leaves in this flickering consciousness of ours, limited to a narrow space and a single moment, a tumultuous record of changes and vicissitudes that are but to us.
Change and movement seem as if they were all that existed. But the appearance of them would be due merely to the momentary passing through our consciousness of ever existing realities.

In thinking of these matters it is hard to divest ourselves of the habit of visual or tangible illustration. If we think of a man as existing in four dimensions, it is hard to prevent ourselves from conceiving him as prolonged in an already known dimension. The image we form resembles somewhat those solemn Egyptian statues which in front represent well enough some dignified sitting figure, but which are immersed to their ears in a smooth mass of stone which fits their contour exactly.

No material image will serve. Organised beings seem to us so complete that any addition to them would deface their beauty. Yet were we creatures confined to a plane, the outline of a Corinthian column would probably seem to be of a beauty unimprovable in its kind. We should be unable to conceive any addition to it, simply for the reason that any addition we could conceive would be of the nature of affixing an unsightly extension to some part of the contour. Yet, moving, as we do in space of three dimensions, we see that the beauty of the stately column far surpasses that of any single outline. So all that we can do is to deny our faculty of judging of the ideal completeness of shapes in three dimensions.

Our conception of existence in four dimensions need not be confined to any particular supposition. There is no reason why a being existing in four dimensions should not be conceived to be as completely limited in all four directions as we are in three. All that we can say in regard to the possibility of such beings is, that we have no experience of motion in four directions. The powers of such beings and their experience would be ampler, but there would be no fundamental difference in the laws of force and motion.

Such a being would be able to make but a part of himself visible to us. He would suddenly appear as a complete and finite body, and as suddenly disappear, leaving no trace of himself, in space. There would be no barrier, no confinement of our devising that would not be perfectly open to him. He would come and go at pleasure; he would be able to perform feats of the most surprising kind. It would be possible by an infinite plane extending in all directions to divide our space into two portions absolutely separated from one another; but a four-dimensional being would slip round this plane with the greatest ease.

With regard to the possibility of the application of any test to discover whether a fourth dimension does exist or not, all that can be said is that no such test has succeeded. And, indeed, before searching for tests a theoretical point of the utmost importance has to be settled. In discussing the geometrical properties of straight lines and planes, we suppose them to be respectively of one and two dimensions, and by so doing deny them any real existence. A plane and a line are mere abstractions. Every portion of matter is of three dimensions. If we consider beings on a plane not as mere idealities, we must suppose them to be of some thickness. If their experience
is to be limited to a plane this thickness must be very small compared to their other dimensions. If, then, we suppose a fourth dimension to exist, either our consciousness itself must consist in a limitation of the knowledge of existence to three instead of four dimensions, or we must be very small in the fourth dimension as compared to others. In such a case it would probably be in the phenomena of the ultimate particles of matter, where the dimensions in all four directions would be comparable, that any indication of the new direction would have to be sought.

It is evident that these speculations present no point of direct contact with fact. But this is no reason why they should be abandoned. The course of knowledge is like the flow of some mighty river, which, passing through the rich lowlands, gathers into itself the contributions from every valley. Such a river may well be joined by a mountain stream, which, passing with difficulty along the barren highlands, flings itself into the greater river down some precipitous descent, exhibiting at the moment of its union the spectacle of the utmost beauty of which the river system is capable. And such a stream is no inapt symbol of a line of mathematical thought, which, passing through difficult and abstract regions, sacrifices for the sake of its crystalline clearness the richness that comes to the more concrete studies. Such a course may end fruitlessly, for it may never join the main course of observation and experiment. But if it gains its way to the great stream of knowledge, it affords at the moment of its union the spectacle of the greatest intellectual beauty, and adds somewhat of force and mysterious capability to the onward current."

Long before Hinton, Abbott, Rodwell, and even Riemann, was Stallo, who expressed the fundamental “space-time” concept in 1847,

“The Spiritual, the absolute primitive movement within itself, can be real and substantial only in stating itself exteriorly; and we have repeatedly seen that this statement is absolute multiplicity. That the result of the statement, the Exterior, is but a statement, and the statement of an internal movement, implies its transience; the statement is from its very nature transient. This transience must exhibit itself, therefore, in the stated Exterior, wherever we take it; it must appear throughout, for the Exterior is inherently transient. Otherwise expressed: the Exterior is but a transience in position; a position in One of existence and non-existence,—or a position and a negation in one. The Exterior can therefore first be taken as such, and then it is space, in which the transience, dependency, shows itself as absolute relativity; secondly, as the bearer of its vivifying movement, and thus it is time. Or, the Exterior as an existence, as positive, fixed, is space; as a negation, non-
existence, it is time. Logically, the first two exteriorations of the Spiritual are therefore space and time. They are both abstractions, i.e. they are only, inasmuch as the understanding forcibly keeps them asunder, though their truth is their being in one, their inseparability in spite of their distinctness. [***] Time and space, whose first reality is their difference, will therefore further state their identity as real unity; and this statement is real motion. Real motion is the union of space and time. The motion under consideration here, namely, the primitive motion in the sphere of the Exterior, is not motion in any given, definite direction; it is motion in all directions, to which we have no observable analogon. It is the pure movement of abstract statement and annulment. [***] The so-called dimensions of space present no difficulty in their deduction, and depend, like all deductions, upon the inherent references of space. Space, the absolute extension, as opposed to the Spiritual, is spatial infinitude, unbounded (mathematical) solidity; as opposed to the spiritual, to the absolute intensity, it is a point,—in space, and yet spaceless; as the unity of the two, it is the line,—extended intensity or punctuality. If we seek for a spatial analogon of time, it must be the line, for it has been seen that time is the Extensive considered in its ideal bearing, the mediating unity therefore between extension and intensity. Now the absolutely Extensive, the Solid, is from its nature limited,—it contains the limit; and this limit of solidity is the surface. Thus punctuality, solidity, surface, and linearity are inherent in the idea of space; we are logically compelled to see space under this fourfold aspect. The mathematical statement, that the motion of a point generates a line, that of a line a surface, and that of a surface a solid, is true only in the following sense:—Spatiality, extension as such, is the absolute reference to the without, beyond itself, absolute relativity. If, then, we ideally isolate a point, we are at the same moment compelled to refer it to ideal adjacent points, and thus the idea of the line starts up in the mind spontaneously. The same takes place with the line and with the surface. The ideas of point, line, surface, &c., from their nature, give birth to each other. The movement of a point, &c., however, as something real, to which the motion accedes, is a false assumption. [Notation in the original: Already Hegel has pointed this out. See my exposition of his philosophy of nature.]

Before Stallo, Gustav Theodor Fechner presented a four-dimensional theory of space-time in 1846 under the pseudonym “Dr. Mises”. Fechner stated, inter alia, in 1846,

“Jedoch, um mein Möglichstes zu tun, sehe ich wieder bei dem Farbenmännchen in zwei Dimensionen nach; weiß ich erst in zwei Dimensionen die dritte zu packen, so muß es ja dann um so leichter sein, in dreien die vierte zu packen. Auch ist dies nur eine besondere Anwendung der von jeher mit Frucht angewandten Methode, das, was man in drei Dimensionen nicht realiter finden kann, in zwei Dimensionen, d. h. auf dem
Papier zu suchen und zu finden. Und siehe da, es gelingt.

Zur Sache: ich nehme die Fläche, worin mein Scheinnännchen sich befindet, und führe sie durch die dritte Dimension hindurch, so erfährt das Scheinnännchen alles, was in dieser dritten Dimension ist; es wird sogar, indem es in andere Lichträume kommt, wo sich die Strahlen anders ordnen und färben, selbst sich hiermit ändern und vielleicht zu Ende des Weges bleich und runzlig aussehen, während es zu Anfänge des Weges rot und glatt aussah. Freilich hat das Männchen niemals ein Stück der dritten Dimension auf einmal und glaubt also in jedem Augenblicke immer noch bloß in seinen zwei Dimensionen zu sein; es faßt von der ganzen Bewegung bloß das zeitliche Element und die vor sich gehende Änderung auf. Aber faktisch durchmißt es doch die dritte Dimension und Alles, was darin ist. Demgemäß sagt das Männchen: es gibt eine Zeit und in der Zeit ändert sich Alles, auch ich selbst.

Nun, wir sagen auch: es gibt eine Zeit und in der Zeit ändert sich alles, auch wir selbst. Was liegt dem also zu Grunde? Die Bewegung unser Raums von drei Dimensionen durch die vierte, von welcher Bewegung wir aber auch nur das zeitliche Element und die Veränderung, welche erfolgt, wahrnehmen.

Nichts ist auch im Grunde einfacher und natürlicher: unsere Welt von drei Dimensionen ist eine ungeheure Kugel, die in eine Menge einzelner Kugeln zerfällt. Jede von diesen läuft; also wird die große Urkugel wohl auch laufen; aber wo sollte sie hinlaufen, wenn es nicht eine vierte Dimension gäbe? Indem sie aber selbst durch diese vierte Dimension läuft, laufen natürlich auch alle Kugeln in ihr, und alles was auf diesen Kugeln lebt und webt, durch die vierte Dimension mit durch.\(^{2532}\)

Boscovich stated, centuries ago,

\[\text{“Hence, the number of other points of space is an infinity of the third order; }\]
\[\text{& thus the probability is infinitely greater with an infinity of the third order, }\]
\[\text{when we are concerned with any other particular instant of time.”}^{2533}\]

Joseph Larmor, in 1900, raised space-time’s significance to relativity theory and expressly called it a \textit{“continuum”}, long before Minkowski. Larmor is perhaps guilty of pun, using \textit{“continuum”} with both its mathematical and metaphysical meanings,

\[\text{“At the same time all that is known (or perhaps need be known) of the aether itself may be formulated as a scheme of differential equations defining the properties of a continuum in space, which it would be gratuitous to further explain by any complication of structure; though we can with great advantage employ our stock of ordinary dynamical concepts in describing the succession of different states thereby defined.”}^{2534}\]

Note the absolutism implicit in the term \textit{“continuum”}, which Minkowski dubbed the \textit{“absolute world”}. The \textit{“continuum”} is Newton’s unchanging God—his myth that the
human Self does not change during a lifetime, and, therefore, neither can
God—absolute “space-time”.

Eugen Karl Dühring\textsuperscript{2535} published a space-time theory in 1873, which inspired
Rudolf Mewes’ space-time theory of 1889.\textsuperscript{2536} Inspired by Johann Julius
Baumann,\textsuperscript{2537} Friedrich Albert Lange\textsuperscript{2538} presented a theory of the space-time
manifold in 1877. In 1882, Gustav Teichmüller\textsuperscript{2539} published a lengthy treatise
enunciating an Eleatic space-time theory free from paradoxes, in which he
recognized the abstract nature, and absolute relativity, of space and time, and created
a space-time with three space dimensions and three time dimensions. E. H. Synge
argued that Sir William Rowan Hamilton’s space-time theory anticipated
Minkowski’s theory by sixty-five years.\textsuperscript{2540} Menyhért (Melchior) Palágyi, in 1901,
published \textit{Neue Theorie des Raumes und der Zeit} (\textit{New Theory of Space and of
Time}), in which he argued for an Eleatic quadri-dimensional space-time, and in
which he justified the principle of relativity in four-dimensions.\textsuperscript{2541} Before Palágyi,
was Rudolf Mewes, who, in 1889-1894, developed a relativistic space-time theory,
declaring in 1889, “Und doch ruht die ganze Wirklichkeit allein auf der
Vereinigung von Raum und Zeit.”\textsuperscript{2542} Johann Heinrich Ziegler lectured in Switzerland
in 1902 on the unity of space, time and force and the significance of light in empty
space, doing away with the æther hypothesis.\textsuperscript{2543} Poincaré established the Palágyi-
style four-dimensional analysis of the “Lorentz Transformation”, before Minkowski,
or Einstein. Roberto Marcolongo\textsuperscript{2544} presented his four-dimensional view of the
“Lorentz Transformation”, before Minkowski.

Henri Bergson wrote in 1888 in his lengthy and detailed theory of space and
time,

“in a word, we create for them a fourth dimension of space, which we call
homogenous time, and which enables the movement of the pendulum,
although taking place at one spot, to be continually set in juxtaposition to
itself.”\textsuperscript{2545}

Prior to Bergson, Ernst Mach discussed quadri-dimensional position in 1866,

“Now, I think that we can go still farther in the scale of presentations of
space and thus attain to presentations whose totality I will call \textit{physical
space}.

It cannot be my intention here to criticize our conceptions of matter,
whose insufficiency is, indeed, generally felt. I will merely make my
thoughts clear. Let us imagine, then, a something behind (\textit{unter}) matter in
which different states can occur; say, for simplicity, a pressure in it, which
can become greater or smaller.

Physics has long been busied in expressing the mutual action, the mutual
attraction (opposite accelerations, opposite pressures) of two material
particles as a function of their distance from each other—therefore of a
spatial relation. Forces are functions of the distance. But now, the spatial
relations of material particles can, indeed, only be recognized by the forces
which they exert one on another.

Physics, then, does not strive, in the first place, after the discovery of the fundamental relations of the various pieces of matter, but after the derivation of relations from other, already given, ones. Now, it seems to me that the fundamental law of force in nature need not contain the spatial relations of the pieces of matter, but must only state a dependence between the states of the pieces of matter.

If the positions in space of the material parts of the whole universe and their forces as functions of these positions were once known, mechanics could give their motions completely, that is to say, it could make all the positions discoverable at any time, or put down all positions as functions of time.

But, what does time mean when we consider the universe? This or that ‘is a function of time’ means that it depends on the position of the vibrating pendulum, on the position of the rotating earth, and so on. Thus, ‘All positions are functions of time’ means, for the universe, that all positions depend upon one another.

But since the positions in space of the material parts can be recognized only by their states, we can also say that all the states of the material parts depend upon one another.

The physical space which I have in mind—and which, at the same time, contains time in itself—is thus nothing other than dependence of phenomena on one another. A complete physics, which would know this fundamental dependence, would have no more need of special considerations of space and time, for these latter considerations would already be included in the former knowledge.”

I confine the discussion to quadri-dimensional hyperspace in which the fourth dimension signifies time or spiritual motion of some kind in a fourth dimension, whatever that should be interpreted to mean as ghosts retreating into a “fourth dimension” to undo tri-dimensional knots, leaving from one position in our world to return in another; but there was a tremendous body of work involving hyperspace beyond this restriction, with a long history pre-dating the special and the general theories of relativity.

For example, Stewart and Tait, in their widely read Unseen Universe, averred, in the then fairly recent tradition of the transcendental geometers,

“Just as points are the terminations of lines, lines the boundaries of surfaces, and surfaces the boundaries of portions of space of three dimensions:—so we may suppose our (essentially three-dimensional) matter to be the mere skin or boundary of an Unseen whose matter has four dimensions.”

The history of four-dimensional spaces is aptly recorded in Henry Parker Manning’s Geometry of Four Dimensions, Macmillan, (1914), republished by Dover, (1956). Bibliographies appear in Manning’s The Fourth Dimension Simply

Returning to the concept of time as the fourth dimension, Edgar Allen Poe wrote in 1848,

“A rational cause for the phenomenon, I maintain that Astronomy has palpably failed to assign: — but the considerations through which, in this Essay, we have proceeded step by step, enable us clearly and immediately to perceive that Space and Duration are one.”

Poe was under the spell of Alexander von Humboldt (and opium). Humboldt stated “Mach’s Principle” long before Mach, but long before Humboldt, Boscovich stated it. Humboldt’s influence on Stallo, Poe and the general intellectual community toward relativism cannot be emphasized strongly enough!

Immanuel Kant stated in his inaugural dissertation of 1770,

“Simultaneous facts are not such for the reason that they do not succeed each other. Removing succession, to be sure, a conjunction is withdrawn which existed by the time-series. Yet thence does not originate another true relation, the conjunction of all things in the same moment. For simultaneous things are joined in the same moment of time exactly as successive things are joined in different moments. Hence, though time is of but one dimension, still the ubiquity of time, to speak with Newton, by which all things sensuously thinkable are some time, adds to the quantity of actual things another dimension, inasmuch as they hang, so to speak, on the same point of time. For designating time by a straight line produced infinitely, and the simultaneous things at any point of time whatever by lines applied in succession, the surface thus generated will represent the phenomenal world, both as to substance and accidents.”

D’Alembert let us in on a secret back in 1754,
“As I’ve already said, it is not possible to conceive of more than three dimensions. However, a brilliant wit with whom I am acquainted considers duration a fourth dimension, and that the product of time multiplied by solidity would, in some sense, be a product of four dimensions. This idea is perhaps contestable, but it appears to me to be of some merit, even if it is only that of novelty.”

Lagrange worked out a new mechanics with time as the fourth dimension, ca. 1788,

“We will apply the theory of functions to mechanics. Here, the functions absolutely correspond to time, which we will always designate with \( t \), and, since the position of a point in space depends upon the three rectilinear coordinates \( x, y, z \), these coordinates, in the problems of mechanics, will be assumed to be functions of \( t \). In this way, we can look upon mechanics as a geometry of four dimensions, and the analysis of mechanics like an extension of the analysis of geometry.”

“Nous allons employer la théorie des fonctions dans la Mécanique. Ici les fonctions se rapportent essentiellement au temps, que nous désignerons toujours par \( t \), et, comme la position d’un point dans l’espace dépend de trois coordonnées rectangulaires \( x, y, z \), ces coordonnées, dans les problèmes de Mécanique, seront censées être des fonctions de \( t \). Ainsi, on peut regarder la Mécanique comme une Géométrie à quatre dimensions et l’Analyse mécanique comme une extension de l’Analyse géométrique.”

John Locke asserted, ca. 1689,

“To conclude: expansion and duration do mutually embrace and comprehend each other; every part of space being in every part of duration, and every part of duration in every part of expansion. Such a combination of two distinct ideas is, I suppose, scarce to be found in all that great variety we do or can conceive, and may afford matter to further speculation.”

In 1671, Henry More argued that spirits inhabit four dimensions. The fourth dimension as a “realm of spirits” became a popular topic, and it often appears in the literature. Samuel Clarke, of the Newton-Leibnitz dispute fame, wrote an Eleatic treatise on the universal nature of God, which certainly qualifies as a space-time theory: A Demonstration of the Being and Attributes of God. The clerical inspired the profane, and four dimensional fantasies become a common theme in popular fiction.

The spiritualistic belief was pursued by astrophysicist Johann Karl Friedrich Zöllner, in the 1870’s, and Bernhard Riemann, who used the spiritual concept to explain gravitation; which spiritualistic four-dimensional views were questioned by physicist Ernst Mach, but embraced by physicist A. E. Dolbear and by T.
Proctor Hall, who was criticized by Edmund C. Sanford. Hall noted, in 1892, that the fourth dimension is useful; in that,

“the theologian could use it for the world of spirits; the physicist for forces

‘All are but parts of one stupendous whole, Whose body Nature is, and
God the soul.’ [Alexander Pope, Essay on Man] If four-fold space exists, it is evident that it must contain an infinite variety of three-fold spaces, of which we know only one. It must also be everywhere possible for a four-fold being to step out of our space at any point and re-enter it at any other point; for his relation to our space is nearly the same as our relation to a plane. If ghosts are four-fold beings, the erratic nature of their movements may become more comprehensible in the course of time. An ordinary knot could in four-fold space be readily untied by carrying one loop out of our space and bringing it back in a different place. In fact, a knot in our space would be simply a loop or coil in four-fold space. A flexible closed shell could be turned inside out as easily as a thin hoop can with us; and many other apparent impossibilities become mere child’s play.”

Hermann Schubert attacked Zöllner and the Spiritualists, and their fourth dimension,

“The high eminence on which the knowledge and civilization of humanity now stands was not reached by the thoughtless employment of fanciful ideas, nor by recourse to a four-dimensional world, but by hard, serious labor, and slow, unceasing research. Let all men of science, therefore, band themselves together and oppose a solid front to methods that explain everything that is now mysterious to us by the interference of independent spirits. For these methods, owing to the fact that they can explain everything, explain nothing, and thus oppose dangerous obstacles to the progress of real research, to which we owe the beautiful temple of modern knowledge.”

Zöllner could not even find respite in The Journal of Speculative Philosophy, where George Stuart Fullerton attacked him. In 1878, P. G. Tait published a polemic against Zöllner, and his fourth dimension, in the journal Nature, which evinces the emerging prejudice against Metaphysics, generated by Bacon, and later by the positivists,

“He is, as Helmholtz long ago said, a genuine Metaphysician, and (as such) is a curiosity really worthy of study:—not of course merely because he is a Metaphysician, but because in this nineteenth century he attempts to bring his metaphysics into pure physical science. In conclusion, though I cannot make pretensions to any minute acquaintance with the German language, I think I may venture to suggest to Prof. Zöllner, for his next edition, a title which shall at least more accurately describe the contents of his work than does his present one. I cannot allow that the title ‘Scientific Papers’ is at all
correctly descriptive. But I think that something like the following would suit his book well

Patriotische
METAPHYSIK DER PHYSIK,
für moderne deutsche Verhältnisse.
Mit speciellem Bezug auf die vierte Dimension und den Socialdemokratismus bearbeitet.

With this little hint, which I hope will be taken, as it is meant, in good part, I heartily wish him and his work farewell. P. G. TAIT

It is ironic that what was considered metaphysical in the Nineteenth Century, with its belief in an observable reality, is today, with the scientific method turned on its head considered scientific; i.e., unobservable and purely abstract “space-time” is today considered the absolute world, and questioning this internally contradictory ontological “nonsense” is today incorrectly, pejoratively and hypocritically referred to as “Metaphysics”.

Just as quadri-dimensional speculation and non-Euclidean geometry have a long and continuing history, so, too, does opposition to it. Eugen Karl Dühring (a Socialist who was attacked by Friedrich Engels and alternatively praised and mocked by Rudolf Mewes, Ernst Mach, Alexander Moszkowski and Albert Einstein) lampooned the transcendental mysticism of Helmholtz, Gauss and Riemann. Johann Bernhard Stallo wrote much against hyperspace, concluding,

“If Riemann’s argument were fundamentally valid, it could be presented in very succinct and simple form. It would be nothing more than a suggestion that, because algebraic quantities of the first, second, and third degrees denote geometrical magnitudes of one, two, and three dimensions respectively, there must be geometrical magnitudes of four, five, six, etc., dimensions corresponding to algebraic quantities of the fourth, fifth, sixth, etc., degree. [Stallo notes: It is not unworthy of remark, here, that the practice of reading $x^2$ and $x^3$ as $x$ square and $x$ cube, instead of $x$ of the second order or third power, is founded upon the silent or express assumption that an algebraic quantity has an inherent geometric import. The practice is, therefore, misleading, and ought to be disused. Principiis obsta!]

It is hardly necessary to say, after all this, that the analytical argument in favor of the existence, or possibility, of transcendental space is another flagrant instance of the reification of concepts.

Stallo’s and Schubert’s foreboding is profound, given the absolutist ontology of the special theory of relativity, which soon followed their admonitions to us. James H. Hyslop wrote in 1896

“THE FOURTH DIMENSION OF SPACE.

Mr. Schiller’s summary of the discussion on this subject in the March number of this REVIEW indicates very clearly that the advocates
of a fourth dimension latterly show a decided tendency to withdraw from some of their original claims, but it omits to notice a matter of very considerable importance in the problem which has received very scant attention on the part of the defenders of the doctrine, and has not been developed by its opponents, whose arguments often imply it. I allude to the purely logical principles at the basis of the matter. That these must first be satisfied, I think, is shown by several facts: (a) the tendency to abandon certain arguments in the case; (b) the absence of all deductive proof for a fourth dimension; (c) the want of data in experience to make the claim inductively rational; (d) the dependence upon analogies and symbolic conceptions as evidence.

But I shall waive all proof of the claim here made and allow the discussion itself to show its truth. The first step is to consider the general grounds upon which the doctrine is supposed to rest, as stated by some of its ablest advocates. They are: (a) the empirical nature of the Euclidean axioms; (b) the relativity of knowledge in general, shutting out a dogmatic denial of the hypothesis; (c) the Kantian doctrine of space, which, though it may prove the inconceivability (non-imaginable nature) of a fourth dimension, supports its possibility beyond the limits of experience; (d) the necessities of non-Euclidean geometry, especially for pseudo-spherical surfaces.

The first thing to be said regarding these arguments is that, if the laws of logic have first been respected, they may be entitled to some weight, but if these laws have been violated, the arguments can count for nothing. Hence I wish to call attention to certain irrelevancies in them, in order to show how the prior conditions of all intelligible discussion in this problem are certain logical principles that reveal very clearly where the confusion originates in the controversy. This irrelevancy is that which connects the question with the problems about empiricism, intuitionism, transcendentalism, realism, idealism, etc. These, in fact, have nothing to do with the matter until after we know the logical terms of the problem. In all cases we have to do with certain conceptions which carry with them the same implications logically, whether we choose to regard them as real or ideal, objective or subjective, empirical or intuitive. What I have to consider, therefore, is the logical use made of the conceptions ‘space,’ ‘property,’ ‘dimension,’ ‘mathematics,’ etc., in the attempt to prove a fourth dimension.

Now I shall first state a few simple logical principles upon which I shall proceed, and which determine the limits of legitimate reasoning in this problem. They are perfectly familiar laws to the logician, but seem to be wholly ignored by mathematicians. They are summarized in this one proposition: *The transfer of predicates and implications from one conception to another is limited to a qualitative identity between them.* This can be clearly illustrated by reference to the relation between certain conceptions and certain tendencies in the growth of knowledge.

Concepts express certain definite relations between genus and species, and between different species. We may express this generally by the formula that their extension varies inversely with their intension. In common parlance, this is only to say that the number of individuals denoted by the
genus is greater than the number denoted by the species, while the number of qualities denoted by the species is greater than that denoted by the genus. It is not necessary here to assert or defend the *absolute* universality of this rule, but only that it is unquestionable in a certain class of conceptions, and these are the conceptions with which we have to deal in our present discussion. Now the plain simple rule here is that we can never transfer the differential predicates of the species to the genus, and also that general formulas have to be modified to suit the differentia of the species. For example, I cannot transfer the differential quality expressed by ‘Caucasian’ over to the concept ‘man,’ and I cannot express the meaning of ‘Caucasian’ by stopping with the predicates of the term ‘man.’ These are simple truisms, but they get great importance in connection with discussions that violate them, owing to the additions made to knowledge by intellectual progress.

The development of knowledge involves two different changes in conceptions. They may be widened or they may be narrowed in their import. These two processes are known to the logician as generalization and specialization. Until the new meaning becomes the only and fixed import of the term, it gives rise to equivocation. In this way an interchange of predicates and implications will occur, and often unconsciously. But this is the illusion for which intelligent men are required to be on the alert. This difficulty, however, is greatly increased by the several ways in which concepts may grow in denotation and meaning. First, concepts may increase or decrease in nothing but quantitative import. Secondly, they may increase or decrease only in qualitative import. Thirdly, quantitative and qualitative import may vary in an inverse ratio with each other. Thus the first of these processes occurs when a new individual or species is added to the genus, or an old one withdrawn, without affecting the conferentia (common qualities) expressed by it. Here the change does not affect the transfer of predicates. It is purely quantitative, and this is the peculiarity of all purely mathematical concepts. In the second process the change occurs when a new quality is added, or an old one withdrawn from a concept, without changing its quantitative import or extension. This change also does not affect the truth or universality of old propositions, and a transfer of predicates will not take place. No equivocation, however, will occur. But it is the third form that causes all the trouble. In this the extension may increase at the expense of the intension and *vice versa*. This occurs when a new species is added to a genus so as to decrease the intension, or a species withdrawn so as to increase the intension. In such cases the transfer of predicates cannot take place. Or, to summarize the discussion, when conceptions change quantitatively, but not qualitatively, the transfer of predicates can be made with perfect logical impunity. When they change qualitatively, but not quantitatively, new predicates are added which are differentially distinct from the old ones, but there is no occasion for a transfer. But when quantitative and qualitative import vary inversely, a transfer of predicates cannot be assumed without proof. Now, since mathematics is limited to the quantitative concepts or
qualities, and logic extends to both quantitative and qualitative meanings of terms, it is apparent how they come into relation with each other, and how a habit contracted in the quantitative determinations of mathematics may pass over to cases where the changes are qualitative as well. In mathematics we either do not deal at all with genus and species, but with whole and part, which are qualitatively identical; or, if we call the broader and narrower concepts ‘genus’ and ‘species,’ they are still qualitatively of the same import. But in logic, besides whole and part we deal with genus and species, which are qualitatively different from each other. The consequences of this may be brought out by illustration.

The instance is taken from the fluctuations in the conception ‘metal.’ In physics and chemistry brass and bronze are not metals; in common parlance they are. Now in scientific usage I can say, ‘All metals are elements’; in common parlance I cannot say it, because brass and bronze are compounds. Here, with the extension of the term ‘metal,’ I cannot carry the predicate of its narrower import with me. With this increase of extension, ‘element’ becomes the differentia of a species. Hence in any case where we undertook to define the differential quality of brass and bronze, we should have to call it non-elemental, not having any right to use the term ‘element’ to describe it, unless it also be generalized. On the other hand, the same process is illustrated by another interesting generalization of the same term. At one time it was assumed that a specific gravity greater than water was an essential property of metals. It was conceived as essential to a metal that it sink in water. This conception excluded at least three of the alkali metals, potassium, sodium, and lithium. But the discovery that these substances possessed metallic lustre and probably other metallic properties, resulted in extending the class ‘metals’ to include them while diminishing the conferentia, and this in spite of the fact that their specific gravity is less than water. Now we have here a generalization of the term ‘metal’ in which we cannot carry with us the old proposition, ‘All metals sink in water.’ This relation now becomes the differentia of a species, and is no longer a conferentia. If the reverse process had taken place, it would have been necessary to have added a new predicate to the species.

The value of these principles will be apparent in the examination of the argument for a fourth dimension, most especially as it appears in Helmholtz’ celebrated articles in Mind.\[Footnote: Vol. I, p. 301; vol. III, p. 212.\] which have done more than anything else to make philosophers take the subject seriously. The first illusion of which he and mathematicians generally have been the victims, is not one which comes under the principles just enunciated, but is nevertheless an important weakness in their argument. It is the transference to the conception of space of assumptions and conceptions that are true of material substance. Now the mathematician tells us that geometry deals with the properties of space. Dimension is said to be one of these properties, if not the only one, and as there are admittedly three of these dimensions, the limitations of our empirical knowledge at once suggest the
possibility of more of them. The only problem is to produce the facts which will either prove their real existence, or show that they are thinkable and possible. The fact that we know of no limits to the properties of matter, and that discovery constantly shows additions to our knowledge of new properties, forces, or modes of action (the Röntgen rays, for example), or at least new phenomena, stands in good stead to shut off dogmatic denials of other than the known dimensions of space. But it is precisely here that the illusion occurs. The mathematician permits himself to be fooled by words, and pays no attention to their real import. He assumes without criticism that the relation between space and its dimensions is the same as that between matter or a metaphysical substance and its properties. This assumption may be absolutely denied, and I certainly deny the right to make it. The illusion arises first from the language about the ‘properties’ of space, and secondly from identifying ‘properties’ with dimensions, while distinguishing tacitly between space and its ‘properties’ on the one hand, and space and its dimensions on the other. Metaphysical realities, subjects or substances, like matter, spirit, ether, etc., may have any number of properties, known and unknown. But we have no a priori right to carry this possibility over to space, because no one entertains for a moment the supposition that it is a metaphysical substance like matter or other reality. It is qualitatively distinguished from such conceptions. It may be that space possesses an indefinite number of properties, but we can neither assume the fact or possibility from what we hold to be true of matter, mind, and other subjects or substances, nor assume that we can treat the conception of space in the same way. We have to prove on other grounds that the conception of space is subject to the same treatment. What I contend for is, that we cannot logically pass, as the mathematicians do, from one of these conceptions to the other, and that propositions in the two cases, notwithstanding their formal resemblances, do not have the same meaning and implication unless proved on other grounds than this formal identity; so that the very first step in the argument for a fourth dimension is vitiated by presumptions which have no right to exist.

The whole problem of the advocates of a fourth dimension is to find a basis for non-Euclidean geometry. Euclidean geometry is admittedly based upon the three dimensions, and they assume that this new kind of geometry requires a new differential principle. They are at least formally correct, according to the principles established regarding the relation between genus and species or between different species. But we must examine what difference they assume to exist between the two kinds of geometry. If the two are the same, the demand for a fourth dimension would be absurd, according to their own admission. If they are different, if non-Euclidean geometry is different from Euclidean, the difference must be either quantitative, or qualitative, or both. If it be merely quantitative, the qualitative principle or condition is the same as the Euclidean; if it be qualitatively different, then the new principle must be a new quality, a new property of space, as the fourth
dimension is supposed to be. If the difference be both quantitative and qualitative, then the distinction between Euclidean and non-Euclidean geometry is not absolute, but they interpenetrate in the dimensions determining Euclidean geometry. After ascertaining the alternatives between which we are placed, the only question that remains to determine concerns the conceptions of the problem entertained by non-Euclidean mathematicians. The second alternative is the one maintained; and this with its qualitative distinction between the two kinds of geometry, implies that the fourth dimension must be a new quality or property of space, or qualitatively different from the other dimensions. The first alternative is fatal because it limits the difference to quantity, the qualitative principle remaining the same, so that but one rational course is open to the mathematician, which is to affirm a difference of kind. We start, then, with the assumption that non-Euclidean geometry requires a principle for its basis qualitatively distinct from that of Euclidean geometry. What is the consequence of this step?

The basis of geometry is said to be the ‘properties of space.’ We may ask what is meant by the ‘properties’ of space, and this question proposes the problem of determining whether ‘space’ is synonymous with its ‘dimensions,’ or may include other ‘properties’ than dimension, and whether its ‘properties’ are the same as its dimensions. This problem ought first to be solved by the non-Euclidean geometer before he takes any other step. But I know of no attempt to do this. He has two alternatives. He may limit the intension of space to the dimensions, or he may extend it to include other properties than dimension, such as penetrability and divisibility or indivisibility. (I hold that space is absolutely indivisible, though it is usually spoken of as divisible. In reality it is body that is divisible.) Now if space denote or imply other properties than dimension, we may ask what evidence is there that the so-called ‘fourth dimension’ is a dimension at all. The non-Euclideans agree that their geometry is based upon the ‘properties of space.’ This limits them to two alternative conceptions, assuming that the two geometries must be distinguished. Either ‘space’ denotes other properties than dimension, or in being limited to dimension we must suppose, as they do, that the fourth dimension is qualitatively different from the other three. The supposition that the ‘fourth dimension’ is different in kind from the other three, and at the same time that space denotes only the three dimensions, would imply that non-Euclidean geometry is non-spatial; that is, not based upon space at all, which is contrary to the original assumption. But, taking the two conceptions just mentioned, it should be noticed that the first may justify us in selecting some other property than dimension for the basis of non-Euclidean geometry. What reason have the non-Euclideans for distinguishing between the fourth dimension and some other property not a dimension at all, especially as they admit that this new ‘dimension’ cannot be pictured or represented in experience? Taking the second alternative, we find that a generalization either of the term ‘space’ or of the term ‘dimension’ has been made. If of the term ‘space,’ the ‘fourth dimension’ either becomes
a non-dimensional property, or the basis of geometry has been altered in its conception, which might enable us to take any quality of anything as the principle of non-Euclidean geometry.

Let me make the case clearer by another form of statement. If we assume the qualitative difference between Euclidean and non-Euclidean geometry, there are four conceptions of space to be considered, three of them absolutely necessary to satisfy this assumption: (i) Space = three dimensions; (2) space = three plus the fourth dimension or \( n \) dimensions; (3) space = three dimensions plus other properties; (4) space = four or \( n \) dimensions plus other properties.

Taking space in the first of these three conceptions, the fourth dimension must make non-Euclidean geometry nonspatial, which is contrary to the supposition. On the third conception, the principle of non-Euclidean geometry is not a dimension, but some other property. Assuming the fourth conception, the non-Euclidean geometer must show the distinction to be made between the fourth dimension and other properties, especially that this dimension is qualitatively different from the other three. If not qualitatively different, non-Euclidean geometry falls to the ground as anything more than a modification of Euclidean geometry. This leaves, as the only alternative for the non-Euclidean, the second, which is the conception, and the only conception, of space that can present even a plausible claim in favor of a fourth dimension for the principle of non-Euclidean geometry.

Now, in regard to this second conception of space, the first remark is that it is an extension of the meaning involved in the first. But passing this by as unimportant, though necessary to non-Euclidean geometry, the second remark is that the term ‘dimension’ is either generalized in its import qualitatively, or it is a name to denote a non-dimensional property. The only other alternative is to hold that the three dimensions and the fourth are not different from each other. I want, therefore, to show the logical consequences to the doctrine from each one of these alternatives.

The assumption is that the fourth dimension is qualitatively different from the other three dimensions. It is, therefore, a species in contradistinction to them as other species. Now, when the term ‘dimension’ includes all of them, it denotes a common property, the conferentia, or genus; and cannot be used to denote the species. This would be in violation of the principle of logical division, which is that the same conception cannot denominate both genus and species. Assuming that it denotes only the genus, or common quality of all the dimensions, we find that both Euclidean and non-Euclidean geometry are based upon the same quality of space, which is contrary to the supposition. On the other hand, if it denote only a species, it must be limited either to the three dimensions or to the fourth, if a qualitative distinction between them is to be maintained. If limited to the three, then it is not legitimate to call the ‘fourth dimension’ a dimension at all, and non-Euclidean geometry would be based upon a non-dimensional property, say penetrability or indivisibility, which is contrary to the original supposition.
If it be limited to the fourth, then the other three are not ‘dimensions’ properly considered, and Euclidean geometry would be non-dimensional, which is also contrary to the supposition. The only alternative left is to apply the term equally to all four dimensions. But this identifies them qualitatively and breaks down the distinction between Euclidean and non-Euclidean geometry, which again is contrary to the supposition, unless we go outside of space altogether for the basis of the latter, which again contradicts the first assumption. Such a fatal set of dilemmas could hardly have been suspected on a first glance at the controversy; but they are there as long as we use the word ‘dimension’ in the case, and distinguish qualitatively between Euclidean and non-Euclidean geometry.

The fundamental fault of the mathematicians has been in extending the meaning of the term ‘dimension’ by adding a new species and calling it by the same name as the old. This mistake never occurs in the natural sciences. When a new species is discovered, increasing the extension of the genus, a new name must be adopted expressing the differentia by which this species is distinguished from the others. If the fourth dimension be a new species qualitatively different from the others, it should either not be called a dimension at all, or something should be indicated to determine the differentia by which it is presumably differentiated from the others. We may generalize the term ‘dimension’ if we choose, but we must not carry with it the differentia which separates the species; and we are equally forbidden to employ the same term for the species. The reply to this criticism would be that the differentia is expressed in the number of the dimension, and this reply is formally legitimate. But it is fatal in two respects to the hypothesis of a new dimension qualitatively determined. First, if number be the differentia of the species, it is purely quantitative, and the basis of non-Euclidean geometry is not qualitatively distinguished from the Euclidean. Secondly, if the conception ‘fourth,’ *i.e.*, number, determines a qualitative differentia, then the first, second, and third dimensions should be qualitatively different from each other, which is contrary to the supposition of Euclidean geometry. They are assumed to express the same commensurable quality, while their supposed differences are only relations of direction from a given point.

The language easily lends itself to an illusion, because it is formally the same as that in which qualitative differences are actually expressed or implied. But in mathematics our first duty is to remember that our conceptions are primarily quantitative, and that when we go beyond purely quantitative distinctions we are transcending mathematics altogether.

What I have said here about the illusory nature of the language in the case is beautifully illustrated in the expression, ‘Space has dimension.’ This proposition resembles the ordinary intensive judgment (such as ‘Man is wise,’ where it is possible to have other predicates in the same subject) only when we conceive the subject, space, as possibly having other properties than dimension; but when the term ‘space’ is made convertible with ‘dimension,’
as is usually or always the case in mathematics, we should either not assume that ‘Space has dimension,’ or when using the phrase we should recognize logically its true import, namely, that ‘Space is dimension.’ For geometry, space and dimension are the same, and hence in reality to assert the existence of a fourth dimension is equivalent to saying that the three dimensions have a fourth or \( n \) dimension, or that the three dimensions are four or \( n \) dimensions. The absurdity of this is apparent, but it is concealed by the formal correctness of the proposition, ‘Space has properties,’ or, ‘Space has dimension.’ But the moment we see that, for geometry, space and its dimensions are the same, we are forced to recognize that the fourth dimension becomes a predicate of the other three dimensions, which is contrary to the supposition of non-Euclidean geometry.

We are now prepared to examine some concrete fallacies and illusions of the same kind committed by Helmholtz in the celebrated articles in Mind already referred to, on the ‘Origin and Meaning of Geometrical Axioms.’ His argument here is to prove the empirical nature of geometrical axioms, and thus to avail himself of the inference, which the limitations of empiricism justify, that there are possibly other data in existence than the three known dimensions. In order to establish this empiricism, he undertakes to show that the axioms do not have the universal and necessary application which they are supposed to have. In this procedure he is half conscious of the principle that I have here laid down about the impossibility of transferring differential predicates when an increase in the extension of our concepts takes place, and the force of his argument derives all its influence from the truth of this principle. But he immediately violates the principle by equivocations which are due to specializing terms without reckoning with the logical consequences of the act. Let us examine his procedure briefly.

He calls attention to the assumed universality of the axiom about a straight line being the shortest path between two points, only to show that it is not true to a being living on a curved surface, to whom a curved line is the shortest distance between two points. This fact is supposed to set aside the universality of the Euclidean axiom. But there is a curious illusion in this claim which can be dispelled in two ways. In the first place, there is an equivocation in the word ‘shortest.’ Mathematically speaking, the Euclidean axiom still remains true to any being living on a spherical surface, though it may not be physically true. Even if it be assumed that such a being could not move directly at all from one point to the other, the distance physically and temporally the shortest to him would be a curved line, but this truth has nothing in it to contradict or modify the Euclidean axiom which still remains true mathematically where we have to do with pure space relations and not with qualities other than the spatial. Secondly, if the being living on the sphere knew that this surface was curved, it would recognize the Euclidean axiom, and, if influenced by any economic motives prevalent about walking on the diagonals of street corners, would sigh for the physical capacity to conform to mathematical principles. But if it did not know that the surface
was a curved one, *it could not draw any distinction between a straight and a curved line*. Its mathematical and physical conceptions of ‘shortest’ would coincide, so that *straight* and *curved* would mean the same thing, and the Euclidean axiom would still remain. But Helmholtz happens to know the difference between mathematical space and physical body, and by an equivocation in the use of ‘shortest’ can obtain an apparent limitation to this axiom, when applying it from the standpoint of his own assumed knowledge compared with that of a being supposed to be ignorant of his point of view. But the equivocation does not help the matter, and the ignorance of the other being does not interfere with the truth of the Euclidean axiom.

A long examination of another instance by Helmholtz, impeaching the universality of the proposition that the sum of the angles of a triangle is equal to two right angles, might be given, but it is sufficient to take note of two omissions in order to vitiate the conclusion that he wishes to draw from his result. In the first place, he confuses two different degrees of extension in the use of the term ‘triangle,’ one limited to plane and the other including spherical triangles, which shows only that the universality of a proposition is never intended to extend beyond its subject. The proposition about the sum of the angles remains forever true within these limits, and Helmholtz forgets that the language, while it may include spherical triangles, is *conceived* by the mathematician concretely to mean plane triangles. He can also obtain a universal proposition for both. Secondly, Helmholtz fails to see that, although a modification of the formula or principle in this proposition is required to meet the conditions of a new species, this modification is purely *quantitative*, not qualitative, and hence the analogy lends no support to the qualitative difference implied or asserted in the fourth dimension as the basis of the relations in pseudo-spherical surfaces. There is an illusion also in assuming or insinuating that pseudo-spherical surfaces are more than quantitatively different from plane and spherical surfaces, so far as commensurable quality is concerned.

The effect of the equivocation in the use of the word ‘dimension’ is apparent in another way, to which attention must be called. If there is anything upon which mathematicians and mankind generally are agreed, it is that space has at least three dimensions, Euclidean geometers and most others holding that it has only three dimensions. But I think both can be denied, without favoring the contention of non-Euclidean mathematicians that there is a fourth dimension in any sense in which they are understood to affirm it. In denying the existence of three dimensions, we have two alternative affirmative propositions, both of which may be true if we assume two meanings for the term ‘dimension.’ They are: (1) that space has only one dimension; (2) that it has an indefinite or infinite number of dimensions. This claim is borne out by the fact that, when we speak of space as having ‘dimension,’ we express a single quality which is divided up into ‘three dimensions,’ without implying that the species are qualitatively different from their base, but are only relations of the same quality to different points
of view. In fact the ‘three dimensions’ are properly defined and reducible to commensurable quality in which the units are always the same in each dimension. The three dimensions, therefore, cannot qualitatively differ from this without losing their commensurable nature. Why, then, are they called ‘dimensions,’ as if they were species of a genus? The answer to this question must be, either that the term is illegitimate altogether, or that it expresses only certain quantitative relations having mathematical convenience in the mensuration of bodies. Both alternatives are fatal to the supposition of a fourth ‘dimension’ in a qualitative sense without either going outside the meaning of dimension as denoting commensurable quality, or going outside the conception of space, which are both contrary to the supposition of non-Euclideans.

The supposition that there are three dimensions instead of one, or that there are only three dimensions, is purely arbitrary, though convenient for certain practical purposes. Here the supposition expresses only differences of relation; that is, differences of direction from an assumed point. Thus, what would be said to lie in a plane in one relation, would lie in the third dimension in another. There is no way to determine absolutely what is the first, second, or third dimension. If the plane horizontal to the sensorium be called plane dimension, the plane vertical to it will be called solid, or the third dimension, but a change of position will change the names of these dimensions without involving the slightest qualitative change or difference in meaning. Moreover, we usually select three lines or planes terminating vertically at the same point, the lines connecting the three surfaces of a cube with the same point, as the representatives of what is meant by three dimensions, and reduce all other lines and planes to these. But interesting facts are observable here. (1) If the vertical relation between two lines be necessary for defining a ‘dimension,’ then all other lines than the specified ones are either not in any dimension at all, or they are outside the three given dimensions. This is denied by all parties, which only shows that a vertical relation to other lines is not necessary to the determination of a dimension. (2) If lines outside the three vertically intersecting lines still lie in dimension, or are reducible to the other dimensions, they may lie in more than one dimension at the same time, which after all is a fact. This only shows that qualitatively all three dimensions are the same, and that any line outside of another can only represent a dimension in the sense of direction from a given point or line, and we are entitled to assume as many dimensions as we please, all within the ‘three dimensions.’

This mode of treatment shows the source of the illusion about the ‘fourth dimension.’ The term in its generic import denotes commensurable quality and denotes only one such quality, so that the property supposed to determine non-Euclidean geometry must be qualitatively different from this, if its figures involve the necessary qualitative differentiation from Euclidean mathematics. But this would shut out the idea of ‘dimension’ as its basis, which is contrary to the supposition. On the other hand, the term has a
specific meaning, which, as different qualitatively from the generic, excludes the right to use the generic term to describe them differentially, but if used only quantitatively, that is, to express direction, as it in fact does in these cases, involves the admission of the actual, not a supposititious, existence of the fourth dimension, which again is contrary to the supposition of non-Euclidean geometry. Stated briefly, dimension as commensurable quality makes the existence of a fourth dimension a transcendental problem, but as mere direction an empirical problem, and the last conception satisfies all the requirements of the case, because it conforms to the purely quantitative differences which exist between Euclidean and non-Euclidean geometry, as the very language about ‘surfaces,’ ‘triangles,’ etc., in spite of the prefix ‘pseudo,’ necessarily implies. If the difference be made qualitative, neither the conception of direction will satisfy the case, because this is quantitative, nor that of dimension, because the fourth dimension would have to be non-dimensional. The simple illusion of Helmholtz lies in the confusion of dimension, now denoting commensurable quality, with direction, now denoting certain quantitative relations, and he merely carries this confusion over to the ‘fourth dimension,’ with the implications of transcendentalism in its qualitative differentiation from the others.

Why Helmholtz should have been guilty of this confusion it is hard to say, when we remember his own conception of the basis of geometry. In the very article above referred to, he says: ‘In conclusion, I would again urge that the axioms of geometry are not propositions pertaining only to the pure doctrine of space. As I said before, they are concerned with quantity.’ If geometry can be based upon the notion of quantity as well as space quality, he ought to have seen at once that his ‘fourth dimension’ did not require to be a new quality, but only a new quantitative relation of the one quality of space, which it in reality is. Distinguish between ‘dimension’ as commensurable quality and the use of the term to denote directional relations, and the problem is solved. The fourth and even \( n \) ‘dimensions’ can be admitted as empirical facts, and there will be no necessity for showing the empirical nature of geometrical axioms, in order to obtain an \( a \ priori \) presumption, from the limitations and indefinite capacities of experience, in favor of a possible existence for transcendental properties of space.

There is one more illusion growing out of this confusion of ‘dimension’ with direction. It relates to the movements of points, lines, and figures, assumed by mathematicians in representing the various relations expressed by Euclidean space. The motion of a point is said to produce a line in one dimension; the motion of a line about one end produces a plane, and the motion of a plane about one of its sides will produce a solid, or the third dimension. The ‘fourth dimension’ is demanded for a certain motion of a solid! But we may say first that, in mathematical parlance, a point cannot be made to move, nor can a line or a plane. Only bodies can move. This may be admitted to be quibbling, but it calls attention to the fact that, if mechanical motion is to determine the matter of dimension, the motion of a ‘point,’ or
‘atom,’ must be in more than one ‘dimension’ at a time. A solid, being in three dimensions, will move in them, and, if it gets out of them, will either not be a solid at all, or, if it is in the ‘fourth dimension,’ we should require a transcendental physics as the basis of non-Euclidean geometry, and this is not in the contract of the mathematician, but only a new property of space. But to dismiss quibbling, if we accept the fact that the dimensions can be constructively represented as described, why assume that a point can move only in one dimension, a line in two, and a plane in the third? From what has been said about the relative and interchangeable nature of the dimensions, any one being the other according to point of view, and from the fact that the motion of a point must pass through what is called the third dimension and also exists in a plane at the same time, it is evident that even a moving point must imply all three dimensions. It cannot move in all three directions at the same time, but the whole commensurable quality of space is implied by the existence of a point, a line, and a plane, as well as a solid. Hence geometry, constructive and symbolic, is based, not upon dimensions as commensurable quality, but upon dimensions as directions, and in this way creates no presumptions in favor of any new commensurable quality. To argue for it is simply one of those equivocations which ought not to deceive a common schoolboy, not to say anything of men with the reputation of Helmholtz and Riemann.

Several other similar illusions might be pointed out, such as Helmholtz’ language about flat space and curved space, but I shall not discuss them here. They are either a confusion of the abstract with the concrete, or of quantitative with qualitative logic; and after our lengthy exposure of this latter all-pervading fallacy, it is not necessary to do more than to reiterate the one important rule that qualitative differences can never be expressed by the same term, so that all this discussion about a fourth dimension is simply an extended mass of equivocations turning upon the various meanings of the term ‘dimension.’ This, when once discovered, either makes the controversy ridiculous or the claim for non-Euclidean properties a mere truism, but effectually explodes the logical claim for a new dimensional quality for space, as a piece of mere jugglery in which the juggler is as badly deceived as his spectators. It simply forces mathematics to transcend its own functions as defined and limited by its own advocates, and to assume the prerogatives of metaphysics. With the non-Euclideanians it would become a science of quality as well as, or instead of, quantity, and would hardly stop with Helmholtz’ empiricism for an argument in favor of its transcendental ‘dimension.’

I have intended this exhaustive logical criticism as a precaution against a great deal of crazy metaphysics which might support itself upon the authority of men like Helmholtz and Riemann. Occultism simply revels in the doctrine of a fourth dimension, and is absolved from the duty of proving it in se by the authority of presumably sane scientific men; and while it may be sufficient simply to laugh at the pretensions of the occultist, and while it
only dignifies his speculations seriously to consider them, there are some at least quasi-genuine phenomena which throw the reins to madhouse theories, when both parties soberly discuss the claims for a fourth dimension and remain wholly ignorant of the logical principles, which not only vitiate the argument for the existence, or even possibility, of this ‘dimension,’ but make the talk about it mere child’s play. In taking this position, however, it is not necessary to deny the fact of other than the known properties of existence, nor to deny that there is more than is dreamt of in any of our philosophies, but only that the logical terms of the problem take us wholly beyond the limits of geometry and mathematics for our ‘metadimension.’ Not only must we distort and change our conception of space, but we require equally to modify that of geometry and mathematics, so that they cease to deal with mere quantity and are made to share the precarious fortunes of metaphysics. We may take this course if we like, but our science would lose its much boasted certitude by the change, and would very soon turn into a fool’s paradise. We cannot limit mathematics by definition to the consideration of pure quantity, and then introduce into our data qualitative differentials which bear no quantitative import but the name. If we do this, the futility of our procedure is only concealed by one of the simplest of illusions, unless it is our distinct purpose to base mathematics upon a system of metaphysics which is as fanciful as wonderland. An equivocation is a poor compass, when we set out on Kant’s shoreless ocean in search of a harbor, and, if we discover its character before we make the venture, we shall be all the wiser for it. But without equivocation we can in no case accomplish any more than the man in Mother Goose, who ‘ran fourteen miles in fifteen days and never looked behind him,’ only to find in the end that he was just where he had started.”

Edward H. Cutler succinctly stated in 1909,

“The fourth dimension has no real existence in the sense in which the external world that we know by means of our senses has real existence. It is a philosophical and metaphysical conception, whose actual existence cannot be demonstrated by observation or by logical reasoning.”

Manning and Whitrow cite Michael Stifel, in 1553, and John Wallis, in 1685, as stigmatizing the conjecture of a fourth or higher dimension, as being unnatural, an expression with religious implications in those times. Aristotle, in contrast to Stewart and Tait, argued for a limitation of three, his favorite number, dimensions,

“The line has magnitude in one way, the plane in two ways, and the solid in three ways, and beyond these there is no other magnitude because three are all [***] There is no transfer from length to area and from area to a solid.”
And then there was Ptolemy,

“The admirable Ptolemy in his book *On Distance* well proved that there are not more than three distances, because of the necessity that distances should be taken along perpendicular lines, and because it is possible to take only three lines that are mutually perpendicular, two by which the plane is defined and a third measuring depth; so that if there were any other distance after the third it would be entirely without measure and without definition. Thus Aristotle seemed to conclude from induction that there is no transfer into another magnitude, but Ptolemy proved it.”

Galileo questioned on what basis Aristotle drew his conclusion, but did not really dispute it.

Not only did Albert Einstein not originate the idea of space-time, he initially strongly opposed it. Einstein, together with Jakob Laub, denounced Minkowski’s recitation of Poincaré’s four-dimensional interpretation of the Lorentzian æther, in 1908, in a paper fraught with mistakes. It wasn’t until it was made clear to Einstein that Poincaré’s quadri-dimensional interpretation of Lorentz’ quasi-rigid æther could be exploited to arrive at Paul Gerber’s 1898 formulation of gravitation, that Einstein ended his attack on it, and instead copied it in the general theory of relativity of 1915—though, predictably, Einstein failed to cite either Poincaré or Gerber.

In 1930, Einstein effectively admitted that he did not originate the special theory of relativity, though he wrongly attributes the theory’s basis to an undeserving Minkowski. Einstein stated,

“The next step in the development of the concept of space is that of the special theory of relativity. The law of the transmission of light in empty space in connection with the principle of relativity with reference to uniform movement led necessarily to the conclusion that space and time had to be combined in a unified four-dimensional continuum. For it was recognized that nothing real corresponded to the inclusive concept of all simultaneous events. As Minkowski was the first to see clearly, this four-dimensional space had to be regarded as possessing a Euclidean metric which was quite analogous to the metric of the three-dimensional space of Euclidean geometry with the use of an imaginary time-coordinate.”

Einstein, by his own definitions, did not achieve the special theory of relativity in 1905, and instead, when first made aware of it, he opposed it! Poincaré created the theory, and Einstein repeatedly stole credit for it and wrongfully gave Minkowski credit for many of Poincaré’s ideas. Each element of Einstein’s argument as to what constitutes the uniqueness of the special theory of relativity was stated by Poincaré before Einstein and Minkowski.

Minkowski noted that Lorentz and Einstein believed in absolute space,
“Neither Einstein nor Lorentz made any attack on the concept of space[.]”

Einstein’s admission that the æther of relativity theory is analogous to Lorentz’ æther is an admission that Lorentz holds priority on the formalism of the theory, and, further, that Einstein felt forced to switch camps from that of Lorentz to that of Poincaré, in 1916, much after the 1905 paper appeared, to a theory which Einstein, himself, together with Jakob Laub, had denounced in 1908, only to admit in 1920 that this “absolute world” of Minkowski “space-time” resulted again in Lorentz’ æther. As Einstein stated,

“If one wants to imagine a medium in space (in which light can easily propagate), then the æther model may be of great advantage, but with limitations. It is not a difficult task to achieve for the light propagation through the æther a velocity of only 0.999999c without any trouble. This velocity thus can be realized with an accuracy to the fifth decimal place when the æther is a fluid of the density 10^30 kg/m^3 having a specific heat of 0.000001 J/(kg·K).”

Relativists would counter this citation by pointing out that Einstein’s æther differs from that of Lorentz in that it is ultimately vague, a word without meaning, and no supposition is made as to its fundamental properties, such as the assertion that the æther may be an ideal fluid of particles immersed in a void of empty space. Einstein denied it the property of “motion”, an assertion made many decades earlier by Philipp Spiller in a much read work. However, this argument over semantics is one made against a straw man, for Lorentz stated as early as 1895,

“It does not suit my purpose to examine more thoroughly such speculations, or to express presumptions about the nature of the æther. I merely wish, as far as possible, to free myself of all preconceived notions regarding this substance and not to ascribe to it, for example, any of the qualities of ordinary liquids and gasses. Should it be shown, that a description of the phenomena is best arrived at through the assumption of absolute permeability, then one must surely in the meantime adopt this sort of hypothesis, and leave it to further research, if possible, to open up a deeper understanding to us.”

Compare this with Schubert’s views,

“In mathematics, in fact, the extension of any notion is admissible, provided such extension does not lead to contradictions with itself or with results which are well established. Whether such extensions are necessary, justifiable, or important for the advancement of science is a different question. It must be admitted, therefore, that the mathematician is justified in the extension of the notion of space as a point-aggregate of three dimensions, and in the introduction of space or point-aggregates of more than three dimensions, and in the employment of them as means of research. Other sciences also operate with things which they do not know exist, and which, though they are sufficiently defined, cannot be perceived by our senses. For example, the physicist employs the ether as a means of investigation, though he can have no sensory knowledge of it. The ether is nothing more than a means which enables us to comprehend mechanically the effects known as action at a distance and to bring them within the range of a common point of view. Without the assumption of a material which penetrates everything, and by means of whose undulations impulses are transmitted to the remotest parts of space, the phenomena of light, of heat, of gravitation, and of electricity would be a jumble of isolated and unconnected mysteries. The assumption of an ether, however, comprises in a systematic scheme all these isolated events, facilitates our mental control of the phenomena of nature, and enables us to produce these phenomena at will. But it must not be forgotten in such reflexions that the ether itself is even a greater problem for man, and that the ether-hypothesis does not solve the difficulties of phenomena, but only puts them in a unitary conceptual shape. Notwithstanding all this, physicists have never had the least hesitation in employing the ether as a means of investigation. And as little do reasons exist why the mathematicians should hesitate to investigate the properties of a four-dimensioned point-aggregate, with the view of acquiring thus a convenient means of research.”

Though Schubert allowed for mathematical speculation—useful fictions, he opposed pretending that such four-dimensional fantasies be taken to signify a reflection of physical reality,

“The high eminence on which the knowledge and civilization of humanity now stands was not reached by the thoughtless employment of fanciful ideas, nor by recourse to a four-dimensional world, but by hard, serious labor, and slow, unceasing research. Let all men of science, therefore, band themselves together and oppose a solid front to methods that explain everything that is now mysterious to us by the interference of independent spirits. For these methods, owing to the fact that they can explain everything, explain nothing, and thus oppose dangerous obstacles to the progress of real research, to which we owe the beautiful temple of modern knowledge.”
Wölfing wrote in 1897,

“It has also been suggested that the vainly sought after fourth dimension is to be found in time, whereby Kinematics (Kinetics) transforms into a four-dimensional Geometry. This is incorrect because time has nothing in common with and (pursuant to this viewpoint) interchangeable with the remaining dimensions; nevertheless, time can be used to advantage to produce four-dimensional bodies from three-dimensional ones.”

“Man hat auch in der Zeit die vergeblich gesuchte vierte Dimension zu finden geglaubt, wodurch sich die Kinematik (Bewegungslehre) in eine vierdimensionale Geometrie verwandelt. Richtig ist dies deshalb nicht, weil die Zeit nichts mit den übrigen Dimension gleichartiges und (je nach dem Standpunkt) vertauschbares ist; immerhin kann die Zeit bei der Erzeugung der vierdimensionalen Körper durch dreedimensionale mit Vorteil Verwendung finden.”

Archbishop Tillotson preached that,

“Others say, God sees and knows future Things by the presentiality and co-existence of all Things in Eternity; For they say, that future Things are actually present and existing to God, though not in mensura propria, yet in mensura aliena. The Schoolmen have much more of this Jargon and canting Language. I envy no Man the understanding these Phrases: But to me they seem to signify nothing, but to have been Words invented by idle and conceited Men; which a great many ever since, lest they should seem to be ignorant, would seem to understand. But I wonder most, that Men, when they have amused and puzzled themselves and others with hard Words, should call this Explaining Things.”

Both Hendrik Antoon Lorentz and Albert Einstein maintained a tri-dimensional privileged frame of “physical space” or “æther”, which is the same physical hypothesis given two different names. The appellation “æther”, which more clearly maintains the concept of a physical entity, is the more fitting title. It was Poincaré, Marcolongo and Minkowski, who incorporated Stallo’s quadri-dimensional æther into the theory of relativity, not Albert Einstein. Stallo stated in 1847 in the explicit context of four-dimensional “space-time”,

“The abstract totality of extension in itself is devoid of all internal difference and distinction. It is, from its ideal origin and nature, absolutely moving; but this motion is yet perfectly the same as absolute repose. For there are no distinct particles as yet successively occupying distinct spaces; in every respect there is thorough homogenousness. We have absolute multiplicity, but a multiplicity intimately and completely blended in extensive continuous unity. It is indifferent to me whether this primitive matter be called ether, or
any other name be given it; the only thing important is, to keep this absence of further material differentiation in view.”
11 Hilbert’s Proofs Prove Hilbert’s Priority

In 1997, amid much fanfare, Leo Corry announced to the world that he had uncovered proof that Albert Einstein arrived at the generally covariant field equations of gravitation before David Hilbert. Leo Corry joined with Jürgen Renn and John Stachel and published an article in the journal Science arguing against Hilbert’s priority. Their claims were largely based on a set of printer’s proofs of David Hilbert’s 20 November 1915 Göttin gen lecture, which Corry had uncovered. However, in this 1997 article, “Belated Decision in the Hilbert-Einstein Priority Dispute,” Corry, Renn and Stachel failed to disclose the fact that these printer’s proofs were mutilated, and are missing a critical part. Full disclosure of the facts reveals that even in their mutilated state, these proofs prove that Hilbert had a generally covariant theory of gravitation before Einstein.

“Artistic proof is, like artistic anything else, simply a matter of selection. If you know what to put in and what to leave out you can prove anything you like, quite conclusively.”—Anthony Berkeley Cox

11.1 Introduction

David Hilbert presented the generally covariant field equations of gravitation of the general theory of relativity to the Göttin gen Royal Academy of Sciences on 20 November 1915, five days before Albert Einstein presented them to the Royal Prussian Academy of Sciences. In 1978, a letter from Einstein to Hilbert dated 18 November 1915 surfaced, and it proved that Einstein learned these equations from an advanced copy of Hilbert’s work, which Hilbert had sent to Einstein at Einstein’s request.

11.2 Corry, Renn and Stachel’s Baseless Historical Revisionism

In 1997, Leo Corry, of the Cohn Institute for the History and Philosophy of Science and Ideas, University of Tel-Aviv, announced to the world that he believed he had found conclusive proof that Albert Einstein must have arrived at the generally covariant field equations of general relativity before David Hilbert. Corry based this extraordinary claim on a set of printer’s proofs of Hilbert’s 20 November 1915 paper “The Foundations of Physics,” which Corry had “brought to light” having found them in Hilbert’s Nachlaß in the Göttin gen archives.2589 These printer’s proofs of Hilbert’s paper are dated with a printer’s stamp of 6 December 1915 and do not today contain the explicit field equations of gravitation of the general theory of relativity containing the trace term which appeared in the published version of Hilbert’s work. However, the proofs do, even in their present mutilated condition, contain generally covariant field equations of gravitation, which renders Corry, Renn and Stachel’s argument pointless.

In 1997, Corry teamed up with Jürgen Renn, Director of the Max Planck Institute
for the History of Science, Berlin; and John Stachel, an early editor of Einstein’s Collected Papers and currently Director of the Center for Einstein Studies at Boston University. Corry, Renn and John Stachel together published an article in the widely read, multidisciplined journal Science\textsuperscript{2590} declaring that Hilbert had conceded Einstein’s priority, and that Hilbert had not arrived at a generally covariant form of the field equations of gravitation as of 6 December 1915, and deduced them only after Einstein had submitted his presentation on 25 November 1915. This article has since been relied upon by others to deny Hilbert’s priority.\textsuperscript{2591} The story received vast press coverage,\textsuperscript{2592} and some of these news reports stated that Hilbert had plagiarized Einstein’s equations.

When I read this 1997 article “Belated Decision in the Hilbert-Einstein Priority Dispute” in Science I considered it to be in poor taste and illogical, in that it was sensationalistic and the conclusions it contained did not follow from the premises it stated. The article contradicted a well-established fact, acknowledged by Einstein himself. I chose not to mention the article in my recent book Albert Einstein: The Incorrigible Plagiarist.\textsuperscript{2593}

After I published said book in 2002, which twice states that Einstein plagiarized Hilbert’s equations, I began to receive letters of encouragement from physicists around the world. Prof. Friedwardt Winterberg, theoretical physicist at the University of Nevada, Reno, after reading my book requested a copy of the proofs. He informed me that the printer’s proofs of Hilbert’s paper, upon which Corry, Renn and Stachel had relied, were in an incomplete set, which had been mutilated at some point in its history in a way which removed the very equations the Science article claimed were missing from Hilbert’s formulation, which renders Corry, Renn and Stachel’s argument baseless as well as pointless.

Prof. Winterberg submitted a paper to Science refuting the claims of Corry, Renn and Stachel, which Science rejected. Prof. Winterberg then submitted a later version of his paper to the Zeitschrift für Naturforschung, which was published in October of 2004.\textsuperscript{2594} I published an article in The Canberra Times in September of 2002 in which I pointed out that Hilbert was first to deduce the equations and that Einstein plagiarized them with irrational arguments.\textsuperscript{2595} I argued in internet forums for many years prior to the publication of Albert Einstein: The Incorrigible Plagiarist that Einstein plagiarized Hilbert’s work and I publicly called for a forensic investigation of the proofs. When I learned of the mutilation, I spread the word across the world. I informed John Stachel that I intended to publish on the proofs, and he published a negative review of my book Albert Einstein: The Incorrigible Plagiarist, which failed to mention our correspondence and which contained numerous errors, to which I responded in Infinite Energy in 2003.\textsuperscript{2596} In my response I repeatedly pointed out that the facts clearly prove that Einstein plagiarized Hilbert’s equations.

I explained Prof. Winterberg’s arguments in a book I published in 2003 Anticipations of Einstein in the General Theory of Relativity. I also proved in several ways in this book that Einstein must have plagiarized Hilbert’s equations and could not have arrived at them independently, which arguments will here be repeated. I tried to convince Prof. Winterberg of this fact and in 2005 he came to agree with me and submitted a paper to Zeitschrift für Naturforschung which explained my proofs.
of Einstein’s plagiarism and which presented Prof. Winterberg’s insight that Einstein fudged his equations in his 18 November 1915 paper on Mercury to derive the doubled Newtonian prediction of a light ray grazing the limb of the Sun.

The fact that Hilbert’s proofs were mutilated came as a surprise to me, because in their four-page article in *Science* disputing Hilbert’s well-established priority, Corry, Renn and Stachel failed to mention the fact that the printer’s proofs were incomplete, mutilated at some point in their history, and were missing the very section where the equations they claimed Hilbert did not know would originally have been found. While it is true that the printer’s proofs do not today contain the express final form of the field equations of gravitation expressing the trace term, it is also true that the missing mutilated section had room for them, and it is a fact that someone at some point in their history had physically cut out a crucial section of the proofs—no one knows who did the cutting, or when, or why the document was mutilated. We do know that Corry, Renn and Stachel elected to not mention the mutilation in their 1997 article in *Science*. The remainder of the proofs are republished in my book *Anticipations of Einstein in the General Theory of Relativity* as Appendix C; and a facsimile of mutilated page 8 appears in Prof. Winterberg’s October, 2004, article for the *Zeitschrift für Naturforschung*.

In 1998, Dr. Tilman Sauer, of the Institut für Wissenschaftsgeschichte Georg-August-Universität Göttingen, proved that even in their mutilated state these proofs prove that Hilbert had a generally covariant theory of gravitation before Einstein, and still contain generally covariant field equations of gravitation. Dr. Sauer published his findings in the *Archive for History of Exact Sciences* in an article entitled, “The Relativity of Discovery: Hilbert’s First Note on the Foundations of Physics.” In 2004, Professors A. A. Logunov (former Vice-President of the Russian Academy of Sciences and currently Director of the Institute for High Energy Physics in Moscow), V. A. Petrov and M. A. Mestvirishvili also published an important paper discrediting the views of Corry, Renn and Stachel.\(^{2597}\) Corry, Renn and Stachel acknowledged in their 1997 article in *Science* that the fact that Hilbert anticipated Einstein was the “commonly accepted view” “presently accepted[. . .] among physicists and historians of science[. . .]” They excitedly proclaimed in their article in *Science*, “Detailed analysis[. . .] of these proofs[. . .] enabled us to construct an account[. . .] that radically differs from the standard view[,]” but failed to mention that their radical revisionism was based on an incomplete document, which had been mutilated at some point in its history removing the very part which likely contained that which they claimed was missing from Hilbert’s formulation.

John Stachel informed me that he has since made mention of the mutilation in a work he coauthored with Jürgen Renn, “Hilbert’s Foundation of Physics: From a Theory of Everything to a Constituent of General Relativity,” Preprint 118 of the Max-Planck-Institut für Wissenschaftsgeschichte, (1999), which also disputes Hilbert’s priority. This preprint notes the mutilation in at least three separate places, unlike the *Science* article, which failed to mention it even once. It appears that this comparatively obscure preprint, and the public disclosure that the printer’s proofs were mutilated, have not met with anywhere near as much publicity as the *Science*
article’s “Belated Decision” that “Detailed analysis[...] of these proofs[...] enabled us to construct an account[...] that radically differs from the standard view[.]”

The preprint article by Renn and Stachel appeared only after the 1998 article by Dr. Tilman Sauer, which raised the issue of the mutilation of the proofs and formally proved that Hilbert did demonstrate a generally covariant theory of gravitation in the printer’s proofs, as is clear even in the remainder of the mutilated proofs. Renn and Stachel refer to Dr. Sauer’s paper in their 1999 article. One would have hoped that Dr. Sauer’s article would have been sufficient to end Renn and Stachel’s attempts to deny Hilbert’s priority based on the mutilated proofs, which efforts should never have begun.

In addition to Renn and Stachel’s subsequent 1999 article disputing Hilbert’s priority, Vladimir Pavlovich Vizgin, of the S. I. Vavilov Institute of Natural Sciences and Technology, Moscow, published an article as recently as 2001 in the Uspekhi Fizicheskikh Nauk, which denies Hilbert’s well-established priority. Vizgin takes up a good deal of space in his article to thank those who prompted him to write it and supplied him with a copy of the printer’s proofs. Vizgin refers many times to Dr. Sauer’s paper, but does not mention the mutilation of the printer’s proofs, or Dr. Sauer’s arguments which vindicate Hilbert. Vizgin’s paper has since been discredited by Professors A. A. Logunov, V. A. Petrov and M. A. Mestvirishvili.

Though Dr. Sauer proved Hilbert’s priority, he mistakenly believed that Einstein could not have copied Hilbert’s results, and Dr. Sauer’s vague and arbitrary arguments regarding Einstein’s plagiarism do not follow from his premises. There is no evidence or circumstance which would preclude Einstein’s plagiarism. On the contrary, the evidence and the circumstances surrounding Einstein’s publication of the generally covariant field equations of gravitation containing the trace term on 25 November 1915 prove beyond any reasonable doubt that Einstein plagiarized them from David Hilbert. Jürgen Renn, himself, once admitted,

“I had personally come to the conclusion that Einstein plagiarized Hilbert[...] [The] conclusion is almost unavoidable, that Einstein must have copied from Hilbert.”

The Ottawa Citizen, 14 November 1997, Final Edition, page A13, reported in an article entitled “Einstein’s Rival was Relatively Late with Solution: Investigation Removes Stigma of Plagiarism from Scientist’s Milestone Theory” with the byline Roger Highfield, The Daily Telegraph,

“Mr. Renn said yesterday that at first he feared Einstein had stolen Hilbert’s ideas. But this discovery marks ‘one of the very rare cases that one has a smoking gun’ to clear Einstein’s name, he said.”

Corry, Renn and Stachel together wrote in their article in Science,

“[..]the arguments by which Einstein is exculpated are rather weak[.]”
It is odd that a set of mutilated printer’s proofs caused Renn & Co. to reverse such strongly held beliefs. It is stranger still that they failed to mention the mutilation in their sensationalistic article in *Science* in 1997.

In the very first line of their 1999 preprint article, Renn and Stachel again made clear that they sought to overturn a well-established fact,

“Hilbert is commonly seen as having publicly presented the derivation of the field equations of general relativity five days before Einstein on 20 November 1915 — after only half a year’s work on the subject in contrast to Einstein’s eight years of hardship from 1907 to 1915.”

The authors boast of their radically revisionist viewpoint and quote from the renowned expert on general relativity Kip Thorne to show us how well-established is the fact they would have us disavow. Thorne wrote, in agreement with the accepted view of the history,

“Remarkably, Einstein was not the first to discover the correct form of the law of warpage[. . . ]. Recognition for the first discovery must go to Hilbert.”

### 11.3 Historical Background and the Correspondence

By late 1915, Albert Einstein had engaged in an on-again, off-again struggle for many years to express the inertial and gravitational mass equivalence principle, which he learned from Max Planck, in a generally covariant form of gravitational field equations. Einstein was unable to arrive at a solution. He solicited help from Ernst Mach, Marcel Grossmann, and others, but to no avail.

The problem seemed almost insurmountable. Meanwhile, the illustrious mathematician David Hilbert was after an all-encompassing axiomatic theory of physics, which would bring mathematical inference to a fundamental end. Einstein turned to Hilbert to solve the seemingly unsolvable. Employing his axiomatic approach, David Hilbert deduced the generally covariant field equations of gravitation of the general theory of relativity by 13 November 1915, and arrived at them before Albert Einstein. Hilbert probably had deduced these equations in early October of 1915. We know that as late as 18 November 1915, Einstein was still publishing unsuccessful attempts at a general theory of relativity, which depended upon his erroneous field equations of gravitation.

On 13 November 1915, Hilbert wrote to Einstein and informed Einstein that he, Hilbert, had solved the problem,

“But since you are so interested, I would like to lay out my th[eory] in very complete detail on the coming Tuesday[. . . ] I find it ideally beautiful[. . . .] As far as I understand your new pap[er], the solution giv[en] by you is entirely different from mine[. . . .]”
On 15 November 1915, Einstein solicited a copy of Hilbert’s work, before it appeared in final printed form,

“Your analysis interests me tremendously[. . . .] If possible, please send me a correction proof of your study to mitigate my impatience.”

Hilbert, trusting Einstein, sent him a copy of his manuscript, sometime prior to 18 November 1915. Einstein wrote a letter to Hilbert on 18 November 1915, acknowledging that he had received Hilbert’s manuscript and echoed Hilbert’s line expressing hesitation about his understanding of the other’s work. Einstein claimed in this letter that he had independently arrived at Hilbert’s solution, when he had not, and we know that he had not, because the papers Einstein submitted in this period missed the mark. Einstein erroneously claimed,

“The system you furnished agrees—as far as I can see—exactly with what I found in the last few weeks and have presented to the Academy.”

Hermann Weyl wrote in his book *Space-Time-Matter*,

“In the first paper in which Einstein set up the gravitational equations without following on from Hamilton’s Principle, the term $-\frac{1}{2} \delta_{ij} T$ was missing on the right-hand side; he recognised only later that it is required as a result of the energy-momentum-theorem.”

Tilman Sauer noted that Hilbert objected to Weyl’s book, because Weyl failed to explicitly acknowledge Hilbert’s priority, as had Gustav Herglotz. Sauer notes that Herglotz responded to an objection by Hilbert that Herglotz had not acknowledged Hilbert’s priority. Herglotz wrote,

“It is true that I should have specifically referred to the fact that the Tensor $K_{\mu\nu} - \frac{1}{2} g_{\mu\nu} K$ appeared for the very first time in your ‘Foundations [of Physics]’ as the natural consequence of the variation of $\int K \sqrt{g} \, d\nu$.”

“Ich hätte freilich auf das erstmalige natürliche Auftreten des Tensors $K_{\mu\nu} - \frac{1}{2} g_{\mu\nu} K$ als Variation von $\int K \sqrt{g} \, d\nu$ in Ihren ‘Grundlagen’ besonders hinweisen sollen.”

Sauer adds,

“And in a draft of a letter to Weyl, dated 22 April 1918, written after he had read the proofs of the first edition of Weyl’s ‘Raum-Zeit-Materie’ Hilbert also objected to being slighted in Weyl’s exposition. In this letter again ‘in
particular the use of the Riemannian curvature [scalar] in the Hamiltonian integral’ (‘insbesondere die Verwendung der Riemannschen Krümmung unter dem Hamiltonschen Integral’) was claimed as one of his original contributions. SUB Cod. Ms. Hilbert 457/17.”

Dr. Tilman Sauer informs us that,

“Hilbert, in his first communication, introduced gravitational field equations which are derived from a variational principle and which are generally covariant. Thus, in contrast to Einstein’s Entwurf theory and in contrast to Einstein’s first November communication, he did not write down gravitational field equations of restricted covariance, and, in contrast to Einstein’s second November communication, Hilbert did formulate the generally covariant field equations in terms of a variational principle.”

Einstein was furious. He wanted desperately to distinguish himself as progressing beyond the limitations of the special theory of relativity, which was then commonly referred to as the “Lorentz-Einstein theory.” Albert Einstein sought to characterize the general theory of relativity as his achievement. But this dream was destroyed. Hilbert had succeeded where Einstein and his industrious collaborators Marcel Grossmann and Erwin Freundlich had not. Einstein posed the problem to Hilbert, and Hilbert solved it. Hilbert was overly generous in referencing Einstein’s work, to the exclusion of many of Einstein’s predecessors, but Hilbert did not take credit for this work unto himself.

Hilbert presented his equations,

$$\left[ \sqrt{g} K \right]_{\mu \nu} = \sqrt{g} \left( K_{\mu \nu} - \frac{1}{2} K g_{\mu \nu} \right),$$

containing the needed trace term missing in all of Einstein’s work until 25 November 1915, to the Göttingen Royal Academy of Sciences on 20 November 1915. Einstein rushed to plagiarize Hilbert’s equations in a paper submitted to the Berlin Royal Prussian Academy of Sciences on 25 November 1915, with an inductive analysis of Hilbert’s synthesis. Both the “bottom up” axiomatic method of Hilbert, and the “top down” inductive “principle theory” method of Einstein resulted in the same field equations. Einstein’s equations are stated in the following terms:

$$G_{\mu \nu} = -\kappa \left( T_{\mu \nu} - \frac{1}{2} g_{\mu \nu} T \right),$$

and are fully equivalent to Hilbert’s prior work. Einstein does not deduce this equation in his 25 November 1915 paper, but simply copies it from Hilbert’s work, then provides examples to show that it works.

David Hilbert’s former lecture assistant Max Born wrote to Hilbert on 23
November 1915 and acknowledged Hilbert’s priority for the generally covariant field equations of gravitation of the general theory of relativity. Born refers to the equations as Hilbert’s and states that Einstein’s work was subsequent to Hilbert’s and less general, and that Einstein acknowledged that he was using Hilbert’s solution. Einstein could not lie to Born as easily as he lied to Zangger, because Born knew from the lecture notes Dr. Baade had sent Erwin Freundlich that Hilbert had the equations before Einstein. Born’s letter is further proof that Einstein copied from Hilbert. The letter also evinces that Freundlich was the real source of the papers on gravitation and Mercury attributed to Einstein in November of 1915 and of Einstein’s famous review of the general theory of relativity published in *Annalen der Physik* in 1916—Einstein lacked the skills needed to have written it.

Einstein claimed that he was going to solve the problem in the same way that Hilbert already had, therefore he must first have seen Hilbert’s solution. Einstein published his 25 November 1915 paper two days after Born sent his letter in the knowledge that Hilbert had publicly delivered the correct equations before him, but Einstein did not mention Hilbert in his paper. Born obviously knew that Hilbert was first to the equations and Einstein was copying from him, though it was a primitive attempt.

Note that Einstein must have discussed Hilbert’s correct and novel equations with Born, which differed from those of all of Einstein’s papers published before 23 November 1915, because Born states that his knowledge of the new equations Einstein intended to use was derived from discussions with Einstein and only from discussions, not from the 18 November 1915 paper which he had read, and Born was intent to read everything published on the subject. On the day Einstein submitted his Mercury paper on 18 November 1915, or perhaps even later, the editor of the reports in which the paper was published noted on page 803 that Einstein held to his obsolete equations. On this date Einstein received Hilbert’s correct equations, which he subsequently copied. He could not have arrived at the equations independently of Hilbert, because he had Hilbert’s correct equations on hand before adopting them.

When discussing the question with Born, Einstein had just adopted Hilbert’s solution and had no written theory such that Born could only know of Einstein’s plagiarism from discussions with him and with Freundlich. Einstein’s mathematical skills were comparatively poor. The strong emphasis on astronomical observations was demonstrably Freundlich’s influence. While Hilbert more aggressively pursued the microscopic world, Freundlich more aggressively pursued the macroscopic world, but the solution to the gravitational problem was Hilbert’s, not Einstein’s nor Freundlich’s.

Einstein and Freundlich’s inability to ever deduce the relevant equations with the trace term is further proof that they plagiarized Hilbert’s paper and lacked even the creative intelligence needed to induce a complete theory around Hilbert’s results. Einstein was disappointed by Freundlich’s inability to provide him with a synthetic theory he could assert as if his own. Again, Einstein never succeeded in publishing a paper in which he derived the gravitational field equations of the general theory of relativity. He was always forced to simply copy Hilbert’s equations outright in their final form without a derivation and then provide examples that they worked to solve
known problems. This is further proof that neither Einstein nor Freundlich could have independently arrived at the equations before Hilbert, because even after having the equations handed to them, they were unable to derive them, and they could not have independently arrived at the equations without first deriving them. Hilbert, on the other hand, provides a complete proof of how he derived the equations in a logical deduction which proceeded from fundamental axioms.

Prof. Jagdish Mehra wrote,

“In his third and fourth communications on this subject, Lorentz derived the Hilbert-Einstein field equations, in particular Equation (37), by a variation of the gravitational potential for the two cases, namely the \( T_{\mu\nu} \) being due to the electromagnetic or the mechanical part respectively. Altogether Lorentz had produced a complete proof of the equivalence of Einstein’s inductive and Hilbert’s deductive methods, treating all the delicate points clearly and in detail.”

Hans Reichenbach accused Einstein of simply guessing the solution to the problem of generally covariant field equations of gravitation. However, there was no need for Einstein to have guessed at the equations, because Einstein had the benefit of Hilbert’s correct solution on 18 November 1915, before presenting it as if his own on 25 November 1915.

On 26 November 1915, Einstein wrote to Heinrich Zangger and unfairly smeared Hilbert. Einstein even plagiarized Hilbert’s description of the theory as “ideally beautiful,” while smearing Hilbert,

“The theory is beautiful beyond comparison. However, only one colleague has really understood it, and he is seeking to ‘partake’ in it (Abraham’s expression) in a clever way. In my personal experience I have hardly come to know the wretchedness of mankind better than as a result of this theory and everything connected to it.”

This letter is further proof that Einstein plagiarized Hilbert’s work; in that Einstein, on 26 November 1915, averred that Hilbert really understood the theory Einstein presented on 25 November 1915 and sought to appropriate it. The only evidence Einstein had for this statement was Hilbert’s manuscript, which Einstein had received by 18 November 1915, and Dr. Baade’s lecture notes from Hilbert’s presentation of his theory. Given the bizarre hypothesis of Corry, Renn and Stachel, that Hilbert revised his 20 November 1915 manuscript to match Einstein’s 25 November 1915 presentation, Hilbert would have to have become aware of the equations in Einstein’s presentation of 25 November 1915, rewritten his work, and have presented it to Einstein on or before 26 November 1915.

It would not have been physically possible for Hilbert to have learned the equations from Einstein’s 25 November 1915 paper, and then rewritten his, Hilbert’s paper to match Einstein’s, and then to have sent Einstein this hypothetical revised paper, and for Einstein to have then received this hypothetical manuscript, all within
24 hours. And what would it have profited Hilbert to have sent Einstein this fictitious plagiarized work? As Radhakrishnan Srinivasan has eloquently argued, the alternative scenario is the irrational assertion (given the completely unfounded allegation of Corry, Renn and Stachel that Hilbert changed course after coming to know Einstein’s alleged innovation) that Einstein accused Hilbert of plagiarism, before it had supposedly occurred.

In Corry, Renn and Stachel’s revisionist account, one must choose between the impossible and the irrational, while excluding the obvious. Their 1997 article would have us make this Hobson’s choice without the knowledge that Hilbert’s proofs were mutilated—without the knowledge that they have no basis for their bizarre revisionism.

Corry, Renn and Stachel attempt to make much of Einstein’s 18 November 1915 letter to Hilbert. They claim that this letter was a sharp reaction against Hilbert. Despite Corry, Renn and Stachel’s obfuscation, this alleged reaction by Einstein would have been for Hilbert’s claiming originality for deducing the generally covariant field equations of gravitation, before Einstein, as claimed by Hilbert in his paper. However, Corry, Renn and Stachel aver that Hilbert had not yet deduced these equations. Their argument, when brought into agreement with the known facts, is self-contradictory. In addition, Einstein’s letter, in contradiction to Corry, Renn and Stachel’s claim of bitter arguer, is ostensibly friendly, though Einstein’s assertion that he had developed the exact same result as Hilbert was evidently an intentional falsehood—Einstein coyly tried to deceive Hilbert into believing he had been anticipated, when he had not—and Hilbert responded to Einstein’s lies and contradicted them. If Einstein had hoped that he could dissuade Hilbert from publishing Hilbert’s results, Einstein was mistaken.

“Einstein’s” theory is really the melding of Ernst Mach’s ideas with those of Marcel Grossmann, as completed by David Hilbert, and then transcribed by Erwin Freundlich and stamped with Einstein’s name. Einstein and Grossmann together published A. Einstein and M. Grossmann, Entwurf einer verallgemeinerten Relativitätstheorie und einer Theorie der Gravitation. I. Physikalischer Teil, von Albert Einstein; II. Mathematischer Teil, von Marcel Grossmann, B. G. Teubner, Leipzig, (1913); reprinted in Zeitschrift für Mathematik und Physik, Volume 62, (1914), pp. 225-259 and “Kovarianzeigenschaften der Feldgleichungen der auf die verallgemeinerte Relativitätstheorie gegründeten Gravitationstheorie”, Zeitschrift für Mathematik und Physik, Volume 63, (1914), pp. 215-225. In 1913 and 1914, Einstein repeatedly credited Mach as the source of Einstein’s contribution to what Einstein repeatedly and expressly called the “Einstein-Grossmann theory”, and Einstein expressly stated again and again that this theory was a collaboration between him and Grossmann.

It is important to note that Einstein credits Marcel Grossmann with participating in the development of the field equations in Einstein’s 18 November 1915 letter to Hilbert and in Einstein’s review article for the Annalen der Physik in 1916, but Einstein demeaned his close friend and teacher Marcel Grossmann and relegated Grossmann to the status of a lackey in a letter to Arnold Sommerfeld dated 15 July 1915, and Einstein makes no mention of Grossmann, Besso, Hilbert or Freundlich
in Einstein’s 25 November 1915 paper. Therefore, we have several proven examples of Einstein’s appropriation of his trusting colleagues’ work in this one 25 November 1915 paper. In Einstein’s 1916 article on general relativity for the *Annalen der Physik*, Einstein gives Hilbert a minor reference, and gives Grossmann only a token mention in the introduction, which introduction is missing in the English reprint of this article in the book *The Principle of Relativity*.2627

The facts, examined without bias and in the full light of day, are consistent and clear. On 18 November 1915, Einstein, by lying to him, attempted to dissuade Hilbert from publishing Hilbert’s generally covariant theory of gravitation. Hilbert was not dissuaded and presented his work on 20 November 1915. Einstein plagiarized Hilbert’s work on 25 November 1915, and then immediately instigated a smear campaign against Hilbert in a 26 November 1915 letter to Heinrich Zangger.

In this period of his life, Einstein had unnecessarily brought enormous pressures upon himself and in this period of his life, Albert Einstein viciously betrayed the trust of many of those who were closest to him. In the same letter to Zangger, Albert Einstein unfairly smears Mileva Einstein-Marity, his first wife, in the next paragraph after unfairly smearing David Hilbert.

In one letter, Albert Einstein blamed Mileva Einstein-Marity for the problems Albert had created with their children and Einstein accused Hilbert of the plagiarism *Einstein* had committed. In one paper, Albert Einstein sought to appropriate the contributions of his friends Marcel Grossmann and Erwin Freundlich, and the man who had trusted in him and who had solved a problem he had long sought to solve, David Hilbert.

Hilbert resented Einstein’s plagiarism. Einstein wrote to Hilbert on 20 December 1915 and stated,

“There has been a certain ill-feeling between us[.]”2628

Hilbert would have had no grounds for hostility towards Einstein, unless Einstein had plagiarized his work. Einstein resented Hilbert for daring to publish the results Einstein could not achieve without knowledge of Hilbert’s solution.

Einstein failed to mention that he was adopting Hilbert’s work, until 1916, when Hilbert forced Einstein to publicly acknowledge Hilbert’s priority. Einstein referred his readers to Hilbert’s 20 November 1915 paper in Einstein’s 1916 review article on the general theory of relativity “Die Grundlage der allgemeinen Relativitätstheorie” for *Annalen der Physik*, Series 4, Volume 49, Number 7, pages769-822, at 810,

Prof. Jagdish Mehra, who greatly admires Einstein, wrote in this context that Einstein was less than fair when referencing Hilbert’s work,
“Hilbert, in retrospect, could not have been satisfied by this weak reference to his work. In a sense, Einstein had ‘appropriated’ Hilbert’s contribution to the gravitational field equations as a march of his own ideas—or so it would seem from the reading of his 1916 Ann. d. Phys. paper on the foundations of general relativity.”

Hilbert wrote in the published version of his 1915 lecture in defense of his priority,

“It appears to me that the differential equations of gravitation arrived at in [my] way are in agreement with those of Einstein in his subsequent papers setting forth the broad theory of general relativity.”

As Prof. Mehra has noted, Hilbert again declared his priority in 1924. Hilbert wrote,

“Einstein [. . .] in his last publications ultimately returns directly to the equations of my theory.”

As was already mentioned, Tilman Sauer has shown that David Hilbert asked Hermann Weyl and Gustav Herglotz to recognize his priority.

Albert Einstein, himself, repeatedly, though somewhat resentfully, acknowledged Hilbert’s priority in 1916, though Einstein had given no one else their due credit in 1915,

“The general theory of relativity has recently been given in a particularly clear form by H. A. Lorentz and D. Hilbert, [Footnote: Four papers by Lorentz in the Publications of the Koninkl. Akad. van Wetensc. te Amsterdam, 1915 and 1916; D. Hilbert, Göttinger Nachr., 1915, Part 3.] who have deduced its equations from one single principle of variation. The same thing will be done in the present paper. But my purpose here is to present the fundamental connexions in as perspicuous a manner as possible, and in as general terms as is permissible from the point of view of the general theory of relativity. In particular we shall make as few specializing assumptions as possible, in marked contrast to Hilbert’s treatment of the subject. On the other hand, in antithesis to my own most recent treatment of the subject, there is to be complete liberty in the choice of the system of co-ordinates.”

In 1919, Einstein again simply asserted Hilbert’s equations without a derivation in a fallacy of Petition Principii without a deductive synthesis and in full knowledge of Hilbert’s work, and again acknowledged David Hilbert’s priority,

“In spite of the beauty of the formal structure of this theory, as erected by Mie, Hilbert, and Weyl, its physical results have hitherto been unsatisfactory. [***] So far the general theory of relativity has made no change in this state
of the question. If we for the moment disregard the additional cosmological
term, the field equations take the form

\[ G_{\mu\nu} - \frac{1}{2} g_{\mu\nu} G = -\kappa T_{\mu\nu} \quad \ldots \quad (1) \]

where \( G_{\mu\nu} \) denotes the contracted Riemann tensor of curvature, \( G \) the scalar
of curvature formed by repeated contraction, and \( T_{\mu\nu} \) the energy-tensor of
‘matter.’ The assumption that the \( T_{\mu\nu} \) do \textit{not} depend on the derivatives of the
\( G_{\mu\nu} \) is in keeping with the historical development of these equations. For
these quantities are, of course, the energy components in the sense of the
special theory of relativity, in which variable \( g_{\mu\nu} \) do not occur. The second
term on the left-hand side of the equation is so chosen that the divergence of
the left-hand side of (1) vanishes identically, so that taking the divergence of
(1), we obtain the equation

\[ \frac{\partial T^\sigma_\mu}{\partial x^\nu} + \frac{1}{2} \varepsilon^{\sigma\tau\rho} T_{\rho\tau\nu} = 0 \quad \ldots \quad (2) \]

which in the limiting case of the special theory of relativity gives the
complete equations of conservation

\[ \frac{\partial T^\mu_\nu}{\partial x^\nu} = 0. \]

Therein lies the physical foundation for the second term of the left-hand side
of (1). It is by no means settled \textit{a priori} that a limiting transition of this kind
has any possible meaning. [**] Thus if we hold to

\[ [G_{\mu\nu} - \frac{1}{2} g_{\mu\nu} G = -\kappa T_{\mu\nu}] \]

we are driven on to the path of Mie’s theory.

Emil Wiechert,\textsuperscript{2635} Gustav Mie,\textsuperscript{2636} Felix Klein,\textsuperscript{2637} Hermann Weyl,\textsuperscript{2638} Wolfgang
Pauli,\textsuperscript{2639} Friedrich Kottler,\textsuperscript{2640} Sir Joseph Larmor,\textsuperscript{2641} Sir William Cecil Dampier,\textsuperscript{2642}
Sir Edmund Whittaker,\textsuperscript{2643} and many others, have acknowledged Hilbert’s work of
20 November 1915, with most acknowledging that Hilbert was first to the equations.
In 1974, Jagdish Mehra presented the most comprehensive treatment of the subject
ever published.\textsuperscript{2644} Prof. Mehra’s thoroughly documented treatise was met with great
enthusiasm and it prompted a sudden surge of research into the origins of the general
theory of relativity.

Damning evidence against Einstein appeared in 1978\textsuperscript{2645} in the form of Einstein’s
18 November 1915 letter to Hilbert acknowledging receipt of Hilbert’s manuscript,
before Einstein’s 25 November 1915 presentation. This letter proves Einstein’s plagiarism; in that Einstein could not have arrived at the equations independently of Hilbert, in spite of the fact that Einstein did not credit Hilbert with providing the solution in Einstein’s presentation of 25 November 1915. Max Born’s letter to David Hilbert has provided yet more proof of Einstein’s plagiarism—as have the printer’s proofs.

11.4 Hilbert’s Proofs Prove Hilbert’s Priority

Even though Corry’s claims that Einstein anticipated Hilbert are clearly untenable, Corry’s discovery is not without some redeeming historical value. Corry correctly notes that Hilbert changed his final published work from the version printed in the proofs. Prof. Winterberg believes this was done in cooperation with Felix Klein in an effort to render Hilbert’s paper clearer. This in no way casts doubt on Hilbert’s priority.

It is my opinion that the proofs are of secondary importance to the fact that Klein, Born, Hilbert and Einstein each acknowledged that Hilbert was first to the covariant equations. They are, after all, printer’s proofs which were rejected, and printer’s proofs are often inaccurate representations of the author’s work. An entire block of text and/or equations may have been missed or misrepresented by the typesetter.

Beyond that, the proofs are in a mutilated and incomplete condition. The burden of proof lies with the radical revisionists Corry, Renn and Stachel, and in the full light of day, we see that they have no evidence to support their absurd claim.

In marked contrast to Corry, Renn and Stachel’s baseless revisionism, Dr. Tilman Sauer and Prof. Friedwardt Winterberg have set forth compelling arguments, which demonstrate that even in their mutilated state the proofs prove that Hilbert had a generally covariant theory of gravitation and these incomplete proofs do present, even in their mutilated state, generally covariant field equations of gravitation.

Dr. Sauer wrote,

“Hilbert, in his communication, introduced gravitational field equations which are derived from a variational principle and which are generally covariant. Thus, in contrast to Einstein’s Entwurf theory and in contrast to Einstein’s first November communication, he did not write down gravitational field equations of restricted covariance, and, in contrast to Einstein’s second November communication, Hilbert did formulate the generally covariant field equations in terms of a variational principle.”

However, Dr. Sauer also states,

“In the proofs, the field equations are not explicitly specified.”

Prof. Winterberg argues that they were present—before the proofs were defaced by some unknown person.

The upper portion of page 8 of the printer’s proofs is missing about twenty-five
percent of the text block which was original to it. As a result, several lines of the original text are missing from the top of the page and at least two equations, numbered equations (14) and (17), are known to be missing. About twenty text lines worth of material in total has been obliterated, including about ten lines from the top of page 8. It appears that it was this material the person who defaced the proofs intended to remove, because the wandering cut splits a line on page 7, but is an even break on page 8.

Sauer, Winterberg, Renn and Stachel agree that this missing section of the proofs contained equation (17), which they believe was,

$$H = K + L.$$

This equation appears in the published version of Hilbert’s lecture as equation (20). Prof. Winterberg has noted that on page 404, the published paper proceeds from this equation as follows:

“Es bleibt noch übrig, bei der Annahme

(20)\[ H = K + L, \]

direkt zu zeigen, wie die oben aufgestellten verallgemeinerten Maxwellschen Gleichungen (5) eine Folge der Gravitationsgleichungen (4) in dem oben angegebenen Sinne sind.

Unter Verwendung der vorhin eingeführten Bezeichnungsweise für die Variationsableitungen bezüglich der $g^{\mu\nu}$ erhalten die Gravitationsgleichungen wegen (20) die Gestalt

(21)\[ \left[ \sqrt{g} K \right]_{\mu\nu} + \frac{\partial \sqrt{g} L}{\partial g^{\mu\nu}} = 0. \]

Das erste Glied linker Hand wird

\[ \left[ \sqrt{g} K \right]_{\mu\nu} = \sqrt{g} \left( K_{\mu\nu} - \frac{1}{2} Kg_{\mu\nu} \right). \]

Therefore, Prof. Winterberg contends, the missing section of the proofs contained the unnumbered equation of the variational derivative with the trace term,

\[ \left[ \sqrt{g} K \right]_{\mu\nu} = \sqrt{g} \left( K_{\mu\nu} - \frac{1}{2} Kg_{\mu\nu} \right), \]

which Prof. Winterberg notes appeared in the published version following the equation $H = K + L$ and equation (21):
\[
\left[\sqrt{g} K\right]_{\mu\nu} + \frac{\partial \sqrt{g} L}{\partial g^{\mu\nu}} = 0.
\]

Prof. Winterberg also holds that, even if we assume the proofs did not originally include the unnumbered equation for the variational derivative,

\[
\left[\sqrt{g} K\right]_{\mu\nu} = \sqrt{g} \left( K_{\mu\nu} - \frac{1}{2} K g_{\mu\nu} \right),
\]

it is still certain that Hilbert had arrived at the generally covariant field equations of gravitation. Prof. Winterberg states that one need only express, “the variational derivative of the Lagrangian \( H = K + L \) in Hilbert’s variational principle,

\[
\delta \int H \sqrt{g} \, dt = 0,
\]

where, apart from the surface terms which vanish at \( \infty \),

\[
\delta \int K \sqrt{g} \, dt = \int \left( K_{\mu\nu} - \frac{1}{2} K g_{\mu\nu} \right) \delta g^{\mu\nu} \sqrt{g} \, dt.
\]

Winterberg further observes that the printer’s proofs, at equation (26), give an abbreviated statement of the field equations of gravitation,

\[
\left[\sqrt{g} K\right]_{\mu\nu} + \frac{\partial \sqrt{g} L}{\partial g^{\mu\nu}} = 0,
\]

which, according to Prof. Winterberg, is identical to the equation,

\[
K_{\mu\nu} - \frac{1}{2} K g_{\mu\nu} = \text{const.} \, T_{\mu\nu}.
\]

It is interesting to note that Hilbert changed a key phrase in the published paper, which appeared after Einstein had plagiarized Hilbert’s equations, from: “in dem von Einstein geforderten Sinne” or, “in the sense requested by Einstein” in the proofs at page 13, to: “in dem von Einstein dargelegten Sinne” or, “in the sense stated by Einstein” in the published paper at page 407, which indicates that it was Einstein who adopted Hilbert’s solution, without an attribution.

### 11.5 A Question of Character

The difference in character between David Hilbert and Albert Einstein can be
The Manufacture and Sale of St. Einstein

summed up by their respective attitudes towards women (in Einstein’s case, 
*disrespectful*). Hilbert championed women’s rights and fought hard for Emmy 
Noether’s acceptance as a *Privatdozent* at Göttingen. When it was objected that if 
Noether became a *Privatdozent* she might one day enter the University’s Senate, 
Hilbert famously responded that the sex of a candidate was not an issue, for, after all, 
“the Senate is not a bath house!”

Albert Einstein was a misogynist. Einstein stated,

“We men are deplorable, dependent creatures. But compared with these 
women, every one of us is king, for he stands more or less on his own two 
feet, not constantly waiting for something outside of himself to cling to. 
They, however, always wait for someone to come along who will use them 
as he sees fit. If this does not happen, they simply fall to pieces.”

Albert Einstein believed,

“where you females are concerned, your production centre is not situated in 
the brain.”

and,

“Women are there to cook and nothing else.”

Peter A. Bucky wrote in his book *The Private Albert Einstein*,

“[Einstein] once told one of his female students that women are not gifted as 
thoretical physicists and that he would never allow a daughter of his to 
study physics. [***] [Einstein] once wrote in a letter to a friend, a Dr. 
Muesham in Haifa, that his definition of a good wife was someone who stood 
somewhere between a pig and a chronic cleaner.”

There are allegations that Albert Einstein may have beaten his first wife Mileva 
Marić and their children. Einstein’s son, Hans Albert Einstein, stated, “Oh, he 
beat me up, just like anyone else would do.” Einstein cruelly abandoned Marić 
during her pregnancy with their first child Lieserl. The fate of this poor child, who 
vanished from the record early in life, is to this day a mystery.

Brutality was nothing new to Albert Einstein. As a child, Albert Einstein 
physically abused his sister Maja, and attacked his violin instructor. Maja Winteler-
Einstein wrote in her biography of Albert,

“The usually calm small boy had inherited from grandfather Koch a tendency 
toward violent temper tantrums. At such moments his face would turn 
completely yellow, the tip of his nose snow-white, and he was no longer in 
control of himself. On one such occasion he grabbed a chair and struck at his 
teacher, who was so frightened that she ran away terrified and was never seen
again. Another time he threw a large bowling ball at his little sister’s head; a third time he used a child’s hoe to knock a hole in her head.”

There are many accounts which portray Einstein as incontinent. According to some accounts, Einstein was perhaps even a foul-mouthed syphilitic, who likely contracted the disease from his many encounters with prostitutes. Albert Einstein was, by his own admission on 23 December 1918, an incestuous adulterer at the time he plagiarized Hilbert’s work.

Einstein stated,

“It is correct that I committed adultery. I have been living together with my cousin, Elsa Einstein, divorced Löwenthal, for about 4 1/2 years and have been continuing these intimate relations since then.”

Albert Einstein was a blood relative with his second wife Elsa Einstein through both his mother and his father. Einstein even felt that he had the option to choose between a marriage with his cousin Elsa, or one of her young daughters, whom he aggressively pursued, much to her disgust. Dismayed, Ilse Einstein wrote to Georg Nicolai about Albert Einstein’s sexual advances toward her,

“I have never wished nor felt the least desire to be close to [Albert Einstein] physically. This is otherwise in his case—recently at least.—He himself even admitted to me once how difficult it is for him to keep himself in check.”

Albert Einstein was perhaps dissuaded from his perverse wish to marry Ilse Einstein by his uncle Rudolf Einstein’s (Rudolf Einstein was Elsa Einstein’s father and Ilse Einstein’s grandfather, as well as Albert Einstein’s uncle and father-in-law) dowry of 100,000 Marks, which Albert Einstein accepted when he married his cousin Else—Albert continued to have access to Ilse. Dennis Overbye tells the story of Ilse Einstein’s letter to Georg Nicolai of 22 May 1918 in which she complains of Albert Einstein’s sexual advances towards her. Albert Einstein was conducting an incestuous and adulterous relationship with her mother, his cousin, Elsa Einstein at the time. Overbye states that Wolf Zuelzer preserved the letter,

“despite pressure from Margot Einstein, Helen Dukas, and lawyers representing the Einstein estate to surrender it or destroy it. The tale, an example of the difficulties scholars have faced in telling the Einstein story, is preserved in Zuelzer’s correspondence in the American Heritage archive at the University of Wyoming.”

Marrying Else enabled Einstein to have her and her daughters. Einstein referred to his wife and cousin Elsa Einstein, and her two daughters, as his “small harem”. Einstein wrote to Max Born, in an undated letter thought to have been written sometime between 24 June 1918 and 2 August 1918,
“We are well, and the small harem eat well and are thriving.”

Philipp Frank wrote,

“Einstein’s wife Elsa died in 1936. Of Einstein’s two stepdaughters, one died after leaving Germany; the other, Margot, a talented sculptress, was divorced from her husband and now lives mostly with Einstein in Princeton.”

Even this might not have been enough for Einstein. There are reasons to believe he had an affair with Elsa’s sister, Paula, another of Albert Einstein’s cousins. Einstein’s son, Hans Albert Einstein, believed that his father was having an affair with his father’s secretary Helen Dukas. After decades of disingenuous hype promoting Einstein as an angelic figure, it is necessary to show that he was not only capable of plagiarism, but that we know for a fact that he committed far worse moral offenses—Albert Einstein’s plagiarism is among the least of his many psychopathic sins. Einstein attempted to blame his psychopathic personality on an old professor from Munich he once visited after becoming a professor himself. The professor could not remember Einstein. Einstein told Peter A. Bucky,

“For some reason, this made me realize that I was on my own, so to speak—fully independent in respect to everybody—and I felt after that that I owed no obligation to any individual.”

Albert Einstein told Peter A. Bucky,

“I was, as a matter of fact, the only Jewish child in the school. This actually worked to my advantage, since it made it easier for me to isolate myself from the rest of the class and find that comfort in solitude that I so cherished.”

It is helpful to know Einstein’s habits. Einstein clearly plagiarized the special theory of relativity, as well as many important aspects of the general theory of relativity from Henri Poincaré and Hendrik Antoon Lorentz. In fact, Einstein evinced a career-long pattern of plagiarism, and has often been accused of appropriating the work of others, accusations he most often tried to avoid, and never refuted. For example, in 1916, when Gehrcke effectively accused Einstein of plagiarizing Gerber’s formula for the perihelion motion of Mercury, Einstein wrote to Willy Wien,

“[. . .] I am not going to respond to Gehrcke’s tasteless and superficial attacks, because any informed reader can do this himself.”

Einstein had quite a reputation as a plagiarist throughout his career. Einstein’s plagiarism became an international scandal in the early 1920’s.
11.6 A Question of Ability

David Hilbert is remembered as one of the most brilliant mathematical minds in all of history. He did not guess at the generally covariant field equations of gravitation. Unlike Einstein, Hilbert did not inductively fabricate by *Petitio Principii* the derivation of these equations from the known result. Hilbert deduced the generally covariant field equations of gravitation from a variational principle in an axiomatic synthesis.

McCrea wrote in 1933,

“GENERAL RELATIVITY
This theory has never been placed on an axiomatic basis. Einstein himself in his original development of it explicitly refrained from any attempt to do so (and his followers have remained loyal to his example!) The first stage of the theory is to represent space-time by means of a four-dimensional Riemannian space. (This gives at once as a pragmatic reason for the absence of an axiomatic development the great difficulty of formulating axioms for differential geometry. Any system of axioms for general relativity would have to include ones corresponding to those of the differential geometry of Riemannian space). This is usually treated as a generalisation of the result that the consequences of the theory of special relativity may be represented by means of Minkowski geometry, the generalisation being guided by the Principle of Equivalence and the Principal of Covariance. Or use may be made of the arguments, extended to four dimensions, which Riemann himself gave for regarding what is now known as Riemannian geometry as a natural extension of euclidean geometry and for its possible applications in physics. But either way we get only plausibility arguments which lead to the attitude, Let us try what consequences follow from assuming that the geometry of space-time may be a general Riemannian geometry instead of Minkowski geometry. That this step is a very tentative one is shown by the immense amount of research to which a further analysis of it can lead. In particular the usual developments do not at this stage enter into the problem of what a system of coordinates in space-time means in terms of possible observations by an observer belonging to it. The whole thing is in fact an example of *hypothesis suggested by mathematical form*, a feature which is not present in any purely deductive theory, of which we say a little more later on.”

Albert Einstein was not a mathematically minded person. Albert Einstein stated, “I am not a mathematician.” Einstein also famously stated,

“Since the mathematicians have attacked the relativity theory, I myself no longer understand it anymore.”

Einstein’s son-in-law, Rudolf Kayser (a. k. a. Anton Reiser) records that, while Einstein was studying,
“He showed very little love for [the] study [of mathematics], which seemed to him rather limitless in relation to other sciences. No one could stir him to visit the mathematical seminars.”

While still a child, Einstein’s parents and teachers suspected that he was mentally retarded. Numerous eyewitnesses (literally) described Albert Einstein’s vacant childlike eyes and childlike behavior and naïveté. For example, when Einstein arrived in America in 1921, *The New York Times*, (3 April 1921), described Einstein on the front page:

> “Under a high, broad forehead are large and luminous eyes, almost childlike in their simplicity and unworldliness.”

Charles Nordmann, who chauffeured Einstein around France, sarcastically described him as a vacant-eyed simian clod. Nordmann sarcastically ranked Einstein with Newton, Des Cartes or Henri Poincaré—from whom Einstein had copied the principle of relativity. Like Rabelais and Voltaire before him, Nordmann lavished sarcastic praise on the new hero and derided him in ways which would elude the unsophisticated, but which were clear to those knowledgeable of the facts. Nordmann was careful not to be too blunt, for he wished to advocate the theory of relativity, and it was politically expedient for him to ride on Einstein’s coat tails, but Nordmann never failed to get his digs in. Charles Nordmann wrote,

> “Einstein is big (he is about 1 m 76), with large shoulders and the back only very slightly bent. His head, the head where the world of science has been recreated, immediately attracts and fixes the attention. His skull is clearly, and to an extraordinary degree, brachycephalic, great in breadth and receding towards the nape of the neck without exceeding the vertical. Here is an illustration which brings to nought the old assurances of the phrenologists and of certain biologists, according to which genius is the prerogative of the dolichocephales. The skull of Einstein reminds me, above all else, of that of Renan, who was also a brachycephale. As with Renan the forehead is huge; its breadth exceptional, its spherical form striking one more than its height. A few horizontal folds cross this moving face which is sometimes cut, at moments of concentration or thought, by two deep vertical furrows which raise his eyebrows.

> His complexion is smooth, unpolished, of a certain duskiness, bright. A small moustache, dark and very short, decorates a sensual mouth, very red, fairly large, whose corners gradually rise in a smooth and permanent smile. The nose, of simple shape, is slightly aquiline.

> Under his eyebrows, whose lines seem to converge towards the middle of his forehead, appear two very deep eyes whose grave and melancholy expression contrast with the smile of this pagan mouth. The expression is usually distant, as though fixed on infinity, at times slightly clouded over. This gives his general expression a touch of inspiration and of sadness which
accentuates once again the creases produced by reflection and which, almost linking with his eyelids, lengthen his eyes, as though with a touch of kohl. Very black hair, flecked with silver, unkempt, falls in curls towards the nape of his neck and his ears, after having been brought straight up, like a frozen wave, above his forehead.

Above all, the impression is one of disconcerting youth, strongly romantic, and at certain moments evoking in me the irrepressible idea of a young Beethoven, on which meditation had already left its mark, and who had once been beautiful. And then, suddenly, laughter breaks out and one sees a student. Thus appeared to us the man who has plumbed with his mind, deeper than any before him, the astonishing depths of the mysterious universe.**2682

Albert Einstein would often simply agree with whomever he had last spoken,**2683 and it is likely that he was little more than a mere parrot. Upon meeting with colleagues, he would often grill them for information on their theories, seemingly soaking it all in to repeat it later as if the ideas were his own.

Certain anecdotal accounts paint Einstein in a bad light. Upon refusing to brush his teeth, Einstein allegedly proclaimed that, “pigs’ bristles can drill through diamond, so how should my teeth stand up to them?”**2684 Explaining why he didn’t wear a hat in the rain, he asserted that hair dries faster than hats, and irritably asserted that such was obvious. It apparently eluded him that the objective was, in the first place, to keep the hair dry. Explaining why he didn’t wear socks, Einstein commented, “When I was young I found out that the big toe always ends up by making a hole in the sock. So I stopped wearing socks**2685 and “What use are socks? They only produce holes.”**2686 Felix Klein told Wolfgang Pauli that Einstein wrote to him that Klein’s paper**2687 delighted him like a child given a bar of chocolate by his mommy.**2688 The New York Times reported on 6 November 1927 on page 22 that Einstein forgot his bags in the waiting room when boarding a train in Gare de l’Est. The New York Times reported on 13 July 1924 on page 22 in an article entitled, “Einstein Counted Wrong”, that Einstein counted the change a street car conductor had given him:

“After counting it hurriedly, Einstein insisted that the conductor had made a mistake. The latter recounted the change deliberately, explaining to Herr Einstein that it was correct, and then turned to the next passenger with a shrug of his shoulders and the remark:

‘His arithmetic is weak.’”

Einstein’s private physician Prof. Janos Plesch wrote,

“Einstein never took any exercise beyond a short walk when he felt like it (which wasn’t often, because he has no sense of direction, and therefore would seldom venture far afield), and whatever he got sailing his boat, though that was sometimes quite arduous—not the sailing exactly, but the
row home of the heavy yacht in the evening calm when there wasn’t a breath of air to stretch the sails.”

Peter A. Bucky recounted many such anecdotes and told how Einstein had decided to live in one room as opposed to four so that the next time he lost a button from his shirt it would be easier to find.

Einstein was taken in by a con man named Otto Reiman, who convinced Einstein that he could describe a person after blindly touching a sample of his or her handwriting. Many physicists including Albert Einstein, A. E. Dolbear and Sir Oliver Lodge, believed in telepathy; but Einstein was perhaps the only one to find proof of it in the fact that we humans do not have skins as thick as an elephant’s hide.

Albert Einstein was taken in by the psychic Roman Ostoja and attended a séance with Upton Sinclair. Einstein wrote a preface for the Thomas edition of Upton Sinclair’s book on telepathy, Mental Radio, in which Einstein—“the greatest mind in the world”—asked that psychologists seriously consider Sinclair’s findings.

Elsa Einstein was Albert Einstein’s second wife and his cousin and they were related by blood through both her mother and father. The inbred Einsteins were as arrogant as they were ridiculous. Denis Brian wrote in his book Einstein: A Life, “The Sinclairs arranged for Einstein to meet some of their distinguished writer friends for dinner at the exclusive Town House in Los Angeles. When Einstein arrived, he somehow missed the cloakroom and appeared in the dining room wearing a ‘humble’ black overcoat and a much-worn hat. In what might have been a scene from a Chaplin film, he removed his overcoat, ‘folded it neatly, and laid it on the floor in a vacant corner and set the hat on top of it. Then he was ready to meet the literary elite of Southern California.’ There was even something Chaplinesque in the way Einstein flirted with the attractive women, while Elsa—‘my old lady’ he called her—was at his elbow.

Elsa confirmed Mrs. Sinclair’s view of her as a dutiful and utterly devoted German hausfrau during a discussion about God. Einstein had stated his belief in God, but not a personal God—a distinction which Mrs. Sinclair didn’t get. She replied, ‘Surely the personality of God must include all other personalities.’ Afterwards, Elsa gently admonished Mrs. Sinclair for arguing with Albert, adding, ‘You know, my husband has the greatest mind in the world.’ ‘Yes, I know,’ said Mrs. Sinclair, ‘but surely he doesn’t know everything!’

Though Roman Ostoja was unable to conjure up a ghost for Albert Einstein, the media were able to put the American public into a trance-like state of adulation. Brian continued,

“Back in his gift-strewn cottage Einstein found tangible evidence that ‘America was prepared to go mad over him.’ A millionairess gave Caltech
$10,000 for the privilege of meeting him.”

Peter Michelmore tells a story of how Einstein dropped his saliva saturated cigar butt into the dust, then unashamedly picked up the gritty stub and shoved it back into his mouth defiantly declaring, “I don’t care a straw for germs.” R. S. Shankland records that Einstein,

“apparently put his cigarette into his coat pocket, and as we took off our coats he had a small conflagration in his.”

Einstein wasn’t too handy around the house, and seemingly had a difficult time conceptualizing geometric problems. In a joke perhaps first told of Ampère, it was said that Einstein insisted that two holes be bored through his front door, one larger than the other, so that both the large cat, and the small cat, could pass through the door. This anecdote is significant, because it is a historical indication of the low esteem in which some of the people who had met Einstein held his intelligence. After meeting Einstein, Max von Laue found it difficult to believe that Einstein had written the 1905 paper,

“[T]he young man who met me made such an unexpected impression on me, that I did not believe him to be capable of being the father of the theory of relativity.”

“[D]er junge Mann, der mir entgegen kam, machte mir einen so unerwarteten Eindruck, daß ich nicht glaubte, er könne der Vater der Relativitätstheorie sein.”

Minkowski, who had been Einstein’s professor, found it difficult to believe that “lazy” Einstein had written the 1905 paper. Minkowski did not think Einstein capable of it. Minkowski thought that Einstein was a poor mathematician. According to both Heaviside and Born, Minkowski anticipated Einstein. Max Born wrote in his autobiography,

“I went to Cologne, met Minkowski and heard his celebrated lecture ‘Space and Time’, delivered on 21 September 1908. Outside the circle of physicists and mathematicians, Minkowski’s contribution to relativity is hardly known. Yet it is upon his work that the imposing structures of modern field theories have been built. He discovered the formal equivalence of the three space coordinates and the time variable, and developed the transformation theory in this four-dimensional universe. He told me later that it came to him as a great shock when Einstein published his paper in which the equivalence of the different local times of observers moving relative to each other was pronounced; for he had reached the same conclusions independently but did not publish them because he wished first to work out the mathematical structure in all its splendour. He never made a priority claim and always gave
Einstein his full share in the great discovery. After having heard Minkowski speak about his ideas, my mind was made up at once. I would go to Göttingen and to help him in his work.**

On 2 February 1920, Albert Einstein wrote a letter to Paul Ehrenfest, in which Einstein made obvious blunders in his arithmetic,

“I have received the 10000 marks.[1] The accounting now looks like this: 16500 marks is what the grand piano costs, 239 marks is the cost of packing, delivery to the train station, and export permit. Remainder is 111 marks,[2] which is consequently being applied toward the violins.[3]**

Ehrenfests response to Einstein of 8 February 1920 is telling and hints that he knew that Einstein was incompetent beyond mere questions of finances,

“We had a great laugh today about your brilliant miscalculation. You write the following, verbatim:
‘I have received the 10000 marks. The acct. looks like this: 16500 marks is what the grand piano costs, 239 marks is the cost of packing, delivery —. Remainder is 111 marks, which is consequently being applied toward the violins.’[4]

God said, ‘Let Einstein be’ and all was skew! — A nice non-Euclidity in the series of numbers! !— After this exercise, I understand perfectly why destitution [Dallessicität] is your normal state!![5]**

Abraham Pais tells a revealing story of one of Einstein’s blunders.** Einstein, himself, described his goals, strengths and limitations as follows in an essay dated 18 September 1896,

“They are, most of all, my individual inclination for abstract and mathematical thinking, lack of imagination and of practical sense.”**

Einstein later found himself in deeper waters and wrote to Paul Hertz on 22 August 1915,

“You do not have the faintest idea what I had to go through as a mathematical ignoramus before coming into this harbor.”**

Albert Einstein wrote to Felix Klein, on 26 March 1917, and confessed that,

“As I have never done non-Euclidean geometry, the more obvious elliptic geometry had escaped me when I was writing my last paper.”**

Einstein often tried to justify his enormous difficulties in school** and his ignorance by admitting that he had thought mathematics unimportant and thought
that formulas and facts need not be memorized because one can simply look them up in textbooks.\textsuperscript{2714} Dr. Tilman Sauer stated,

\begin{quote}
[Hilbert] would soon [. . .] pinpoint flaws in Einstein’s rather pedestrian way of dealing with the mathematics of his gravitation theory.\textsuperscript{2715}
\end{quote}

It is well-established that Einstein had relied upon collaborators to accomplish the mathematical work for which he would sometimes take sole credit. Einstein admitted to Peter A. Bucky that he relied upon experts to do his mathematical work,

\begin{quote}
[Even after I became well-known I many times made use of experts to assist me in complicated calculations in order to prove certain physics problems. Also, I have always strongly believed that one should not burden his mind with formulae when one can go to a textbook and look them up. I have done that, too, on many occasions.\textsuperscript{2716}
\end{quote}

At this point in his career, Einstein had already collaborated with Mileva Marić, Jacob Laub, Walter Ritz, Ludwig Hopf, Otto Stern, Marcel Grossmann, Michele Besso, Adriàan Fokker, and Wander de Haas. He had copied the formulae of Lorentz, Poincaré, Gerber, and countless others, without attribution. On 3 April 1921, \textit{The New York Times} quoted Chaim Weizmann,

\begin{quote}
When [Einstein] was called ‘a poet in science’ the definition was a good one. He seems more an intuitive physicist, however. He is not an experimental physicist, and although he is able to detect fallacies in the conceptions of physical science, he must turn his general outlines of theory over to some one else to work out.\textsuperscript{2717}
\end{quote}

Einstein told Leopold Infeld, “I am really more of a philosopher than a physicist.”\textsuperscript{2718} Not only did Einstein not offer to include Grossmann and Hilbert in Einstein’s 25 November 1915 paper, Einstein attempted to discourage Hilbert from publishing the generally covariant field equations of gravitation, which Hilbert had deduced by 13 November 1915 and probably had in early October of 1915.

Einstein hid from the many accusations that his theory was metaphysical nonsense—an inconsistent jumble of fallacies of \textit{Petitio Principii}—nothing but an excuse to plagiarize. A meeting was arranged to discuss Vaihinger’s theory of fictions in 1920. Einstein pledged that he would attend this meeting. Knowing that Einstein would be devoured in a debate over his mathematical fictions, which confused induction with deduction, Wertheimer and Ehrenfest helped Einstein fabricate an excuse to miss the meeting he had agreed to attend. Einstein was proven a liar.\textsuperscript{2719} Einstein also hid from many other criticisms, and Einstein refused to answer T. J. J. See’s many charges of plagiarism,\textsuperscript{2720} and refused to debate Arvid Reuterdahl or to answer his many charges of plagiarism.\textsuperscript{2721} Einstein hid from the French Academy of Sciences.\textsuperscript{2722} Einstein hid from Cardinal O’Connell.\textsuperscript{2723} Einstein
hid from Dayton C. Miller’s falsification of the special theory of relativity.\textsuperscript{2724} Einstein hid from Cartmel.\textsuperscript{2725} Miller hammered Einstein in the press over the course of many years. *The New York Times Index* lists several articles in which Miller’s and William B. Cartmel’s falsifications of the special theory of relativity are discussed. Einstein and Lorentz were very worried by Miller’s results and could not find fault with them.\textsuperscript{2726} Einstein told R. S. Shankland not to perform an experiment which might falsify the special theory of relativity,

“[Einstein] again said that more experiments were not necessary, and results such as Synge might find would be ‘irrelevant.’ [Einstein] told me not to do any experiments of this kind.”\textsuperscript{2727}

Einstein knew that he was caught at the Arbeitsgemeinschaft deutscher Naturforscher meeting in the Berlin Philharmonic, and wanted to run away from Germany. Einstein desired to hide from the Bad Nauheim debate, in which he had threatened to devour his opponents,\textsuperscript{2728} then Einstein—after being talked into appearing and after much hype promoting the event which attracted thousands of visitors—then Einstein, when losing the debate, ran away during the lunch break and again wanted to run away from Germany. Einstein prospered from hype and had no legitimacy as a supposed “genius”. The press rescued him again and again, while he hid. Einstein was unable to defend his theories in the light of strict scrutiny.

11.7 Conclusion

Since the printer’s proofs were mutilated at some point in their history in a way which removed critical material relevant to Hilbert’s formulation of the generally covariant field equations of gravitation; and since Einstein acknowledged receipt of Hilbert’s manuscript containing Hilbert’s results, before Einstein presented them as if his own and attempted to discourage Hilbert from publishing Hilbert’s work; it is clear that the “Belated Decision” is that Einstein plagiarized Hilbert’s work, as is apparent even in the mutilated printer’s proofs of Hilbert’s paper. Jürgen Renn was quoted in *The Washington Post*, on 14 November 1997, as having said,

“I had personally come to the conclusion that Einstein plagiarized Hilbert[.] [***] [The] conclusion is almost unavoidable, that Einstein must have copied from Hilbert.”\textsuperscript{2729}

“Mr. Renn said yesterday that at first he feared Einstein had stolen Hilbert’s ideas. But this discovery marks ‘one of the very rare cases that one has a smoking gun’ to clear Einstein’s name, he said.”
The “smoking gun” was firing blanks. Now that the smoke has cleared, I borrow a line from Corry, Renn and Stachel’s 1997 article in the journal *Science*, “the arguments by which Einstein is exculpated are rather weak[.]” Since the proofs are in a mutilated condition and lack the critical section of Hilbert’s work which originally contained his generally covariant field equations of gravitation, and further since the remainder of the proofs prove that Hilbert had the generally covariant equations of gravitation of the general theory of relativity before Einstein—easily derived trace term or no—Corry, Renn and Stachel’s arguments are not only weak, they are both baseless and pointless.
The Manufacture and Sale of St. Einstein
12 GERBER’S FORMULA

In 1915, Albert Einstein manipulated credit for Paul Gerber’s 1898 formula for the perihelion motion of Mercury. The extensive history of the question of the speed at which gravitational effects propagate and the perihelion motion of the planet Mercury has largely been forgotten, with the full credit for the raising of these questions and their solution too often wrongfully given to an undeserving Einstein.

“In the general theory of relativity, Einstein tried to explain the perihelion shift of the planets, and he arrived at the same formula P. Gerber had found a long time before him, based on the assumption that the effects of gravitation do not propagate at an infinite speed in space.”—STJEPAN MOHOROVIČIĆ

12.1 Introduction

In 1898, Paul Gerber published a widely read paper in which he derived a solution to the question of the speed of the propagation of gravitational effects. Gerber, taking the known perihelion motion of the planet Mercury as empirical evidence, set the speed of gravity at the speed of light, and presented the formula for the perihelion of Mercury which Einstein copied in 1915 without an attribution. In 1900, Hendrik Antoon Lorentz argued that gravity propagates at light speed and introduced the perihelion motion of Mercury into the theory of relativity. In 1905, Jules Henri Poincaré attempted a relativistic, covariant (scalar) theory of gravitation based on the presupposition that gravity must propagate at light speed and in 1908 sought to apply it to Mercury’s motion.

Albert Einstein plagiarized some of these ideas on 18 November 1915 in a lecture entitled, “Explanation of the Perihelion Motion of Mercury from the General Theory of Relativity.” Einstein, who had already been accused of being a plagiarist, should (at a bare minimum) have cited at least something from Soldner, Mach, Tisserand, Lehmann-Filhés, Lévy, Hall, Drude, Gerber, Lorentz, Zenneck, Oppenheim and Poincaré; and should have acknowledged the help he had received from his close friends Michele Besso, Marcel Grossmann and Erwin Freundlich on the field equations of gravitation and on the perihelion motion of the planet Mercury.

Einstein did not hesitate to cite the empirical evidence, just the explanations of those effects supplied by his predecessors. Richard Moody, Jr. has stressed the fact that as a former patent clerk Einstein knew the value of intellectual property and the need to recognize the property rights of others, though he failed to meet his moral obligations to give his predecessors their due credit. Einstein was not naïve in this regard. His experience at the patent office taught Einstein the value of a good idea and may have provided him with the incentive to copy what he could not create. Witnessing patent disputes perhaps taught him to deny his theft when caught and
leave as little evidence behind as was possible.

Einstein knew how to reference his papers and did so to the extent necessary to sponsor and justify an analysis of known problems. Einstein then confused induction with deduction and employed the formulas his predecessors had provided as solutions to those problems before him, without acknowledging their work, to solve the known problems with known solutions. The history of the problem of the perihelion motion of Mercury was one of the best documented histories to date, when Einstein published on the subject. The readily available articles by Drude, Oppenheim and Zenneck are filled with copious and detailed references, and there is no excuse for Einstein not to have made any effort to acknowledge this prior work on the problem.

When Gehrcke confronted Einstein with the fact that Gerber was first to publish the formula, Einstein professed that he was the first to correctly explain the perihelion motion of Mercury, and snidely attacked Gerber on this basis, as if that awarded Einstein the privilege to repeat Gerber’s formula without an attribution,

“[...]Gerber, who has given the correct formula for the perihelion motion of Mercury before I did. The experts are not only in agreement that Gerber’s derivation is wrong through and through, but the formula cannot be obtained as a consequence of the main assumption made by Gerber. Mr. Gerber’s work is therefore completely useless, an unsuccessful and erroneous theoretical attempt. I maintain that the theory of general relativity has provided the first real explanation of the perihelion motion of mercury. I have not mentioned the work by Gerber originally, because I did not know it when I wrote my work on the perihelion motion of Mercury; even if I had been aware of it, I would not have had any reason to mention it.”

It is well-established that Einstein had relied upon collaborators to accomplish the mathematical work for which he would sometimes take sole credit. Einstein admitted to Peter A. Bucky that he relied upon experts to do his mathematical work and copied his formulae from others,

“[E]ven after I became well-known I many times made use of experts to assist me in complicated calculations in order to prove certain physics problems. Also, I have always strongly believed that one should not burden his mind with formulae when one can go to a textbook and look them up. I have done that, too, on many occasions.”

At this point in his career, Einstein had already demonstrably and deliberately copied the formulae of Lorentz, Poincaré, and countless others, without an attribution.

12.2 How Fast Does Gravity Go?

Newton had assumed that gravity acted instantaneously at a distance. Reviewing many previous theories, Paul Drude published a well-referenced paper calling into
question the speed of the propagation of gravitational effects and the perihelion motion of Mercury. Drude’s paper appeared in 1897. Paul Gerber took up this challenge and presented a solution to the perihelion motion of the planet Mercury one year later, in 1898, concluding that gravitational effects propagate at light speed. In 1902, Gerber published a brochure which further explained his ideas and which presented an extensive historical background for his work, which Ernst Gehrcke later republished in *Annalen der Physik* in 1917. Gerber’s 1898 paper states,

“Man erhält daher schliesslich

\[ c^2 = \frac{6\pi \mu}{a(1 - e^2)} \psi. \]

Hierin ist

\[ \mu = \frac{4\pi^2 a^3}{\tau^2}, \]

wenn \( \tau \) die Umlaufszeit des Planeten bedeutet. Speziell für Merkur gelten folgende Werte:

\[
\begin{align*}
\alpha &= 0.3871 \cdot 149 \cdot 10^6 \text{ km}, \\
e &= 0.2056, \\
\tau &= 88 \text{ Tage}, \\
\psi &= 4.789 \cdot 10^{-7}.
\end{align*}
\]

Man findet damit

\[ c = 305500 \text{ km/sec}. \]

Die kleinste bisher gefundene Geschwindigkeit des Lichtes hat Foucault erhalten, gleich 298000 km/sec; die grösste ergiebt sich nach der Methode von Römer aus den neuesten Beobachtungen zu 308000 km/sec; die Geschwindigkeit der elektrischen Wellen fand Hertz in seinen Versuchen 320000 km/sec. Also stimmt die Geschwindigkeit, mit der sich das Gravitationspotential ausbreitet, mit der Geschwindigkeit des Lichtes und der elektrischen Wellen überein. Darin liegt zugleich die Bürgschaft, dass diese Geschwindigkeit existiert.*

Ernst Gehrcke noted that if we substitute for \( \mu \) as provided for in Gerber’s paper, we obtain,
Albert Einstein submitted a paper on 18 November 1915, and stated without reference to Gerber,

“Bei einem ganzen Umlauf rückt also das Perihel um

$$\varepsilon = 3\pi \frac{a}{a(1 - e^2)}$$

im Sinne der Bahnbewegung vor, wenn mit \(a\) die große Halbachse, mit \(e\) die Exzentrizität bezeichnet wird. Führt man die Umlaufszeit \(T\) (in Sekunden) ein, so erhält man, wenn \(c\) die Lichtgeschwindigkeit in cm/sec. bedeutet:

$$\varepsilon = 24\pi^3 \frac{a^2}{T^2 c^2 (1 - e^2)}.$$  

Die Rechnung liefert für den Planeten Merkur ein Vorschreiten des Perihels um 43'' in hundert Jahren, während die Astronomen 45'' ± 5'' als unerklärten Rest zwischen Beobachtungen und Newtonscher Theorie angeben. Dies bedeutet volle Übereinstimmung.”

As Gehrke noted, one need only standardize the notation to see that Einstein’s 1915 solution to the problem of the perihelion motion of the planet Mercury is identical to Gerber’s much earlier 1898 solution.

Contrary to the impression one receives from the majority of modern histories on the theory of relativity which make it appear that Einstein created the problem of the perihelion motion of Mercury in his imagination and solved it by force of will in a completely unprecedented attempt, Einstein was not even the first to pose the questions of the speed of gravity and the perihelion motion of Mercury in the theory of relativity, let alone in the history of Physics and Astronomy. The question of the speed of the propagation of gravitational effects and the use of Mercury as a test case for the theory were introduced into the theory of relativity long before Einstein took credit for them.

In 1900 Lorentz wrote extensively on gravitation and the perihelion motion of the planet Mercury, concluding, after Gerber and Mewes, that gravity propagates at light speed. Lorentz’ work was highly derivative of the works of Mewes, Zöllner, Mossotti, Hall and Lehmann-Filhés, among many others—contrary to the modern impression that Einstein was an innovator in attacking the problem of Mercury. In fact, a non-Newtonian law of gravity and the problem of the perihelion motion of Mercury were much discussed problems long before Einstein addressed them, and Einstein, Besso, Grossmann and Freundlich
immersed themselves in this thoroughgoing and widely read literature, though you wouldn’t know it from reading Albert Einstein’s 1915 paper with its complete lack of references to the works of these men.

In 1903, Jonathan A. Zenneck wrote in his famous article “Gravitation” in the widely read *Encyklopädie der Mathematischen Wissenschaften*, referring to Lorentz’ April, 1900, paper “Considerations on Gravitation”:

> “Die Zusatzkräfte, welche Lorentz ausser den vom Newton’schen Gesetz gelieferten bekommt, enthalten als Faktor entweder \( \left( \frac{p}{c} \right)^2 \) oder \( \frac{p \cdot w}{c^2} \),

worin \( p \) die konstant angenommene Geschwindigkeit des Centralkörpers, \( w \) die Geschwindigkeit des Planeten relativ zum Centralkörper und \( c \) die Lichtgeschwindigkeit bedeutet. Diese Zusatzkräfte sind also so klein, dass sie wohl in allen Fällen sich der Beobachtung entziehen werden, im Falle des Merkur, wie die Rechnung von Lorentz zeigt, sicher unter dem Beobachtbaren liegen. Daraus folgt, dass die Lorentz’schen Gleichungen, verbunden mit der Zöllner’ischen Anschauung über die Natur der gravitierenden Moleküle, auf die Gravitation zwar angewandt werden können [Footnote: Das schliesst die Möglichkeit in sich, dass die Fortpflanzungsgeschwindigkeit der Gravitation gleich der Lichtgeschwindigkeit ist.—emphasis found in the original], aber zur Beseitigung der bestehenden Differenzen zwischen Beobachtung und Berechnung nichts beitragen.”

Lorentz wrote often on the speed of gravity and the case of the perihelion motion of Mercury. In 1910, in a work republished in the book *Das Relativitätsprinzip* in 1913, a book which included two of Einstein’s papers, Lorentz wrote,

Citing Poincaré’s 1905 Rendiconti paper\textsuperscript{2759} and his own 1910 *Physikalische Zeitschrift* article referenced immediately above, Lorentz wrote in 1913, in a book Albert Einstein reviewed for *Die Naturwissenschaften* in 1914,\textsuperscript{2760}
“Das Relativitätsprinzip ist eine physikalische Hypothese, die in sich schließt, daß all Kräfte sich mit der Geschwindigkeit \( c \) fortpflanzen. So auch die Gravitation. [***] Erstens bemerken wir, daß das Newtonsche Attractionsgesetz nicht mit dem Relativitätsprinzip in Übereinstimmung ist, und daß dieses Prinzip also eine Änderung des Gravitationsgesetzes erfordert.1) [***] Eine der Folgen der angegebene Änderung des Newtonschen Gravitationsgesetzes würde in einer langsamen Bewegung des Perihels des Merkurius bestehen. Eine solche Bewegung existiert tatsächlich. Die beobachtete Bewegung beträgt in einem Jahrhundert 44”.**2761

Beginning in 1905 and continuing over the years in several of his papers, Henri Poincaré attacked the problem of gravitation and the motion of the perihelion of Mercury from the perspective that gravity must propagate at light speed and comply with the principle of relativity. Henri Poincaré wrote in 1905 in his note in the Comptes Rendus,

“[.. .]I was first led to propose that the propagation of gravitation is not instantaneous, but it propagates with the velocity of light.”**2762

We know from Henri Vergne’s lecture notes that Poincaré addressed the perihelion motion of Mercury in his lectures of 1906 and 1907,**2763 and in 1908 Poincaré published the following statement,

“The effect will be more sensible in the movement of Mercury, because this is the planet which has the greatest speed.”

“C’est dans le mouvement de Mercure que l’effet sera plus sensible, parce que cette planète est celle qui possède la plus grande vitesse.”**2764

Poincaré stated in 1909,

“If there is an appreciable difference, it will therefore be greatest for Mercury, which has the greatest velocity of all the planets. Now it happens precisely that Mercury presents an anomaly not yet explained. The motion of its perihelion is more rapid than the motion calculated by the classic theory. The acceleration is \( 38^\text{rd} \) too great. Leverrier attributed this anomaly to a planet not yet discovered and an amateur astronomer thought he observed its passage across the sun. Since then no one else has seen it and it is unhappily certain that this planet perceived was only a bird.

Now the new mechanics explains perfectly the sense of the error with regard to Mercury, but it still leaves a margin of \( 32^\text{nd} \) between it and observation. It therefore does not suffice for bringing concord into the explanation of the velocity of Mercury. If this result is hardly decisive in favor of the new mechanics, still less is it unfavorable to its acceptance since
the sense in which it corrects the deviation from the classic theory is the right one. Our explanation of the velocity of the other planets is not sensibly modified in the new theory and the results coincide, to within the approximation of the measurements, with those of the classic theory."

12.3 Gerber’s Formula was Well-Known

Contrary to the view that Paul Gerber’s work was obscure, his 1898 paper in the Zeitschrift für Matematik und Physik was very well known and easily accessible. In fact, few papers received as much notice as Gerber’s work on Mercury and gravity. Lampe immediately called attention to it in the Beiblätter zu den Annalen der Physik und Chemie, Volume 22, Number 8, (1898), pp. 529-530:

\[
V = \frac{\mu}{r \left( 1 - \frac{1}{c} \frac{dr}{dt} \right)^2},
\]

wo \( c \) die Geschwindigkeit ist, mit der das Potential sich bewegt. Aus (1) folgt für im Vergleich zu \( \frac{dr}{dt} \) grosse Werte von \( c \) bis zur zweiten Potenz genau:

\[
V = \frac{\mu}{r} \left[ 1 + \frac{2}{c} \frac{dr}{dt} + \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 \right],
\]

und hieraus ergibt sich für die Beschleunigung \( \varphi \) von \( m \):

\[
\varphi = -\frac{\mu}{r^2} \left[ 1 - \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 + \frac{6r}{c^2} \frac{d^2r}{dt^2} \right] = -\frac{\mu}{r^2} (I - F),
\]

Setzt man diesen Wert von \( \varphi \) in die Differentialgleichungen der Planetenbewegungen ein, so folgt aus dem Zusatzfaktor \( (I - F) \) eine Bewegung des Perihels. Aus der bekannten Perihelbewegung beim Merkur im Betrage von \( 41'' \) in einem Jahrhundert berechnet nun der Verf. unter der Voraussetzung, dass dieselbe einzig von jenem Faktor herrührt, die Konstante \( c \) und findet sie gleich \( 305500 \text{ km/s} \), also gleich der Lichtgeschwindigkeit. Für die übrigen Planeten würden auf dieselbe Weise
die folgenden säkularen Perihelbewegungen sich berechnen: Venus 8"., Erde 3,6", Mond 0,06", Mars 1,3", Jupiter 0,06", Saturn 0,01", Uranus 0,002", Neptun 0,0007". Eine Abfindung mit den astronomischen Arbeiten (vgl. Oppenheim: Zur Frage nach der Fortpflanzungsgeschwindigkeit der Gravitation. Wien 1895), welche aus den Störungen die Unmöglichkeit einer so geringen Fortpflanzungsgeschwindigkeit der Gravitation folgern, ist nicht versucht worden.

Lampe wrote in *Die Fortschritte der Physik im Jahre 1898*, Volume 54, Part 1, (1898), p. 390,

Betrachtungen von sehr allgemeiner Art führen den Verf. zur Aufstellung des folgenden Ausdruckes für das Gravitationspotential eines Massenpunktes auf einen anderen m:

1) \[ V = \frac{\mu}{r \left(1 - \frac{1}{c} \frac{dr}{dt}\right)^2}, \]

wo c die Geschwindigkeit ist, mit der das Potential sich bewegt. Aus (1) folgt für grosse Werthe von c \( \left(\text{im Vergleich zu} \frac{dr}{dt}\right) \) bis zur zweiten Potenz von c genau:

2) \[ V = \frac{\mu}{r} \left[1 + \frac{2}{c} \frac{dr}{dt} + \frac{3}{c^2} \left(\frac{dr}{dt}\right)^2\right], \]

und hieraus ergibt sich für die Beschleunigung \( \phi \) von m:

3) \[ \phi = -\frac{\mu}{r^2} \left[1 - \frac{3}{c^2} \left(\frac{dr}{dt}\right)^2 + \frac{br}{c^2} \frac{d^2r}{dt^2}\right] = -\frac{\mu}{r^2} (1 - F). \]

Setzt man diesen Werth von \( \phi \) in die Differentialgleichungen der Planetenbewegungen ein, so ergibt sich aus dem Zusatzfaktor \( (1 - F) \) eine Bewegung des Perihels. Mit Hilfe der bekannten Perihelbewegung beim Merkur im Betrage von 41" in einem Jahrhundert berechnet der Verf. unter der Voraussetzung, dass diese Bewegung einzig von jenem Zusatzfaktor herrührt, die Constante c und erhält dafür die Zahl:
\[ c = 305,500 \text{ km/sec.}, \]

also die Lichtgeschwindigkeit. Für die übrigen Planeten würden die auf diese Weise entstehenden Perihelbewegungen in einem Jahrhundert betragen: Erde 3,6", Mond 0,06", Mars 1,3", Jupiter 0,06", Saturn 0,01", Uranus 0,002", Neptun 0,0007".

Die entgegenstehenden Ergebnisse der bezüglichen Untersuchungen von Astronomen sind nicht erwähnt.

Lampe published a quite similar review in *Die Fortschritte der Physik im Jahre 1898*, Volume 54, Part 3, (1898), pp. 412-413,

Verf. will nur die Annahme machen, dass in dem Raum zwischen zwei gravitirenden Massen etwas geschehe, das Theil an der Gravitation hat. Er leitet dann mit Hülfe eines in Mach's Principien der Wärmelehre aufgestellten Mittelwerthsatzes für das Potential ruhender gravitirender Massen den Newton'schen Ausdruck \( \mu/r \) ab. Sind die Massen dagegen in Bewegung, so folgt für das Potential der Ausdruck

\[ V = \frac{\mu}{r \left(1 - \frac{1}{c} \frac{dr}{dt}\right)^2}, \]

wobei unter \( c \) die Ausbreitungsgeschwindigkeit des Gravitationspotentials verstanden wird und ausserdem vorausgesetzt ist, dass \( \frac{dr}{dt} \) gegen \( c \) klein sei. Unter dieser Annahme kann man auch nach dem binomischen Satze entwickeln und findet dann näherungsweise:

\[ V = \frac{\mu}{r} \left\{1 + \frac{2}{c} \frac{dr}{dt} + \frac{3}{c^2} \left(\frac{dr}{dt}\right)^2\right\}. \]

Hieraus resultirt die Beschleunigung:

\[ -\frac{\mu}{r^2} \left\{1 - \frac{3}{c^2} \left(\frac{dr}{dt}\right)^2 + \frac{6r}{c^2} \frac{d^2r}{dt^2}\right\} = -\frac{\mu}{r^2} \left(1 - F\right), \]

Um den Werth von \( c \) zu bestimmen, wird die Perihelbewegung des Mercur herangezogen. Das Zusatzglied \( F \) veranlasst nämlich, wie leicht zu erkennen, eine solche, und darum lässt sich umgekehrt aus der bekannten
Perihelbewegung $F$ und damit $c$ finden. Für $c$ wird die Formel abgeleitet:

$$c = \frac{6 \pi}{\alpha (1 - \varepsilon^2)^2} \cdot \frac{4 \pi^2 \alpha^3}{\tau^2}$$

wo $\alpha$ die halbe grosse Axe der Planetenbahn, $\varepsilon$ die numerische Excentricität, $\tau$ die Umlaufszeit und $\psi$ die jährliche Perihelbewegung bedeutet. Setzt man den Theil der Perihelbewegung des Mercur, der nicht aus Störungen zu erklären ist, gleich $41''$ in einem Jahrhundert, so ergiebt sich:

$$c = 305500 \text{ km/ sec.}$$

also ein Werth, der mit der Geschwindigkeit des Lichtes und der Elektricität übereinstimmt.”

Lampe reviewed Gerber’s Die Fortpflanzungsgeschwindigkeit der Gravitation.
Gerber's Formula

(Progr. Realprogymn. Stargard. 24 S. 1902.)"

The Physikalische Zeitschrift, Volume 4, Number 12, (1903), p. 355, wrote,

"Paul Gerber, Die Fortpflanzungsgeschwindigkeit der Gravitation.
(Progr. d. Realprogymn. i. Stargard i. Pommmern 1902.) 25 S.

Bei der Bestimmung des Potentials zweier bewegter Teilchen folgt der Verf. zunächst C. Neumann in der Anschauung, dass das an der einen Masse eben wirkende Potential von der anderen um die zum Durchlaufen der
gegenseitigen Entfernung nötige Zeit \( \frac{r}{c} \) früher ausging, d. h. als diese

\[
r - \frac{r\,dr}{c\,dt}
\]

war und daher den Betrag

\[
\frac{1}{r\left(1 - \frac{1}{c}\frac{dr}{dt}\right)}
\]

hat. Nun aber bemerkt der Verf. weiter, dass infolge der Bewegung beider Massen das Potential mit der

\[
\frac{1}{c}\left(c - \frac{dr}{dt}\right)
\]

fachen Geschwindigkeit, als im Falle der Ruhe beider Teilchen, an der angezogenen Masse vorüberstreicht und nimmt an, dass es deshalb einen im gleichen Verhältnis kleineren Effekt hervorbringt, wodurch er das Potential erhält:

\[
\frac{1}{r\left(c - \frac{1}{c}\frac{dr}{dt}\right)^2} = \frac{1}{r} \left\{1 + \frac{2}{c}\frac{dr}{dt} + \frac{3}{c^2}\left(\frac{dr}{dt}\right)^2\right\}
\]

oder die Kraft:

\[
\frac{1}{r^2} \left\{1 - \frac{3}{c^2}\left(\frac{dr}{dt}\right)^2 + \frac{6r}{c^2}\frac{d^2r}{dt^2}\right\}.
\]

Also gerade das dreifache Zusatzglied des W e b e r schen Gesetzes, wodurch die aus diesem unter der Annahme \( c = 3.10^{10} \frac{c}{s} \) folgende Perihelstörung des Merkur von \( 13^h65 \) (pro 100 Jahre), den durch die Beobachtungen geforderten Wert von \( 3 \times 13^h65 = 41^h \) erreicht. Ausserdem enthält die Arbeit eine kritische Darstellung der verschiedenen seit L a p l a c e gemachten Versuche, die zeitliche Ausbreitung der Gravitation in Rechnung zu ziehen.

G. H e r g l o t z.
Jonathan A. Zenneck’s famous 1903 review of gravitational theories in the *Encyklopädie der mathematischen Wissenschaften*, in addition to featuring Lorentz’ work, also featured Paul Gerber’s theory and its use of the known perihelion motion of Mercury to determine the speed of the propagation of gravitational effects, which as Mie had noted turns out to be light speed in Gerber’s and in Lorentz’ theories. Zenneck wrote,

a) Das von einer Masse \( \mu \) nach einer zweiten \( m \) ausgesandte Potential \( P \) ist \( \frac{\mu}{r} \), wo \( r \) den Abstand von \( \mu \) und \( m \) im Moment der Aussendung des Potentials bedeutet. Dieses Potential pflanzt sich mit der endlichen Geschwindigkeit \( c \) fort.

b) Es ist eine gewisse Dauer nötig, damit das Potential „bei \( m \) angelangt, dieser Masse sich mitteile, d. h. die von ihm entsprechenden Bewegungszustand von \( m \) hervorruft“. „Wenn die Massen ruhen, geht die Bewegung des Potentials mit ihrer eigenen Geschwindigkeit an \( m \) vorüber; dann bemisst sich sein auf \( m \) übertragener Wert nach dem umgekehrten Verhältnis zum Abstande. Wenn die Massen aufeinander zuileiten, verringert sich die Zeit der Übertragung, mithin der übertragene Potentialwert im Verhältnis der eigenen Geschwindigkeit des Potentials zu der aus ihr und der Geschwindigkeit der Massen bestehenden Summe, da das Potential in Bezug auf \( m \) die Gesamtgeschwindigkeit hat.“

Zu dem Wert, den das Potential unter diesen Annahmen haben muss, gelangt Gerber auf folgende Weise:

„Das Potential bewegt sich ausser mit seiner Geschwindigkeit \( c \) noch mit der Geschwindigkeit der anziehenden Masse. Der Weg \( r - \Delta r \) [Footnote: \( \Delta r > 0 \) bei wachsendem \( r \)] den die beiden sich entgegen kommenden Bewegungen, die des Potentials und die der angezogenen Masse, in der Zeit \( \Delta t \) zurücklegen, beträgt daher

\[
\Delta t \left( c - \frac{\Delta r}{\Delta t} \right),
\]

während \( r = c\Delta t \) ist. Also erhält man für den Abstand, bei dem sich das Potential zu bilden anfängt und dem es umgekehrt proportional ist,

\[
r - \Delta r = r \left( 1 - \frac{1}{c} \frac{\Delta r}{\Delta t} \right).
\]
Weil ferner die Geschwindigkeit, mit der die Bewegungen aneinander vorbeigehen, den Wert

\[ c = \frac{\Delta r}{\Delta t} \]

hat, fällt das Potential wegen des Zeitverbrauchs zu seiner Mitteilung an \( m \) auch proportional

\[ \frac{c}{c - \frac{\Delta r}{\Delta t}} \]

aus. Man findet so

\[ P = \frac{\mu}{r \left(1 - \frac{1}{c} \frac{\Delta r}{\Delta t}\right)^2}. \]

Solange der Weg \( \Delta r \) kurz und deshalb \( \frac{\Delta r}{\Delta t} \) gegen \( c \) klein ist, darf man dafür \( \frac{dr}{dt} \) setzen. Dadurch wird

\[ P = \frac{\mu}{r \left(1 - \frac{1}{c} \frac{dr}{dt}\right)^2}, \]

woraus mit Hilfe des binomischen Satzes bis zur zweiten Potenz folgt:

\[ P = \frac{\mu}{r} \left[1 + \frac{2}{c} \frac{dr}{dt} + \frac{3}{c^2} \left(\frac{dr}{dt}\right)^2\right]. \]

Die Anwendung dieser Gleichung auf die Planetenbewegungen ergibt das bemerkenswerte Resultat: Bestimmt man aus der beobachteten Perihelbewegung des Merkur die Fortpflanzungsgeschwindigkeit \( c \), so erhält man \( c = 305 \, 500 \text{ km/sec} \), also überraschend genau die Lichtgeschwindigkeit oder: Setzt man in der Gerber’schen Gleichung als Fortpflanzungsgeschwindigkeit der Gravitation die Lichtgeschwindigkeit ein, so ergibt diese Gleichung genau die beobachtete anomale Perihelbewegung.
des Merkur.
Für die anderen Planeten folgen aus der Gerber’schen Annahme keine Schwierigkeiten, ausgenommen für Venus, wo der Gerber’sche Ansatz die etwas zu grosse säkulare Perihelbewegung von 8″ ergibt.
Die Gerber’sche Annahme zeigt also, ebenso wie diejenige von Lévy, dass eine Fortpflanzungsgeschwindigkeit der Gravitation von derselben Grösse wie die Lichtgeschwindigkeit nicht nur möglich ist, sondern sogar dazu dienen kann, die schlimmste Differenz, welche bisher zwischen astronomischer Beobachtung und Berechnung vorhanden war, aus der Welt zu schaffen. Allerdings ist dies nur erreicht worden dadurch, dass die Gültigkeit des Newton’schen Gesetzes auf ruhende Körper beschränkt und für bewegte Körper ein erweitertes Gesetz zu Grunde gelegt wurde.**

The topic of the speed of gravity was hot in 1903. Samuel Oppenheim wrote in his book *Kritik des Newtonschen Gravitationsgesetzes*, in 1903,

Die Voraussetzung, von welcher C. Neumann ausgeht, ist die, daß das Potential der gegenseitigen Anziehung zweier Teilchen \( m_1 \) und \( m_2 \), das für ruhende Punkte durch \( \frac{k m_1 m_2}{r} \) gegeben ist, einiger Zeit bedarf, um von
m_1 zu m_2 zu gelangen, und daher dort nicht zur Zeit t sondern etwas später ankommt, ebenso wie das zur Zeit t in m_1 angekommene und von m_2 ausgesandte Potential von dort etwas früher ausging. Beiden Fällen entspricht eine Vergrößerung des Potentials im Verhältnisse von r : r - Δr, wo Δr von der Zeitdifferenz abhängig ist, die das Potential zu seiner Fortpflanzung benötigt. Das Anziehungspotential ist daher

\[ P = \frac{k^2 m_1 m_2}{r - Δr} \]

und stimmt nach gehöriger Entwicklung, durch welche es in

\[ P = \frac{k^2 m_1 m_2}{r} \left[ 1 + \frac{1}{c^2} \left( \frac{dr}{dt} \right)^2 \right] \]

übergeht, formell mit dem Weberschen Gesetze überein.

\[ P = \frac{k^2 m_1 m_2}{r \left( 1 - \frac{Δr}{r} \right)^k} \]

setzt. Man erhält so

\[ P = \frac{k^2 m_1 m_2}{r} \left[ 1 + \frac{k(k + 1)}{1 \cdot 2c^2} \left( \frac{dr}{dt} \right)^2 \right] \]

als ein neues, dem Weberschen Gesetze analoges, Fernkraftgesetz, das 2 Konstante enthält, die sich den Beobachtungen anpassen können. Die Berechnung der Bewegung der Planeten unter der Annahme, daß an Stelle des Newtonschen Gesetzes dieses erweiterte tritt, führt zu dem Resultate, daß säkularen Störungen die Länge des Perihels sowie die mittlere Länge unterworfen sind, daß aber bloß die erstere ausschlaggebend ist, indem die letztere das Quadrat der Exzentrizität als Faktor erhält und daher wegen der Kleinheit dieser stets unmerklich bleibt. Die säkulare Störung in der Länge des Perihels ist
Gerber’s Formula 2113

\[ \Delta \pi = \frac{\lambda (\lambda + 1)}{1 \cdot 2} \cdot \frac{n^2 a^2}{c^2} \]

und muß, soll sie die Anomalie in der Bewegung des Merkur beseitigen, die Gleichung

\[ \frac{\lambda (\lambda + 1)}{1 \cdot 2} \cdot \frac{n^2 a^2}{c^2} = 41''25 \]

erfüllen. Die aus dem Weberschen Gesetze \((\lambda = 1)\) allein resultierende Perihelstörung unter der Annahme, daß die Fortpflanzungsgeschwindigkeit der Gravitation, \(c\), identisch ist mit der des Lichtes, \((c = 300000 \text{ km/sek.})\) beträgt \(13''65\). Es bleibt daher für \(\lambda\) die Gleichung

\[ \frac{\lambda (\lambda + 1)}{1 \cdot 2} = \frac{41''25}{13''65} = 3 \]

aus der die 2 Werte

\[ \lambda = 2 \text{ und } \lambda = -3 \]

folgen. Wie man sieht, läßt sich unter der Annahme, daß das Potential der anziehenden Kraft zweier bewegter Teilchen durch den Ausdruck

\[ \frac{k^2 m_1 m_2}{r} \left[ 1 + \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 \right] \]

gengeben ist, in welchem \(c\) als die Fortpflanzungsgeschwindigkeit der Gravitation identisch angenommen werden kann mit der des Lichtes, der Widerspruch in der Bewegungstheorie des Planeten Merkur vollständig lösen. Auch für die anderen Planeten folgen, wie die folgenden Zahlen es zeigen, Differenzen, die noch, etwa den Planeten Venus ausgenommen, innerhalb der möglichen Beobachtungsfehler liegen:

\[ \lambda = 1 \text{ (Weber) } \lambda = 2 \text{ (Gerber)} \]

Planet Merkur \(\Delta \pi = 13''65 \ldots 40''95\)

Venus \(= 2 \cdot 86 \ldots 8 \cdot 58\)

Erde \(= 1 \cdot 27 \ldots 3 \cdot 81 \text{ Zeiteinheit } = 100 \text{ Jahre.}\)

Mars \(= 0 \cdot 44 \ldots 1 \cdot 32\)
Das Grundgesetz, welches Riemann für das Webersche substituiert, lautet

\[ P = \frac{k^2 m_1 m_2}{r} \left( 1 - \frac{1}{c^2} \left( \left( \frac{dx}{dt} \right)^2 + \left( \frac{du}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right) \right) \]

Auch unter Zugrundelegung dieses ergibt sich für die Bewegung der Planeten nur eine Störung, die merklich werden kann, u. z. ebenfalls in der Länge des Perihels. Dieselbe ist doppelt so groß als die aus dem Weberschen sich ergebende, so daß, wenn man nach einem Vorschlag von Lévy [Footnote in the Annalen der Physik reprint: Lévy, Sur l’application des lois électrodynamiques au mouvement des planètes. Compt. rend. Paris 1890.] beide unter Einführung einer erst zu bestimmenden Konstanten \( \lambda \) zu einem vereinigt in der Form

\[ P = P_{\text{Weber}} + \lambda \left( P_{\text{Riemann}} - P_{\text{Weber}} \right) \]

\[ = \frac{k^2 m_1 m_2}{r} \left[ 1 - \left( 1 - \lambda \right) \left( \frac{dr}{dt} \right)^2 + \lambda \left[ \left( \frac{dx}{dt} \right)^2 + \left( \frac{du}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right] \right] \]

man eine Perihelstörung von der Größe

\[ 13^h 65 + \lambda \left( 27^h 30 - 13^h 65 \right) = 13^h 65 \left( 1 + \lambda \right) \]

erhält. Soll dieselbe gleich sein \( 41^h 25 \), so wird \( \lambda = 2 \) und die Gesetze

\[ P_1 = \frac{k^2 m_1 m_2}{r} \left( 1 + \frac{1}{c^2} \left( \frac{dr}{dt} \right)^2 - \frac{2}{c^2} \left[ \left( \frac{dx}{dt} \right)^2 + \left( \frac{du}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right] \right) \]

ebenso wie

\[ P_2 = \frac{k m_1 m_2}{r} \left[ 1 + \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 \right] \]

beseitigen, das Newtonsche Gesetz substituierend, mindestens eine der bisher in den Bewegungen der Planeten konstatierten Unregelmäßigkeiten, d. i. die im Perihel des Merkur, unter der gewiß einfachen Annahme, daß die Fortpflanzungsgeschwindigkeit der Gravitation der des Lichtes an Größe gleich ist, ohne gar zu große Schwierigkeiten in den Bewegungen der
anderen Planeten hervorzurufen. Es muß jedoch hervorgehoben werden, daß dieses einzige Ergebnis, so zutreffend es auch sein mag, nicht genügt, um die volle Substitution des Newtonschen Gesetzes durch eines derselben $P_1$ oder $P_2$ nach allen Richtungen hin zu rechtfertigen. Zunächst bleibt nämlich, wie man sich leicht überzeugen kann, die Schwierigkeit bestehen, die nach Seeliger in der Ausdehnung ihrer Gültigkeit auf den unendlichen Raum liegt, andererseits müßte auch noch die Bewegung sehr sonnennaher Kometen untersucht werden, hauptsächlich was mögliche periodische Störungen anlangt, um eine endgültige Entscheidung zu treffen.

§ 32. Auch die neuere elektromagnetische Theorie, insbesondere in ihre weiteren Ausbildung als Elektronentheorie durch H. Lorentz wurde schon auf die Bewegung der Planeten um die Sonne angewandt.

H. A. Lorentz [Footnote in the original book: H. A. Lorentz, „Considérations on Gravitation“ in den koninkl. Akad. von Wetensk. Verslag. Amsterdam 1900.] nimmt zur Erklärung der Gravitation an, daß die 2 Störungen, welche durch das Vorhandensein eines positiven und negativen Elektrons im Äther hervorgerufen werden, sich nicht vollständig aufheben, sondern ein wenig von einander verschieden sind, und zeigt, daß diese Annahme genügt, um eine Anziehung zwischen 2 körperlichen Molekulen zu erhalten, die dem Newtonschen Gesetz gehorcht. Indem er dann die weitere Annahme macht, daß diese Ätherstörungen sich mit derselben Geschwindigkeit fortpflanzen, wie die in einem elektromagnetischen Felde indem er ferner die Maxwellschen Feldgleichungen auch auf sie ausdehnt, kommt er zu dem Ergebnis, daß die Anziehung zweier materieller Teilchen nur dann dem Newtonschen Gesetze folgt, wenn die 2 Teilchen in Ruhe sind, daß aber Zusatzkräfte auftreten, wenn die Teilchen in Bewegung sich befinden. Diese Zusatzkräfte enthalten als Faktoren entweder $\frac{p^2}{c^2}$ oder $\frac{w^2}{c^2}$ oder $\frac{pw \cos \vartheta}{c^2}$ wenn $p$ die absolute Geschwindigkeit des anziehenden Punktes, $w$ die relative Geschwindigkeit des bewegten Körpers um den anziehenden Punkt, $\vartheta$ der Winkel zwischen den beiden Geschwindigkeiten und $c$ die Fortpflanzungsgeschwindigkeit der Gravitation im Äther bedeutet, wobei diese mit der der Elektrizität identisch angenommen wird.

H. A. Lorentzwendet die von ihm so abgeleiteten Gleichungen auf die Bewegung des Merkur um die Sonne an. Er identifiziert hiebei die absolute Geschwindigkeit $p$ der Sonne mit ihrer Eigenbewegung (im astronomischen Sinne genommen) und setzt für diese fest $\alpha = 276^{\circ}$ $\delta = +34^{\circ}$ die Geschwindigkeit $15 \ km/sec$. Die Störungen der Bahnelemente, die hieraus resultieren, sind so gering, daß sie stets vernachlässigt und daher nicht dazu herangezogen werden können, beispielsweise die Anomalie in der Bewegung des Merkurperihels zu erklären.

An die Entwicklungen von Lorentz schließen sich die Untersuchungen

Oppenheim republished section 31 of his 1903 book in an article in Annalen der Physik in 1917, with some changes. The full article is reproduced in the endnote.\textsuperscript{2772} Einstein had studiously read Mach, who paraphrased Paul Gerber’s work in Mach’s book Science of Mechanics, in 1904,

“Paul Gerber alone („Ueber die räumliche u. zeitliche Ausbreitung der Gravitation,” Zeitschr. f. Math. u. Phys., 1898, II), from the perihelial motion of Mercury, forty-one seconds in a century, finds the velocity of propagation of gravitation to be the same as that of light. This would speak in favor of the ether as the medium of gravitation. (Compare W. Wien, “Ueber die Möglichkeit einer elektromagnetischen Begründung der Mechanik,” Archives Néerlandaises, The Hague, 1900, V, p. 96.)”\textsuperscript{2773}

In 1910, de Tunzelmann wrote of Gerber’s work,

“In 1910, de Tunzelmann wrote of Gerber’s work,

“P. Gerber [Footnote: Zeitschr. Math. Phys., vol. xliii., 1898, p. 93.] approaches the problem by regarding the gravitational potential as something propagated from the attracting mass $m_1$ to the attracted mass $m_2$ with a proper velocity of its own, $v$, to which is to be added the velocity of $m_1$ relative to $m_2$. Suppose these to be at a distance $r$ at the time $t$, and to be approaching each other with a velocity which is small compared with $v$. When the bodies are not in relative motion the potential will be
\[ V_0 = \frac{m_1 m_2}{r}. \]

When \( m_1 \) and \( m_2 \) are approaching each other, then, if \( \Delta t \) be the time taken by the potential emitted from \( m_1 \) to reach \( m_2 \), we shall have \( r = v \Delta t \), and therefore the distance traversed will be

\[ r - \Delta r = \Delta t \left( v - \frac{\Delta r}{\Delta t} \right) = r \left( 1 - \frac{1}{v} \frac{\Delta r}{\Delta t} \right). \]

The amount of transmitted potential will be inversely proportional to this distance, and the relative velocity of transmission is \( v - \Delta r / \Delta t \), so that the potential \( V \) will be proportional to

\[ \frac{v}{v - \frac{\Delta r}{\Delta t}}, \]

and therefore

\[ V = \frac{m_1 m_2}{r \left( 1 - \frac{1}{v} \frac{\Delta r}{\Delta t} \right)^2}; \]

or, if the velocity of approach be sufficiently small compared with \( v \),

\[ V = \frac{m_1 m_2}{r \left( 1 - \frac{\Delta r}{v} \right)^2} = \frac{m_1 m_2}{r} \left( 1 + \frac{2 \Delta r}{v} + \frac{3 \Delta r^2}{v^2} \right). \]

Gerber finds that the anomaly of forty-one seconds will be completely accounted for by taking \( v = 305500 \) kilometers per second, that is to say, within the limits of errors of observation, by taking \( v = c \), the velocity of radiation in the ether. For the perihelion motion of Venus this value introduces an anomaly of about eight seconds per century, but does not lead to any difficulties in the cases of the other planets, the amounts of the anomaly in the motion of the perihelion being:—for the Earth, 3.6 seconds per century; for the moon, 0.06 sec.; for Mars, 1.3 secs.; for Jupiter, 0.06 sec.; for Saturn, 0.01 sec.; for Uranus, 0.002 sec.; and for Neptune, 0.0007 sec. per century.
This investigation is not one that suggests any physical representation of gravitational action, and is only presented as a preliminary inquiry into some of the conditions to be satisfied by a satisfactory theory, and as indicating the possibility of gravitational propagation with the velocity of radiation. It could not, however, with such a velocity, be of the nature of radiation, as the impossibility of this was shown in Chapter XXIII.”

In 1914, before the appearance of Einstein’s 1915 paper, Ebenezer Cunningham asserted that Paul Gerber had solved the riddle of Mercury, and had done so in conformity with the principle of relativity, making Cunningham, not Einstein, the first to use Gerber’s formula as the fulfillment of the principle of relativity,

“16. The second order corrections inappreciable.

The possibility of obtaining equations which, to the first order, are of Newtonian form removes the old objection to the velocity of propagation of gravitation being \( c \), an objection which was based on the prediction of a first order effect.

But for a complete comparison with astronomical observations it is necessary to examine the nature and magnitude of the second order effect. This has been carefully and exhaustively done by Professor de Sitter. [Footnote: Monthly Notices of Roy. Astr. Soc. Mar. 1911, p. 388.] It would carry us too far to give the calculations here, but the results may be summarized.

Taking the following equations, either of which is a particular case of \( (\alpha) \), p. 176,

\[
m_1 \frac{d^2(x_1, y_1, z_1)}{dt_0^2} = \frac{\mu}{\rho_2^3} \left\{ (x, y, z) - \frac{\rho_1 v_2}{\gamma c} \right\} \quad \text{............(I)},
\]

and

\[
m_2 \frac{d^2(x_1, y_1, z_1)}{dt_0^2} = \frac{\mu(-\gamma)}{\rho_2^3} \left\{ (x, y, z) - \frac{\rho_1 v_2}{\gamma c} \right\} \quad \text{......(II)},
\]

(II) differing from (I) only in the extra invariant factor \((-\gamma)\) on the right-hand side—de Sitter approximates to the second order in both cases and comes to the following conclusions.

Case I.

(i) The coordinates of a planet of small mass are expressed by the ordinary formulae of elliptical motion.

(ii) But to express the eccentric anomaly in terms of the heliocentric time
we must take a slightly altered eccentricity, the difference between heliocentric and geocentric time consisting in a small change of scale together with small periodic fluctuations.

(iii) Kepler’s third law is not quite exact, but there are periodic variations.
(iv) The difference between the constant of precession as determined from the fixed stars and from the motions in the solar system would be of the order of

\[ -0^\prime 0000044 \] per century.

The variation in the eccentricity in (ii) is of the order \( (v/c)^2 \) of itself, and for the earth this is of the order \( 10^{-8} \).

The periodic change in the time in (ii) has amplitude \( (v^2e/c^2n) \), \( n \) being the mean angular velocity, and is approximately equal to \( 0.0008 \) second.

The deviation from the Keplerian angular velocity in (iii) is again of the order \( (v/c)^2 \) of the mean, that is of the order \( 10^{-4} \).

All these effects are inappreciable.

There is really no need to go any further, as these results, if correct, shew that there is no essential inconsistency between astronomical observations and the Principle of Relativity.

De Sitter however goes on to shew that the equation (II) also leads to results which are at present incapable of observation, except in one important respect. He finds in fact that this equation would lead to a secular motion of the perihelia of the planets which in the case of Mercury amounts to about \( 7^\prime \) per century. An effect of this kind has for some time been known by practical astronomers to exist, though the magnitude is about \( 40^\prime \) per century. Various hypotheses have been suggested to explain it. One of them proposed by Gerber [Footnote: Zeitschr. für Math. Phys. 43 (1908), pp. 93-104. See also Enzyk. der Math. Wiss. Vol. v. p. 49.] in 1898 quite independently of the principle of relativity is the possibility that the Newtonian Law of Gravitation is only approximate, and that more accurately gravitational influence is propagated with the velocity of light, and that a correction of nature very similar to that suggested by equation (II) must be applied to the usual expression for the force on the planet. He arrives at the conclusion that the known motion of the perihelia can be so explained.

By using instead of equation (II) an equation derived from (I) by multiplying the right-hand side by another power of the invariant factor \( (v/c) \) instead of the first, the magnitude of the effect predicted could be made just of the actual order, and Gerber’s conclusion is thereby corroborated and found to be perfectly consistent with the hypothesis of relativity.”

Ernst Gehrcke noticed that Einstein’s 1915 solution to the problem of the
perihelion motion of the planet Mercury was identical to Paul Gerber’s 1898 solution. Gehrcke published numerous articles effectively accusing Einstein of plagiarism. But Gehrcke was not alone. Einstein’s two dear friends Michele Besso and Friedrich Adler also noticed that Einstein had repeated Gerber’s solution.

Besso, who had worked with Einstein for years on the problem of the perihelion motion of Mercury (and Einstein did not mention Besso in Einstein’s 1915 paper), wrote to Einstein on 5 December 1916,

“Thus I want to offer an aperçu in the phys. colloquium on earlier attempts to explain perihelion motion [***] I have found interesting material by Zenneck on gravitation in the *Enzyklop. der mathem. Wiss.* [12] I have also thought about Gerber’s idea:[13] It can be presented in a way that makes it entirely reasonable:

Besso and Einstein had worked together on the problem of the perihelion motion of Mercury before Einstein’s 18 November 1915 paper, and Besso’s letter makes it appear that Einstein knew of Gerber’s work during that period, which was before Einstein wrote his 1915 paper. Note that Besso gives no citation for Gerber and makes no mention of Gehrcke. Was he talking to an old friend about an old issue, when Besso mentioned “Gerber’s idea”?

Friedrich Adler wrote to Einstein on 23 March 1917,

“Are you familiar with: Paul Gerber ‘Die räumliche und zeitliche Ausbreitung der Gravitation’ [***] For, Gerber obviously comes to his result using Euclidean geometry. Therefore, I think that it ought to be possible to explain the perihelion motion of Mercury using the *old* tools, thus that the verification of the gen. theory of relativity through this result is *not as far-reaching* as you assume it to be.”

Since Gehrcke, Besso and Adler noticed that Einstein parroted Gerber, it seems quite reasonable to believe that Albert Einstein, who had worked harder than any of them on the problem, must have been aware of Gerber’s work. How could Einstein have missed it? He surely studied at least some of the many works, which referred directly to Gerber’s paper. We know that Einstein studiously read Mach. Could Einstein have missed the widely read and often cited works of Riecke, Zenneck, Cunningham, Oppenheim and de Tunzelmann? And what of Gerber’s work, itself, which twice appeared? How was it that Lampe, Herglotz, Mie, Riecke, Mach, Zenneck, Oppenheim, de Tunzelmann, Cunningham, Gehrcke, Besso and Adler each knew of Gerber’s work, but Einstein claimed he did not—though he presented Gerber’s solution? Is Einstein’s claim plausible?

And what of Einstein’s attitude when forced to acknowledge Gerber? Why was he so spiteful toward Gerber, who had simply dared to solve the problem with a solution Einstein later copied without an acknowledgment? Albert Einstein wrote in 1920,
“...Gerber, who has given the correct formula for the perihelion motion of Mercury before I did. The experts are not only in agreement that Gerber’s derivation is wrong through and through, but the formula cannot be obtained as a consequence of the main assumption made by Gerber. Mr. Gerber’s work is therefore completely useless, an unsuccessful and erroneous theoretical attempt. I maintain that the theory of general relativity has provided the first real explanation of the perihelion motion of mercury. I have not mentioned the work by Gerber originally, because I did not know it when I wrote my work on the perihelion motion of Mercury; even if I had been aware of it, I would not have had any reason to mention it.”

Instead of delighting in the fact that he had been anticipated and instead of thanking those who informed him of the fact, Einstein issued a vindictive attack against Gerber, who was deceased, declaring that even if he had known of Gerber’s work, and he denied that he had, he would not have mentioned it. Therefore, it is easy to believe that Einstein did know of Gerber’s work and failed to mention it. Einstein also failed to mention the work of Lorentz, Poincaré, de Sitter, Drude, Lehmann-Filhés, Hall, Tisserand, Besso, etc. on the problem of the perihelion motion of Mercury and the speed of gravity.

Albert Einstein believed he had a right to plagiarize the ideas of others, if he could put a new spin on the old ideas. Einstein asserted this “privilege” in 1907 after Max Planck\textsuperscript{2781} and Walter Kaufmann\textsuperscript{2782} publicly pointed out that Einstein’s theory of relativity was merely a generalization of Lorentz’ theory, and note that in order for Einstein to allege that his viewpoint was “new” he must have known what the “old” viewpoint was,

“It appears to me that it is the nature of the business that what follows has already been partly solved by other authors. Despite that fact, since the issues of concern are here addressed from a new point of view, I believe I am entitled to leave out what would be for me a thoroughly pedantic survey of the literature, all the more so because it is hoped that these gaps will yet be filled by other authors, as has already happened with my first work on the principle of relativity through the commendable efforts of Mr. Planck and Mr. Kaufmann.”

12.4 Einstein’s Fudge

Prof. Friedwardt Winterberg, theoretical physicist at the University of Nevada, Reno, who received his Ph.D. under Nobel Prize laureate Werner Heisenberg, argues that Einstein fudged the equations in Einstein’s 18 November 1915 paper on the perihelion motion of Mercury. Einstein had not yet plagiarized David Hilbert’s generally covariant field equations of gravitation incorporating the essential trace term, and, therefore, Einstein could not properly derive the solution to the problem of Mercury’s motion, which Gerber had published in 1898, or the amount of deflection of ray of light grazing the limb of the Sun.

In Einstein’s 11 November 1915 addendum to his 4 November 1915 paper in the *Berliner Sitzungsberichte*, “Zur allgemeinen Relativitätstheorie”, Einstein states,

“The energy tensor of ‘matter’ \( T^\mu_\nu \) possesses a scalar \( \sum_\mu T^\mu_\mu \). It is well-known that this vanishes for the electromagnetic field. On the other hand, it appears to be different from zero for true matter. [***] Now suppose that [***] the scalar of the energy tensor would vanish as well! [***] Then \( \sum_\mu T^\mu_\mu \) can seemingly be positive for the whole thing, whereas in reality only \( \sum_\mu \left( T^\mu_\mu + t^\mu_\mu \right) \) is positive, while \( \sum_\mu T^\mu_\mu \) vanishes everywhere. We assume in what follows, that the condition \( \sum_\mu T^\mu_\mu = 0 \) really is generally fulfilled.”

Einstein begins his 18 November 1915 lecture on the perihelion motion of Mercury,

“In a work which recently appeared in these reports, I have introduced field equations of gravitation, which are covariant for arbitrary transformations of the determinate 1. In an addendum, I have shown that the field equations are generally covariant if the trace of the energy tensor of ‘matter’ vanishes, and I have demonstrated that no objections made on principle stand in the way of the introduction of this hypothesis, by means of which time and space are robbed of the last vestiges of objective reality1. In the present paper, I find an important confirmation of this most radical relativity theory; which is to say, it will be shown that the secular rotation of the orbit of Mercury discovered by Leverrier, which is about 45” per century, can be qualitatively and quantitatively explained without having to presuppose any special hypothesis.

Furthermore, it will be shown that the theory increases, (by twice) the curvature of a ray of light due to a gravitational field than resulted from my earlier investigations.”

Tellingly, Einstein annotates the published paper of his 18 November 1915 lecture on the perihelion motion of Mercury just quoted above (which was published
on 25 November 1915) with a refutation of his own arguments,

“In a report soon to follow, it will be shown that this hypothesis is non-essential. It is only essential that the determinate \( \left| g_{\mu\nu} \right| \) assumes the value -1, because such a choice of reference system is possible. The following analysis is independent of this.”

The presiding secretary Hr. Waldeyer prefaced the *Sitzungsberichte* on 18 November 1915 on page 803 with the introductory comments:

“3. Mr. **Einstein** submitted an article: *Explanation of the Perihelion Motion of Mercury from the General Theory of Relativity*.

It is shown that the general theory of relativity explains the perihelion motion of Mercury discovered by Leverrier both qualitatively and quantitatively, thus confirming the hypothesis that the trace of the energy tensor of ‘matter’ vanishes. In addition, it is shown that the investigation of the curvature of a ray of light in a gravitational field also offers a possibility to test this important hypothesis.”

Einstein contradicts the first footnote of his paper, which footnote must have been added after 18 November 1915, probably shortly before 25 November 1915, otherwise Waldeyer would not have written what he wrote on 18 November 1915, or later, the date of Einstein’s submission. The letter from Max Born to David Hilbert of 23 November 1915 suggests that Einstein had not yet produced even a written draft of his paper on the equations of gravitation submitted 25 November 1915, because Born stated that he only knew of Einstein’s work from discussions between them.

Einstein states later in his 18 November 1915 lecture on the perihelion motion of Mercury, *in contradiction to the first footnote of the paper which was added sometime after 18 November 1915 and after Einstein had sight of Hilbert’s generally covariant equations of gravitation containing the trace term*, that his derivation of the amount of deflection of a ray of light grazing the limb of the Sun depended upon the (erroneous) hypothesis \( \sum T_{\mu}^{\mu} = 0 \),

“Upon the application of Huygen’s principle, we find from equations (5) and
(4b), after a simple calculation, that a light ray passing at a distance $\Delta$ suffers
an angular deflection of magnitude $\frac{2\alpha}{\Delta}$, while the earlier calculation, which
was not based upon the hypothesis $\sum T_{\mu}^{\nu} = 0$, had produced the value $\frac{\alpha}{\Delta}$.

A light ray grazing the surface of the sun should experience a deflection of
1.7 sec of arc instead of 0.85 sec of arc.\textsuperscript{2786}

Einstein must have learned the correct equations from Hilbert. His letter to
Hilbert of 18 November 1915 demonstrates that he had not yet delivered his lecture
on the perihelion of Mercury when writing to Hilbert after having read Hilbert’s
manuscript. Einstein wrote to Hilbert on 18 November 1915,

“Today I am presenting to the Academy a paper in which I derive
quantitatively out of general relativity, without any guiding hypothesis, the
perihelion motion of Mercury discovered by Le Verrier.”\textsuperscript{2787}

In his 25 November 1915 paper on the field equations of gravitation, in which
Einstein plagiarized Hilbert’s generally covariant field equations of gravitation,
Einstein was forced to abandon his hypothesis that $\sum T_{\mu}^{\nu} = 0$, which Einstein had
maintained even shortly after receiving Hilbert’s manuscript with the correct
equations, as evinced not only twice by Einstein in his Mercury paper, but also by
Waldeyer’s comments on page 803.

Presiding Secretary Waldeyer noted that Einstein had changed his equations after
having had sight of Hilbert’s equations, on 25 November 1915:

“2. Mr. Einstein presented an article: ‘The Field Equations of
Gravitation’.
It is shown that the general theory of relativity allows field equations of
gravitation, which do not presuppose the disappearance of the energy trace
of matter.”

Es wird gezeigt, daß die allgemeine Relativitätstheorie Feldgleichungen
der Gravitation zuläßt, welche nicht das Verschwinden des Energieskalars
der Materie voraussetzen.”\textsuperscript{2788}

Einstein wrote in this 25 November 1915 paper on the field equations of
gravitation,

“The development was as follows. First of all, I found the equations which
contained the Newtonian theory as an approximation and were covariant
under arbitrary substitutions of the determinate 1. Thereupon, I found that
these equations correspond to generally covariant equations, if the scalar of 
the energy tensor of ‘matter’ vanishes. However, as mentioned, the 
hypothesis had to be introduced, that the scalar of the energy tensor of matter 
vanishes. As of late, I now find that one can get by without hypotheses about 
the energy tensor of matter, if one formulates the energy tensor of matter in 
a somewhat different way from that of my two earlier communications. The 
vacuum field equations, upon which I founded the explanation of the 
perihelion motion of Mercury, remain unaffected by this modification.”

Einstein cleverly words his 25 November 1915 paper and avoids addressing the 
issue of his 18 November 1915 self-contradictory derivation of Gerber’s formula 
based on his since abandoned hypothesis that \( \sum T^\mu_\nu = 0 \), and recall that Einstein 
asserted that it was this hypothesis that led him to double the Newtonian prediction 
of deflection for a light ray grazing the Sun. Though the vacuum field equations 
remained unaffected in Einstein’s 25 November 1915 paper, the derivation of 
Gerber’s formula for the perihelion motion of Mercury and the calculation of the 
deflection of a light ray grazing the limb of the Sun did not.

Einstein also failed to mention in his 25 November 1915 paper that it was David 
Hilbert who had provided him with the somewhat different formulation of the energy 
tensor of matter. In a 28 November 1915 letter to Arnold Sommerfeld, Einstein 
admitted that he could not deduce Hilbert’s equations and dishonestly reversed the 
order of “discovery” of his copying of Hilbert’s equations and of his 18 November 
1915 paper on Mercury, making it appear to Sommerfeld that he had found Hilbert’s 
equations before conceiving of his Mercury paper of the 18th, which lie is 
contradicted by the face of the paper itself and by Waldeyer’s comments.

This constitutes positive proof that Einstein plagiarized Hilbert’s work on 25 
November 1915, because Einstein and Waldeyer affirm that on 18 November 1915 
after having sight of Hilbert’s solution Einstein still did not know the correct field 
equations and was still relying on his false hypothesis that \( \sum T^\mu_\nu = 0 \); and further 
because Einstein, after reading Hilbert’s manuscript, wrote to Hilbert on 18 
November 1915 that he, Einstein, had derived and published the correct equations 
in the prior weeks.

Since Einstein published incorrect equations not only weeks prior to 18 
November 1915 but on the selfsame date and either believed that these erroneous 
equations were correct upon first sight of Hilbert’s manuscript or attempted to 
deceive Hilbert into believing he had been anticipated him, Einstein must have 
plagiarized Hilbert’s manuscript on 25 November 1915. Of course, Einstein and his 
collaborator Erwin Freundlich most probably understood that Hilbert’s manuscript 
solved the riddle on first sight of it and simply lied to Hilbert in order to discourage 
him from publishing his paper. In any event, it is a proven fact that Einstein had sight 
of Hilbert’s equations before revising his, Einstein’s, theory to duplicate Hilbert’s 
results, and Einstein failed to acknowledge that Hilbert was the original discoverer 
of these equations.

Einstein’s 18 November 1915 paper contradicts itself and its derivations are
erroneous. Prof. Winterberg holds that, because Einstein assumed that $\mathbf{T} = \mathbf{0}$ for the trace of the energy-momentum tensor of matter, Einstein derived incorrect field equations, which lacked the needed trace term supplied by Hilbert. Since Einstein believed that $\mathbf{T} = \mathbf{0}$, he was compelled to treat the Sun as if it were composed of electromagnetic radiation, instead of normal mass. Einstein wrote to Michele Besso on 3 January 1916,

"The first paper along with the addendum still suffers from want of the term $\frac{1}{2} \kappa \varepsilon_{\mu \nu} \mathbf{T}$ on the right-hand side; therefore the postulate $\mathbf{T} = \mathbf{0}$. The matter must naturally be executed as in the last paper, whereby no conditions result on the structure of matter."  

"The condition $\mathbf{T} = \mathbf{0}$ would have suggested that matter is electromagnetic in nature.[.]

As a result of Einstein’s incorrect hypothesis, Einstein’s theory as of 18 November 1915, if it were stated in consistent terms, leads to a predicted value for the deflection of a ray of light grazing the Sun coming from infinity and passing to infinity *four* times as great as the Newtonian prediction. Richard C. Tolman explained,

"disordered radiation in the interior of a fluid sphere contributes roughly speaking *twice* as much to the gravitational field of the sphere as the same amount of energy in the form of matter. [***] the gravitational deflexion of light in passing an attracting mass is *twice* as much as would be calculated from a direct application of Newtonian theory for a particle moving with the velocity of light."  

In the case of the attraction between the Sun and a ray of light, Newton’s law becomes, in Einstein’s view, if stated consistently,

$$F_g = G \frac{2m_1 \cdot 2m_2}{r^2}.$$  

Einstein obviously knew Gerber’s formula. Knowing this solution, Einstein inductively fabricated by fallacy of *Petitio Principii* a theory around it and employed a fudge factor of one half of the solar mass in order to achieve Gerber’s 1898 formula, which formula accurately describes the observed perihelion motion of the planet Mercury.
Alexander Moszkowski asked Einstein,

“Notwithstanding, cases may arise in which a certain result is to be verified by observation and experiment. This might easily give rise to nerve-racking experiences. If, for instance, a theory leads to a calculation which does not agree with reality, the propounder must surely feel considerably oppressed by this mere possibility. Let us take a particular event. I have heard that you have made a new calculation of the path of the planet Mercury on the basis of your doctrine. This must certainly have been a laborious and involved piece of work. You were firmly convinced of the theory, perhaps you alone. It had not yet been verified by an actual fact. In such cases conditions of great psychological tension must surely assert themselves. What in Heaven’s name will happen if the expected result does not appear? What if it contradicts the theory? The effect on the founder of the theory cannot even be imagined!”

Moszkowski’s premise was false. The “result” had been confirmed before Einstein was born. Einstein answered Moszkowski,

“Such questions, did not lie in my path. That result could not be otherwise than right. I was only concerned in putting the result into a lucid form. I did not for one second doubt that it would agree with observation. There was no sense in getting excited about what was self-evident.”

The “lucid form” Einstein put the result into was Gerber’s form. According to Prof. Winterberg, Einstein also ended up with a prediction for the deflection of a light ray grazing the sun twice as great as the Newtonian prediction, as a consequence of using a fudge factor of one half of the solar mass in his calculations. Without the fudge factor, Einstein’s 18 November 1915 theory produces a prediction for the deflection of the light ray four times as large as the Newtonian prediction.

Prof. Winterberg explains that the gravitational field equation for the vacuum surrounding the Sun is $\mathcal{R}_{ik} = 0$, which is equivalent to Einstein’s equation (1):

$$
\sum_{\alpha} \frac{\partial \Gamma_{\mu\nu}^{\alpha}}{\partial x^{\alpha}} + \sum_{\alpha \beta} \Gamma_{\mu\beta}^{\alpha} \Gamma_{\nu\alpha}^{\beta} = 0.
$$

However, according to Prof. Winterberg, the constant of integration is, in the instant case, the solar mass. In equations (4b), Einstein gives:

$$
g_{44} = 1 - \frac{a}{r}.
$$

Einstein defines $a$ as “a constant determined by the mass of the sun.” In equation
(13), Einstein gives,

\[ \varepsilon = 3\pi \frac{\alpha}{a\left(1 - e^2\right)}, \]

where \( \varepsilon \) is the perihelion advance following one full orbit, \( a \) is the orbit’s semi-major axis, and \( e \) is the eccentricity. Einstein then asserts, without proof, that,

“If we introduce the orbital period \( T \) (in seconds), we obtain

\[ \varepsilon = 24\pi^3 \frac{a^2}{T^2 c^2 \left(1 - e^2\right)}, \quad (14) \]

where \( c \) denotes the velocity of light in units of cm sec\(^{-1}\).”  

Einstein’s equation (14) is identical to the formula Gerber published in 1898. Gerber gave,

\[ c^2 = \frac{6\pi \mu}{a\left(1 - e^2\right)}, \text{ where } \mu = \frac{4\pi^2 a^3}{r^2}. \]

Ernst Gehrcke and Arvid Reuterdahl noted that if we substitute for \( \mu \) in Gerber’s formula; and standardize the notation from Gerber’s \( r \) for the time of the orbital period to Einstein’s \( T \), change Gerber’s \( \varepsilon \) to Einstein’s \( e \) for the eccentricity and change Gerber’s \( \Psi \) to Einstein’s \( \varepsilon \) for the advance of the perihelion’s motion and solve for it while assuming that the speed of gravity is the speed of light, instead of solving for the speed of gravity squared (which is what Zenneck proposed we do, in 1903); we obtain Einstein’s equation (14),

\[ \varepsilon = 24\pi^3 \frac{a^2}{T^2 c^2 \left(1 - e^2\right)}. \]

ENTER EINSTEIN’S FUDGE: In accord with Newtonian theory, Poisson’s equation \( \nabla^2 \phi = 4\pi G \rho \) results in the gravitational potential:

\[ \phi = -\frac{GM}{r}, \]

where \( M \) is the solar mass and \( G \) is the gravitational constant. In the vacuum field equation \( \nabla^2 \phi = 0 \), the constant in \( \phi = \frac{\text{const}}{r} \) is left open.

The correct field equations of gravitation are:
Prof. Winterberg explains that Einstein’s erroneous field equation,
\[ R^t_t = \frac{8\pi G}{c^4} \left( T^t_t - \frac{1}{2} \delta^t_t T \right) \]
within the limits of \( t = k = 0 \), produces instead,
\[ R^0_0 = \frac{8\pi G}{c^2} \rho \quad \text{and} \quad \nabla^2 \phi = \frac{8\pi G}{c^2} \rho. \]

As previously noted, Einstein defines \( a \) as “a constant determined by the mass of the sun.” Einstein also states,

“Moreover, it should be observed that equations (7b) and (9) for the case of circular motion give no deviation from Kepler’s three laws.”

Kepler’s third law gives us:
\[ T^2 = \frac{4\pi^2 a^3}{GM}, \]
where \( M \) is the mass of the sun. Prof. Winterberg demonstrates that if we replace \( T^2 \) with \( \frac{4\pi^2 a^3}{GM} \) in Einstein’s expression for \( \varepsilon \), then we obtain:
\[ \varepsilon = \frac{6\pi GM}{ac^2 \left( 1 - e^2 \right)}. \]

It is clear from Einstein’s equation (13):
\[ \varepsilon = \frac{3\pi a}{c^2 (1 - e^2)}, \]
that Einstein merely assumes, without offering up any proof, that the constant \( a \) is equal to \( \frac{2GM}{c^2} \) (which matches the Schwarzschild radius of the solar system), in contradiction to the results of Einstein’s own erroneous theory. Pursuant to Einstein’s equation (10):
and Einstein’s equation (11):

\[
\frac{d^2 \varphi}{ds^2} = \frac{2A}{B^2} + \frac{\alpha}{B^2} x - x^2 + \alpha x^3,
\]

one finds that: \( \frac{\alpha}{B^2} = \frac{2GM}{c^2 B^2} \).

As Prof. Winterberg has shown, Einstein’s erroneous field equations result in

\[ \nabla^2 \varphi = 8\pi G \rho \]

in the approximation of the weak field limit, therefore, the gravitational potential is, in Einstein’s view:

\[ \varphi = -\frac{2GM}{r} \].

In the weak field limit,

\[ g_{\mu\nu} = 1 + \frac{2\varphi}{c^2} = 1 - \frac{4GM}{c^2 r} \].

Though Einstein erroneously assumed without proof that,

\[ \alpha = \frac{2GM}{c^2} \]

in fact, according to Einstein’s incorrect theory of the perihelion motion of Mercury based on the erroneous hypothesis that the trace of the energy-momentum tensor is \( T = 0 \), made before Einstein plagiarized David Hilbert’s generally covariant field equations of gravitation, Einstein was instead obliged to conclude that,

\[ \alpha = \frac{4GM}{c^2} \].

Prof. Winterberg argues that Einstein was, therefore, forced to fudge the equations with a factor of one half of the solar mass in order to derive Gerber’s formula:

\[ \delta \psi = \frac{6\pi GM}{\alpha (1 - e^2) c^2} \].

Einstein must have known the result he was after and simply employed induction.
to fabricate what is shown to be an inconsistent theory around Gerber’s well-known formula, without mentioning Gerber. Charles Lane Poor found Einstein’s derivations suspect and published several articles in the 1920’s and 1930’s, in which he attempted to expose Einstein’s trickery. Poor wrote in 1930,

“[Einstein] starts his wonderful fabric by defining his tensor symbol, $g_{\mu\nu}$, in such a way as to make it the exact equivalent of the Newtonian potential of ordinary astronomy. [***] The fact is that Einstein made a slip in his preparations for his public exhibition of relativity: he did not work his mathematical machine correctly. [***] The golden nugget that Einstein thus forgot to transform is the mathematical symbol which represents the mass of the sun. [***] Thus the claim of Einstein to have found a new law of gravitation and the many assertions that the theory of relativity has worked in accounting for the motions of Mercury and has been conclusively proved by the eclipse observations and by the displacement of spectral lines are all merely unproved, and, so far, really unsupported illusions. Einstein and his followers have been dwelling in the ‘pleasing land of dreams that wave before the half shut eye.’”

12.5 Who Was Paul Gerber?

There has been very little published on the life of Paul Gerber. Three letters I found in the papers of Arvid Reuterdahl in the Department of Special Collections, O’Shaunessy-Frey Library, University of St. Thomas, reveal some of the details of his somewhat tragic life and that of his widow, as well as his death at age 55 in 1909. Two are from Paul Gerber’s widow Marta Gerber to Arvid Reuterdahl (Prof. Friedwardt Winterberg has kindly transcribed Mrs. Gerber’s handwriting):

“Stargard Pm. d. 7. 9. 21.
Barminstr. 10.

Sehr geehrter Herr Professor!

erklären wie sich eigentlich die Einstein’sche Sache verhältn, ich weiss davon so wenig. Indem ich Ihrer Schrift recht viel Glueck auf den Weg wünsche, bleibe ich, hochachtungsvoll und ergebenst

Marta Gerber**2801

and,

“Stargard d. 2. 10. 21.

Sehr geehrter Herr Professor!

Am 8. Sept. habe ich Ihnen die beiden Bilder an Sie abgeschickt, hoffentlich sind sie jetzt schon in Ihrem Besitz, Herr Professor.”**2802
12.6 Conclusion

Edouard Guillaume stated in 1920,

“The expression $\varepsilon = \frac{6 \pi \mu m}{a(1-e^2)}$ was given for the first time by the German physicist Gerber.”

“L’expression (37) a été donnée pour la première fois par le physicien allemand Gerber.”

Stjepan Mohorovićić wrote in 1922,

“In the general theory of relativity, Einstein tried to explain the perihelion shift of the planets, and he arrived at the same formula P. Gerber had found a long time before him, based on the assumption that the effects of gravitation do not propagate at an infinite speed in space.”

“In der allgemeinen Relativitätstheorie hat Einstein versucht, die Perihelverschiebung der Planeten zu erklären, und er gelangte zu derselben Formel, welche längst vorher P. Gerber gefunden hat, unter der Voraussetzung, daß die Wirkung der Gravitation (der Schwerkraft) sich im Raume nicht unendlich rasch fortpflanzt.”

Similar statements, or more direct accusations of Einstein’s plagiarism of Gerber’s work, are found in the writings of Gehrcke, Silberstein, Lenard, Reuterdahl, See, Weyland, Riem, Glaser, Gleich, Roseveare, Beckmann, and others.

While there has long been a controversy over the viability of Gerber’s theory, such a controversy cannot take from the man his priority for producing the correct formula for the perihelion motion of Mercury long before Einstein plagiarized it (if indeed the formula is correct). Nor would any flaw in Gerber’s derivation or theorization preclude the possibility of Einstein’s plagiarism. Einstein simply worked inductively from Gerber’s successful result to fabricate a theory around it, and in the process was forced to fudge his equations. Ludwig Silberstein, who assumed that Einstein had independently derived Gerber’s much older formula, nevertheless insisted that it be properly called “Gerber’s formula”. Silberstein wrote in March of 1917, *inter alia*,

“It is well known that as early as 1845 Le Verrier found that the motion of the perihelion of Mercury, as derived from observations of transits, was greater by $38''$ per century than it should be from the perturbation due to all the other planets of our system. A recent discussion of the subsequent investigations has shown the excess of motion to be about $5''$ greater, viz., per century,
Equally well known are the attempts of Newcomb and of Seeliger to account for this excess of motion of Mercury’s perihelion. A discussion of Seeliger’s results (which, broadly speaking, were very satisfactory) and a modification of his treatment have been given by H. Jeffreys (M. N., vol. lxxvii. p. 112). On the other hand, a great sensation has been recently produced among astronomers by the surprising circumstance that Einstein’s newest ‘generalised’ theory of relativity’ has yielded for the said excess just its full value, i.e., in round figures, 43″. In fact, Einstein gives in his recent paper,[Footnote: Annalen der Physik, vol. xlix., 1916, pp. 769-822. See also Professor de Sitter’s papers in M. N., vol. lxxvi., 1916, p. 699, and vol. lxxvii. p. 155.] for the angle through which the elliptic orbit of a planet is turned, in the direction of motion, per period $T$, the formula

$$
\delta \omega = +42^{\prime\prime}.9.
$$

where $a, e$ stand for the major semi-axis and the eccentricity of the orbit, and $c$ is the velocity of light in empty space. Substituting $a = 0.3871 \cdot 1.49 \cdot 10^6 \text{ km.}$, $e = 0.206$, $T = 87.97$ days, $c = 3 \cdot 10^5 \text{ km./sec.}$, the reader will find, for $\delta \omega$ per century, 43″.1, which is the desired angle. The reason why I have denoted the above formula by (G) is, with all respect due to Einstein, that identically the same formula was given eighteen years earlier by Gerber, [Footnote: P. Gerber, Zeitshcr. math. Phys., xliii., 1898, pp. 93-104. A short account of Gerber’s theory is given in Enc. d. math. Wiss., vol. V. I, pp. 49-51; a still shorter, and very unfair, account is given by Herr E. Gehrcke in Annalen der Physik, li., 1916, pp. 122-124.] whose investigation, entirely independent of any relativity (‘old’ or ‘new’), seems to have passed unobserved, most likely owing to its badly supported fundamental assumptions. To enter upon these latter would not answer the purposes of the present paper. It may, however, be interesting to notice that Gerber replaces Newton’s potential $\frac{M}{r}$ by $\frac{M}{r \left(1 - \frac{1}{c} \frac{dr}{dt}\right)^2}$, where $c$ is the ‘velocity of propagation of the gravitation potential’; rejecting the third, and the higher, powers of $\frac{dr}{c dt}$, Gerber obtains for any (isolated) planet in its motion round the central body the above formula. It is historically interesting that Gerber does not identify $c$ with the velocity of light, but determines its value from the observed excess of the secular motion of the perihelion of Mercury, and finds $c = 305500 \text{ km/sec.}$, i.e. ‘surprisingly near the light velocity.’ Thus, whatever his theory, the formula
Gerber’s Formula

(G), accounting for the full excess of Mercury’s perihelion motion, will appropriately be called Gerber’s formula.

Now, to repeat it, Gerber has deduced his formula from an untenable theory, or at least from one which has not been based upon well-established general principles. Einstein, eighteen years later, but undoubtedly without knowing Gerber’s formula, has rediscovered it by deducing it from his ‘generalised’ theory of relativity, which, in its turn, is again very far from being well established. In fact, notwithstanding its broadness and mathematical elegance, it certainly offers many serious difficulties in its very foundations, while none of its predictions of new phenomena, as the deflection of a ray by the sun, have thus far been verified. And even the fact that Einstein’s new theory gives Gerber’s formula, and therefore the full excess of $43\frac{1}{2}$ for Mercury, does not seem to be decisive in its favour. As far as I can understand from Jeffreys’s investigation,Footnote: loc. cit., see especially p. 113, and the final paragraph of the paper, p. 118.] it would rather alleviate the astronomer’s difficulties if the Sun by itself gave only a part of these 43 seconds.”

Prof. Friedwardt Winterberg contends that Einstein (who as of 18 November 1915 had not yet plagiarized Hilbert’s generally covariant field equations of gravitation, and, therefore, did not have a tenable theory) fudged the equations to produce the forced result, Gerber’s result, by taking half of the solar mass. Einstein’s fudge factor also doubled the value of the Newtonian prediction of the total deflection of a light ray grazing the Sun coming from infinity and passing to infinity, by halving the result of Einstein’s erroneous 18 November 1915 theory; which, if stated consistently, predicts a deflection four times as great as the Newtonian prediction.

Those who would deny Gerber’s priority based on perceived flaws in his derivation and/or theorization must likewise deny Einstein any priority. However, Gerber deserves credit for first stating the formula. Zenneck proposed that we assume for the speed of gravity the speed of light and employ Gerber’s formula as an accurate description of the perihelion motion of Mercury. Cunningham deserves credit for introducing Gerber’s formula into the theory of relativity as the fulfillment of the principle of relativity. Grossmann and Hilbert derived the generally covariant field equations of gravitation of the general theory of relativity. To SchwarzschildFootnote: 2809 goes the honor of first providing the correct and exact derivation of Gerber’s formula in the general theory of relativity.
13 SELLER’S PREDICTION

In 1919, (on dubious grounds) Frank Watson Dyson, Charles Davidson and Arthur Stanley Eddington made Albert Einstein internationally famous by affirming that experiment had confirmed, without an attribution to Soldner, Johann Georg von Soldner’s 1801 hypothesis that the gravitational field of the Sun should curve the path of a light ray coming from a star and grazing the limb of the Sun. Shortly after that Einstein won the Nobel Prize, though it is unclear why he won it, other than as a reward for his newly found fame for reiterating Soldner’s ideas, and for his pacifist stance during World War I—the law of the photoelectric effect was mentioned as a possible reason for the prize.

“That the idea of a bending of light rays was bound to emerge at the time of the emission theory is quite natural, as is the fact that the numerical result is exactly the same as that according to the equivalence hypothesis.”—ALBERT EINSTEIN

13.1 Introduction

Isaac Newton asked if mass is convertible into light, and wondered if light might be subject to gravity. From Newton’s Opticks,

“QUERY 1. Do not bodies act upon light at a distance, and by their action bend its rays; and is not this action (caeteris paribus) strongest at the least distance?”

and,

“QUERY 30. Are not gross bodies and light convertible into one another, and may not bodies receive much of their activity from the particles of light which enter their composition? [***] The changing of bodies into light, and light into bodies, is very conformable to the course of Nature, which seems delighted with transmutations. [***] [W]hy may not Nature change bodies into light, and light into bodies?”

Newton’s corpuscular theory of light demands that light be subject to the force of gravity. As a result, Newton’s theory predicts that light emitted from a distant star grazing the Sun is deflected by the gravitational field of the Sun before it reaches the Earth. This predicted effect was already known in the 1700’s. Huyghens’ wave theory of light produces the same result on other grounds. It is theoretically possible to measure the amount of any deflection during an eclipse of the Sun.

Arthur Stanley Eddington acknowledged Newton’s priority for predicting that gravitational fields would deflect the path of a ray of light. The Times of London reported on 28 November 1919, on page 14,
“PROFESSOR EDDINGTON ON NEWTON’S FORESIGHT.”

In an article in the Contemporary Review on ‘Einstein’s Theory of Space and Time,’ Professor A. S. Eddington, referring to the recent observations of the eclipse of the sun, says:—

‘The deflection of the star images means a bending of the ray of light as it passes near the sun, just as thought the light had weight which caused it to drop towards the sun. But it is not the bending of light that threatens the downfall of Newton. On the contrary, were Newton alive he would be congratulating himself on his foresight. In his ‘Opticks’ we read:—Query 1.—Do not bodies act upon light at a distance, and by their action bend its rays, and is not this action (caeteris paribus) strongest at the least distance?

‘Weight of light seemed less strange to Newton than to us, because he believed light to consist of minute corpuscles, whereas for us the bending of a wave of light is a much more difficult conception. This confirmation of Newton’s speculation is in itself a striking result; it might perhaps be described as the first new thing that has been learnt about gravitation in more than 200 years.’

13.2 Soldner’s Hypothesis and Solution

Johann Georg von Soldner\textsuperscript{2814} predicted in 1801 and that the gravitational mass of a ray of light from a distant star would curve its trajectory when it passed near the Sun. Soldner gave a value for the deflection twice as great as the Newtonian prediction, as did Einstein, the second time around. Soldner anticipated Einstein by more than a century.\textsuperscript{2815}

In 1907, Albert Einstein wrote without an attribution to anyone,

“As a result, the light rays which do not proceed along the $\xi$–axis are bent by the gravitational field; as is easily seen, the deflection comes to $\frac{y}{c^2} \sin \phi$ per centimeter of the path of light, where $\phi$ is the angle between the direction of the gravitational force and that of the ray of light.

Employing these equations and those equations known from the optics of resting bodies among the field strength and electrical current at a point, we are able to determine the influence of the gravitational field on optical phenomena in resting bodies. We must keep in mind the fact that the equations of the optics of resting bodies hold for the local time $\sigma$. Unfortunately, according to our theory, the influence of the gravitational field of the Earth is so slight (owing to the minuteness of $\frac{y\Sigma}{c^2}$), as to afford no possibility to test the results of the theory against experience.”\textsuperscript{2816}
Einstein’s lamentations remind one of Soldner’s work of 1801. In 1911, Einstein repeated the Newtonian prediction\textsuperscript{2817} for the deflection of a light ray grazing the limb of the Sun without giving an attribution to anyone:

“By equation (4) a ray of light passing along by a heavenly body suffers a deflexion to the side of the diminishing gravitational potential, that is, on the side directed toward the heavenly body, of the magnitude

\[
\alpha = \frac{1}{c^2} \int \frac{kM}{r^2} \cos \theta \, ds = 2 \frac{kM}{c^2 \Delta}
\]

where \( k \) denotes the constant of gravitation, \( M \) the mass of the heavenly body, \( \Delta \) the distance of the ray from the centre of the body. A ray of light going past the Sun would accordingly undergo deflexion to the amount of \( 4 \times 10^{-6} \approx 0.83 \) seconds of arc. The angular distance of the star from the centre of the Sun appears to be increased by this amount. As the fixed stars in the parts of the sky near the Sun are visible during total eclipses of the Sun, this consequence of the theory may be compared with experience. With the planet Jupiter the displacement to be expected reaches to about \( \frac{1}{100} \) of the amount given. It would be a most desirable thing if astronomers would take up the question here raised. For apart from any theory there is the question whether it is possible with the equipment at present available to detect an influence of gravitational fields on the propagation of light.”\textsuperscript{2818}

As was demonstrated in Section 12.4 Einstein’s Fudge, Einstein mysteriously doubled the predicted amount of deflection in 1915, which is to say he doubled the value of the Newtonian prediction to match Soldner’s 1801 prediction. Einstein based this new prediction upon his erroneous assumption that \( \sum T^\mu_\mu = 0 \) for the trace of the energy-momentum tensor of matter, which should have netted him a quadrupled value had he been logically consistent and had he not fudged his equations by halving the mass of the Sun. Einstein wrote on 18 November 1915, without giving an attribution to anyone:

“Upon the application of Huygen’s principle, we find from equations (5) and (4b), after a simple calculation, that a light ray passing at a distance \( \Delta \) suffers an angular deflexion of magnitude \( 2a/\Delta \), while the earlier calculation, which was not based upon the hypothesis \( \sum T^\mu_\mu = 0 \), had produced the value \( a/\Delta \). A light ray grazing the surface of the sun should experience a deflexion of 1.7 sec of arc instead of 0.85 sec of arc.”\textsuperscript{2819}
This doubled figure is quite significant, in that it enabled Einstein to distinguish his work from Newton’s and it was this doubled figure which was allegedly confirmed in 1919 by the dubious eclipse observations of Dyson, et al.—an event which made Einstein world-famous almost overnight. In truth, the eclipse observations did not achieve the results or the accuracy claimed and were little more than a publicity stunt and a fraud perpetrated on the general public. Before this event, the general public had not yet become acquainted with Albert Einstein. After this event, Einstein was promoted as the new Newton and immediately became an international celebrity. The story of the eclipse observations and Einstein’s alleged greatness was covered by most every major newspaper around the world.

Prof. Friedwardt Winterberg holds that Einstein’s doubled figure, which nearly matches Soldner’s 1801 value, is the result of Einstein’s fudging of the figures in his attempts to appropriate Gerber’s formula for the perihelion motion of Mercury. Prof. Winterberg argues that Einstein, before having the benefit of plagiarizing Hilbert’s generally covariant field equations of gravitation, used half of the solar mass in Einstein’s formulation of the perihelion motion of Mercury. This inductively determined fudge factor allowed him to deduce Gerber’s result and Soldner’s result. However, Einstein’s 18 November 1915 theory, if it were stated in consistent terms, results in a prediction of the deflection of a ray of light four times as great as the Newtonian prediction.

13.3 Einstein Knew the Newtonian Prediction

Soldner’s work of 1801 was fresh on the mind’s of physicists in 1915. Franz Johann Müller presented an analysis of Soldner’s work in 1914. Müller wrote,

“3. Über die Ablenkung eines Lichtstrahls von seiner geradlinigen Bewegung durch die Attraktion eines Weltkörpers, an welchem er nahe vorbeigeht.

Soldner kommt auf Grund der zu seiner Zeit herrschenden Newton’schen Emanationstheorie zu der Ansicht, daß der Lichtstrahl die Bahn eines mit Lichtstoff angefüllten (schweren) Massenpunktes sei, welcher der Newton’schen Attraktion unterworfen ist. Hiemit ist die Aufgabe auf ein äußerst einfaches Problem der Punktmekhanik zurückgeführt.

Soldner läßt den leuchtenden Punkt von der Oberfläche des störenden Körpers in den Weltraum hinausgehen und findet dadurch, daß die Bahnungkurve zur Verbindungslinie des Anfangspunktes (vielmehr Endpunktes) und dem Zentrum des störenden Körpers symmetrisch sein muß, weil die Bedingungen auf beider Seiten dieser Geraden dieselben sind.

Aus den Elementen der Mechanik ist bekannt, daß ein so affizierter Massenpunkt einen Kegelschnitt beschreibt, dessen einer Brennpunkt mit dem Attraktionszentrum zusammenfällt und dessen Hauptsachsenrichtung durch die oben beschriebene Gerade gegeben ist.
Die Exzentrizität $e$ des in Frage stehenden Kegelschnitts ist gegeben durch die Formel:

$$e = \sqrt{1 + \frac{k^2}{\mu^2} \left( \frac{C^2 - \frac{2\mu}{n}}{n} \right)}$$

$k$ ist die Konstante des Flächensatzes, $C$ die Lichtgeschwindigkeit. Da Soldner in seiner Überlegung die Bewegung in einem Scheitelpunkt beginnen läßt, so findet er $k = C$; $\mu$ ist die am störenden Himmelskörper herrschende Schwerebeschleunigung. Da die Lichtgeschwindigkeit pro Sekunde bekanntlich 308 043 km beträgt, so ist ohne weiteres klar, daß die in obiger Formel auftretende algebraische Summe stets positiv ist. Die Bahn ist also hyperbolisch. Soldner denkt sich den leuchtenden Punkt als aus dem Unendlichen kommend, so daß die Ablenkung $w$ aus der im Horizonte des Beobachtungsortes nach dem leuchtenden Punkt gezogenen Geraden durch die Gleichung:

$$\tan w = \frac{\mu}{C \sqrt{C^2 - \frac{2\mu}{n}}} \quad (\text{Asymptotenwinkel})$$

gaben ist.

$n$ setzt Soldner gleich der Einheit; der wirkliche Wert dieser Größe ist:

$$\sqrt{a^2 + b^2 - a}.$$

wo $a$ und $b$ die zwei Achsen der Hyperbel vorstellen.
Für die Erde als störenden Körper findet Soldner:

$$w = 0,\, \text{"}009798.$$

Er schließt seine Untersuchung mit den Worten: „Also ist es ausgemacht, daß man, wenigstens bei dem jetzigen Zustande der praktischen Astronomie, nicht nötig hat, auf die Perturbationen der Lichtstrahlen durch anziehende Weltkörper Rücksicht zu nehmen.“

Albert Einstein knew in 1911 that he was only repeating the Newtonian prediction for the deflection of light based upon the “corpuscular” emission theory of light. Einstein wrote to Erwin Freundlich in August of 1913,

“That the idea of a bending of light rays was bound to emerge at the time of the emission theory is quite natural, as is the fact that the numerical result is
Jürgen Renn believes that Einstein may have been inspired by Ferdinand Rosenberger’s famous book on Newton, *Isaac Newton und seine physikalischen Principien*.

Others hold that Aaron Bernstein’s popular books on science Naturwissenschaftliche Volksbücher influenced Einstein, which books Einstein had read as an adolescent. Einstein cited none of this work in 1911-1915, though he did discuss it with Alexander Moszkowski shortly thereafter, and mentioned it in his autobiographical statements, in each instance only in the most general of terms,

“Auch hatte ich das Glück, die wesentlichen Ergebnisse und Methoden der gesamten Naturwissenschaft in einer vortrefflichen, fast durchweg aufs Qualitative sich beschränkenden Darstellung kennen zu lernen (Bernsteins naturwissenschaftliche Volksbücher, ein Werk von 5 oder 6 Bänden), ein Werk, das ich mit atemloser Spannung las.”

Maja Winteler-Einstein also mentioned that her brother Albert had read Bernstein’s books.

As Samuel Guggenheimer and Charles Lane Poor discovered, Einstein effectively conceded in 1920 that in 1911 he had simply repeated the Newtonian prediction. Einstein stated,

“It may be added that, according to the theory, half of this deflection is produced by the Newtonian field of attraction of the sun, and the other half
by the geometrical modification (‘curvature’) of space caused by the sun.”

After Philipp Lenard and Ernst Gehrcke accused Einstein of plagiarism in 1921, which caused an international scandal, Einstein lied in 1923 in a Czech translation of his book *Relativity: The Special and the General Theory* and publicly contradicted his own private statements,

“[. . . ]I discovered in 1911 that the principle of equivalence demands a deflection of the light rays passing by the sun with observable magnitude—this without knowing that more than one hundred years ago a similar consequence had been anticipated from Newton’s mechanics in combination with Newton’s emission theory of light.”

On the advice of Wodetzky of Budapest, Philipp Lenard noted that Poisson wrote of light’s being attracted by gravity, the curvature of a ray of light by the sun, and the change in wavelength of light by the sun. Thomas Jefferson Jackson See mentioned the priority of Cavendish, and Jaki and Eisenstaedt refer to Laplace’s and John Michell’s priority. In 1801, Soldner published the doubled Newtonian prediction Einstein presented in 1915, as if novel.

Edwin E. Slosson wrote in 1919,

“The amount of the observed angular deviation of the light rays from the straight line is 1.75 seconds, which is the same as was predicted by Einstein in 1911[\textit{sic}], and considerably more than the deviation (.83 second) to be expected if Newton’s law of gravitation applied to light.”

The eclipse observations were one of the big three empirical demonstrations taken to justify the complicated geometry of the general theory of relativity. The eclipse observations were also employed as a publicity stunt to promote Einstein as the new and improved Newton. The other two alleged verifications were the perihelion motion of Mercury and the displacement of spectral lines towards the red.

13.4 Soldner’s Formulation

“Two \( g \) or not \( 2g \)?” that is the question. It is widely held that Soldner’s formulation includes an erroneous factor of two and is not the true Newtonian formulation. Soldner’s 1801 factor of two anticipated Einstein’s 1915 predicted result by more than a century. Robert Trumpler wrote in the 31 August 1923 edition of *Science*,

“In setting up the differential equations for the motion of the particle [Soldner] erroneously used for the gravitational force the expression

\[
2gr^{-2}
\]

where \( g = \) acceleration at the surface of the attracting body, and
r = distance from the center of the attracting body (adopting the radius of this body as unit distance).

The factor 2 has no justification and should be omitted.**2835

Trumpler wrote to Mr. L. A. Redman on 30 September 1925 and explained that Soldner erred in his first equations:

\[
\frac{ddx}{dt^2} = -\frac{2g}{r^2} \cos \varphi \quad (I)
\]

\[
\frac{ddy}{dt^2} = -\frac{2g}{r^2} \sin \varphi \quad (II)
\]

Trumpler contended that,

“If these equations are applied to the point A on the Sun’s surface it will read

\[
\frac{d^2x}{dt^2} = -2g
\]

or the acceleration is equal to twice the acceleration: \(1 = 2\)

which evidently must be wrong.”**2836

Soldner not only revealed his doubled Newonian prediction in his equations, but also in his diagram, and on page 170 of his paper he states,

“If one were to investigate by means of the given formula how much the moon would deviate a light ray when it goes by the moon and comes to earth, then one must, after substituting the corresponding magnitudes and taking the radius of the moon for unity, double the value found through the formula, because a light ray, which goes by the moon and comes to the earth describes two arms of a hyperbola.”**2837

In 1918, Eddington asserted that Einstein’s 1915 prediction was twice that of the Newtonian prediction.**2838 H. H. Turner wrote on 30 November 1919, where \(E\) is Einstein and \(N\) is Newton,

“On Einstein’s theory the deflection would be just twice this amount, \(E = 2N\).”**2839

Arvid Reuterdahl stated on 22 March 1924,

“In *Science* (August 31, 1923), Dr. Robert Trumpler calls attention to the *error in Soldner’s work*. Note that it is Soldner that is wrong despite the fact that Einstein’s 1911 formula is identical with that of Soldner. It is also curious that when Einstein tried again in 1916 to produce a formula it did not
agree with his first effort, in fact, the 1916 formula gives a value twice as large as the one of 1911. Both are right according to the Einsteinians:—two equals one.”

Reuterdahl, relying upon Philipp Lenard’s somewhat confusing analysis, mistakenly believed that Soldner’s result matched Einstein’s 1911 prediction, when in fact it comes closer to Einstein’s revised 1915 prediction. (Abraham Pais and many others have made the same mistake Reuterdahl made.) In fact,\[ E = \frac{1}{2} E'' = 2E' = S = 2N, \]

where $E$ is Einstein’s 18 November 1915 prediction, $E''$ is the prediction Einstein’s 18 November 1915 paper would have presented, if it were expressed in logically consistent terms, $S$ is Soldner’s 1801 prediction (warts and all), and $E'$ is Einstein’s 1911 prediction, which simply duplicates the Newtonian prediction $N$. Reuterdahl later came to understand what Soldner had predicted and spent years trying to justify his prediction, claiming that it is the correct Newtonian prediction.

Some have speculated as to why Soldner might have added the factor of two. Richard de Villamil argued in a letter to Arvid Reuterdahl (in which de Villamil called Einstein’s “Relativity” the “finest spoof of the century!” nay, “of modern times”) that Soldner’s logic should have led him to,

\[ v = -\frac{G}{R^2} \times \text{Time} \]

which after differentiating becomes,

\[ \frac{d^2 x}{dt^2} = -\frac{G}{R^2}. \]

de Villamil notes that Soldner instead refers to Laplace’s equation of velocity in distance or space, as opposed to time,

\[ v^2 = -2 \frac{G}{R^2} \times \text{Distance} + \text{constant} \]

or,

\[ \left( \frac{dx}{dt} \right)^2 \frac{dx^2}{dt^2} = -2 \frac{G}{R^2} \times \text{Distance} + \text{constant}. \]

de Villamil holds that if $\frac{ddx}{dt^2}$ is correct, then Soldner’s $2g$ should be $g$, and if
Soldner had instead,

“differentiated \( v^2 \) he would have got a ‘2’ on the left side of his equation;
\[
2 \cdot \frac{d^2 x}{dt^2} = -\frac{2G}{R^2}
\]
and, eventually, this would (after cancelling the
‘2’s) have resolved itself into
\[
\frac{d^2 x}{dt^2} = -\frac{G}{R^2} !
\]

de Villamil concludes,

“Soldner in differentiating \( \left( \frac{dx}{dt} \right)^2 \) squared, appears to have overlooked that
this involves the use of a ‘2’.\textsuperscript{2843}

13.5 Conclusion

In the case of the Sun, Soldner gives a prediction of \( \omega = 0.84 \) for half of the
deflection of a ray of light going from infinity past the sun to infinity; and \( 1.68 \) for
the full deflection from infinity to infinity—quite nearly the same as Einstein’s \( 1.7 \)
of 1915—which was allegedly confirmed in 1919. As is the case with Paul Gerber,
either Johann Georg von Soldner deserves credit for first making the correct
prediction, or Einstein deserves no credit due to his flawed derivation based on half
of the solar mass and his erroneous hypothesis that \( T = 0 \) for the trace of the energy-
momentum tensor of matter.
14 THE PRINCIPLE OF EQUIVALENCE, ETC.

Albert Einstein was fond of propounding thought experiments as if they would somehow account for the research he had never conducted. Einstein also tried to lay claim to well-known experimental facts by propounding that a posteriori problems were instead a priori first principles. He confused induction with deduction and analysis with synthesis. However, even Einstein’s thought experiments were unoriginal.

“In 1907 Planck broke new ground. It had been established by the careful experiments of R. v. Eötvös that *inertial mass* [***] and *gravitational mass* [***] are always exactly equal [***] Now, said Planck, all energy has inertial properties, and therefore *all energy must gravitate*. Six months later Einstein published a memoir in which he introduced what he later called the \textit{Principle of Equivalence}[.].”—SIR EDMUND WHITTAKER

14.1 Introduction

Galileo Galilei criticized Aristotle for leaving to logic and assumption that which could be experimentally tested. Albert Einstein became famous for pretending that he had used logic and assumption to create “thought experiments” in lieu of real experiments. In fact, Einstein either copied these thought experiments from his predecessors, or converted the actual experiments others had performed into “thought experiments” so that he could lay claim to them as if he were the first to argue the point. Just as Galileo disproved many of Aristotle’s assumptions, many of the fundamental assumptions of the theory of relativity have been physically contradicted.

14.2 Eötvös’ Experimental Fact and Planck’s Proposition

Maxwell’s equations implicitly contain the formula $E = mc^2$. Simon Newcomb pioneered the concept of relativistic energy in 1889. S. Tolver Preston, J. J. Thomson, Henri Poincaré, Olinto De Pretto, Fritz Hasenöhrl, [etc. etc. etc.] each effectively (Albert Einstein, himself, did not expressly state it in 1905), or directly, presented the formula $E = mc^2$, before 1905, and Max Planck refined the concept in 1906-1908, including Galileo’s, Huyghens’, Newton’s, Boscovich’s, Schopenhauer’s, Mach’s, Bolliger’s, Geissler’s, Bessel’s, Stas’, Eötvös’, Kreichgauer’s, Landolt’s, Heydweiller’s and Hecker’s implications that inertial mass and gravitational mass are equivalent—before Albert Einstein. Einstein was familiar with Henri Poincaré’s 1900 paper, which implicitly contained the formula $E = mc^2$, and which presented the thought experiment of synchronizing clocks with light signals that Einstein copied without an attribution. Einstein also copied Hasenöhrl’s thought
experiments without an attribution. With respect to Planck’s equation, G. N. Lewis gave us relativistic mass in 1908, and in 1909, “drew attention to the formula for the kinetic energy
\[
\frac{m_0 c^2}{\left(1 - v^2/c^2\right)^{1/2}} - m_0 c^2
\]
and suggested that the last term should be interpreted as the energy of the particle at rest.”

Louis Rougier’s *Philosophy and the New Physics* contains much useful information on this subject. Max Jammer’s *Concepts of Mass in Classical and Modern Physics* is yet more detailed, and Sir Edmund Whittaker’s *A History of the Theories of Aether and Electricity* in two volumes is phenomenal.

In 1908, Einstein published a review article on the special theory of relativity. Einstein cited Planck’s earlier 1907 work, which enunciated the principle of equivalence of inertial and gravitational mass. Later, in the same paper, Einstein appears to “nostriify” the principle.

Max Planck wrote on 13 June 1907, before Einstein ever touched upon the subject,

“An diese Betrachtung schliesst sich sogleich ein drittes Beispiel, nämlich die Frage nach der Identität von träger und ponderabler Masse. Die Wärmestrahlung in einem vollständig evacuirten, von spiegelnden Wänden begrenzten Raume besitzt sicher träge Masse; aber besitzt sie auch ponderable Masse? Wenn diese Frage zu verneinen ist, was wohl das Nächstliegende sein dürfte, so ist damit offenbar die durch alle bisherige Erfahrungen bestätigte und allgemein angenommene Identität von träger und ponderabler Masse aufgehoben. Man darf nicht einwenden, dass die Trägheit der Hohlraumstrahlung unmerklich klein ist gegen die der begrenzenden materiellen Wände. Im Gegenteil: durch ein gehörig grosses Volumen des Hohlraumes lässt sich die Trägheit der Strahlung sogar beliebig gross machen gegen die der Wände. Eine solche, durch dünne starre spiegelnde Wände von dem äusseren Raum vollständig abgeschlossene, im Übrigen frei bewegliche Hohlraumstrahlung liefert ein anschauliches Beispiel eines starren Körpers, dessen Bewegungsgesetze von denen der gewöhnlichen Mechanik total abweichen. Denn während er, äusserlich betrachtet, sich durch Nichts von anderen starren Körpern unterscheidet, auch eine gewisse träge Masse besitzt und dem Gesetz des Beharrungsvermögens gehorcht, ändert sich seine Masse merklich mit der Temperatur, ausserdem hängt sie in bestimmter angebbarer Weise von der Grösse der Geschwindigkeit ab sowie von der Richtung, welche die bewegende Kraft mit der
Geschwindigkeit bildet. Dabei haben die Eigenschaften eines solchen Körpers gar nichts Hypothetisches an sich, sondern lassen sich quantitativ in allen Einzelheiten aus bekannten Gesetzen ableiten.

Angesichts der geschilderten Sachlage, durch welche einige der bisher gewöhnlich als festeste Stütze für theoretische Betrachtungen aller Art benutzten Anschauungen und Sätze ihres allgemeinen Charakters entkleidet werden, muss es als eine Aufgabe von besonderer Wichtigkeit erscheinen, unter den Sätzen, welche bisher der allgemeinen Dynamik zu Grunde gelegt wurden, diejenigen herauszubrechen, welche ihres allgemeinen Charakters wegen nicht als absolut genau bewährt haben; denn sie allein werden fernerhin Anspruch erheben dürfen, als Fundamente der Dynamik Verwendung zu finden. Damit soll natürlich nicht gesagt werden, dass die oben als merklich unexact gekennzeichneten Sätze künftig ausser Gebrauch werden sollten: denn die enorme praktische Bedeutung, welche die Zerlegung der Energie in eine innere und eine fortschreitende, oder die Annahme der absoluten Unveränderlichkeit der Masse, oder die Voraussetzung der Identität der trägen und der ponderablen Masse in der ungeheuren Mehrzahl aller Fälle besitzt, wird ja durch die hier angestellten Betrachtungen überhaupt gar nicht berührt, und niemals wird man in die Lage kommen, auf die Benutzung jener so wesentlich vereinfachenden Annahmen Verzicht leisten zu können. Aber vom Standpunkte der allgemeinen Theorie aus wird man unbedingt und prinzipiell unterscheiden müssen zwischen solchen Sätzen, die nur als Annäherungen aufzufassen sind, und solchen, welche genaue Gültigkeit beanspruchen, schon deshalb, weil heute noch gar nicht abzusehen ist, zu welchen Consequenzen die Weiterentwicklung der exacten Theorie einmal führen wird; sind ja doch häufig genug weitreichende Umwälzungen, auch in der Praxis, von der Entdeckung fast unmerklich kleiner Ungenauigkeiten in einer bis dahin allgemein für exact gehaltenen Theorie ausgegangen.

The Principle of Equivalence, Etc.

Dieser Erwägung folgend hielt ich es für eine lohnende Aufgabe, die Schlüsse zu entwickeln, zu welchen eine Combination des Princips der Relativität mit dem Princip der kleinsten Wirkung für beliebige ponderable Körper führt. Es haben sich dabei gewisse weitere Ausblicke ergeben, sowie auch einige Folgerungen, die vielleicht einer directen experimentellen Prüfung zugänglich sind.”

Though Einstein’s 4 December 1907 Jahrbuch der Radioaktivität und Elektronik article was meant as a review article of the special theory of relativity, Einstein did not refer to any of Poincaré’s many important and relevant works.

Einstein failed to acknowledge that Poincaré had iterated the general principle of relativity, the concept of and exposition on relative simultaneity, the synchronization of clocks by light signals, a generally covariant relativistic theory of gravitation in which gravitational effects propagate at light speed, the group properties of the Lorentz transformation, etc.; before Einstein.

Einstein again raised the issue of the principle of equivalence in 1911 in a paper he published on the effects of gravity on the propagation of light. Einstein did not mention Planck in this 1911 paper, and Einstein’s “nostrification” of the principle of equivalence of inertial and gravitational mass was complete.

14.3 Kinertia’s Elevator is Einstein’s Happiest Thought

While the principle of equivalence, the excuse given for Einstein’s 1911 Newtonian prediction for the deflection of a light ray grazing the Sun, was known before Einstein was born, tales of its practical manifestation were also enunciated before him in thought experiments and real experiments. There was, of course, Jules Verne’s famous novel of 1865 From the Earth to the Moon. Then came Kinertia’s elevator and train experiments.

In 1919, Einstein promulgated another of his “Eureka!” stories meant to supply a history of his development of an idea, and passed word among reporters that he had been inspired to independently invent the then well-known inertial and gravitational mass equivalence principle,
“According to tradition, Isaac Newton was led to his theory of gravitation by observing an apple falling from a tree in his garden. The newspaper correspondents start a similar tradition by reporting that Einstein got his theory of gravitation by observing a man falling from the roof of a building in Berlin. Now a man has the advantage of an apple in that he is able to tell his sensations. When Dr. Einstein, who had seen the accident from his library window in the top story of a neighboring apartment house, reached the spot he found the man had hit upon a pile of soft rubbish and had escaped almost without injury. Asked how it felt to fall he told Dr. Einstein that he had no sensation of downward pull at all. This led Dr. Einstein to consider whether the relativity theory, which he had applied only to the case of uniform motion in a straight line, could not be extended to difform or accelerated motion by gravitation. So the special relativity theory which he had enunciated in 1905 developed ten years later into a generalized relativity theory (Verallgemeinerte Relativitätstheorie).”

The New York Times interviewed Albert Einstein and reported on 3 December 1919 that Einstein was,

“Inspired as Newton was[,] but by the fall of a man from a roof instead of the fall of apple. [***] The doctor lives on the top floor of a fashionable apartment house on one of the few elevated spots in Berlin—so to say, close to the stars which he studies, not with a telescope, but rather with the mental eye, and so far only as they come within the range of his mathematical formulae; for he is not an astronomer but a physicist.

It was from his lofty library, in which this conservation took place, that he observed years ago a man dropping from a neighboring roof—luckily on a pile of soft rubbish—and escaping almost without injury. This man told Dr. Einstein that in falling he experienced no sensation commonly considered as the effect of gravity, which, according to Newton’s theory, would pull him down violently toward the earth. This incident, followed by further researches along the same line, started in his mind a complicated chain of thoughts leading finally, as he expressed it, ‘not to a disavowal of Newton’s theory of gravitation, but to a sublimation or supplement of it. [***] It was during the development of the formulas for difform motions that the incident of the man falling from the roof gave me the idea that gravitation might be explained by difform motion.’

Einstein’s “Eureka!” story varied and therefore must have been a lie. Einstein stated on 14 December 1922,

“The breakthrough came suddenly one day. I was sitting on a chair in my patent office in Bern. Suddenly a thought struck me: If a man falls freely, he would not feel his weight, I was taken aback. This simple thought experiment made a deep impression on me. This led me to the theory of gravity.”
In another account written sometime after 22 January 1920, Einstein stated,

“When I was busy (in 1907) writing a summary of my work on the theory of special relativity [***] I got the happiest thought of my life [***] for an observer in free-fall from the roof of a house there is during the fall—at least in his immediate vicinity—no gravitational field. Namely, if the observer lets go of any bodies, they remain relative to him, in a state of rest or uniform motion [***] The observer, therefore, is justified in interpreting his state as being ‘at rest.’”

Einstein continues with his story in a fashion that, as Arvid Reuterdahl noted, is remarkably derivative of the “Kinertia” articles, which had appeared years earlier in *Harper’s Weekly*.

However, as late as 1916, Einstein had not yet revealed his *happiest thought in life*. Instead, Einstein told another “Kinertia” story in 1916, the elevator analogy,

“We imagine a large portion of empty space, so far removed from stars and other appreciable masses that we have before us approximately the conditions required by the fundamental law of Galilei. It is then possible to choose a Galilean reference-body for this part of space (world), relative to which points at rest remain at rest and points in motion continue permanently in uniform rectilinear motion. As reference-body let us imagine a spacious chest resembling a room with an observer inside who is equipped with apparatus. Gravitation naturally does not exist for this observer. He must fasten himself with strings to the floor, otherwise the slightest impact against the floor will cause him to rise slowly towards the ceiling of the room.

To the middle of the lid of the chest is fixed externally a hook with rope attached, and now a ‘being’ (what kind of a being is immaterial to us) begins pulling at this with a constant force. The chest together with the observer then begin to move ‘upwards’ with a uniformly accelerated motion. In course of time their velocity will reach unheard-of values—provided that we are viewing all this from another reference-body which is not being pulled with a rope.

But how does the man in the chest regard the process? The acceleration of the chest will be transmitted to him by the reaction of the floor of the chest. He must therefore take up this pressure by means of his legs if he does not wish to be laid out full length on the floor. He is then standing in the chest in exactly the same way as anyone stands in a room of a house on our earth. If he release a body which he previously had in his band, the acceleration of the chest will no longer be transmitted to this body, and for this reason the body will approach the floor of the chest with an accelerated relative motion. The observer will further convince himself that the acceleration of the body towards the floor of the chest is always of the same magnitude, whatever kind of body he may happen to use for the experiment. Relying on his knowledge of the gravitational field (as it was discussed
in the preceding section), the man in the chest will thus come to the conclusion that he and the chest are in a gravitational field which is constant with regard to time. Of course he will be puzzled for a moment as to why the chest does not fall in this gravitational field. Just then, however, he discovers the hook in the middle of the lid of the chest and the rope which is attached to it, and he consequently comes to the conclusion that the chest is suspended at rest in the gravitational field.

Ought we to smile at the man and say that he errs in his conclusion? I do not believe we ought to if we wish to remain consistent; we must rather admit that his mode of grasping the situation violates neither reason nor known mechanical laws. Even though it is being accelerated with respect to the ‘Galileian space’ first considered, we can nevertheless regard the chest as being at rest. We have thus good grounds for extending the principle of relativity to include bodies of reference which are accelerated with respect to each other, and as a result we have gained a powerful argument for a generalised postulate of relativity.

We must note carefully that the possibility of this mode of interpretation rests on the fundamental property of the gravitational field of giving all bodies the same acceleration, or, what comes to the same thing, on the law of the equality of inertial and gravitational mass. If this natural law did not exist, the man in the accelerated chest would not be able to interpret the behaviour of the bodies around him on the supposition of a gravitational field, and he would not be justified on the grounds of experience in supposing his reference-body to be ‘at rest.’

Suppose that the man in the chest fixes a rope to the inner side of the lid, and that he attaches a body to the free end of the rope. The result of this will be to stretch the rope so that it will hang ‘vertically’ downwards. If we ask for an opinion of the cause of tension in the rope, the man in the chest will say: ‘The suspended body experiences a downward force in the gravitational field, and this is neutralised by the tension of the rope; what determines the magnitude of the tension of the rope is the gravitational mass of the suspended body.’ On the other hand, an observer who is poised freely in space will interpret the condition of things thus: ‘The rope must perforce take part in the accelerated motion of the chest, and it transmits this motion to the body attached to it. The tension of the rope is just large enough to effect the acceleration of the body. That which determines the magnitude of the tension of the rope is the inertial mass of the body.’ Guided by this example, we see that our extension of the principle of relativity implies the necessity of the law of the equality of inertial and gravitational mass. Thus we have obtained a physical interpretation of this law.

From our consideration of the accelerated chest we see that a general theory of relativity must yield important results on the laws of gravitation. In point of fact, the systematic pursuit of the general idea of relativity has supplied the laws satisfied by the gravitational field. Before proceeding farther, however, I must warn the reader against a misconception suggested
by these considerations. A gravitational field exists for the man in the chest, despite the fact that there was no such field for the co-ordinate system first chosen. Now we might easily suppose that the existence of a gravitational field is always only an apparent one. We might also think that, regardless of the kind of gravitational field which may be present, we could always choose another reference-body such that no gravitational field exists with reference to it. This is by no means true for all gravitational fields, but only for those of quite special form. It is, for instance, impossible to choose a body of reference such that, as judged from it, the gravitational field of the earth (in its entirety) vanishes.

We can now appreciate why that argument is not convincing, which we brought forward against the general principle of relativity at the end of Section XVIII. It is certainly true that the observer in the railway carriage experiences a jerk forwards as a result of the application of the brake, and that he recognises in this the non-uniformity of motion (retardation) of the carriage. But he is compelled by nobody to refer this jerk to a ‘real’ acceleration (retardation) of the carriage. He might also interpret his experience thus: ‘My body of reference (the carriage) remains permanently at rest. With reference to it, however, there exists (during the period of application of the brakes) a gravitational field which is directed forwards and which is variable with respect to time. Under the influence of this field, the embankment together with the earth moves non-uniformly in such a manner that their original velocity in the backwards direction is continuously reduced.”

Jules Verne, whose analysis of the problem was not perfect, wrote in 1865 (and we must not forget Galileo) a story of a projectile-ship, fired from a cannon, carrying men to the moon,

“The president approached the window, and saw a sort of flattened sack floating some yards from the projectile. This object seemed as motionless as the projectile, and was consequently animated with the same ascending movement. [***] ‘Because we are floating in space, my dear captain, and in space bodies fall or move (which is the same thing) with equal speed whatever be their weight or form; it is the air, which by its resistance creates these differences in weight. When you create a vacuum in a tube, the objects you send through it, grains of dust or grains of lead, fall with the same rapidity. Here in space is the same cause and the same effect.’ [***] In looking through the scuttle Barbicane saw the spectre of the dog, and other divers objects which had been thrown from the projectile, obstinately following them. Diana howled lugubriously on seeing the remains of Satellite, which seemed as motionless as if they reposed on solid earth. [***] Then they struck up a frantic dance, with maniacal gestures, idiotic stampings, and somersaults like those of the boneless clowns in the circus. Diana, joining in the dance, and howling in her turn, jumped to the top of the
projectile. An unaccountable flapping of wings was then heard amid most fantastic cock-crows, while five or six hens fluttered like bats against the walls. [***] Such was their situation; and Barbicane clearly explained the consequences to his travelling companions, which greatly interested them. But how should they know when the projectile had reached this neutral point situated at that distance, especially when neither themselves, nor the objects enclosed in the projectile, would be any longer subject to the laws of weight?

Up to this time, the travellers, while admitting that this action was constantly decreasing, had not yet become sensible to its total absence.

But that day, about eleven o’clock in the morning, Nicholl having accidentally let a glass slip from his hand, the glass, instead of falling, remained suspended in the air.

‘Ah!’ exclaimed Michel Ardan, ‘that is rather an amusing piece of natural philosophy.’

And immediately divers other objects, firearms and bottles, abandoned to themselves, held themselves up as by enchantment. Diana too, placed in space by Michel, reproduced, but without any trick, the wonderful suspension practiced by Caston and Robert Houdin. Indeed the dog did not seem to know that she was floating in air.

The three adventurous companions were surprised and stupefied, despite their scientific reasonings. They felt themselves being carried into the domain of wonders! They felt that weight was really wanting to their bodies. If they stretched out their arms, they did not attempt to fall. Their heads shook on their shoulders. Their feet no longer clung to the floor of the projectile. They were like drunken men having no stability in themselves.

Fancy has depicted men without reflection, others without shadow. But here reality, by the neutralisations of attractive forces, produced men in whom nothing had any weight, and who weighed nothing themselves.

Suddenly Michel, taking a spring, left the floor and remained suspended in the air, like Murillo’s monk of the Cusine des Anges.

The two friends joined him instantly, and all three formed a miraculous ‘Ascension’ in the centre of the projectile. [***] A slight side movement brought Michel back toward the padded side; thence he took a bottle and glasses, placed them ‘in space’ before his companions, and, drinking merrily, they saluted the line with a triple hurrah.”

Jules Verne’s book was illustrated with images depicting the principle of equivalence. It influenced film pioneer Georges Méliès, whose film *A Trip to the Moon (La Voyage dans la Lune)* based on Verne’s book appeared in 1902 and was shown around the world. Many of Méliès’ films depict the principle of equivalence, perhaps most notably his *Faust in Hell (Faust aux Enfers)* of 1903, and Méliès’ *The Merry Frolics of Satan (Les Quat’ Cents Farces du Diable)* of 1906. These films had little competition and were very popular. It is likely that Einstein had seen them.

Robert Stevenson, a.k.a. “Kinertia”, was born in Glasgow in 1844. At age 24, he
began to manage the mining interests of Baron Rothschild. In 1882, Stevenson emigrated to the United States and purchased a gold mine in California. He died in New York City, on 2 July 1922, at his residence at 606 West 115th Street; survived by his widow, Georgia Stevenson. In what follows, Stevenson’s articles are greatly condensed. All figures have been deleted. The goal here is to record his anticipations of Einstein’s thought experiments and the principle of equivalence, with respect to the nature of “weight” and the rejection of the “Newtonian” doctrine of “mutual attraction”. Kinertia did not present a non-Euclidean geometry to account for the apparent “force” of gravity. Those interested in understanding Kinertia’s full theory are encouraged to read his full article. Arvid Reuterdahl informs us that Kinertia filed a description detailing the mechanical workings of Kinertia’s “gravity machine” with the Royal Prussian Academy of Sciences on 27 June 1903, which Reuterdahl describes as,

“The ‘gravity machine’ of ‘Kinertia’, when water only is used, generates a spiral vortex in space similar to the vortex of a spiral nebulae. When lead balls are projected from the machine by means of either water or compressed air, then the balls describe elliptical orbits, like the planets, while advancing along the neutral axis of rotation. The resultant path, in the latter case, is therefore an elliptical spiral.”

Reuterdahl believed that Kinertia was the first to present the path of the planets as a corkscrew in space.

“Kinertia” wrote, *inter alia*, in *Harper’s Weekly* in 1914,

“**T**his statement is concerning a discovery in natural science, and the ordinary phenomena of daily life, which I discovered about fifteen years ago while engaged in carrying on some experiments to verify what I had previously suspected to be the true physical cause of *Elasticity, Gravity, Weight* and *Energy*.

While at college in the year 1866, my attention was called by Lord Kelvin to the possibility and importance of the discovery of the true physical cause of Elasticity, and Gravity, which he said for many years engrossed his attention. In his class lectures he devoted much time to the experimental verification of the fundamental principles of the Newtonian system of natural philosophy; and in interpreting an experiment that seemed to establish one of those principles, regarding Newton’s theory of force, it struck me that the experiment did not confirm, but rather disproved the action he claimed for it, that in fact his explanation was a misinterpretation of the true action.

As I was too young to challenge his interpretations, I allowed it to remain in abeyance in my mind; and in my practice as an engineer, I often met it as an unsolvable obstacle in many forms of the mechanical application of forces. Theory failed in these particular cases, and empirical formulae were used in text books to meet the requirements of engineering practice.

When I rose in my profession in Great Britain, and was General Manager
of extensive works, I devoted some time to investigating this obscure principle, and corresponded with many of the scientific authorities, such as Kelvin, Tait, and Niven of Cambridge, from 1877 to 1881, but I found that each of them had a different theory of the cause of the discrepancy between theory and practice; and this satisfied me that there was something at the foundation of all natural action which was worth investigating.

Years passed, and through an accident I was deprived of my hearing, causing me to give up my position and go out to California to a rancher’s life. There I had a little more leisure, and I worked on this idea until I found it to be the true principle, which as the cause of Elasticity and Gravity, is the fundamental natural cause of all physical phenomena. I found that the fall of bodies is not due to the Newtonian force of attraction inherent in matter.

When I told the scientific authorities this, they seemed to be terribly shocked at such a sacrilegious statement, and many of them thought it was a case for Torquemado to deal with. However, my old professors, Lord Kelvin, and Blackburn, wrote to me that I would first have to prove that Newton’s first law of motion was a fallacy, and that Galileo and Newton were fools in believing that they were experimenting with falling bodies at the earth’s surface. I did not think the first law was violated, but the more I studied the subject I could see that if the fall of bodies were a reality, as Galileo and Newton believed it to be, it would prove a serious obstacle to the acceptance of my theory.

I set to work to find out by experiment whether bodies actually did fall with the acceleration which the force of attraction was said to produce. Years before that, when in England, where some of our coal mines had vertical shafts about 1500 feet deep, I had studied the cause of weight by having the hoisting engine drop me down with the full acceleration for about 500 feet. Then, by retardation during the lowest 500 feet, I could experience increase of weight all over me so marked that my legs could hardly support me. That taught me that acceleration was the proximate cause of weight, but at the time of these experiments I still thought the acceleration of the falling cage was really caused by the earth’s attraction.

In California, while trying to prove that bodies actually fall, as they appear to do, I thought of those experiments and remembered that in the fall down the shaft I did not lose my consciousness. I reasoned that if my body was actually accelerated at a rate of 32 feet per second, I would instantly lose my consciousness, owing to my breath and the light portions of my body not falling as fast as the heavier portion. I read the accounts of parachuters, and bridge jumpers, who declared they were perfectly conscious until the water struck them, and they thought that the water and ground under them was rising towards them. Thus I was led to the conclusion that there was a possibility, after all, Galileo and Newton had been fooled by the apparent fall of bodies, which instead of being a reality, was simply an illusion of the senses, in every way similar to the diurnal revolution of the sun around the earth, which Copernicus proved to be an illusion of the senses.
I wrote to a number of my scientific friends, asking them what they thought of the possibility of falling bodies being an illusion of the senses, but I found that this was the one thing needed to destroy their respect for me. Very few replied, and those who did reply thought I was joking.

After some years of fruitless endeavor to find a crucial experiment that I could present as proof to the scientific authorities, I set to work to study the subject from a mathematical point of view, and in a short time found the conclusive kinematical proof that bodies do not fall. I tried to convince scientists of this fact, but I could not make any impression. They began to think I was a crank.

Now I am retired from business, and will devote the few years of my life in an effort to arouse the public to force scientists to investigate, and either confirm the truth that bodies do not fall or prove that they do fall, as they appear to do and as the universities are teaching all over the world. I hope to find some lover of truth who will back my effort by making a substantial offer to the first scientist who will prove that bodies actually fall with acceleration. Such an offer as that would put the scientific authorities on their mettle, and place them before a world wide audience that will want to know the truth, and it will prevent them from sacrificing any individual professor who dares to teach the unorthodox truth.

The kinematical proof which I am prepared to present gives the qualitative analysis of the action, showing how the earth, in its orbital motion round the sun, when combined with its rotations round its axis in the direction of its orbital motion, produces on persons on its surface the illusion that bodies are actually falling of their own gravity to the earth. The proof is of the simplest possible character, and yet so conclusive that any ordinarily educated person can understand it, if he is not controlled by prejudice produced by a life time of training.

I HAVE set out to prove that the fall of bodies as at present believed and taught, is a pure illusion of the senses, of a character similar to that of the apparent motion of the sun round the earth daily.

The illusion of the sun’s motion was believed and taught for twelve hundred years, and it took the combined efforts of Copernicus, Kepler, Galileo, Huygens, Newton, and many other great minds, agitating and demonstrating for more than one hundred and fifty years, to convince the then scientific authorities that the apparent fact was an absurd fallacy.

For fifteen years I have been trying to persuade scientists that the apparent fall of bodies is a similar illusion, and I am met with the same inertia of mind and reluctance to investigate.

The fact that the present doctrine of the fall of bodies has been established and taught as an orthodox truth for nearly two hundred years, is considered by professional scientists as a good reason for their refusal to investigate anything that is contrary to what they believe to be the truth.

The Dean of Science of one of our largest universities told me, in 1903,
that if he was known by the University authorities to be investigating this unorthodox doctrine, he would be in danger of losing his professorship at the University. When I asked if he would allow me to demonstrate the truth by an experiment, he said that if it were known to his colleagues that he had so little faith in what he was teaching as to watch an experiment that professed to prove the contrary of what was being taught, he would be jeered at for his credulity. It was the same old story that Doctor Sissi at Padua University told Galileo, when asked to look through the telescope at a new planet. He said that it would be sacrilege for him to do so, since the number 7 is a perfect number, all God’s works are perfect, there are 7 planets, and therefore the eighth one seen in the glass is an illusion. [***] The ‘Principia’ of Newton and the ‘Mechanique Celeste’ of Laplace are the established authorities on all questions dealing with the motions and configurations of the solar system, as now taught in the universities of the world. But as basis of their mathematical deduction is the apparent fall of bodies, towards the earth, with acceleration.

I shall prove that this apparent fall is a pure illusion of the senses, in every way comparable to the illusion which deceived Ptolemy. We are on the eve of a revolution in physical and astronomical science.

We shall find that weight on the surface of the earth can be produced without attraction;

That the moon is not attracted to the earth, and does not fall with the same acceleration toward the earth, as Newton supposed;

That the tides are not caused by the moon’s attraction, but by a peculiar motion of the earth itself;

That the pressure and density of the atmosphere resting on the earth is not caused by its weight due to the earth’s attraction:

But that the weight of the atmosphere is caused by the earth’s continual pressure against the atmosphere;

That this same pressure (which is intermittent) is the cause of the internal work of the air—a fact which puzzled the mind of the great Langley so long;

That the ‘holes in the air’ which startle the aviator are due to the same peculiar motion of the earth, where its surface underneath the aviator is not a plain surface but has houses and chasms and trees;

That the same peculiar motion of the earth causes the atmosphere, or air, above a choppy sea, to rock the aeroplane;

That even the Brownian movements, which are thought by some to be the very essence of vitality in organic life, are caused by this same peculiar intermittent pressure of the earth’s surface against the inertia of the organized fluid cells within the organism under the pressure of the atmosphere. [***] Ptolemy based his mathematical treatment on the Earth as the fixed centre of the universe.

Newton used the Sun as the fixed centre of coördinates in his mathematical system, and being nearer the truth, he was able to present a much simpler mathematical system than that of Ptolemy.
Now we know that the Sun is not a fixture in the heavens, and consequently to reach a true physical as well as mathematical system of the universe, it is necessary to have fixed coördinates in space, which will enable mathematicians to demonstrate to astronomers the true helicoidal motions and configurations of the planets in fixed space.

The possible motion of the Sun in space, as adrift with the planets, was anticipated by Newton; but his laws of motion prevented him from reaching the true corkscrew path of the planets in space as they revolve round the Sun.

That is the work which is now awaiting the mathematicians of this age, and which will revolutionize the Newtonian System now being taught, even more than that system revolutionized the Ptolemaic System which it supplanted.

Now we have a simple and beautiful mathematical system, from which we can understand the configurations and relative motions of the planets; but, as Newton himself said, there could be no physical cause of these conditions deduced from the mathematical explanation of the phenomena.

Laplace, who stands next to Newton as the greatest exponent of the system, was more daring but less philosophical than Newton. He said the force of attraction which is innate in all matter, and which acts throughout the Universe according to Newton’s law of gravitation, is all the physical force which necessary to create and sustain all the phenomena of the Universe. And as he told Napoleon, ‘No, Sire, there is no need for any other God but this force of Attraction.’

But now, since it can be proven that there is no such force in the Universe as attraction and that the supposed fall of bodies toward the Earth by that force is only an illusion of the senses, there will be new ground upon which theologians can meet the Laplace attractionists, and Haeckel and his materialists. [***] The very suggestion that modern scientists are teaching to the university students a fallacy has been resented by them to an extent that has prevented me, up to this time, from securing an opportunity to present my proof. Yet the complete and perfect proof of the new theory of Gravitation must, of course, be passed on ultimately by professional scientists, after they have been convinced that the fall of bodies at the earth’s surface is an illusion of the senses.

Therefore, what I propose to do in these pages is to show good reasons for believing that what is being taught about the fall of bodies to the students at the universities is an error. I hope that the might of public opinion will force the scientific authorities to investigate this error, and prevent them from sacrificing individual professors who are anxious to study the true theory.

If they cannot force the authorities to investigate, they can at least be challenged to prove that what they are teaching at present about the fall of bodies is a truth.

I have now been fifteen years trying to persuade the scientists of this age to investigate the fact that the Earth falls against bodies with acceleration, instead of the erroneous illusion that bodies fall against the Earth. Though till
now it seems that I have made no progress, I feel sure that during the few remaining years of my life I shall, after all, be able at least to set the leaven to working. [***] Thus we hope by ordinary experimental reasoning to be able to prove to the ordinary reader that Newton’s cause of gravity is only an imaginary cause, used by him as a ‘mathematical metaphor’, and that his law is only a law of configuration, not a physical law at all.

As an illustration of what is meant by the difference between a quality and a quantity, and their application in the case of laws and causes, let us take the underground cable car system which Halliday constructed in the city of San Francisco thirty years ago. The cars seemed to run of their own volition, from the bay on the one side of the city to the ocean on the other side. That fact was a source of never ending astonishment to the Chinamen when they first arrived in the city. Here then was a case like that of the Solar System in the days of Galileo, requiring a great philosopher to explain the cause of this most wonderful phenomenon.

Let us suppose that a modern Kepler in charge of the Chabot observatory trained his instruments on these apparently self moving cars, and by reason of his position relative to their lines of motion he found that they described an ellipse in going from the bay to the ocean, and that their angular motion from his position varied inversely as the square of the distance, and that the area described by the radius vector per unit of time was always constant; and, furthermore, that the time taken in making a complete journey to and fro, when squared, was found to be proportionate to the cube of the major axis of the ellipse.

Now with these facts all found by observation, by a careful study of a map of the route, it would be possible to compile a time table that would fix the exact position of the cars every minute of the day, if their motion was uniform, and never interfered with.

That time table would be the law of their motion. But the cause of their motion would still have to be explained; and here is where the genius of a great philosopher like Newton can attract the admiration of a world.

After a complete study of Kepler’s facts, and the rates of acceleration and retardation of the cars as they start from the bay and stop at the ocean and retrace their course without any apparent push or pull, the attention of the scientists is called to the fact that there is water at both termini, which is always in constant flux and reflux, that such an enormous quantity of water in motion to and fro like a pendulum must exert an enormous push and pull on everything that comes within the range of its attraction, which power is just like the power of the magnet in its quality, and is not visible to mortal eyes. Though it is beyond our ken, we must be satisfied to know that this power of attraction is necessary to enable us to formulate a mathematical law that will also set at rest the curiosity of the non-scientists who worry so much about causes. [***] In like manner I have been told by these champions of orthodoxy that they would not believe that it is the Earth which falls with acceleration against a falling body, even if I could prove it to be true; that it
is an impossibility and an insult to mankind to ask their belief in such a ridiculous supposition.

That being the position that the scientific authorities have assumed towards this great truth for fifteen years, I can only suggest one way to settle this matter, and that is to shame them by the force of public opinion to prove that what they are teaching about the fall of bodies is really true.

I would like to see posted a large monetary prize for the orthodox scientist who can prove that a stone when let go from a height of 16 feet above the surface of the Earth actually falls that distance in space in one second. Lacking this, I can only challenge scientists to give their proof. I will give my proofs in these pages, showing that it is the Earth which falls that 16 feet towards the body or stone in one second of time, and let the readers of this weekly decide who is correct. That appears to me to be a fair way to overcome both inertia and prejudice. As was the custom of the ancient Greeks and Romans, the contest should be in the open forum. There should be no star chamber proceedings in a case, which, when established, will not only free mankind from a ridiculous fallacy, and an illusion of the senses, but will supply a true knowledge of the constitution of the Universe. [***] I remember fifty years ago when I first began to study weight and falling bodies, the impression I got was that weight was an attribute of matter instead of being a mere property, and the consequence was that I believed matter could not exist without weight, nor weight without matter; and it took years of study to get rid of these mistakes, owing to the prejudice they produced on the mind.

Weight, then, is a property of Matter, not an attribute as some scientists believe. Consequently matter can exist constitutionally without weight, and weight can exist without matter, as we know in the case of a hypnotic subject who by suggestion can be made to feel the weight of one hundred pounds, when it only exists as an idea.

The proof that matter can exist without weight depends on the first law of motion: because if a mass moves uniformly in a straight line in space, it cannot have any weight. If weight is caused by the mutual attraction of matter, then a mass subject to attraction must move in a curve. If weight is caused by acceleration, then it cannot follow Newton’s laws and move with uniform velocity in a straight line. [***] Perhaps Leonardo da Vinci was the first scientist to record the fact that a ball projected parallel to a horizontal plane offered a different resistance at the start to the same ball thrown vertically upwards with the same velocity. But neither he nor Galileo, nor even Newton, seemed to be fully aware of the dynamical importance of that difference.

The want of a correct knowledge of that fact led to seventy five years’ war from Des Cartes to D’Alembert, as to whether a force was proportional to the velocity, or to the square of the velocity.

Newton’s definition of mass as the quantity of matter in a body, and proportional to the volume and density conjointly, does not give the
dynamical meaning of mass as a component part of the resistance of weight. Mechanical matter is supposed to be a group, aggregate, or quantum of substance, on which weight has been superimposed by force. Newton says, by an innate force; I say, by an applied force; this is the kernel of the whole controversy about gravitation.

Newton’s theory is a static theory.

My theory is a kinetic theory of gravitation.

When you hold a weight in your hand you feel a pressure, and it can be proven experimentally that wherever there is weight there is the quality of pressure. Consequently pressure is an attribute of weight; but all pressure is not weight. Therefore weight is not a physical reality; it can be produced and annihilated by force. But if weight were wholly due to attraction, then it could neither be produced nor annihilated by an applied force. Weight is not a kinetic force because it cannot produce acceleration. If a body were accelerated in proportion to its weight, then weight would be a force.

When weight of any magnitude is held in a fixed position 16 feet above the surface of the earth, and let go, it will appear to fall against the surface of the earth in one second of time, and strike with a velocity of 32 feet per second; consequently the acceleration is said to be 32 feet per second, per second.

But if it can be shown that the earth in its curvilinear motion rushes up against the body with that acceleration, then it is unnecessary to adopt the Newtonian theory of attraction to explain the apparent fall of bodies.

Figure 2 gives a kinetic illustration, showing how the Earth in its orbit, without rotation, falls against the body, with the acceleration of gravity, in one second, when the body is held at a height of 16 feet above the surface and let go, so that it is free from the earth’s orbital motion; and, according to the Lex I of Newton, the body moves with uniform velocity in the straight line $PP'$ in space, until the earth’s acceleration in its orbital curve brings the earth up against the body with a differential velocity 32 feet per second in one second of time from when the body at $P$ is released. [***] Now just think of dear old Galileo dropping different weights from 1 pound to 100 pounds from the top of the tower of Pisa, to prove to the Pope and his Cardinals that Aristotle was wrong in saying that the heavier weight fell the faster, and these celebrities standing amazed with their mouths wide open at the spectacle, which proved Aristotle to be a false guide for the Church, when in reality the weights were not falling at all. And just think of Newton being knighted, and idolized by the Royal Society and all the rest of the world for nearly two centuries, for proving by mathematical reasoning that the fall and acceleration of the body is caused by the attraction of the earth.

Yet the truth will establish itself and then the world will smile at the present day fallacy that is being taught; and especially when it reads in the writings of great philosophers such adoration of Newton’s law of gravitation.
I shall now quote in condensed form the opinions of a few of the great philosophers and scientists who have since the days of Newton studied this subject of attraction—in order to show that I am fully warranted in challenging the doctrine of orthodox science regarding the existence, nature, cause, and laws of this idol, this unknown God, they have so long worshipped. These quotations show that this theory of attraction has always been looked upon by great and independent thinkers as a bogus theory; and when I complete the proof that bodies do not fall—that will be proof positive that they cannot be under the influence of the Earth’s attraction. And when I prove to the scientists what Kinertia in its nature, cause, and laws really is, then it will be seen that the Sun does not attract the planets and that the force of gravitation is not of an attractive character at all.

I have shown the absurdity of attraction from various dynamical standpoints, and I have shown that many of the greatest natural philosophers during the last two hundred years, including Newton himself, could not be brought to believe that attraction was a physical quality; but held that it was only useful as a mathematical metaphor, to give to the law of the distance a comprehensive form. According to the present erroneous doctrine, Gravity and Weight are produced throughout the Universe by the mutual attraction of one particle for another, in the manner mentioned in Newton’s law of Gravitation. See the text books and encyclopedias on Gravity and Weight. I will now show by the following proposition that the above theory is an absurd fallacy.

Prop. I—To prove that Gravity and Weight can be produced by man’s power and intelligence combined, without the mutual attraction of matter.

In Fig. 1 let \( XX'YY' \) be a fixed coordinate system in the plane of the paper. Let A, B, C, be a ball of any mass M (without weight), gyrating in a circle in free space, with any uniform velocity \( V \), without rotation, and with radius \( R \) from the centre of the circle to the centre of the mass of the ball. Let \( 2r = 1 \text{ mile} = \text{diameter of ball} \); then any particle P on the surface of the ball would be pressed towards the centre of the ball, with the same physical quality as that which gravity and weight are supposed to produce. Now to cause a mass to gyrate in a circle requires not only power, but also some Intelligence to direct the power in its application.

If \( R = 53,200 \text{ miles}, V = 18 \text{ miles per second of time} \).

The pressure of \( P \) on the surface of the ball towards its centre would be \( M 32 = mg = \text{Weight at the Earth’s surface, where } M = \text{mass of Particle } P \).

I am only dealing with weight as a physical quality due to pressure. There is no need to ask what happens on the other side of the ball, because if the
ball were sliding along a rigid circle of radius $R + r$, the same weight pressure would be there also.

**Further Kinetic Illustration**

Fig. 2. I use these car illustrations so that the reader may imagine himself as a passenger and actually experiencing the pressure and weight due to the gyration of the car in its circle, and so be convinced of the absurdity of the theory of attraction.

Let $C$ be an imponderable car of mass $M$, gyrating in a circle of radius $R = 53,200$ miles, with uniform velocity of $V = 18$ miles per second, in free space, fixed and infinite; without any other material body in the same space to which it could bear any space or time relationship; taking the plane of the paper for the plane of the motion, and looking down from above. Then its motion in fixed space would be absolute, and its momentum absolute, its acceleration absolute, and its mass absolute. Suppose it to be inhabited like the earth by intelligent beings whose minds during ten thousand generations had been gradually developed to a point when they began to study the nature, cause, and laws of the phenomena that affected their senses within the car. This motion $V$, going on from generation to generation, without any visible point of reference, would be unknowable to the inhabitants; but there would be several facts within the car which would be knowable and likely to excite their curiosity and wonder.

First, every loose thing, and every person within the car, would be apparently pulled by some invisible force towards one side of the car; and those with the best gift of forming hypotheses on the subject would be called at first philosophers, because they would base their theories on the laws of thought, and deduce by geometrical and logical reasoning many wonderful results. They would believe, of course, the car to be absolutely at rest in space. Then after ages of speculation on the *what*, and the *why*, of this phenomena, a period would arrive when these metaphysicians would become more practical and would say as Galileo said, ‘Why bother about the nature and cause of the phenomena?’ (See Dialogue 202.) ‘Let us experiment and find its laws, or what is called the *how* of the performance’, as Lord Verulam [Francis Bacon] in his *Novum Organum* recommended. This inductive method of research was the genetic starting point of what is now called Science, and its professors are now called Scientists, instead of Philosophers. The scope of the study has been narrowed, but the results have increased beyond all comparison.

Aristotle (the master of those who know) explained that weight was caused by the tendency of material bodies to return to their proper place in nature, and that tendency caused them to fall towards the side of the car, from which it took an effort to lift them; and that the rate of fall was proportional to their weight.

Epicurus, on the other hand, compared the tendency of a body to fall to the tendency he felt when hungry and passing a restaurant where a savory stew was being cooked. He said it was a case of appetite or desire, and that
a physical quality or substance was naturally endowed with physical desire, as the physiological quality had the craving for food, and the spiritual for truth.

The theologians for fifteen hundred years preferred the explanation of Aristotle, until a great experimental philosopher called Galileo began to investigate the subject. He said, Why bother about causes? Let us find the laws of falling bodies first, and by that means we can better arrive at a knowledge of causation. (See Dialogue 202.) He lifted bodies of various sizes, densities, and weights, to great distances from the side of the car, and let them fall back of their own volition; and by careful measurements with pendulums and clepsydrias he established the laws of their motion, on the supposition that the car was at rest, and the motion was all in the apparently falling body.

Then he projected them parallel to the sides, and at various distances with various velocities, and found the trajectory to be a parabola, and he found numerous other facts, all of which you can find in his dialogues already mentioned. When he was threatened by the Inquisition, he took up the speculative study of the causes; and in his other great work on the system of the world he showed that he was nearer to the truth than either Kepler, Descartes, or Newton, but the infirmities of age prevented him from completing the task.

Newton, another great philosopher, was born the same year that Galileo died; and in his youth was trained in Galileo’s system by the greatest mathematician of that age, Doctor Barrow of Cambridge. He became interested in the fall of bodies, and by using established facts which Kepler had deduced from Tycho Brache’s observations, he formulated a geometrical law of motion, which if the car had been stationary, or moving in a straight line in space, as Newton supposed, would have been as marvellous as true. So wonderfully correct was this law in its geometrical application that it seemed to hypnotize with its brilliancy all the scientist of the world for two hundred years. He actually made them believe that the weight and fall were caused by the mutual attraction between the mass of the apparently falling bodies and the mass of the car, all concentrated in the side of the car; that it did not matter whether the car was absolutely at rest or moving with any finite velocity in space; that the cause of the weight and rate of acceleration, or fall of bodies towards the side of the car, depended on the mutual innate desire they had to pull each other; and that the relative resultant pull was always equal to $Mm \div D^2$, where $M = \text{mass of car}$, and $m = \text{mass of body}$, and $D = \text{distance from the side of the car to the centre of the body}$; and that it did not depend on the velocity at all. And beyond this point no human research has been able to penetrate. You will notice that this is a mathematical resultant, not a natural or physical resultant, because physically, Nature in producing an aggregate resultant mass always adds its masses, but by this law they are multiplied to meet the mathematical requirements of the case.
Anyone acquainted with Dynamics, or Mechanics, will see at a glance that weight can be produced in the way shown in these diagrams without any innate force of attraction in matter, and as astronomical dynamics is only a special application of the general laws of mechanics, you will wonder why science should have been so long hypnotized with such an absurd fallacy as this Newtonian doctrine of attraction.

Of course, Galileo Galilei is famous for dropping balls from the leaning tower of Pisa and is the ultimate source of the principle of equivalence. Einstein was quoted in *The New York Times*, on 3 April 1921, on the front page:

> “The interview took place in the Captain’s cabin, where Professor Einstein was almost surrounded by speakers after knowledge. It is a theory of space and time, so far as physics are concerned,” he said. “How long did it take you to conceive your theory?” he was asked. “I have not finished yet,” he said with a laugh. “But I have worked on it for about sixteen years. The theory consists of two grades or steps. On one I have been working for about six years and on the other about eight or nine years. ‘I first became interested in it through the question of the distribution and expansion of light in space; that is, for the first grade or step. The fact that an iron ball and a wooden ball fall to the ground at the same speed was perhaps the reason which prompted me to take the second step.’”

Albert Einstein stated in 1921,

> “Two of the great facts explained by the theory are the relativity of motion and the equivalence of mass of inertia and mass of weight, said Prof. Einstein. ‘There has been a false opinion widely spread among the general public,’ [Einstein] said, ‘that the theory of relativity is to be taken as differing radically from the previous developments in physics from the time of Galileo and Newton—that it is violently opposed to their deductions. The contrary is true. Without the discoveries of every one of the great men of physics, those who laid down preceding laws, relativity would have been impossible to conceive and there would have been no basis for it. Psychologically, it is impossible to come to such a theory at once without the work which must be done before. The four men who laid the foundations of physics on which I have been able to construct my theory are Galileo, Newton, Maxwell, and Lorenz.”

Philipp Frank gave a lecture in 1909, which presented thought experiments pertaining to the principle of equivalence Einstein would essentially later repeat,

> “The system of the fixed stars constitutes a fundamental body. Even in
shooting a cannon ball towards the south we see no deviation from the law of inertia if we consider it with reference to the fixed stars. The ball remains in the same plane; but this plane does not retain the same relative position to the meridian of the earth, wherefore, of course, with reference to the earth the law of inertia is violated. On the whole it is evident that we really recover all the observed motor phenomena when we refer Newton’s laws of motion to the fixed stars. Not until they are referred to the fixed stars do these laws acquire an exact sense which makes it possible to apply them to concrete conditions.

We shall call those motions which are referred to a fundamental body ‘true movements’ and those related to any other body of reference ‘apparent movements.’ For instance the immobility of my chair is only apparent, for when referred to the fixed stars it is in motion.

We now ask whether there are any other fundamental bodies aside from the system of the fixed stars. Obviously not any body revolving in an opposite direction to the fixed stars can be such a fundamental body, for considered with reference to such a body all rectilinear movements are curved. Therefore the law of inertia could not hold with reference to the body in question if it is valid with reference to the fixed stars. Then too a fundamental body can possess no acceleration with reference to the fixed stars, because otherwise there would be no uniformity of the motion of inertia with reference to it. However, these conditions are not only necessary but they are sufficient to characterize a fundamental body. All bodies moving uniformly and in a straight line with reference to the fixed stars will also be fundamental bodies inasmuch as rectilinearity and uniformity continue to hold for them, as do likewise the supplementary velocities determined by the second law. Accordingly Newton’s laws do not indicate one single fundamental body, but an infinite number moving in opposite directions with a uniform and rectilinear motion.

Hence we may well speak of ‘true’ in contrast to apparent rotary motion; for all bodies revolving with reference to a fundamental body revolve with reference to all other bodies. The same is true of true acceleration because an acceleration with respect to a fundamental body is also acceleration (i. e., change of velocity) with respect to all the rest. On the other hand, there is no sense in speaking of ‘true’ uniform rectilinear motion; for if a body possesses a uniform velocity with respect to the fixed stars, it is itself a fundamental body possessing of course with respect to itself a velocity of zero; it is at rest. Accordingly there is true acceleration, but not true velocity. From this is easily derived a proposition established by Newton which is called the principle of relativity of mechanics, namely that a uniform rectilinear movement of the system as a whole makes no change in the processes within the system; that is to say, we can not tell from the processes within the system what velocity the uniform rectilinear movement possesses with reference to the fixed stars. On the other hand, the rotary motion of a system has indeed an influence on the processes within the system, as for instance
in the phenomena of centrifugal force; thus the earth has become flattened at
its poles because of its rotation, or if I revolve a dish full of water the water
will rise at the sides.

[***]

Is it to a certain extent accidental, or is it essential, that the totality of the
fixed stars coincides with that fundamental body in relation to which the laws
of Newton hold valid? Or to put it more clearly: If the fixed stars were set
violently in motion among each other and hence could no longer constitute
a fixed body of reference, would the mechanical processes on earth proceed
exactly as they did before? For instance, would the Foucault pendulum move
just as at present, even though it now turns with the fixed stars, whereas in
that case it would not be quite clear which constellations’s revolution it should
join?

Were everything to remain as of old the fundamental system of reference
would not be determined by the fixed stars but would only accidentally
coincide with them, and would in reality be some merely ideal or yet
undiscovered body. In the other case all mechanical occurrences on earth
would have to be completely altered to correspond with the promiscuous
movements of the fixed stars.

It is well known that this is the view held by Ernst Mach. It alone holds
with consistent firmness to physical relativism, and it alone answers the
second main question of physics in the relativistic sense.

The opposite view is represented by Alois Höfler in his studies on the
current philosophy of mechanics, and lately by G. Hamel, professor of
mechanics at the technical high school of Brünn, in an essay which appeared
in the annual report of the German mathematical society of 1909 on ‘Space,
Time and Energy as a priori Forms of Thought.’

Before I enter upon the controversy itself I would like further to elucidate
Mach’s view by carrying out its results somewhat farther. In his well-known
essay on the History and Root of the Principle of the Conservation of Energy
Mach ascribes to the distant masses in space a direct influence on the motor
phenomena of the earth which supplements the influence afforded by
gravitation. Of course no effect of gravitation from the fixed stars upon the
earth can be observed, yet in spite of this they influence, for instance, the
plane of oscillation of the Foucault pendulum because in Mach’s opinion it
remains parallel to them.

The question now arises according to what general law of nature this
influence operates which does not, like gravity, produce accelerations but
velocities instead. Obviously this influence must be a property belonging to
every mass, for according to our present conception the fixed stars of course
are precisely the same sort of masses as earthly bodies.

However, experience teaches us that terrestrial masses have no more
influence on the plane of oscillation of the Foucault pendulum than has the
changing position of the moon, sun and planets; but on the other hand it is
exactly the most distant masses, the fixed stars, which determine its plane of
oscillation. Accordingly we must either assume that the effect is directly proportional to the distance of the masses (which would be very strange indeed) or simply assume that this effect is proportional to the effective masses and independent of the distance, whence the dominant influence of the more remote, as the far greater and more numerous, bodies would naturally follow, and Mach inclines to this latter view.

Mach’s view shows most clearly in his position with regard to Newton’s famous bucket experiment. In this Newton intended to show that the centrifugal force produced by a revolving body is due not to its relative but to its absolute velocity of rotation. He suspended a bucket filled with water by a vertical cord, twisted the cord quite tightly and then let it untwist itself, in this way setting the bucket to revolve rapidly. At first the water did not rotate with the bucket and therefore the bucket had a velocity of rotation with reference to the water while in the meantime the surface of the water remained undisturbed. In time, however, friction caused the water to become so affected by the rotary motion that bucket and water revolved like one homogeneous mass whereby the centrifugal force caused the water to rise at the sides of the bucket and the surface became concave.

Hence it is evident that the centrifugal force reached its greatest strength at the moment when the relative motion of the water with respect to the bucket became zero; hence according to Newton this force can be produced only by the absolute rotary motion of the water.

To this now Mach justly protests that only the relative rotation of the water with reference to the fixed stars is to be considered, for this system of the fixed stars and not the bucket is the fundamental body. And indeed at first the water was at rest with reference to the fixed stars, but at the close of the experiment it was revolving. The mass of the bucket compared to the mass of the fixed stars is an entirely negligible quantity, so that it does not depend in the least upon the rotation. But we can not know, adds Mach, how the experiment would turn out if the sides of the bucket were miles thick; and by this he apparently means so thick that their mass would be considerable even when compared with the mass of the system of fixed stars. Then indeed might the rotation of the bucket disturb the action of the fixed stars.

Höfler protests, on the other hand, that a system which is symmetrical round its axis could not according to all our experience in mechanics produce by its rotation that sort of an effect on the water within it.

This also is quite true. But the effect of the masses assumed by Mach is such that it can not be expressed in our ordinary experiences with mechanics except by means of the facts of the inertia of all motion with reference to the fixed stars. New conditions such as the rotation of an enormously thick bucket might give rise to new phenomena. If we agree with Mach’s view that the rotation of the plane of the Foucault pendulum is directly produced by the masses of the fixed stars, we must likewise admit, in order to be consistent, that the relative rotation of the very thick bucket might give rise to similar effects with reference to the water, as the rotation of the system of the fixed
Höfler expresses his contention against Mach’s thesis in the form of the following question: If in Galileo’s time the sky had been clouded over and had never become clear again so that we would never have been able to have taken the stars into our calculation, would it then have been impossible to have established our present mechanics solely by the aid of terrestrial experiments? By this question Höfler means to say that if the connection with the fixed stars were a constituent of the concept of uniform motion, we would never have been able in such an overclouded world to have established the law of inertia, for instance, whereas in reality it is clear that this would nevertheless have been possible.

I will not dwell on the more psychological question as to whether or how easily this would have been possible, but will only consider now the logical construction of mechanics in such a darkened world on the hypothesis that easily or with difficulty in one way or another we would have attained to our present knowledge of mechanics.

Let us for a moment imagine ourselves in such a world. Above our heads extends a uniform vault of uninterrupted gray or black. Were we to shoot projectiles toward the south we would see that they describe paths which are curved towards the west; if we started pendulums to vibrating we would see that they would revolve their planes of oscillation in mysterious periods—I say mysterious because we might perhaps be able to perceive the change of day and night as an alternation of light and darkness, but would not be able to refer it to the movements of celestial bodies. Perhaps at first we would surmise that the motion of the pendulum could be ascribed to optical influences. I would like to see placed in such a world one of the philosophers who regard the law of inertia as an a priori truth. In the face of these mysterious curvatures and deflections he would probably find no adherents and he would not know himself what to make of his own standpoint.

Finally, let us assume, there arises a dauntless man, the Copernicus of this starless world, who says that all motions proceed spontaneously in a straight line, but that this straight line is not straight with reference to the earth but with respect to a purely ideal system of reference which turns in a direction opposite to that of the earth. The period of this rotation is supplied by the period of the Foucault pendulum.

This man would of course deny physical relativism upon the earth, for in his opinion terrestrial processes would not depend only on the relative velocities of terrestrial bodies but on something else besides, viz., their velocities with respect to a purely ideal system of reference. Nevertheless, he would not introduce any non-physical element because for the purpose of the physicist a purely ideal system of reference whose motion with respect to an empirical system is known serves the same purpose as would the empirical system itself. This bold innovator might finally refer the words ‘true rest’ and ‘true motion’ to his ideal fundamental body and so ascribe true motion and only apparent rest to the earth, thus maintaining a mechanics which would
coincide literally with that of ours to-day, except that no small luminous points would be seen sparkling in connection with the fundamental body.

Hence we see that physical relativism is not a necessary tool of the physicist. Apart, perhaps, from the psychological improbability—of which, however, nothing more positive can be said—the possibility of the development here indicated is logically free from objections throughout, and, therefore the same is also true of the possibility of a nonrelativistic physics.

But I would like to strengthen the argument of Höfler even somewhat further. That is to say, I would ask whether the world in which we live is then really so essentially different from that fictitious one. Imagine the dark roof which conceals the sky placed somewhat higher so that there is room beneath it for the fixed stars, perhaps as the dark background which may be seen nightly in the starry sky. The whole difference then consists in the fact that not only the Foucault pendulum and similar appliances move with reference to the earth, but enormously greater masses as well—all the twinkling lights of the sky by which the thought of a fundamental body in motion with respect to the earth is psychologically greatly facilitated, but logically is not much changed. Now imagine the sky of this earlier dark world suddenly illuminated; then we would see that the fictitious system of reference is closely linked to enormous cosmic masses, and it would be easy enough to accept Mach’s hypothesis that these masses condition the fundamental system...

If a distinction must be drawn between the respective values of the conceptions of Mach and Höfler, it is as follows: Mach’s view adds decidedly more to the observed facts; for that it retains physical relativism does not involve freedom from hypothesis, because at best this relativism is theory and not fact. Mach sets up, hypothetically of course, a new formal natural law with regard to the action of masses existing side by side with gravitation, affecting the experiment very materially but unable to raise any claim to the simplest description of actual conditions.

The other view, which simply introduces the system of reference procured by observation of the terrestrial and celestial movements without asking whence all this is derived, represents the present state of our knowledge most adequately without any arbitrary addendum but also without giving the spirit of inquiry any incentive to new experiments.

It is the old contrast between the most exact and least hypothetical representation possible of the known science, and progressive inquiry after new things in more or less daring and fantastic hypotheses. But Mach in this case stands in the opposite camp as in most other cases where his repugnance to all hypothesis has made him a pioneer in the phenomenological direction.

I therefore believe I have proved that we can grant the following: Physical phenomena do not depend only on the relative motion of bodies without at the same time admitting the possibility of the concept of an absolute motion in the philosophical sense.”
“Mach’s” principle fails for many reasons. It depends upon the mystical notion of *instantaneous* “action at a distance”, i.e. mutual attraction, and it does not tell us what general laws dictate that the fixed stars be fixed, which laws are more fundamental than Mach’s fundamental assertions. Frank sought to provide an answer, as did Newton with absolute space, and many others with the æther hypothesis. Other possibilities certainly exist, though the minute expanse of the visible universe leaves us guessing.

### 14.4 Dynamism

Long before Einstein was born, Roger Joseph Boscovich introduced a theory of Dynamism. Boscovich argued in the 1700's for a general principle of relativity, length contraction, time dilatation, “Mach’s principle” and the notion that “atoms” are point centers of force.²⁸⁸⁹

Boscovich wrote in 1763 in the second supplement to his *Natural Philosophy*,

> **§ II**
> 
> *Of Space & Time, as we know them*
> 
> {We cannot obtain an absolute knowledge of local modes of existence nor yet of absolute distances or magnitudes. [The original margin notes are here reproduced inside of braces {}].}

18. We have spoken, in the preceding Supplement, of Space & Time, as they are in themselves; it remains for us to say a few words on matters that pertain to them, in so far as they come within our knowledge. We can in no direct way obtain a knowledge through the senses of those real modes of existence, nor can we discern one of them from another. We do indeed perceive, by a difference of ideas excited in the mind by means of the senses, a determinate relation of distance & position, such as arises from any two local modes of existence; but the same idea may be produced by innumerable pairs of modes or real points of position; these induce the relations of equal distances & like positions, both amongst themselves & with regard to our organs, & to the rest of the circumjacent bodies. For, two points of matter, which anywhere have a given distance & position induced by some two modes of existence, may somewhere else on account of two other modes of existence have a relation of equal distance & like position, for instance if the distances exist parallel to one another. If those points, we, & all the circumjacent bodies change their real positions, & yet do so in such a manner that all the distances remain equal & parallel to what they were at the start, we shall get exactly the same ideas. Nay, we shall get the same ideas, if, while the magnitudes of the distances remain the same, all their directions are turned through any the same angle, & thus make the same angles with one another as before. Even if all these distances were diminished, while the angles remained constant, & the ratio of the distances to one another also remained constant, but the forces did not change owing to that change of distance; then if the scale of forces is correctly altered, that is to say, that
The Principle of Equivalence, Etc. 2175

curved line, whose ordinates express the forces; then there would be no change in our ideas.

{The motion, if any, common to us & the Universe could not come within our knowledge; nor could we know it, if it were increased in any ratio, or diminished, as a whole.}

19. Hence it follows that, if the whole Universe within our sight were moved by a parallel motion in any direction, & at the same time rotated through any angle, we could never be aware of the motion or the rotation. Similarly, if the whole region containing the room in which we are, the plains & the hills, were simultaneously turned round by some approximately common motion of the Earth, we should not be aware of such a motion; for practically the same ideas would be excited in the mind. Moreover, it might be the case that the whole Universe within our sight should daily contract or expand, while the scale of forces contracted or expanded in the same ratio; if such a thing did happen, there would be no change of ideas in our mind, & so we should have no feeling that such a change was taking place.

{Since, if our position & that of everything we see is changed, our ideas are not changed; therefore we can ascribe no motion to ourselves or to anything else.}

20. When either objects external to us, or our organs change their modes of existence in such a way that that first equality or similitude does not remain constant, then indeed the ideas are altered, & there is a feeling of change; but the ideas are the same exactly, whether the external objects suffer the change, or our organs, or both of them unequally. In every case our ideas refer to the difference between the new state & the old, & not to the absolute change, which does not come within the scope of our senses. Thus, whether the stars move round the Earth, or the Earth & ourselves move in the opposite direction round them, the ideas are the same, & there is the same sensation. We can never perceive absolute changes; we can only perceive the difference from the former configuration that has arisen. Further, when there is nothing at hand to warn us as to the change of our organs, then indeed we shall count ourselves to have been unmoved, owing to a general prejudice for counting as nothing those things that are nothing in our mind; for we cannot know of this change, & we attribute the whole of the change to objects situated outside of ourselves. In such manner any one would be mistaken in thinking, when on board ship, that he himself was motionless, while the shore, the hills & even the sea were in motion.

{The manner in which we are to judge of the equality of two things from their equality with a third; there never can be congruence in length, any more than there can be in time; the matter is to be inferred from causes.}

21. Again, it is to be observed first of all that from this principle of the [invariance] of those things, of which we cannot perceive the change through our senses, there comes forth the method that we use for comparing the magnitudes of intervals with one another; here, that, which is taken as a
measure, is assumed to be [invariant]. Also we make use of the axiom, *things that are equal to the same thing are equal to one another*; & from this is deduced another one pertaining to the same thing, namely, *things that are equal multiples, or submultiples, of each, are also equal to one another*; & also this, *things that coincide are equal*. We take a wooden or iron ten-foot rod; & if we find that this is congruent with one given interval when applied to it either once or a hundred times, & also congruent to another interval when applied to it either once or a hundred times, then we say that these intervals are equal. Further, we consider the wooden or iron ten-foot rod to be the same standard of comparison after translation. Now, if it consisted of perfectly continuous & solid matter, we might hold it to be exactly the same standard of comparison; but in my theory of points at a distance from one another, all the points of the ten-foot rod, while they are being transferred, really change the distance continually. For the distance is constituted by those real modes of existence, & these are continually changing. But if they are changed in such a manner that the modes which follow establish real relations of equal distances, the standard of comparison will not be identically the same; & yet it will still be an equal one, & the equality of the measured intervals will be correctly determined. We can no more transfer the length of the ten-foot rod, constituted in its first position by the first real modes, to the place of the length constituted in its second position by the second real modes, than we are able to do so for intervals themselves, which we compare by measurement. But, because we perceive none of this change during the translation, such as may demonstrate to us a relation of length, therefore we take that length to be the same. But really in this translation it will always suffer some slight change. It might happen that it underwent even some very great change, common to it & our senses, so that we should not perceive the change; & that, when restored to its former position, it would return to a state equal & similar to that which it had at first. However, there always is some slight change, owing to the fact that the forces which connect the points of matter, will be changed to some slight extent, if its position is altered with respect to all the rest of the Universe. Indeed, the same is the case in the ordinary theory. For no body is quite without little spaces interspersed within it, altogether incapable of being compressed or dilated; & this dilatation & compression undoubtedly occurs in every case of translation, at least to a slight extent. We, however, consider the measure to be the same so long as we do not perceive any alteration, as I have already remarked.

{Conclusion reached; the difference between ordinary people & philosophers in the matter of judgement.}

22. The consequence of all this is that we are quite unable to obtain a direct knowledge of absolute distances; & we cannot compare them with one another by a common standard. We have to estimate magnitudes by the ideas through which we recognize them; & to take as common standards those measures which ordinary people think suffer no change. But philosophers
should recognize that there is a change; but, since they know of no case in which the equality is destroyed by a perceptible change, they consider that the change is made equally.

{Although, when the ten-foot rod is moved in position, those modes that constitute the relations of the interval are also altered, yet equal intervals are reckoned as same for the reasons stated.}

23. Further, although the distance is really changed when, as in the case of the translation of the ten-foot rod, the position of the points of matter is altered, those real modes which constitute the distance being altered; nevertheless if the change takes place in such a way that the second distance is exactly equal to the first, we shall call it the same, & say that it is altered in no way, so that the equal distances between the same ends will be said to be the same distance & the magnitude will be said to be the same; & this is defined by means of these equal distances, just as also two parallel directions will be also included under the name of the same direction. In what follows we shall say that the distance is not changed, or the direction, unless the magnitude of the distance, or the parallelism, is altered.

{The same observations apply equally to Time; but in it, it is well known, even to ordinary people, that the same temporal interval cannot be translated for the purpose of comparing two intervals; it is because of this that they fall into error with regard to space.}

24. What has been said with regard to the measurement of space, without difficulty can be applied to time; in this also we have no definite & constant measurement. We obtain all that is possible from motion; but we cannot get a motion that is perfectly uniform. We have remarked on many things that belong to this subject, & bear upon the nature & succession of these ideas, in our notes. I will but add here, that, in the measurement of time, not even ordinary people think that the same standard measure of time can be translated from one time to another time. They see that it is another, consider that it is an equal, on account of some assumed uniform motion. Just as with the measurement of time, so in my theory with the measurement of space it is impossible to transfer a fixed length from its place to some other, just as it is impossible to transfer a fixed interval of time, so that it can be used for the purpose of comparing two of them by means of a third. In both cases, a second length, or a second duration is substituted, which is supposed to be equal to the first; that is to say, fresh real positions of the points of the same ten-foot rod which constitute a new distance, such as a new circuit made by the same rod, or a fresh temporal distance between two beginnings & two ends. In my Theory, there is in each case exactly the same analogy between space & time. Ordinary people think that it is only for measurement of space that the standard of measurement is the same; almost all other philosophers except myself hold that it can at least be considered to be the same from the idea that the measure is perfectly solid & continuous, but that in time there is only equality. But I, for my part, only admit in either case the equality, & never the identity.\textcopyright 2890
Arthur Schopenhauer expressed a “space-time” theory of matter in the early 1800's:

“§ 4. Whoever has recognised the form of the principle of sufficient reason, which appears in pure time as such, and on which all counting and arithmetical calculation rests, has completely mastered the nature of time. Time is nothing more than that form of the principle of sufficient reason, and has no further significance. Succession is the form of the principle of sufficient reason in time, and succession is the whole nature of time. Further, whoever has recognised the principle of sufficient reason as it appears in the presentation of pure space, has exhausted the whole nature of space, which is absolutely nothing more than that possibility of the reciprocal determination of its parts by each other, which is called position. The detailed treatment of this, and the formulation in abstract conceptions of the results which flow from it, so that they may be more conveniently used, is the subject of the science of geometry. Thus also, whoever has recognised the law of causation, the aspect of the principle of sufficient reason which appears in what fills these forms (space and time) as objects of perception, that is to say matter, has completely mastered the nature of matter as such, for matter is nothing more than causation, as any one will see at once if he reflects. Its true being is its action, nor can we possibly conceive it as having any other meaning. Only as active does it fill space and time; its action upon the immediate object (which is itself matter) determines that perception in which alone it exists. The consequence of the action of any material object upon any other, is known only in so far as the latter acts upon the immediate object in a different way from that in which it acted before; it consists only of this. Cause and effect thus constitute the whole nature of matter; its true being is its action. (A fuller treatment of this will be found in the essay on the Principle of Sufficient Reason, § 21, p. 77.) The nature of all material things is therefore very appropriately called in German *Wirklichkeit,* [Footnote: Mira in quibusdam rebus verborum proprietas est, et consuetudo sermonis antiqui quædam efficacissimis notis signat. *Seneca,* epist. 81.] a word which is far more expressive than *Realität.* Again, that which is acted upon is always matter, and thus the whole being and essence of matter consists in the orderly change, which one part of it brings about in another part. The existence of matter is therefore entirely relative, according to a relation which is valid only within its limits, as in the case of time and space.

But time and space, each for itself, can be mentally presented apart from matter, whereas matter cannot be so presented apart from time and space. The form which is inseparable from it presupposes space, and the action in which its very existence consists, always imports some change, in other words a determination in time. But space and time are not only, each for itself, presupposed by matter, but a union of the two constitutes its essence, for this, as we have seen, consists in action, *i. e.*, in causation. All the innumerable conceivable phenomena and conditions of things, might be
coexistent in boundless space, without limiting each other, or might be successive in endless time without interfering with each other: thus a necessary relation of these phenomena to each other, and a law which should regulate them according to such a relation, is by no means needful, would not, indeed, be applicable: it therefore follows that in the case of all co-existence in space and change in time, so long as each of these forms preserves for itself its condition and its course without any connection with the other, there can be no causation, and since causation constitutes the essential nature of matter, there can be no matter. But the law of causation receives its meaning and necessity only from this, that the essence of change does not consist simply in the mere variation of things, but rather in the fact that at the same part of space there is now one thing and then another, and at one and the same point of time there is here one thing and there another: only this reciprocal limitation of space and time by each other gives meaning, and at the same time necessity, to a law, according to which change must take place. What is determined by the law of causality is therefore not merely a succession of things in time, but this succession with reference to a definite space, and not merely existence of things in a particular place, but in this place at a different point of time. Change, i.e., variation which takes place according to the law of causality, implies always a determined part of space and a determined part of time together and in union. Thus causality unites space with time. But we found that the whole essence of matter consisted in action, i.e., in causation, consequently space and time must also be united in matter, that is to say, matter must take to itself at once the distinguishing qualities both of space and time, however much these may be opposed to each other, and must unite in itself what is impossible for each of these independently, that is, the fleeting course of time, with the rigid unchangeable perduration of space: infinite divisibility it receives from both. It is for this reason that we find that co-existence, which could neither be in time alone, for time has no contiguity, nor in space alone, for space has no before, after, or now, is first established through matter. But the co-existence of many things constitutes, in fact, the essence of reality, for through it permanence first becomes possible; for permanence is only knowable in the change of something which is present along with what is permanent, while on the other hand it is only because something permanent is present along with what changes, that the latter gains the special character of change, i.e., the mutation of quality and form in the permanence of substance, that is to say, in matter1. [Footnote: It is shown in the Appendix that matter and substance are one.] If the world were in space alone, it would be rigid and immovable, without succession, without change, without action; but we know that with action, the idea of matter first appears. Again, if the world were in time alone, all would be fleeting, without persistence, without contiguity, hence without co-existence, and consequently without permanence; so that in this case also there would be no matter. Only through the union of space and time do we reach matter, and matter is the possibility
of co-existence, and, through that, of permanence; through permanence again matter is the possibility of the persistence of substance in the change of its states.² [Footnote: This shows the ground of the Kantian explanation of matter, that it is ‘that which is movable in space,’ for motion consists simply in the union of space and time.] As matter consists in the union of space and time, it bears throughout the stamp of both. It manifests its origin in space, partly through the form which is inseparable from it, but especially through its persistence (substance), the a priori certainty of which is therefore wholly deducible from that of space³ [Footnote: Not, as Kant holds, from the knowledge of time, as will be explained in the Appendix.] (for variation belongs to time alone, but in it alone and for itself nothing is persistent). Matter shows that it springs from time by quality (accidents), without which it never exists, and which is plainly always causality, action upon other matter, and therefore change (a time concept). The law of this action, however, always depends upon space and time together, and only thus obtains meaning. The regulative function of causality is confined entirely to the determination of what must occupy this time and this space. The fact that we know a priori the unalterable characteristics of matter, depends upon this derivation of its essential nature from the forms of our knowledge of which we are conscious a priori. These unalterable characteristics are space-occupation, i. e., impenetrability, i. e., causal action, consequently, extension, infinite divisibility, persistence, i. e., indestructibility, and lastly mobility: weight, on the other hand, notwithstanding its universality, must be attributed to a posteriori knowledge, although Kant, in his ‘Metaphysical Introduction to Natural Philosophy,’ p. 71 (p. 372 of Rosenkranz’s edition), treats it as knowable a priori.

But as the object in general is only for the subject, as its idea, so every special class of ideas is only for an equally special quality in the subject, which is called a faculty of perception. This subjective correlative of time and space in themselves as empty forms, has been named by Kant pure sensibility; and we may retain this expression, as Kant was the first to treat of the subject, though it is not exact, for sensibility presupposes matter. The subjective correlative of matter or of causation, for these two are the same, is understanding, which is nothing more than this. To know causality is its one function, its only power; and it is a great one, embracing much, of manifold application, yet of unmistakable identity in all its manifestations. Conversely all causation, that is to say, all matter, or the whole of reality, is only for the understanding, through the understanding, and in the understanding. The first, simplest, and ever-present example of understanding is the perception of the actual world. This is throughout knowledge of the cause from the effect, and therefore all perception is intellectual. The understanding could never arrive at this perception, however, if some effect did not become known immediately, and thus serve as a starting-point. But this is the affection of the animal body. So far, then, the animal body is the immediate object of the subject; the perception of all
other objects becomes possible through it. The changes which every animal body experiences, are immediately known, that is, felt; and as these effects are at once referred to their causes, the perception of the latter as objects arises. This relation is no conclusion in abstract conceptions; it does not arise from reflection, nor is it arbitrary, but immediate, necessary, and certain. It is the method of knowing of the pure understanding, without which there could be no perception; there would only remain a dull plant-like consciousness of the changes of the immediate object, which would succeed each other in an utterly unmeaning way, except in so far as they might have a meaning for the will either as pain or pleasure. But as with the rising of the sun the visible world appears, so at one stroke, the understanding, by means of its one simple function, changes the dull, meaningless sensation into perception. What the eye, the ear, or the hand feels, is not perception; it is merely its data. By the understanding passing from the effect to the cause, the world first appears as perception extended in space, varying in respect of form, persistent through all time in respect of matter; for the understanding unites space and time in the idea of matter, that is, causal action. As the world as idea exists only through the understanding, so also it exists only for the understanding. In the first chapter of my essay on 'Light and Colour,' I have already explained how the understanding constructs perceptions out of the data supplied by the senses; how by comparison of the impressions which the various senses receive from the object, a child arrives at perceptions; how this alone affords the solution of so many phenomena of the senses; the single vision of two eyes, the double vision in the case of a squint, or when we try to look at once at objects which lie at unequal distances behind each other; and all illusion which is produced by a sudden alteration in the organs of sense. But I have treated this important subject much more fully and thoroughly in the second edition of the essay on 'The Principle of Sufficient Reason,' § 21. All that is said there would find its proper place here, and would therefore have to be said again; but as I have almost as much disinclination to quote myself as to quote others, and as I am unable to explain the subject better than it is explained there, I refer the reader to it, instead of quoting it, and take for granted that it is known.

The process by which children, and persons born blind who have been operated upon, learn to see, the single vision of the double sensation of two eyes, the double vision and double touch which occur when the organs of sense have been displaced from their usual position, the upright appearance of objects while the picture on the retina is upside down, the attributing of colour to the outward objects, whereas it is merely an inner function, a division through polarisation, of the activity of the eye, and lastly the stereoscope,—all these are sure and incontrovertible evidence that perception is not merely of the senses, but intellectual—that is, pure knowledge through the understanding of the cause from the effect, and that, consequently, it presupposes the law of causality, in a knowledge of which all perception—that is to say all experience, by virtue of its primary and only
possibility, depends. The contrary doctrine that the law of causality results from experience, which was the scepticism of Hume, is first refuted by this. For the independence of the knowledge of causality of all experience,—that is, its \textit{a priori} character—can only be deduced from the dependence of all experience upon it; and this deduction can only be accomplished by proving, in the manner here indicated, and explained in the passages referred to above, that the knowledge of causality is included in perception in general, to which all experience belongs, and therefore in respect of experience is completely \textit{a priori}, does not presuppose it, but is presupposed by it as a condition. This, however, cannot be deduced in the manner attempted by Kant, which I have criticised in the essay on ‘The Principle of Sufficient Reason,’ § 23.”

Ernst Mach wrote:

“Obviously it does not matter whether we think of the earth as turning round on its axis, or at rest while the celestial bodies revolve round it. Geometrically these are exactly the same case of a relative rotation of the earth and of the celestial bodies with respect to one another. Only, the first representation is astronomically more convenient and simpler.

But if we think of the earth at rest and the other celestial bodies revolving round it, there is no flattening of the earth, no Foucault’s experiment, and so on—at least according to our usual conception of the law of inertia. Now, one can solve the difficulty in two ways: Either all motion is absolute, or our law of inertia is wrongly expressed. Neumann preferred the first supposition, I, the second. The law of inertia must be so conceived that exactly the same thing results from the second supposition as from the first. By this it will be evident that, in its expression, regard must be paid to the masses of the universe.

In ordinary terrestrial cases, it will answer our purposes quite well to reckon the direction and velocity with respect to the top of a tower or a corner of a room; in ordinary astronomical cases, one or other of the stars will suffice. But because we can also choose other corners of rooms, another pinnacle, or other stars, the view may easily arise that we do not need such a point at all from which to reckon. But this is a mistake; such a system of co-ordinates has a value only if it can be determined by means of bodies. We here fall into the same error as we did with the representation of time. Because a piece of paper money need not necessarily be funded by a definite piece of money, we must not think that it need not be funded at all.

In fact, any one of the above points of origin of co-ordinates answers our purposes as long as a sufficient number of bodies keep fixed positions with respect to one another. But if we wish to apply the law of inertia in an earthquake, the terrestrial points of reference would leave us in the lurch, and, convinced of their uselessness, we would grope after celestial ones. But, with these better ones, the same thing would happen as soon as the stars showed movements which were very noticeable. When the variations of the
positions of the fixed stars with respect to one another cannot be disregarded, the laying down of a system of co-ordinates has reached an end. It ceases to be immaterial whether we take this or that star as point of reference; and we can no longer reduce these systems to one another. We ask for the first time which star we are to choose, and in this case easily see that the stars cannot be treated indifferently, but that because we can give preference to none, the influence of all must be taken into consideration.

We can, in the application of the law of inertia, disregard any particular body, provided that we have enough other bodies which are fixed with respect to one another. If a tower falls, this does not matter to us; we have others. If Sirius alone, like a shooting-star, shot through the heavens, it would not disturb us very much; other stars would be there. But what would become of the law of inertia if the whole of the heavens began to move and the stars swarmed in confusion? How would we apply it then? How would it have to be expressed then? We do not inquire after one body as long as we have others enough; nor after one piece of money as long as we have others enough. Only in the case of a shattering of the universe, or a bankruptcy, as the case may be, we learn that all bodies, each with its share, are of importance in the law of inertia, and all money, when paper money is funded, is of importance, each piece having its share.

Yet another example: A free body, when acted upon by an instantaneous couple, moves so that its central ellipsoid with fixed centre rolls without slipping on a tangent-plane parallel to the plane of the couple. This is a motion in consequence of inertia. Here the body makes very strange motions with respect to the celestial bodies. Now, do we think that these bodies, without which one cannot describe the motion imagined, are without influence on this motion? Does not that to which one must appeal explicitly or implicitly when one wishes to describe a phenomenon belong to the most essential conditions, to the causal nexus of the phenomenon? The distant heavenly bodies have, in our example, no influence on the acceleration, but they have on the velocity.

Now, what share has every mass in the determination of direction and velocity in the law of inertia? No definite answer can be given to this by our experiences. We only know that the share of the nearest masses vanishes in comparison with that of the farthest. We would, then, be able completely to make out the facts known to us if, for example, we were to make the simple supposition that all bodies act in the way of determination proportionately to their masses and independently of the distance, or proportionately to the distance, and so on. Another expression would be: In so far as bodies are so distant from one another that they contribute no noticeable acceleration to one another, all distances vary proportionately to one another.

[***]

ON THE DEFINITION OF MASS

The circumstance that the fundamental propositions of mechanics are neither wholly a priori nor can wholly be discovered by means of
experience—for sufficiently numerous and accurate experiments cannot be made—results in a peculiarly inaccurate and unscientific treatment of these fundamental propositions and conceptions. Rarely is distinguished and stated clearly enough what is a priori, what empirical, and what is hypothesis.

Now, I can only imagine a scientific exposition of the fundamental propositions of mechanics to be such that one regards these theorems as hypotheses to which experience forces us, and that one afterwards shows how the denial of these hypotheses would lead to contradictions with the best-established facts.

As evident a priori we can only, in scientific investigations, consider the law of causality or the law of sufficient reason, which is only another form of the law of causality. No investigator of nature doubts that under the same circumstances the same always results, or that the effect is completely determined by the cause. It may remain undecided whether the law of causality rests on a powerful induction or has its foundation in the psychical organization (because in the psychic life, too, equal circumstances have equal consequences).

The importance of the law of sufficient reason in the hands of an investigator was proved by Clausius’s works on thermodynamics and Kirchhoff’s researches on the connexion of absorption and emission. The well-trained investigator accustoms himself in his thought, by the aid of this theorem, to the same definiteness as nature has in its actions, and then experiences which are not in themselves very apparent suffice, by exclusion of all that is contradictory, to discover very important laws connected with the said experiences.

Usually, now, people are not very chary of asserting that a proposition is immediately evident. For example, the law of inertia is often stated to be such a proposition, as if it did not need the proof of experience. The fact is that it can only have grown out of experience. If masses imparted to one another, not acceleration, but, say, velocities which depended on the distance, there would be no law of inertia; but whether we have the one state of things or the other, only experience teaches. If we had merely sensations of heat, there would be merely equalizing velocities (Ausgleichungsgeschwindigkeiten), which vanish with the differences of temperature.

One can say of the motion of masses: ‘The effect of every cause persists,’ just as correctly as the opposite: ‘Cessante causa cessat effectus’; it is merely a matter of words. If we call the resulting velocity the ‘effect,’ the first proposition is true, if we call the acceleration the ‘effect,’ the second is true.

Also people try to deduce a priori the theorem of the parallelogram of forces; but they must always bring in tacitly the supposition that the forces are independent of one another. But by this the whole derivation becomes superfluous.

I will now illustrate what I have said by one example, and show how I think the conception of mass can be quite scientifically developed. The
difficulty of this conception, which is pretty generally felt, lies, it seems to me, in two circumstances: (1) in the unsuitable arrangement of the first conceptions and theorems of mechanics; (2) in the silent passing over important presuppositions lying at the basis of the deduction.

Usually people define \( m = \frac{P}{g} \) and again \( p = mg \). This is either a very repugnant circle, or it is necessary for one to conceive force as ‘pressure.’ The latter cannot be avoided if, as is customary, statics precedes dynamics. The difficulty, in this case, of defining magnitude and direction of a force is well-known.

In that principle of Newton, which is usually placed at the head of mechanics, and which runs: ‘Actioni contrariam semper et aequalem esse reactionem: sive corporem duorum actiones in se mutuo semper esse aequales et in partes contrarias dirigi,’ the actio is again a pressure, or the principle is quite unintelligible unless we possess already the conception of force and mass. But pressure looks very strange at the head of the quite phoronomical mechanics of today. However, this can be avoided.

If there were only one kind of matter, the law of sufficient reason would be sufficient to enable us to perceive that two completely similar bodies can impart to each other only equal and opposite accelerations. This is the one and only effect which is completely determined by the cause.

Now, if we suppose the mutual independence of forces, the following easily results. A body \( A \), consisting of \( m \) bodies \( a \), is the presence of another body \( B \), consisting of \( m' \) bodies \( a \). Let the acceleration of \( A \) be \( \varphi \) and that of \( B \) be \( \varphi' \). Then we have \( \varphi : \varphi' = m : m' \).

If we say that a body \( A \) has the mass \( m \) if it contains the body \( a m \) times, this means that the accelerations vary as the masses.

To find by experiment the mass-ratio of two bodies, let us allow them to act on one another, and we get, when we pay attention to the sign of the acceleration, \( \frac{m}{m'} = -\left(\frac{\varphi'}{\varphi}\right) \).

If the one body is taken as a unit of mass, the calculation gives the mass of the other body. Now, nothing prevents us from applying this definition in cases in which two bodies of different matter act on one another. Only, we cannot know \textit{a priori} whether we do not obtain other values for a mass when we consult other bodies used for purposes of comparison and other forces. When it was found that \( A \) and \( B \) combine chemically in the ratio \( a : b \) of their weights and that \( A \) and \( C \) do so in the ratio \( a : c \) of their weights, it could not be known beforehand that \( B \) and \( C \) combine in the ratio \( b : c \). Only experience can teach us that two bodies which behave to a third as equal masses will also behave to one another as equal masses.

If a piece of gold is opposed to a piece of lead, the law of sufficient reason leaves us completely. We are not even justified in expecting contrary
motions: both bodies might accelerate in the same direction. The calculation would then lead to negative masses.

But that two bodies which behave as equal masses to a third behave as such to one another, with respect to any forces, is very likely, because the contrary would not be reconcilable with the law of the conservation of work (Kraft), which has hitherto been found to be valid.

Imagine three bodies $A, B,$ and $C$ movable on an absolutely smooth and absolutely fixed ring. The bodies are to act on one another with any forces. Further, both $A$ and $B$, on the one hand, and $A$ and $C$, on the other, are to behave to one another as equal masses. Then the same must hold between $B$ and $C$.

If, for example, $C$ behaved to $B$ as a greater mass to a lesser one, and we gave $B$ a velocity in the direction of the arrow, it would give this velocity wholly to $A$ by impact, and $A$ would give it wholly to $C$. Then $C$ would communicate to $B$ a greater velocity and yet keep some itself. With every revolution in the direction of the arrow, then, the vis viva in the ring would increase; and the contrary would take place if the original motion were in a direction opposite to that of the arrow. But this would be in glaring contradiction with the facts hitherto known.

If we have thus defined mass, nothing prevents us from keeping the old definition of force as product of mass and acceleration. The law of Newton mentioned above then becomes a mere identity.

Since all bodies receive from the earth an equal acceleration, we have in this force (their weight) a convenient measure of their masses; again, however, only under the two suppositions that bodies which behave as equal masses to the earth do so to one another, and with respect to every force. Consequently, the following arrangement of the theorems of mechanics would appear to me to be the most scientific.

**Theorem of experience.**—Bodies placed opposite to one another communicate to each other accelerations in opposite senses in the direction of their line of junction. The law of inertia is included in this.

**Definition.**—Bodies which communicate to each other equal and opposite accelerations are said to be of equal mass. We get the mass-value of a body
by dividing the acceleration which it gives the body with which we compare others, and choose as the unit, by the acceleration which it gets itself.

Theorem of experience.—The mass-values remain unaltered when they are determined with reference to other forces and to another body of comparison which behaves to the first one as an equal mass.

Theorem of experience.—The accelerations which many masses communicate to one another are mutually independent. The theorem of the parallelogram of forces is included in this.

Definition.—Force is the product of the mass-value of a body into the acceleration communicated to that body.”

Fechner stated,

“All that is given is what can be seen and felt, movement and the laws of movement. How then can we speak of force here? For physics, force is nothing but an auxiliary expression for presenting the laws of equilibrium and of motion; and every clear interpretation of physical force brings us back to this. We speak of laws of force; but when we look at the matter more closely, we find that they are merely laws of equilibrium and movement which hold for matter in the presence of matter. To say that the sun and the earth exercise an attraction upon one another, simply means that the sun and earth behave in relation to one another in accordance with definite laws. To the physicist, force is but a law, and in no other way does he know how to describe it. . . All that the physicist deduces from his forces is merely an inference from laws, through the instrumentality of the auxiliary word ‘force’.”

In his professorial address, Hendrik Antoon Lorentz avowed,

“The word ‘forces’ is but a name for certain entities present in our formulae[.]”

In 1877, Frederick William Frankland stated,

 “[T] he conception of space is a particular variety of a wider and more general conception. This wider conception, of which time and space are particular varieties, it has been proposed to denote by the term manifoldness.”

In an argument dating as far back as 1870, the journal Mind published an article by Frankland in 1881, which set forth a version of “Mach’s principle”:

“Our first step will show us how thoroughly interdependent all these conceptions are. Matter can only be defined as that which possesses inertia—as that which requires a force proportional to its amount (designated
its mass) to effect a given change in its motion (either a change in velocity, or a change in direction, or both) in a given time. Force, again, can only be defined as that which causes a change in the velocity or direction of the motion of matter. It is tacitly assumed, though not often expressed, that the only thing which can cause such a change in velocity or direction is the co-existence of other matter. This amounts to saying that force is a relation of co-existence between different portions of matter. But every relation of co-existence in the material or phenomenal world is a relation of mutual positions in space. Hence force is a relation of mutual position between different portions of matter. Motion, in the kinetic, or dynamical, as opposed to the merely kinematical sense, is a change in the position of matter, and is completely determined when the mass of the moving body and the kinematical conditions of the case are given. The notion of energy does not require the introduction of any fundamentally new conception. Hence the phenomenal world is accurately described if we speak of it as a complex of motions, varying in infinite ways as regards mass on the one hand, and velocity and the other kinematical aspects on the other, tending severally to constancy in all these respects, but having a mutual action on one another, determined by their relations of co-existence, and, therefore, undergoing perpetual transformation. Now mark the parallelism. The noumenal world, we have seen, may be described as a complex of feeling elements, or Mind-Stuff units, having, just as motion has, extension in Time, varying in infinite ways as regards volume, intensity, and quality or timbre, having a mutual action on one another, determined by their mutual relations of co-existence, and undergoing perpetual transformations.

“Mind-stuff is the reality which we perceive as Matter. [***] Matter is a mental picture in which mind-stuff is the thing represented.”

It is interesting to note that Cunningham, in 1914, uses Clifford’s term “mind-stuff” (which perhaps derives from Riemann) in the context of Minkowski’s “imaginary space of four dimensions”. Eddington (appropriately enough also, like Frankland, in the journal *Mind*) later in 1920 relegated many aspects of Physics to solipsism, as if this were a novel approach by Einstein, when it clearly was not.

“The theory of relativity has introduced into physics new conceptions of time and space, which have aroused widespread interest. Less attention has been paid to the position of matter in the new theory; but a natural interpretation suggests a view of the nature of matter, which is in some respects novel and is more precise than the theories hitherto current. It is perhaps a commonplace that, whatever may be the true nature of matter, it is the mind which from the crude substratum constructs the familiar picture of a
substantial world around us. On the present theory we seem able to discern something of the motives of the mind in selecting and endowing with substantiality one particular quality of the external world, and to see that practically no other choice was possible for the rational mind. It will appear in the discussion that many of the best-known laws of physics are not inherent in the external world, but were automatically imposed by mind when it made the selection.\textsuperscript{2899}

R. B. Braithwaite stated in 1929,

“Mr. Eddington’s metaphysic is, it is true, what W. K. Clifford’s would have been had he been a member of the Society of Friends instead of a militant atheist[.]”\textsuperscript{2900}

And, indeed, Eddington had quoted Clifford in a long section of his Gifford lectures of 1927 dedicated to the definition of “Mind-Stuff”,

“The mind-stuff is the aggregation of relations and relata which form the building material for the physical world. Our account of the building process shows, however, that much that is implied in the relations is dropped as unserviceable for the required building. Our view is practically that urged in 1875 by W. K. Clifford—

‘The succession of feelings which constitutes a man’s consciousness is the reality which produces in our minds the perception of the motions of his brain.’

That is to say, that which the man himself knows as a succession of feelings is the reality which when probed by the appliances of an outside investigator affects their readings in such a way that it is identified as a configuration of brain-matter.”\textsuperscript{2901}

David Hilbert declared in the concluding paragraph of his 1915 lecture “The Foundations of Physics” that “the possibility draws near that in principle from Physics a science evolves which is a type of geometry”. In the 1800's, the anti-Kantian Bolliger sought to attribute gravity to geometry, as did W. W. R. Ball.\textsuperscript{2902}

In 1881, Johann Bernhard Stallo summarized the movement to abolish the term “force” from Physics, a movement often wrongfully attributed to Einstein,\textsuperscript{2903} as if originator,

“The prevailing errors respecting the inertia of matter have naturally led to corresponding delusions as to the nature of force. Here we are met, \textit{in limine}, by an ambiguity in the meaning of the term force in physics and mechanics. When we speak of a ‘force of nature,’ we use the word force in a sense very different from that which it bears in mechanics. A ‘force of nature,’ is a survival of ontological speculation; in common phraseology the term stands for a distinct and real entity. But, as a determinate mechanical function, force
is simply the rate of change of momentum—mathematically expressed, the
differential of momentum at a given instant of time. ‘Momentum,’ says Mr.
Tait, [Footnote: On Some Recent Advances in Physical Science, second ed.,
p. 347.] ‘is the time-integral of force, because force is the rate of change of
momentum.’ In the canonical text-books on physics, force is defined as the
cause of motion. ‘Any cause,’ says Whewell, [Footnote: Mechanics, p. 1.]
‘which moves or tends to move a body, or which changes or tends to change
its motion, is called force.’ So Clerk Maxwell: [Footnote: Theory of Heat,
p. 83.] ‘Force is whatever changes or tends to change the motion of a body
by altering either its direction or its magnitude.’ Far greater insight into the
nature of force is exhibited in the definition of Somoff, though the word
‘cause’ is retained: ‘A material point is moved by the presence of matter
without it. This action of extraneous matter is attributed to a cause which is
named force.’ [Footnote: Somoff, Theoretische Mechanik (trans. by Ziwet),
vol. ii, p. 155.] Taking these definitions as correctly representing the received
theories of physical science, it is manifest, irrespective of the considerations
I have presented in this and the preceding chapters, that force is not an
individual thing or entity that presents itself directly to observation or to
thought, but that, so far as it is treated as a definite and unital term in the
operations of thought, it is purely an incident to the conception of the
interdependence of moving masses. The cause of motion, or of the change of
motion, in a body is the condition or group of conditions upon which the
motion depends; and this condition or group of conditions is always a
respective motion, or change of motion, of the bodies outside of the body
in question which are its dynamical correlates. [Footnote: ‘Der gegenwartig
klar entwickelte mechanische Begriff der Kraft,’ says Zoellner (Natur der
Kometen, p. 328), ‘enthält nichts Anders als den Ausdruck einer
raumlichen und zeitlichen Beziehung zweier Körpere.’] Otherwise
expressed, force is a mere inference from the motion itself under the
universal conditions of reality, and its measure and determination lie solely
in the effect for which it is postulated as a cause; it has no other existence.
The only reality of force and its action is the correspondence between
physical phenomena in conformity with the principle of the essential
relativity of all forms of physical existence.

That force has no independent reality is so plain and obvious that it has
been proposed by some thinkers to abolish the term force, like the term
cause, altogether. However desirable a sparing use of such terms may be (as
is illustrated in the clearness of some modern mechanical treatises [Footnote:
Cf. e. g. Kirchhoff, Vorlesungen ueber mathematische Physik. Heidelberg,
1876.]), it is impracticable wholly to dispense with it, for the reason that the
conceptual element force, when properly interpreted in terms of experience,
is a legitimate incident to the conception of physical action, and, if its name
were disused, it would instantly reappear under another name. There are few
concepts which have not, in science as well as in metaphysics, given rise to
the same confusion that prevails in regard to ‘force’ and ‘cause;’ and the
blow leveled at these would demolish all concepts whatever. Nevertheless, it is of the greatest moment, in all speculations concerning the interdependence of physical phenomena, never to lose sight of the fact that force is a purely conceptual term, and that it is not a distinct tangible or intangible thing.  

In the Nineteenth Century, Robert Mayer, and many others argued for the “correlation and conservation of force.” Also in the Nineteenth Century, among the Anti-Kantians, Monists, mathematicians, Positivists, æther theorists and field theorists, there were primarily two schools of thought pushing for the abandonment of the term “force” as a mystical Newtonian concept. One school opposed the Newtonian mythology of “action at a distance” and sought the unification of all “forces” long before Einstein pursued Hilbert’s goal of a unified field theory. Hilbert wrote in 1915,

“We see that the few simple assumptions expressed in the axioms I and II are sufficient for the building of the theory: through the same, not only our conceptions of space, time and motion from the theory of Einstein are made anew, but I am also convinced that through the here established basic equations the most intimate hitherto concealed processes within the atom will be clarified, and in particular a general reduction of all physical constants to mathematical constants must be possible — as, in fact, this is already making it possible that from physics, in principle, a science of the kind of geometry will become: which is certainly the most splendid merit of the axiomatic method, by which we see how the powerful instruments of analysis, namely the calculus of variations and the invariant theory, come to the service.”

This school included Pasley, Faraday, Secchi, Anderssohn, Spiller, Vogt, Haeckel, Jahr, Sutherland, See, Wiechert, etc. and most of them sought a universal æther as a cause of the motions hitherto attributed to mystical nondescript “force”. The other school included Herbart, Mossotti, Poe, Dühring, Mach, Bolliger, Stallo, Geissler, Noble, Hilbert, etc. and they believed in relativity, geometry and multiplicity as the apparent “cause” of the seeming “effects” attributed to mysterious Newtonian “forces”. This all happened long before Lorentz, Ishiwara, de Donder, Nordström, Einstein, Weyl, Thirring, Kaluza and Klein, etc. took up the research program of the unification of forces and fields in the theory of relativity, which followed directly from Faraday’s experimental work.

Schopenhauer stated in 1819 in his book *The World as Will and Representation,*

“Force and substance are inseparable, because at bottom they are one; for, as Kant has shown, matter itself is given to us only as the union of forces, that
of expansion and that of attraction. Therefore there exists no opposition between force and substance; on the contrary, they are precisely one.”

Michael Faraday, like many others, pursued Boscovich’s atomic theory of atoms as point centers of force and expressed Dynamism as a field theory without an æther. Faraday was inspired by Peter Mark Roget, famous for the theory of persistent vision and for his thesaurus. The editors of the English translation of Mossotti’s influential article “On the Forces which regulate the Internal Constitution of Bodies”, Scientific Memoirs, Volume 1, Richard Taylor, London, (1837), pp. 448-469; included the following endnote:

“[The readers of this Memoir will doubtless be interested in referring to Dr. Roget’s “Treatise on Electricity” in the Library of Useful Knowledge, published March 15th, 1828; the following passage from which was noticed with reference to M. Mossotti’s views, by Prof. Faraday in his lecture at the Royal Institution, Jan. 20th of the present year.— EDIT.]

‘(239.) It is a great though a common error to imagine, that the condition assumed by Æpinus, namely that the particles of matter when devoid of electricity repel one another, is in opposition to the law of universal gravitation established by the researches of Newton; for this law applies, in every instance to which inquiry has extended, to matter in its ordinary state; that is, combined with a certain proportion of electric fluid. By supposing, indeed, that the mutual repulsive action between the particles of matter is, by a very small quantity, less than that between the particles of the electric fluid, a small balance would be left in favour of the attraction of neutral bodies for one another, which might constitute the very force which operates under the name of gravitation; and thus both classes of phænomena may be included in the same law.’”

Edgar Allen Poe wrote in his Monistic and Dynamistic Eureka: A Prose Poem of 1848, which contains many of the elements of modern relativity theory,

“Discarding now the two equivocal terms, ‘gravitation’ and ‘electricity,’ let us adopt the more definite expressions, ‘Attraction’ and ‘Repulsion.’ The former is the body, the latter the soul; the one is the material, the other the spiritual, principle of the Universe. No other principles exist. All phenomena are referable to one, or to the other, or to both combined. So rigorously is this the case, so thoroughly demonstrable is it that Attraction and Repulsion are the sole properties through which we perceive the Universe—in other words, by which Matter is manifested to Mind—that, for all merely argumentative purposes, we are fully justified in assuming that Matter exists only as Attraction and Repulsion—that Attraction and Repulsion are Matter; there being no conceivable case in which we may not employ the term ‘Matter’ and the terms ‘Attraction’ and ‘Repulsion,’ taken together, as equivalent, and
therefore convertible, expressions in Logic.”

Faraday wrote in 1845,

“2146. I have long held an opinion, almost amounting to conviction, in common I believe with many other lovers of natural knowledge, that the various forms under which the forces of matter are made manifest have one common origin; or, in other words, are so directly related and mutually dependent, that they are convertible, as it were, one into another, and possess equivalents of power in their action. [Footnote: Experimental Researches, 57, 366, 376, 877, 961, 2071.] In modern times the proofs of their convertibility have been accumulated to a very considerable extent, and a commencement made of the determination of their equivalent forces.”

Faraday’s statement caught the attention of Sir Edward Bulwer-Lytton, who referred to it soon after in Chapter 7 of his novel The Coming Race,

“‘What is vril?’ I asked.

Therewith Zee began to enter into an explanation of which I understood very little, for there is no word in any language I know which is an exact synonym for vril. I should call it electricity, except that it comprehends in its manifold branches other forces of nature, to which, in our scientific nomenclature, differing names are assigned, such as magnetism, galvanism, etc. These people consider that in vril they have arrived at the unity in natural energetic agencies, which has been conjectured by many philosophers above ground, and which Faraday thus intimates under the more cautious term of ‘correlation’:

‘I have long held an opinion,’ says that illustrious experimentalist, ‘almost amounting to a conviction, in common, I believe, with many other lovers of natural knowledge, that the various forms under which the forces of matter are made manifest have one common origin; or, in other words, are so directly related and mutually dependent, that they are convertible, as it were, into one another, and possess equivalents of power in their action.’

These subterranean philosophers assert that, by one operation of vril, which Faraday would perhaps call ‘atmospheric magnetism,’ they can influence the variations of temperature—in plain words, the weather; that by other operations, akin to those ascribed to mesmerism, electro-biology, odic force, etc., but applied scientifically through vril conductors, they can exercise influence over minds, and bodies animal and vegetable, to an extent not surpassed in the romances of our mystics. To all such agencies they give the common name of ‘vril.’”

Helene Petrovna Blavatsky in turn referred to both Faraday’s statement and Bulwer-Lytton’s “vril” in her Isis Unveiled: A Master-key to the Mysteries of Ancient and Modern Science and Theology, Volume 1, Chapter 5, J.W. Bouton, New York,
“Sir E. Bulwer-Lytton, in his *Coming Race*, describes it as the VRIL.[Footnote: We apprehend that the noble author coined his curious names by contracting words in classical languages. Gy would come from gune; vril from virile.] used by the subterranean populations, and allowed his readers to take it for a fiction. ‘These people,’ he says, ‘consider that in the vril they had arrived at the unity in natural energetic agencies’; and proceeds to show that Faraday intimated them ‘under the more cautious term of correlation,’ thus:

‘I have long held an opinion, almost amounting to a conviction, in common, I believe, with many other lovers of natural knowledge, that the various forms under which the forces of matter are made manifest, HAVE ONE COMMON ORIGIN; or, in other words, are so directly and naturally dependent, that they are convertible, as it were, into one another, and possess equivalents of power in their action.’

Absurd and unscientific as may appear our comparison of a fictitious vril invented by the great novelist, and the primal force of the equally great experimentalist, with the kabalistic astral light, it is nevertheless the true definition of this force.”

Faraday stated in 1850,

“2702. The long and constant persuasion that all the forces of nature are mutually dependent, having one common origin, or rather being different manifestations of one fundamental power (2146), has made me often think upon the possibility of establishing by experiment, a connexion between gravity and electricity, and so introducing the former into the group, the chain of which, including also magnetism, chemical force and heat, binds so many and such varied exhibitions of force together by common relations. Though the researches I have made with this object in view have produced only negative results, yet I think a short statement of the matter, as it has presented itself to my mind, and of the result of the experiments, which offering at first much to encourage, were only reduced to their true value by most careful searchings after sources of error, may be useful, both as a general statement of the problem, and as awakening the minds of others to its consideration.”

Faraday argued, on 15 April 1846,

“AT your request I will endeavour to convey to you a notion of that which I ventured to say at the close of the last Friday-evening Meeting, incidental to the account I gave of Wheatstone’s electro-magnetic chronoscope; but from first to last understand that I merely threw out as matter for speculation, the vague impressions of my mind, for I gave nothing as the result of
sufficient consideration, or as the settled conviction, or even probable conclusion at which I had arrived.

The point intended to be set forth for consideration of the hearers was, whether it was not possible that the vibrations which in a certain theory are assumed to account for radiation and radiant phenomena may not occur in the lines of force which connect particles, and consequently masses of matter together; a notion which as far as it is admitted, will dispense with the æther, which, in another view, is supposed to be the medium in which these vibrations take place.

You are aware of the speculation [Footnote: Philosophical Magazine, 1844, vol xxiv, p136; or Exp. Res. ii.284.] which I some time since uttered respecting that view of the nature of matter which considers its ultimate atoms as centres of force, and not as so many little bodies surrounded by forces, the bodies being considered in the abstract as independent of the forces and capable of existing without them. In the latter view, these little particles have a definite form and a certain limited size; in the former view such is not the case, for that which represents size may be considered as extending to any distance to which the lines of force of the particle extend: the particle indeed is supposed to exist only by these forces, and where they are it is. The consideration of matter under this view gradually led me to look at the lines of force as being perhaps the seat of the vibrations of radiant phenomena.

Another consideration bearing conjointly on the hypothetical view both of matter and radiation, arises from the comparison of the velocities with which the radiant action and certain powers of matter are transmitted. The velocity of light through space is about 190,000 miles in a second; the velocity of electricity is, by the experiments of Wheatstone, shown to be as great as this, if not greater: the light is supposed to be transmitted by vibrations through an æther which is, so to speak, destitute of gravitation, but infinite in elasticity; the electricity is transmitted through a small metallic wire, and is often viewed as transmitted by vibrations also. That the electric transference depends on the forces or powers of the matter of the wire can hardly be doubted, when we consider the different conductibility of the various metallic and other bodies; the means of affecting it by heat or cold; the way in which conducting bodies by combination enter into the constitution of non-conducting substances, and the contrary; and the actual existence of one elementary body, carbon, both in the conducting and non-conducting state. The power of electric conduction (being a transmission of force equal in velocity to that of light) appears to be tied up in and dependent upon the properties of the matter, and is, as it were, existent in them.

I suppose we may compare together the matter of the æther and ordinary matter (as, for instance, the copper of the wire through which the electricity is conducted), and consider them as alike in their essential constitution; i. e. either as both composed of little nuclei, considered in the abstract as matter,
and of force or power associated with these nuclei, or else both consisting of mere centres of force, according to Boscovich’s theory and the view put forth in my speculation; for there is no reason to assume that the nuclei are more requisite in the one case than in the other. It is true that the copper gravitates and the æther does not, and that therefore the copper is ponderable and the æther is not; but that cannot indicate the presence of nuclei in the copper more than in the æther, for of all the powers of matter gravitation is the one in which the force extends to the greatest possible distance from the supposed nucleus, being infinite in relation to the size of the latter; and reducing that nucleus to a mere centre of force. The smallest atom of matter on the earth acts directly on the smallest atom of matter in the sun, though they are 95,000,000 miles apart; further, atoms which, to our knowledge, are at least nineteen times that distance, and indeed in cometary masses, far more, are in a similar way tied together by the lines of force extending from and belonging to each. What is there in the condition of the particles of the supposed æther, if there be even only one such particle between us and the sun, that can in subtlety and extent compare to this?

Let us not be confused by the ponderability and gravitation of heavy matter, as if they proved the presence of the abstract nuclei; these are due not to the nuclei, but to the force super-added to them, if the nuclei exist at all; and, if the æther particles be without this force, which according to the assumption is the case, then they are more material, in the abstract sense, than the matter of this our globe; for matter, according to the assumption, being made up of nuclei and force, the æther particles have in this respect proportionately more of the nucleus and less of the force.

On the other hand, the infinite elasticity assumed as belonging to the particles of the æther, is as striking and positive a force of it as gravity is of ponderable particles, and produces in its way effects as great; in witness whereof we have all the varieties of radiant agency as exhibited in luminous, calorific, and actinic phenomena.

Perhaps I am in error in thinking the idea generally formed of the æther is that its nuclei are almost infinitely small, and that such force as it has, namely its elasticity, is almost infinitely intense. But if such be the received notion, what then is left in the æther but force or centres of force? As gravitation and solidity do not belong to it, perhaps many may admit this conclusion; but what are gravitation and solidity? certainly not the weight and contact of the abstract nuclei. The one is the consequence of an attractive force, which can act at distances as great as the mind of man can estimate or conceive; and the other is the consequence of a repulsive force, which forbids for ever the contact or touch of any two nuclei; so that these powers or properties should not in any degree lead those persons who conceive of the æther as a thing consisting of force only, to think any otherwise of ponderable matter, except that it has more and other forces associated with it than the æther has.

In experimental philosophy we can, by the phenomena presented,
recognize various kinds of lines of force; thus there are the lines of
gravitating force, those of electro-static induction, those of magnetic action,
and others partaking of a dynamic character might be perhaps included. The
lines of electric and magnetic action are by many considered as exerted
through space like the lines of gravitating force. For my own part, I incline
to believe that when there are intervening particles of matter (being
themselves only centres of force), they take part in carrying on the force
through the line, but that when there are none, the line proceeds through
space. [Footnote: Experimental Researches in Electricity, pars. 1161, 1613,
1663, 1770, 1729, 1735, 2443.] Whatever the view adopted respecting them
may be, we can, at all events, affect these lines of force in a manner which
may be conceived as partaking of the nature of a shake or lateral vibration.
For suppose two bodies, A B, distant from each other and under mutual
action, and therefore connected by lines of force, and let us fix our attention
upon one resultant of force, having an invariable direction as regards space;
if one of the bodies move in the least degree right or left, or if its power be
shifted for a moment within the mass (neither of these cases being difficult
to realise if A and B be either electric or magnetic bodies), then an effect
equivalent to a lateral disturbance will take place in the resultant upon which
we are fixing our attention; for, either it will increase in force whilst the
neighboring results are diminishing, or it will fall in force as they are
increasing.

It may be asked, what lines of force are there in nature which are fitted
to convey such an action and supply for the vibrating theory the place of the
æther? I do not pretend to answer this question with any confidence; all I can
say is, that I do not perceive in any part of space, whether (to use the
common phrase) vacant or filled with matter, anything but forces and the
lines in which they are exerted. The lines of weight or gravitating force are,
certainly, extensive enough to answer in this respect any demand made upon
them by radiant phænomena; and so, probably, are the lines of magnetic
force: and then who can forget that Mossotti has shown that gravitation,
aggregation, electric force, and electro-chemical action may all have one
common connection or origin; and so, in their actions at a distance, may have
in common that infinite scope which some of these actions are known to
possess?

The view which I am so bold as to put forth considers, therefore,
radiation as a high species of vibration in the lines of force which are known
to connect particles and also masses of matter together. It endeavours to
dismiss the æther, but not the vibration. The kind of vibration which, I
believe, can alone account for the wonderful, varied, and beautiful
phenomena of polarization, is not the same as that which occurs on the
surface of disturbed water, or the waves of sound in gases or liquids, for the
vibrations in these cases are direct, or to and from the centre of action,
whereas the former are lateral. It seems to me, that the resultant of two or
more lines of force is in an apt condition for that action which may be
considered as equivalent to a lateral vibration; whereas a uniform medium, like the æther, does not appear apt, or more apt than air or water.

The occurrence of a change at one end of a line of force easily suggests a consequent change at the other. The propagation of light, and therefore probably of all radiant action, occupies time; and, that a vibration of the line of force should account for the phænomena of radiation, it is necessary that such vibration should occupy time also. I am not aware whether there are any data by which it has been, or could be ascertained whether such a power as gravitation acts without occupying time, or whether lines of force being already in existence, such a lateral disturbance of them at one end as I have suggested above, would require time, or must of necessity be felt instantly at the other end.

As to that condition of the lines of force which represents the assumed high elasticity of the æther, it cannot in this respect be deficient: the question here seems rather to be, whether the lines are sluggish enough in their action to render them equivalent to the æther in respect of the time known experimentally to be occupied in the transmission of radiant force.

The æther is assumed as pervading all bodies as well as space: in the view now set forth, it is the forces of the atomic centres which pervade (and make) all bodies, and also penetrate all space. As regards space, the difference is, that the æther presents successive parts or centres of action, and the present supposition only lines of action; as regards matter, the difference is, that the æther lies between the particles and so carries on the vibrations, whilst as respects the supposition, it is by the lines of force between the centres of the particles that the vibration is continued. As to the difference in intensity of action within matter under the two views, I suppose it will be very difficult to draw any conclusion, for when we take the simplest state of common matter and that which most nearly causes it to approximate to the condition of the æther, namely the state of the rare gas, how soon do we find in its elasticity and the mutual repulsion of its particles, a departure from the law, that the action is inversely as the square of the distance!

And now, my dear Phillips, I must conclude. I do not think I should have allowed these notions to have escaped from me, had I not been led unawares, and without previous consideration, by the circumstances of the evening on which I had to appear suddenly and occupy the place of another. Now that I have put them on paper, I feel that I ought to have kept them much longer for study, consideration, and, perhaps final rejection; and it is only because they are sure to go abroad in one way or another, in consequence of their utterance on that evening, that I give them a shape, if shape it may be called, in this reply to your inquiry. One thing is certain, that any hypothetical view of radiation which is likely to be received or retained as satisfactory, must not much longer comprehend alone certain phænomena of light, but must include those of heat and of actinic influence also, and even the conjoined phenomena of sensible heat and chemical power produced by them. In this respect, a view, which is in some degree founded upon the ordinary forces
of matter, may perhaps find a little consideration amongst the other views that will probably arise. I think it likely that I have made many mistakes in the preceding pages, for even to myself, my ideas on this point appear only as the shadow of a speculation, or as one of those impressions on the mind which are allowable for a time as guides to thought and research. He who labours in experimental inquiries knows how numerous these are, and how often their apparent fitness and beauty vanish before the progress and development of real natural truth.

Faraday’s ideas were very influential. William Kingdon Clifford argued for a space theory of matter in the 1870’s. Clifford speculated in the year of his death and of Einstein’s birth, 1879, that light may be naught but flickering “space”,

“In order to explain the phenomena of light, it is not necessary to assume anything more than a periodical oscillation between two states at any given point of space.”

Karl Pearson noted, as second editor and annotator of Clifford’s *The Common Sense of the Exact Sciences* in 1884-1885,

“The most notable physical quantities which vary with position and time are heat, light, and electro-magnetism. It is these that we ought peculiarly to consider when seeking for any physical changes, which may be due to changes in the curvature of space. If we suppose the boundary of any arbitrary figure in space to be distorted by the variation of space-curvature, there would, by analogy from one and two dimensions, be no change in the volume of the figure arising from such distortion. Further, if we assume as an axiom that space resists curvature with a resistance proportional to the change, we find that waves of ‘space-displacement’ are precisely similar to those of the elastic medium which we suppose to propagate light and heat. We also find that ‘space-twist’ is a quantity exactly corresponding to magnetic induction, and satisfying relations similar to those which hold for the magnetic field. It is a question whether physicists might not find it simpler to assume that space is capable of a varying curvature, and of a resistance to that variation, than to suppose the existence of a subtle medium pervading an invariable homaloidal space.”

“Riemann has shown that as there are different kinds of lines and surfaces, so there are different kinds of space of three dimensions; and that we can only find out by experience to which of these kinds the space in which we live belongs. In particular, the axioms of plane geometry are true within the limits of experiment on the surface of a sheet of paper, and yet we know that the sheet is really covered with a number of small ridges and furrows, upon
which (the total curvature not being zero) these axioms are not true. Similarly, he says although the axioms of solid geometry are true within the limits of experiment for finite portions of our space, yet we have no reason to conclude that they are true for very small portions; and if any help can be got thereby for the explanation of physical phenomena, we may have reason to conclude that they are not true for very small portions of space.

I wish here to indicate a manner in which these speculations may be applied to the investigation of physical phenomena. I hold in fact

(1) That small portions of space are in fact of a nature analogous to little hills on a surface which is on the average flat; namely, that the ordinary laws of geometry are not valid in them.

(2) That this property of being curved or distorted is continually being passed on from one portion of space to another after the manner of a wave.

(3) That this variation of the curvature of space is what really happens in that phenomenon which we call the motion of matter, whether ponderable or ethereal.

(4) That in the physical world nothing else takes place but this variation, subject (possibly) to the law of continuity.

I am endeavouring in a general way to explain the laws of double refraction on this hypothesis, but have not yet arrived at any results sufficiently decisive to be communicated."

Clifford stated, in a work published posthumously in 1885, some six years after his death,

“§19. On the Bending of Space

The peculiar topic of this chapter has been position, position namely of a point P relative to a point A. This relative position led naturally to a consideration of the geometry of steps. I proceeded on the hypothesis that all position is relative, and therefore to be determined only by a stepping process. The relativity of position was a postulate deduced from the customary methods of determining position, such methods in fact always giving relative position. Relativity of position is thus a postulate derived from experience. The late Professor Clerk-Maxwell fully expressed the weight of this postulate in the following words:—

All our knowledge, both of time and place, is essentially relative. When a man has acquired the habit of putting words together, without troubling himself to form the thoughts which ought to correspond to them, it is easy for him to frame an antithesis between this relative knowledge and a so-called absolute knowledge, and to point out our ignorance of the absolute position of a point as an instance of the limitation of our faculties. Any one, however, who will try to imagine the state of a mind conscious of knowing the absolute position of a point will ever after be content with our relative knowledge.
It is of such great value to ascertain how far we can be certain of the truth of our postulates in the exact sciences that I shall ask the reader to return to our conception of position albeit from a somewhat different standpoint. I shall even ask him to attempt an examination of that state of mind which Professor Clerk-Maxwell hinted at in his last sentence.

But we may press our analogy a step further, and ask, since our hypothetical worm and fish might very readily attribute the effects of changes in the bending of their spaces to changes in their own physical condition, whether we may not in like fashion be treating merely as physical variations effects which are really due to changes in the curvature of our space; whether, in fact, some or all of those causes which we term physical may not be due to the geometrical construction of our space. There are three kinds of variation in the curvature of our space which we ought to consider as within the range of possibility.

(i) Our space is perhaps really possessed of a curvature varying from point to point, which we fail to appreciate because we are acquainted with only a small portion of space, or because we disguise its small variations under changes in our physical condition which we do not connect with our change of position. The mind that could recognize this varying curvature might be assumed to know the absolute position of a point. For such a mind the postulate of the relativity of position would cease to have a meaning. It does not seem so hard to conceive such a state of mind as the late Professor Clerk-Maxwell would have had us believe. It would be one capable of distinguishing those so-called physical changes which are really geometrical or due to a change of position in space.

(ii) Our space may be really same (of equal curvature), but its degree of curvature may change as a whole with the time. In this way our geometry based on the sameness of space would still hold good for all parts of space, but the change of curvature might produce in space a succession of apparent physical changes.

(iii) We may conceive our space to have everywhere a nearly uniform curvature, but that slight variations of the curvature may occur from point to point, and themselves vary with the time. These variations of the curvature with the time may produce effects which we not unnaturally attribute to physical causes independent of the geometry of our space. We might even go so far as to assign to this variation of the curvature of space ‘what really happens in that phenomenon which we term the motion of matter.’

We have introduced these considerations as to the nature of our space to bring home to the reader the character of the postulates we make in the exact sciences. These postulates are not, as too often assumed, necessary and universal truths; they are merely axioms based on our experience of a certain limited region. Just as in any branch of physical inquiry we start by making experiments, and basing on our experiments a set of axioms which form the foundation of an exact science, so in geometry our axioms are really,
although less obviously, the result of experience. On this ground geometry has been properly termed at the commencement of Chapter II a physical science. The danger of asserting dogmatically that an axiom based on the experience of a limited region holds universally will now be to some extent apparent to the reader. It may lead us to entirely overlook, or when suggested at once reject, a possible explanation of phenomena. The hypotheses that space is not homaloidal, and again, that its geometrical character may change with the time, may or may not be destined to play a great part in the physics of the future; yet we cannot refuse to consider them as possible explanations of physical phenomena, because they may be opposed to the popular dogmatic belief in the universality of certain geometrical axioms—a belief which has arisen from centuries of indiscriminating worship of the genius of Euclid.”

14.5 Mach’s Principle

The pantheistic Cabalist Henry More (who was also inspired by Aristotle and who inspired John Locke, Isaac Newton and Samuel Clarke) wrote that absolute space is God, as proved by the thought experiment of the hypothetical annihilation of all matter,

“But if this will not satisfy, ’tis no detriment to our cause: For if, after the removal of corporeal Matter out of the world, there will be still Space and Distance in which this very Matter, while it was there, was also conceiv’d to lie, and this distant Space cannot but be something, and yet not corporeal, because neither impenetrable nor tangible; it must of necessity be a Substance Incorporeal necessarily and eternally existent of itself: which the clearer Idea of a Being absolutely perfect will more fully and punctually inform us to be the Self-subsisting God.”

John Locke raised the issue in his essay Concerning Human Understanding, Chapter 13, Section 22, which would lead Berkeley to “Mach’s Principle” some 150 years before Mach. Locke wrote,

“22. The power of annihilation proves a vacuum. Farther, those who assert the impossibility of space existing without matter, must not only make body infinite, but must also deny a power in God to annihilate any part of matter. No one, I suppose, will deny that God can put an end to all motion that is in matter, and fix all the bodies of the universe in a perfect quiet and rest, and continue them so long as he pleases. Whoever then will allow that God can, during such a general rest, annihilate either this book or the body of him that reads it, must necessarily admit the possibility of a vacuum. For, it is evident that the space that was filled by the parts of the annihilated body will still remain, and be a space without body. For the circumambient bodies being in perfect rest, are a wall of adamant, and in that state make it a perfect
impossibility for any other body to get into that space. And indeed the necessary motion of one particle of matter into the place from whence another particle of matter is removed, is but a consequence from the supposition of plenitude; which will therefore need some better proof than a supposed matter of fact, which experiment can never make out;—our own clear and distinct ideas plainly satisfying us, that there is no necessary connexion between space and solidity, since we can conceive the one without the other. And those who dispute for or against a vacuum, do thereby confess they have distinct ideas of vacuum and plenum, i.e. that they have an idea of extension void of solidity, though they deny its existence; or else they dispute about nothing at all. For they who so much alter the signification of words, as to call extension body, and consequently make the whole essence of body to be nothing but pure extension without solidity, must talk absurdly whenever they speak of vacuum; since it is impossible for extension to be without extension. For vacuum, whether we affirm or deny its existence, signifies space without body; whose very existence no one can deny to be possible, who will not make matter infinite, and take from God a power to annihilate any particle of it.”

Locke’s idea was pursued by Isaac Newton, Samuel Clarke, and Carl Neumann, who stated in 1869,

“This seems to be the right place for an observation which forces itself upon us and from which it clearly follows how unbearable are the contradictions that arise when motion is conceived as something relative rather than something absolute. Let us assume that among the stars there is one which is composed of fluid matter and is somewhat similar to our terrestrial globe and that it is rotating around an axis that passes through its center. As a result of such a motion, and due to the resulting centrifugal forces, this star would take on the shape of a flattened ellipsoid. We now ask: What shape will this star assume if all remaining heavenly bodies are suddenly annihilated (turned into nothing)? These centrifugal forces are dependent only on the state of the star itself; they are totally independent of the remaining heavenly bodies. Consequently, this is our answer: These centrifugal forces and the spherical ellipsoidal form dependent on them will persist regardless of whether the remaining heavenly bodies continue to exist or suddenly disappear.”

Berkeley, Mach and others opposed the ontological supposition that space is an entity unto itself and that inertia would exist without other matter. Des Cartes asserted that extension is a property of matter, and only by mental abstraction becomes “space”. Leibnitz’ monadistic philosophy emphasized that, “without matter no space”. Berkeley was one of many who argued against Newtonian absolutism. From Berkeley’s Principles of Human Knowledge of 1710,
“97. Beside the external existence of the objects of perception, another great source of errors and difficulties with regard to ideal knowledge is the doctrine of abstract ideas, such as it hath been set forth in the Introduction. The plainest things in the world, those we are most intimately acquainted with and perfectly know, when they are considered in an abstract way, appear strangely difficult and incomprehensible. Time, place, and motion, taken in particular or concrete, are what everybody knows, but, having passed through the hands of a metaphysician, they become too abstract and fine to be apprehended by men of ordinary sense. Bid your servant meet you at such a time in such a place, and he shall never stay to deliberate on the meaning of those words; in conceiving that particular time and place, or the motion by which he is to get thither, he finds not the least difficulty. But if time be taken exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence or duration in abstract, then it will perhaps gravel even a philosopher to comprehend it. 

98. For my own part, whenever I attempt to frame a simple idea of time, abstracted from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embrangled in inextricable difficulties. I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to entertain odd thoughts of my existence; since that doctrine lays one under an absolute necessity of thinking, either that he passes away innumerable ages without a thought, or else that he is annihilated every moment of his life, both which seem equally absurd. Time therefore being nothing, abstracted from the succession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind. Hence, it is a plain consequence that the soul always thinks; and in truth whoever shall go about to divide in his thoughts, or abstract the existence of a spirit from its cogitation, will, I believe, find it no easy task. 

99. So likewise when we attempt to abstract extension and motion from all other qualities, and consider them by themselves, we presently lose sight of them, and run into great extravagances. All which depend on a twofold abstraction; first, it is supposed that extension, for example, may be abstracted from all other sensible qualities; and secondly, that the entity of extension may be abstracted from its being perceived. But, whoever shall reflect, and take care to understand what he says, will, if I mistake not, acknowledge that all sensible qualities are alike sensations and alike real; that where the extension is, there is the colour, too, i.e., in his mind, and that their archetypes can exist only in some other mind; and that the objects of sense are nothing but those sensations combined, blended, or (if one may so speak) concreted together; none of all which can be supposed to exist unperceived.

[***]

110. The best key for the aforesaid analogy or natural Science will be
The Principle of Equivalence, Etc. 2205

easily acknowledged to be a certain celebrated Treatise of Mechanics. In the entrance of which justly admired treatise, Time, Space, and Motion are distinguished into absolute and relative, true and apparent, mathematical and vulgar; which distinction, as it is at large explained by the author, does suppose these quantities to have an existence without the mind; and that they are ordinarily conceived with relation to sensible things, to which nevertheless in their own nature they bear no relation at all.

111. As for Time, as it is there taken in an absolute or abstracted sense, for the duration or perseverance of the existence of things, I have nothing more to add concerning it after what has been already said on that subject.

[Sect. 97 and 98] For the rest, this celebrated author holds there is an absolute Space, which, being unperceivable to sense, remains in itself similar and immovable; and relative space to be the measure thereof, which, being movable and defined by its situation in respect of sensible bodies, is vulgarly taken for immovable space. Place he defines to be that part of space which is occupied by any body; and according as the space is absolute or relative so also is the place. Absolute Motion is said to be the translation of a body from absolute place to absolute place, as relative motion is from one relative place to another. And, because the parts of absolute space do not fall under our senses, instead of them we are obliged to use their sensible measures, and so define both place and motion with respect to bodies which we regard as immovable. But, it is said in philosophical matters we must abstract from our senses, since it may be that none of those bodies which seem to be quiescent are truly so, and the same thing which is moved relatively may be really at rest; as likewise one and the same body may be in relative rest and motion, or even moved with contrary relative motions at the same time, according as its place is variously defined. All which ambiguity is to be found in the apparent motions, but not at all in the true or absolute, which should therefore be alone regarded in philosophy. And the true as we are told are distinguished from apparent or relative motions by the following properties.—First, in true or absolute motion all parts which preserve the same position with respect of the whole, partake of the motions of the whole. Secondly, the place being moved, that which is placed therein is also moved; so that a body moving in a place which is in motion doth participate the motion of its place. Thirdly, true motion is never generated or changed otherwise than by force impressed on the body itself. Fourthly, true motion is always changed by force impressed on the body moved. Fifthly, in circular motion barely relative there is no centrifugal force, which, nevertheless, in that which is true or absolute, is proportional to the quantity of motion.

112. But, notwithstanding what has been said, I must confess it does not appear to me that there can be any motion other than relative; so that to conceive motion there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. Hence, if there was one only body in being it could not possibly be moved. This seems evident, in that the idea I have of motion doth necessarily include relation.
113. But, though in every motion it be necessary to conceive more bodies than one, yet it may be that one only is moved, namely, that on which the force causing the change in the distance or situation of the bodies, is impressed. For, however some may define relative motion, so as to term that body moved which changes its distance from some other body, whether the force or action causing that change were impressed on it or no, yet as relative motion is that which is perceived by sense, and regarded in the ordinary affairs of life, it should seem that every man of common sense knows what it is as well as the best philosopher. Now, I ask any one whether, in his sense of motion as he walks along the streets, the stones he passes over may be said to move, because they change distance with his feet? To me it appears that though motion includes a relation of one thing to another, yet it is not necessary that each term of the relation be denominated from it. As a man may think of somewhat which does not think, so a body may be moved to or from another body which is not therefore itself in motion.

114. As the place happens to be variously defined, the motion which is related to it varies. A man in a ship may be said to be quiescent with relation to the sides of the vessel, and yet move with relation to the land. Or he may move eastward in respect of the one, and westward in respect of the other. In the common affairs of life men never go beyond the earth to define the place of any body; and what is quiescent in respect of that is accounted absolutely to be so. But philosophers, who have a greater extent of thought, and juster notions of the system of things, discover even the earth itself to be moved. In order therefore to fix their notions they seem to conceive the corporeal world as finite, and the utmost unmoved walls or shell thereof to be the place whereby they estimate true motions. If we sound our own conceptions, I believe we may find all the absolute motion we can frame an idea of to be at bottom no other than relative motion thus defined. For, as hath been already observed, absolute motion, exclusive of all external relation, is incomprehensible; and to this kind of relative motion all the above-mentioned properties, causes, and effects ascribed to absolute motion will, if I mistake not, be found to agree. As to what is said of the centrifugal force, that it does not at all belong to circular relative motion, I do not see how this follows from the experiment which is brought to prove it. See Philosophiae Naturalis Principia Mathematica, in Schol. Def. VIII. For the water in the vessel at that time wherein it is said to have the greatest relative circular motion, hath, I think, no motion at all; as is plain from the foregoing section.

115. For, to denominate a body moved it is requisite, first, that it change its distance or situation with regard to some other body; and secondly, that the force occasioning that change be applied to it. If either of these be wanting, I do not think that, agreeably to the sense of mankind, or the propriety of language, a body can be said to be in motion. I grant indeed that it is possible for us to think a body which we see change its distance from some other to be moved, though it have no force applied to it (in which sense there may be apparent motion), but then it is because the force causing the
change of distance is imagined by us to be applied or impressed on that body thought to move; which indeed shews we are capable of mistaking a thing to be in motion which is not, and that is all.

116. From what has been said it follows that the philosophic consideration of motion does not imply the being of an absolute Space, distinct from that which is perceived by sense and related bodies; which that it cannot exist without the mind is clear upon the same principles that demonstrate the like of all other objects of sense. And perhaps, if we inquire narrowly, we shall find we cannot even frame an idea of pure Space exclusive of all body. This I must confess seems impossible, as being a most abstract idea. When I excite a motion in some part of my body, if it be free or without resistance, I say there is Space; but if I find a resistance, then I say there is Body; and in proportion as the resistance to motion is lesser or greater, I say the space is more or less pure. So that when I speak of pure or empty space, it is not to be supposed that the word ‘space’ stands for an idea distinct from or conceivable without body and motion—though indeed we are apt to think every noun substantive stands for a distinct idea that may be separated from all others; which has occasioned infinite mistakes. When, therefore, supposing all the world to be annihilated besides my own body, I say there still remains pure Space, whereby nothing else is meant but only that I conceive it possible for the limbs of my body to be moved on all sides without the least resistance, but if that, too, were annihilated then there could be no motion, and consequently no Space. Some, perhaps, may think the sense of seeing doth furnish them with the idea of pure space; but it is plain from what we have elsewhere shewn, that the ideas of space and distance are not obtained by that sense. See the Essay concerning Vision.”

Berkeley presented a long and detailed argument against Newton’s bucket experiment to detect absolute motion in Berkeley’s De Motu of 1721 in sections 53-66, iterating what later came to be known as “Mach’s Principle”.

Newton wrote in the Principia, Book I, Definition VIII, Scholium, inter alia,

“The Effects which distinguish absolute from relative motion are, the forces of receding from the axe of circular motion. For there are no such forces in a circular motion purely relative, but in a true and absolute circular motion, they are greater or less, according to the quantity of the motion. If a vessel, hung by a long cord, is so often turned about that the cord is strongly twisted, then fill’d with water, and held at rest together with the water; after by the sudden action of another force, it is whirl’d about the contrary way, and while the cord is untwisting itself, the vessel continues for some time in this motion; the surface of the water will at first be plain, as before the vessel began to move: but the vessel, by gradually communicating its motion to the water, will make it begin sensibly to revolve, and recede by little and little from the middle, and ascend to the sides of the vessel, forming itself into a concave figure, (as I have experienced) and the swifter the motion becomes,
the higher will the water rise, till at last, performing its revolutions in the same times with the vessel, it becomes relatively at rest in it. This ascent of the water shows its endeavour to recede from the axe of its motion; and the true and absolute circular motion of the water, which is here directly contrary to the relative, discovers itself, and may be measured by this endeavour. At first, when the relative motion of the water in the vessel was greatest, it produc’d no endeavour to recede from the axe: the water shew’d no tendency to the circumference, nor any ascent towards the sides of the vessel, but remain’d of a plain surface, and therefore its True circular motion had not yet begun. But afterwards, when the relative motion of the water had decreas’d, the ascent thereof towards the sides of the vessel, prov’d its endeavour to recede from the axe; and this endeavour shew’d the real circular motion of the water perpetually increasing, till it had acquir’d its greatest quantity, when the water rested relatively in the vessel. And therefore this endeavour does not depend upon any translation of the water in respect of the ambient bodies, nor can true circular motion be defin’d by such translation. There is only one real circular motion of any one revolving body, corresponding to only one power of endeavouring to recede from its axe of motion, as its proper and adequate effect: but relative motions in one and the same body are innumerable, according to the various relations it bears to external bodies, and like other relations, are altogether destitute of any real effect, any otherwise than they may perhaps participate of that one only true motion. And therefore in their system who suppose that our heavens, revolving below the sphere of the fixt Stars, carry the Planets along with them; the several parts of those heavens, and the Planets, which are indeed relatively at rest in their heavens, do yet really move. For they change their position one to another (which never happens to bodies truly at rest) and being carried together with their heavens, participate of their motions, and as parts of revolving wholes, endeavour to recede from the axe of their motions."

Berkeley objected to Newton’s argument, and wrote, *inter alia*,

“‘Therefore we must say that the water forced round in the bucket rises to the sides of the vessel, because when new forces are applied in the direction of the tangent to any particle of water, in the same instant new equal centripetal forces are not applied. From which experiment it in no way follows that absolute circular motion is necessarily recognized by the forces of retirement from the axis of motion. [***] [I]t would be enough to bring in, instead of absolute space, relative space as confined to the heavens of the fixed stars, considered as at rest. But motion and rest marked out by such relative space can conveniently be substituted in place of the absolutes, which cannot be distinguished from them by any mark.”

Boscovich argued in the second supplement to his *A Theory of Natural Philosophy*, Section 20,
20. When either objects external to us, or our organs change their modes of existence in such a way that that first equality or similitude does not remain constant, then indeed the ideas are altered, & there is a feeling of change; but the ideas are the same exactly, whether the external objects suffer the change, or our organs, or both of them unequally. In every case our ideas refer to the difference between the new state & the old, & not to the absolute change, which does not come within the scope of our senses. Thus, whether the stars move round the Earth, or the Earth & ourselves move in the opposite direction round them, the ideas are the same, & there is the same sensation. We can never perceive absolute changes; we can only perceive the difference from the former configuration that has arisen. Further, when there is nothing at hand to warn us as to the change of our organs, then indeed we shall count ourselves to have been unmoved, owing to a general prejudice for counting as nothing those things that are nothing in our mind; for we cannot know of this change, & we attribute the whole of the change to objects situated outside of ourselves. In such manner any one would be mistaken in thinking, when on board ship, that he himself was motionless, while the shore, the hills & even the sea were in motion.\textsuperscript{2955}

In 1881, Johann Bernhard Stallo provided us with a good history which fills in the gaps in the evolution of “Mach’s Principle” between Berkeley and Mach,

“Now, in any discussion of the operations of thought, it is of the utmost importance to bear in mind the following irrefragable truths, some of which—although all of them seem to be obvious—have not been clearly apprehended until very recent times:

1. Thought deals, not with things as they are, or are supposed to be, in themselves, but with our mental representations of them. Its elements are, not pure objects, but their intellectual counterparts. What is present in the mind in the act of thought is never a thing, but always a state or states of consciousness. However much, and in whatever sense, it may be contended that the intellect and its object are both real and distinct entities, it can not for a moment be denied that the object, of which the intellect has cognizance, is a synthesis of objective and subjective elements, and is thus primarily, in the very act of its apprehension and to the full extant of its cognizable existence, affected by the determinations of the cognizing faculty. Whenever, therefore, we speak of a thing, or a property of a thing, it must be understood that we mean a product of two factors neither of which is capable of being apprehended by itself. In this sense all knowledge is said to be relative.

2. Objects are known only through their relations to other objects. They have, and can have, no properties, and their concepts can include no attributes, save these relations, or rather, our mental representations of them. Indeed, an object can not be known or conceived otherwise than as a complex of such relations. In mathematical phrase: things and their properties are known only as functions of other things and properties. In this
sense, also, relativity is a necessary predicate of all objects of cognition.

3. A particular operation of thought never involves the entire complement of the known or knowable properties of a given object, but only such of them as belong to a definite class of relations. In mechanics, for instance, a body is considered simply as a mass of determinate weight and volume (and in some cases figure), without reference to its other physical or chemical properties. In like manner each of the several other departments of knowledge effects a classification of objects upon its own peculiar principles, thereby giving rise to different series of concepts in which each concept represents that attribute or group of attributes—that aspect of the object—which it is necessary, in view of the question in hand, to bring into view. Our thoughts of things are thus, in the language of Leibnitz, adopted by Sir William Hamilton, and after him by Herbert Spencer, symbolical, not (or, at least, not only) because a complete mental representation of the properties of an object is precluded by their number and the incapacity of the mind to hold them in simultaneous grasp, but because many (and in most cases the greater part) of them are irrelevant to the mental operation in progress.

CHARACTER AND ORIGIN OF THE MECHANICAL THEORY (CONTINUED).—ITS EXEMPLIFICATION OF THE FOURTH RADICAL ERROR OF METAPHYSICS.

The reality of all things which are, or can be, objects of cognition, is founded upon, or, rather, consists in, their mutual relations. A thing in and by itself can be neither apprehended nor conceived; its existence is no more a presentation of sense than a deliverance of thought. Things are known to us solely through their properties; and the properties of things are nothing else than their interactions and mutual relations. ‘Every property or quality of a thing,’ says Helmholtz [Footnote: Die neueren Fortschritte in der Theorie des Sehens. Pop. Wiss. Vortraege, ii, 55 seq.] (speaking of the inveterate prejudice according to which the qualities of things must be analogous to, or identical with, our perceptions of them), ‘is in reality nothing but its capability of producing certain effects on other things. The effect occurs either between like parts of the same body so as to produce differences of aggregation, or it proceeds from one body to another, as in the case of chemical reactions; or the effects are upon our organs of sense and manifest themselves as sensations such as those with which we are here concerned (the sensations of sight). Such an effect we call a ‘property,’ its reagent being understood without being expressly mentioned. Thus we speak of the ‘solubility’ of a substance, meaning its behavior toward water; we speak of its ‘weight,’ meaning its attraction to the earth; and we may justly call a substance ‘blue’ under the tacit assumption that we are only speaking of its action upon a normal eye. But, if what we call a property always implies a relation between two things, then a property or quality can never depend upon the nature of one agent alone, but exists only in relation to and dependence on the nature of some second object acted upon. Hence, there is
really no sense in talking of properties of light which belong to it absolutely, independently of all other objects, and which are supposed to be representable in the sensations of the human eye. The notion of such properties is a contradiction in itself. They can not possibly exist, and therefore we can not expect to find any coincidence of our sensations of color with qualities of light.’

The truth which underlies these sentences is of such transcendent importance that it is hardly possible to be too emphatic in its statement, or too profuse in its illustration. The real existence of things is coextensive with their qualitative and quantitative determinations. And both are in their nature relations, quality resulting from mutual action, and quantity being simply a ratio between terms neither of which is absolute. Every objectively real thing is thus a term in numberless series of mutual implications, and forms of reality beyond these implications are as unknown to experience as to thought. There is no absolute material quality, no absolute material substance, no absolute physical unit, no absolutely simple physical entity, no absolute physical constant, no absolute standard, either of quantity or quality, no absolute motion, no absolute rest, no absolute time, no absolute space. There is no form of material existence which is either its own support or its own measure, and which abides, either quantitatively or qualitatively, otherwise than in perpetual change, in an unceasing flow of mutations. An object is large only as compared with another which, as a term of this comparison, is small, but which, in comparison with a third object, may be indefinitely large; and the comparison which determines the magnitude of objects is between its terms alone, and not between any or all of its terms and an absolute standard. An object is hard as compared with another which is soft, but which, in turn, may be contrasted with a third still softer; and, again, there is no standard object which is either absolutely hard or absolutely soft. A body is simple as compared with the compound into which it enters as a constituent; but there is and can be no physically real thing which is absolutely simple [Footnote: One of the most noteworthy specimens of ontological reasoning is the argument which infers the existence of absolutely simple substances from the existence of compound substances. Leibnitz places this argument at the head of his ‘Monadology.’ ‘Necess est,’ he says, ‘dari substantias simplicesquia dantur compositae; neque enim compositum est nisi aggregatum simplicium.’ (Leibniti, Opera omnia, ed. Dutens, t. ii., p. 21.) But the enthymeme is obviously a vicious paralogism—a fallacy of the class known in logic as fallacies of suppressed relative. The existence of a compound substance certainly proves the existence of absolutely simple substances from the existence of compound substances. That proves nothing whatever as to the simplicity of these parts in themselves.] It may be observed, in this connection, that not only the law of causality, the conservation of energy, and the indestructibility of matter, so called, have their root in the relativity of all objective reality—being, indeed, simply
different aspects of this relativity—but that Newton's first and third laws of motion, as well as all laws of least action in mechanics (including Gauss's law of movement under least constraint), are but corollaries from the same principle. And the fact that everything is, in its manifest existence, but a group of relations and reactions at once accounts for Nature's inherent teleology.

Although the truth that all our knowledge of objective reality depends upon the establishment or recognition of relations is sufficiently evident and has been often proclaimed, it has thus far been almost wholly ignored by men of science as well as by metaphysicians. It is to this day assumed by physicists and mathematicians, no less than by ontologists, that all reality is in its last elements absolute. And this assumption is all the more strenuously insisted on by those whose scientific creed begins with the proposition that all our knowledge of physical things is derived from experience. Thus the mathematician, who fully recognizes the validity of this proposition and at the same time concedes that we have, and can have, no actual knowledge of bodies at rest or in motion, except in relation to other bodies, nevertheless declares that rest and motion are real only in so far as they and their elements, space and time, are absolute. The physicist reminds us at every step that in the field of his investigations there are no a priori truths and that nothing is known of the world of matter save what has been ascertained by observation and experiment; he then announces as the uniform result of his observations and experiments, that all forms of material existence are complex and variable; and yet he avers that not merely the laws of their variation are constant, but that the real constituents of the material world are absolutely simple, invariable, individual things.

The assumption that all physical reality is in its last elements absolute—that the material universe is an aggregate of absolutely constant physical units which in themselves are absolutely at rest, but whose motion, however induced, is measurable in terms of absolute space and absolute time—is obviously the true logical basis of the atomo-mechanical theory. And this assumption is identical with that which lies at the root of all metaphysical systems, with the single difference that in some of these systems the physical substratum of motion (termed the "substance" of things) is not specialized into individual atoms.

To show how irrepressibly the ontological prejudice, that nothing is physically real which is not absolute, has asserted itself in science during the last three centuries, I propose briefly to review the doctrines of some of the most eminent mathematicians and physicists respecting space and motion (and, incidentally, time), beginning with those of Descartes.

In the introductory parts of his Principia, Descartes states in the most explicit terms that space and motion are essentially relative. ‘In order that the place [of a body] may be determined,’ he says, [Footnote: Princ. ii, § 18.] ‘we must refer to other bodies which we may regard as immovable, and accordingly as we refer to different bodies it can be said that the same thing
The Principle of Equivalence, Etc. 2213

does, and does not, change its place. Thus, when a ship is carried along at
sea, he who sits at the stern remains always at the same place in reference to
the parts of the ship among which he retains the same position; but he
continually changes his place in reference to the shores. . . . And besides, if
we allow that the earth moves and proceeds—precisely as far from west to
east as the ship meanwhile is carried from east to west—we shall say again
that he who sits at the stern does not move his place, because we determine
it with reference to some immovable points in the heavens. But, if finally we
concede that no truly immovable points are to be found in the universe, as I
shall hereafter show is probable, our conclusion will be that there is nothing
which has a fixed place except so far as it is determined in thought.’

[Footnote: The illustration of the relativity of motion by the motion of a ship
is of constant recurrence whenever reference is had to the question discussed
in the text. Cf. Leibnitz, Opp. ed. Erdmann, p. 604; Newton, Princ., Def. viii,
Schol. 3; Euler, Theoria Motús Corporum Solidorum, vol. i, 9, 10; Berkeley,
Principles of Human Knowledge, § 114; Kant, Metaphysische
Auffangsgrunde der Naturwissenschaft, Phor. Grundsatz I; Cournot, De
l’Enchainment, etc., vol. i, p. 56; Herbert Spencer, First Principles, chapter
iii, § 17, etc., etc.]

Statements to the same effect are found in various other parts of the same
book. [Footnote: E. g., Princ., ii, 24, 25, 29, etc.] And of space Descartes
does not hesitate to say that is really nothing in itself, and that ‘void space’
is a contradiction in terms—that, as Sir John Herschel puts it, [Footnote:
Familiar Lectures, p. 445.] ‘if it were not for the foot-rule between them, the
two ends of it would be in the same place.’ But, in the further progress of his
discussions, having meanwhile declared that God always conserves in the
universe the same quantity of motion, he all at once takes it for granted
[Footnote: Princ., ii, §§ 37-39.] that motion and space are absolute and
therefore real entities.

This inconsistency of Descartes is severely censured by Leibnitz. ‘It
follows,’ says Leibnitz, [Footnote: Leibn., Opp. Math., ed. Gerhardt, sect. ii,
vol. ii, p. 247.] ‘that motion is nothing but a change of place, and thus, so far
as phenomena are concerned, consists in a mere relation. This Cartesius also
acknowledged; but in deducing his consequences he forgot his own definition
and framed his laws of motion as though motion were something real and
absolute.’ As will be noticed, Leibnitz here assumes, as a matter of course,
that what is real is also absolute. In view of this it is hardly surprising that he,
too, falls into the same inconsistency with which he charges Descartes, and,
in his letters to Clarke, speaks of ‘absolutely immovable space’ and an
766, 770.]

Newton, in the great Scholium to the last of the ‘Definitions’ prefixed to
his Principia, sharply distinguishes between absolute and relative time and
motion. ‘Absolute and mathematical time,’ he says, [Footnote: Princ. (Ed.
Le Seur & Jacq.), p. 8.’] ‘in itself and in its nature without relation to
anything external, flows equally and is otherwise called duration; relative, apparent and vulgar time is any sensible and extrinsic, accurate or unequal measure of duration by motion which is ordinarily taken for true time. . . . Absolute is distinguished from relative time in astronomy by the equation of vulgar time. For the natural days, which are vulgarly taken in the measurement of time as equal, are unequal. . . . It may be that there is no equable motion by which time is accurately measured.’ [Footnote: L. c., p. 10.]

‘Absolute space, in its nature without relation to anything external, always remains similar and immovable; of this (absolute space) relative space is any movable measure or dimension which is sensibly defined by its place in reference to bodies, and is vulgarly taken for immovable space. . . . [Footnote: L. c., p. 9.] We define all places by the distances of things from some [given] body which we take as immovable. . . . It may be that there is no body truly at rest to which places and motions are to be referred.’ [Footnote: Ib., p. 10.]

Absolute motion, according to Newton, is ‘the translation of a body from one absolute place to another,’ and relative motion ‘the translation of a body from one relative place to another. . . . Absolute rest and motion are distinguished from relative rest and motion by their properties and by their causes and effects. It is the property of rest that bodies truly at rest are at rest in respect to each other. Hence, while it is possible that in the regions of the fixed stars, or far beyond them, there is some body absolutely at rest, it is nevertheless impossible to know from the relative places of bodies in our regions, whether any such distant body persists in the given position, and therefore true rest can not be defined from the mutual position of these’ [i.e., the bodies in our regions]. . . . ‘It is the property of motion that the parts which retain their given positions to the wholes participate in their motion. For all the parts of rotating bodies tend to recede from the axis of motion, and the impetus of the moving bodies arises from the impetus of the parts. Hence, when the surrounding bodies move, those which move within them are relatively at rest. And for this reason true and absolute motion, can not be defined by their translation from the vicinity of bodies which are looked upon as being at rest. . . . [Footnote: Ib., p. 10, 11.] The causes by which true and relative motions are distinguished from each other are the forces impressed upon bodies for the generation of motion. True motion is generated or changed solely by the forces impressed upon the body moved; but relative motion may be generated and changed without the action of forces upon it. For it is sufficient that forces are impressed upon other bodies to which reference is had, so that by their giving way a change is effected in the relation in which the relative motion or rest of the body consists. . . . [Footnote: L. c., p. 11.] The effects by which absolute and relative motion are mutually distinguished are the forces by which bodies recede from the axis of circular motion. For in purely relative circular motion these forces are null, while in true and absolute motion they are greater or less according to
the quantity of motion.’ [Footnote: Ib.]

It is apparent that in all these definitions Newton, like Descartes and Leibnitz, assumes real motion to be absolute, and that he takes the terms *relative motion* and *apparent motion* to be strictly synonymous, notwithstanding his express admission (in the passages which I have italicized) that in fact there may be neither absolute time nor absolute space. That admission naturally leads to the further admission that there may in fact be no absolute motion; but from this Newton recoils, resorting to the expedient of trying to find tenable ground for the distinction between absolute and relative motion, despite the possible nonexistence of absolute time and space, in what he calls their respective causes and effects. But these causes and effects serve to distinguish, not relative from absolute change of position, but simply change of position in one body with reference to another from simultaneous changes of position in both with reference to a third.

Newton’s doctrine is pushed to its last consequences by Leonhard Euler. In the first chapter of his ‘Theory of the Motion of Solid or Rigid Bodies,’ Euler begins with the emphatic declaration that rest and motion, so far as they are known to sensible experience, are purely relative. After referring to the typical case of the navigator in his ship, he proceeds: [Footnote: Theoria motus Corp. Sol, etc., cap. i, explic. 2.] ‘The notion of rest here spoken of, therefore, is one of relations, inasmuch as it is not derived solely from the condition of the point O to which it is attributed, but from a comparison with some other body A . . . . And hence it appears at once that the same body which is at rest with respect to the body A is in various motion with respect to other bodies. . . . What has been said of relative rest may be readily applied to relative motion; for when a point O retains its place with respect to a body A, it is said to be relatively at rest, and, when it continually changes that place, it is said to be relatively in motion. . . . [Footnote: Ib., p. 7.] Therefore motion and rest are distinguished merely in name and are not opposed to each other in fact, inasmuch as both may at the same time be attributed to the same point, accordingly as it is referred to different bodies. Nor does motion differ from rest otherwise than as one motion differs from another.’ [Footnote: Ib., p. 8.]

After thus insisting upon the essential relativity of rest and motion, Euler proceeds, in the second chapter. ‘On the Internal Principles of Motion,’ to consider the question whether or not rest and motion are predicable of a body without reference to other bodies. To this question he unhesitatingly gives an affirmative answer, holding it to be axiomatic that ‘every body, even without respect to other bodies, is either at rest or in motion, i. e., is either absolutely at rest or absolutely in motion. . . . [Footnote: Omne corpus etiam sine respectu ad alia corpora vel quiescit vel movetur, hoc est, vel absolute quiescit, vel absolute movetur.’ Ib., p. 30 (cap. ii, axioma 7.)] ‘Thus far,’ he explains, ‘following the senses, we have not recognized any other motion or rest than that with respect to other bodies, whence we have called both motion and rest relative. But, if we now mentally take away all bodies but
one, and if thus the relation by which we have hitherto distinguished its rest and motion is withdrawn, it will first be asked whether or not the conclusion respecting the rest or motion of the remaining body still stands. For, if this conclusion can be drawn only from a comparison of the place of the body in question with that of other bodies, it follows that, when these bodies are gone, the conclusion must go with them. But, albeit we do not know of the rest or motion of a body except from its relation to other bodies, it is nevertheless not to be concluded that these things (rest and motion) are nothing in themselves but a mere relation established by the intellect, and that there is nothing inherent in the bodies themselves which corresponds to our ideas of rest and motion. For, although we are unable to know quantity otherwise than by comparison, yet, when the things with which we instituted the comparison are gone, there is still left in the body the fundamentum quantitatis, as it were; for, if it were extended or contracted, such extension or contraction would have to be taken as a true change. Thus, if but one body existed, we should have to say that it was either in motion or at rest, inasmuch as it could not be taken as being both or neither. Whence I conclude that rest and motion are not merely ideal things, born from comparison alone, so that there would be nothing inherent in the body corresponding to them, but that it may be justly asked in respect to a solitary body whether it is in motion or at rest. . . . Inasmuch, therefore, as we can justly ask respecting a single body itself, without reference to other bodies, or under the supposition that they are annihilated, whether it is at rest or in motion, we must necessarily take one or the other alternative. But what this rest or motion will be, in view of the fact that there is here no change of place with respect to other bodies, we can not even think without admitting an absolute space in which our body occupies some given space whence it can pass to other places.’ [Footnote: Theoria motus, etc., p. 31.] Accordingly Euler most strenuously insists on the necessity of postulating an absolute, immovable space. ‘Whoever denies absolute space,’ he says, ‘falls into the gravest perplexities. Since he is constrained to reject absolute rest and motion as empty sounds without sense, he is not only constrained also to reject the laws of motion, but to affirm that there are no laws of motion. For, if the question which has brought us to this point, What will be the condition of a solitary body detached from its connection with other bodies? is absurd, then those things also which are induced in this body by the action of others become uncertain and indeterminable, and thus everything will have to be taken as happening fortuitously and without any reason.’ [Footnote: Ib., p. 32.]

That the basis of all this reasoning is purely ontological is plain. And, when the thinkers of the eighteenth century became alive to the fallacies of ontological speculation, the unsoundness of Euler's 'axiom,' that rest and motion are substantial attributive entities independent of all relation, could hardly escape their notice. Nevertheless, they were unable to emancipate themselves wholly from Euler's ontological prepossessions. They did not at
once avoid his dilemma by repudiating it as unfounded—by denying that motion and rest can not be real without being absolute—but they attempted to reconcile the absolute reality of rest and motion with their phenomenal relativity by postulating an absolutely quiescent point or center in space to which the positions of all bodies could be referred. Foremost among those who made this attempt was Kant

[Footnote: It is remarkable how many of the scientific discoveries, speculations and fancies of the present day are anticipated or at least foreshadowed in the writings of Kant. Some of them are enumerated by Zoellner (Natur der Kometen, p. 455 seq.)—among them the constitution and motion of the system of fixed stars; the nebular origin of planetary and stellar systems; the origin, constitution and rotation of Saturn’s rings and the conditions of their stability; the non-coincidence of the moon’s center of gravity with her center of figure; the physical constitution of the comets; the retarding effect of the tides upon the rotation of the earth; the theory of the winds, and Dove’s law. Fritz Schultze has shown (Kant and Darwin, Jena, 1875) that Kant was one of the precursors of Darwin. In this connection it is curious to note a coincidence (no doubt wholly accidental) in the example resorted to both by Kant and A. R. Wallace for the purpose of illustrating ‘adaptation by general law.’ The case put by both is that of the channel of a river which, in the view of the teleologists, as Wallace says (Contributions to the Theory of Natural Selection, p. 276 seq.), ‘must have been designed, it answers its purpose so effectually,’ or, as Kant expresses it, must have been scooped out by God himself. (‘Wenn man die physisch-theologischen Verfasser hoert, so wird man dahin gebracht, sich vorzustellen, ihre Lanfrinnen waeren alle von Gott ausgehoehlt.’ Beweisgrund zu einer Demonstration des Dasein’s Gottes, Kant’s Werke, i, p. 232.) Even of the vagaries of modern transcendental geometry there are suggestions in Kant’s essays, Von der wahren Schaetzung der lebendigen Kraefte, Werke v, p. 5, and Von dem ersten Grunde des Unterschiedes der Gegenden im Raume, ib., p. 293—a fact which is not likely to conduce to the edification of those who, like J. K. Becker, Tobias, Weissenborn, Krause, etc., have raised the Kantian standard in defense of Euklidean space. It is probably not without significance that in the second edition of his Critique of Pure Reason Kant omits the third paragraph of the first section of the Transcendental Aesthetics, in which he had enforced the necessity of assuming the a priori character of the idea of space by the argument that without this assumption the propositions of geometry would cease to be true apodictically, and that ‘all that could be said of the dimensions of space would be that thus far no space had been found which had more than three dimensions.’]

In the seventh chapter of his ‘Natural History of the Heavens’—the same work in which, nearly fifty years before Laplace, he gave the first outlines of the Nebular Hypothesis—he sought to show that in the universe there is
somewhere a great central body whose center of gravity is the cardinal point of reference for the motions of all bodies whatever. ‘If in the immeasurable space,’ he says, [Footnote: Naturgeschichte des Himmels, Werke, vol. vi, p. 152.] ‘wherein all the suns of the milky way have been formed, a point is assumed round which, from whatever cause, the first formative action of nature had its play, then at that point a body of the largest mass and of the greatest attractions, must have been formed. This body must have become able to compel all systems which were in process of formation in the enormous surrounding sphere to gravitate toward it as their center, so as to constitute an entire system, similar to the solar and planetary system which was evolved on a small scale out of elementary matter.’

A suggestion similar to that of Kant has recently been made by Professor C. Neumann, who enforces the necessity of assuming the existence, at a definite and permanent point in space, of an absolutely rigid body, to whose center of figure or attraction all motions are to be referred, by physical considerations. The drift of his reasoning appears in the following extracts from his inaugural lecture On the Principles of the Galileo-Newtonian Theory: [Footnote: Ueber die Principien der Galileo-Newton’schen Theorie. Leipzig, B. G. Teubner, 1870.] The principles of the Galileo-Newtonian theories consist in two laws—the law of inertia proclaimed by Galileo, and the law of attraction added by Newton. . . . A material point, when once set in motion, free from the action of an extraneous force, and wholly left to itself, continues to move in a straight line so as to describe equal spaces in equal times. Such is Galileo’s law of inertia. It is impossible that this proposition should stand in its present form as the corner-stone of a scientific edifice, as the starting-point of mathematical deductions. For it is perfectly unintelligible, inasmuch as we do not know what is meant by ‘motion in a straight line,’ or, rather, inasmuch as we do know that the words ‘motion in a straight line’ are susceptible of various interpretations. A motion, for instance, which is rectilinear as seen from the earth, would be curvilinear as seen from the sun, and would be represented by a different curve as often as we change our point of observation to Jupiter, to Saturn, or another celestial body. In short, every motion which is rectilinear with reference to one celestial body will appear curvilinear with reference to another celestial body. . . .

‘The words of Galileo, according to which a material point left to itself proceeds in a straight line, appear to us, therefore, as words without meaning—as expressing a proposition which, to become intelligible, is in need of a definite background. There must be given in the universe some special body as the basis of our comparison, as the object in reference to which all motions are to be estimated; and only when such a body is given shall we be able to attach to those words a definite meaning. Now, what body is it which is to occupy this eminent position? Or, are there several such bodies? Are the motions near the earth to be referred to the terrestrial globe, perhaps, and those near the sun to the solar sphere? . . .
Unfortunately, neither Galileo nor Newton gives us a definite answer to this question. But, if we carefully examine the theoretical structure which they erected, and which has since been continually enlarged, its foundations can no longer remain hidden. We readily see that all actual or imaginable motions in the universe must be referred to one and the same body. Where this body is, and what are the reasons for assigning to it this eminent, and, as it were, sovereign position, these are questions to which there is no answer.

'It will be necessary, therefore, to establish the proposition, as the first principle of the Galileo-Newtonian theory, that in some unknown place of the universe there is an unknown body—a body absolutely rigid and unchangeable for all time in its figure and dimensions. I may be permitted to call this body 'The Body Alpha.' It would then be necessary to add that the motion of a body would import, not its change of place in reference to the earth or sun, but its change of position in reference to the body Alpha.

'From this point of view the law of Galileo is seen to have a definite meaning. This meaning presents itself as a second principle, which is, that a material point left to itself progresses in a straight line—proceeds, therefore, in a course which is rectilinear in reference to the body Alpha.'

After thus showing, or attempting to show, that the reality of motion necessitates its reference to a rigid body unchangeable in its position in space, Neumann seeks to verify this assumption by asking himself the question, what consequences would ensue, on the hypothesis of the mere relativity of motion, if all bodies but one were annihilated. 'Let us suppose,' he says, 'that among the stars there is one which consists of fluid matter, and which, like our earth, is in rotatory motion round an axis passing through its center. In consequence of this motion, by virtue of the centrifugal forces developed by it, this star will have the form of an ellipsoid. What form, now, I ask, will this star assume if suddenly all other celestial bodies are annihilated?

'These centrifugal forces depend solely upon the state of the star itself; they are wholly independent of the other celestial bodies. These forces, therefore, as well as the ellipsoidal form, will persist, irrespective of the continued existence or disappearance of the other bodies. But, if motion is defined as something relative—as a relative change of place of two points—the answer is very different. If, on this assumption, we suppose all other celestial bodies to be annihilated, nothing remains but the material points of which the star in question itself consists. But, then, these points do not change their relative positions, and are therefore at rest. It follows that the star must be at rest at the moment when the annihilation of the other bodies takes place, and therefore must assume the spherical form taken by all bodies in a state of rest. A contradiction so intolerable can be avoided only by abandoning the assumption of the relativity of motion, and conceiving motion as absolute, so that thus we are again led to the principle of the body Alpha.'

Now, what answer can be made to this reasoning of Professor Neumann?
None, if we grant the admissibility of the hypothesis of the annihilation of all bodies in space but one, and the admissibility of the further assumption that an absolutely rigid body with an absolutely fixed place in the universe is possible. But such a concession is forbidden by the universal principle of relativity. In the first place, the annihilation of all bodies but one would not only destroy the motion of this one remaining body and bring it to rest, as Professor Neumann sees, but would also destroy its very existence and bring it to naught, as he does not see. A body can not survive the system of relations in which alone it has its being; its presence or position in space is no more possible without reference to other bodies than its change of position or presence is possible without such reference. As has been abundantly shown, all properties of a body which constitute the elements of its distinguishable presence in space are in their nature relations and imply terms beyond the body itself.

In the second place the absolute fixity in space attributed to the body Alpha is impossible under the known conditions of reality. The fixity of a point in space involves the permanence of its distances from at least four other fixed points not in the same plane. But the fixity of these several points again depends on the constancy of their distances from other fixed points, and so on ad infinitum. In short, the fixity of position of any body in space is possible only on the supposition of the absolute finitude of the universe; and this leads to the theory of the essential curvature of space, and the other theories of modern transcendental geometry, which will be discussed hereafter.

There is but one issue from the perplexities of Euler, and that is through the proposition that the reality of rest and motion, far from presupposing that they are absolute, depends upon their relativity. The source of these perplexities is readily discovered. It is to be found in the old metaphysical doctrine, that the Real is not only distinct from, but the exact opposite of, the Phenomenal. Phenomenalities are the deliverances of sense; and these are said to be contradictory of each other, and therefore delusive. Now, the truth is that there is no physical reality which is not phenomenal. The only test of physical reality is sensible experience. And the assertion, that the testimony of the senses is delusive, in the sense in which this assertion is made by the metaphysicians, is groundless. The testimony of the senses is conflicting only because the momentary deliverance of each sense is fragmentary and requires control and rectification, either by other deliverances of the same sense, or by the deliverances of the other senses. When the traveler in the desert sees before him a lake which continually recedes and finally disappears, proving to be the effect of mirage, it is said that he is deceived by his senses, inasmuch as the supposed body of water was a mere appearance without reality. But the senses were not deceptive. The lake was as real as the image. The deception lay in the erroneous inferences of the traveler, who did not take into account all the facts, forgetting (or being ignorant of) the refraction of the rays proceeding from the real object, whereby their direction and the
apparent position of the object were changed. The true distinction between the Apparent and the Real is that the former is a partial deliverance of sense which is mistaken for the whole deliverance. The deception or illusion results from the circumstance that the senses are not properly and exhaustively interrogated and that their whole story is not heard.

The coercive power of the prevailing ontological notions of Euler’s time over the clear intellect of the great mathematician is most strikingly exhibited in his statement that without the assumption of absolute space and motion there could be no laws of motion, so that all the phenomena of physical action would become uncertain and indeterminable. If this argument were well founded, the same consequence would follow, *a fortiori*, from his repeated admissions in the first chapter of his book, to the effect that we have no actual knowledge of rest and motion, except that derived from bodies at rest or in motion in reference to other bodies. Euler’s proposition can have no other meaning than this, that the laws of motion can not be established or verified unless we know its absolute direction and its absolute rate. But such knowledge is by his own showing unattainable. It follows, therefore, that the establishment and verification of the laws of motion are impossible. And yet no one knew better than Euler himself that all experimental ascertainment and verification of dynamical laws *like all acts of cognition*, depend upon the insulation of phenomena; that they can be effected only by disentangling the effects of certain forces from the effects of other forces (*determinable aliunde, i.e.*, by their other effects) with which they are complicated—a proceeding which, in many cases, is facilitated by the circumstance that these latter effects are inappreciably small. Surely the verification of the law of inertia by the inhabitants of our planet does not depend upon their knowledge, at any moment, of the exact rate of its angular velocity of motion round the sun! And the validity of the Newtonian theory of celestial motion is not to be drawn in question because its author suggests that the center of gravity of our solar system moves in some elliptic orbit whose elements are not only unknown, but will probably never be discovered! As well might it be contended that the mathematical theorems respecting the properties of the ellipse are of doubtful validity, since no such curve is accurately described by any celestial body or can be exactly traced by a human hand!

Although in particular operations of thought we may be constrained, for the moment, to treat the Complex as simple, the Variable as constant, the Transitory as permanent, and thus in a sense to view phenomena *‘sub quadam specie absoluti,’* [*Footnote: ‘De natura rationis est res sub quadam æternitatis specie percipere.’ Spinoza, Eth., Pars. ii, Prop. xliiv, Coroll. 2.*] nevertheless there is no truth in the old ontological maxim that the true nature of things can be discovered only by divesting them of their relations—that to be truly known they must be known as they are in themselves, in their absolute essence. Such knowledge is impossible, all cognition being founded upon a recognition of relations; and this impossibility nowhere stands out in stronger relief than in the exposition, by Newton and Euler, of the reality of
rest and motion under the conditions of their determinability.

It follows, of course, from the essential relativity of rest and motion, that the old ontological disjunction between them falls, and that in a double sense rest differs from motion, in the language of Euler, ‘as one motion differs from another,’ [Footnote: ‘Neque motus a quiete alter differt, atque alius motus ab alio.’ Theoria motus, etc., p. 8.] or, as modern mathematicians and physicists express it, that ‘rest is but a special case of motion.’ [Notation, ‘Die Ruhe ist nur ein besonderer Fall der Bewegung.’ Kirchhoff, Vorlesungen ueber math. Physik, p. 32.] And it follows, furthermore, that rest is not the logically or cosmologically primum, of material existence—that it is not the natural and original state of the universe which requires no explanation while its motion, or that of its parts, is to be accounted for. What requires, and is susceptible of, explanation is always a change from a given state of relative rest or motion of a finite material system; and the explanation always consists in the exhibition of an equivalent change in another material system. The question respecting the origin of motion in the universe as a whole, therefore, admits of no answer, because it is a question without intelligible meaning.

The same considerations which evince the relativity of motion also attest the relativity of its conceptual elements, space and time. As to space, this is at once apparent. And of time, ‘the great independent variable’ whose supposed constant flow is said to be the ultimate measure of all things, it is sufficient to observe that it is itself measured by the recurrence of certain relative positions of objects or points in space, and that the periods of this recurrence are variable, depending upon variable physical conditions. This is as true of the data of our modern time-keepers, the clock and chronometer, as of those of the clepsydra and hour-glass of the ancients, all of which are subject to variations of friction, temperature, changes in the intensity of gravitation, according to the latitude of the places of observation, and so on. And it is equally true of the records of the great celestial time-keepers, the sun and the stars. After we have reduced our apparent solar day to the mean solar day, and this, again, to the sidereal day, we find that the interval between any two transits of the equinoctial points is not constant, but becomes irregular in consequence of nutation, of the precession of the equinoxes, and of numerous other secular perturbations and variations due to the mutual attraction of the heavenly bodies. The constancy of the efflux of time, like that of the spatial positions which serve as the basis for our determination of the rates and amounts of physical motion, is purely conceptual.

The relativity of mass has repeatedly been adverted to in the preceding chapters. It has been shown that the measure of mass is the reciprocal of the amount of acceleration produced in a body by a given force, while force, in turn, is measured by the acceleration produced in a given mass. It is readily seen that the concept mass might be expanded, so as to assign the measure of mass, not to mechanical motion alone, but to physical action generally,
including heat and chemical affinity. This would lead to an equivalence of masses differing with the nature of the agency selected as the basis of the comparison. Thermally equivalent masses would be the reciprocals of the specific heats of masses as now determined; and chemically equivalent masses would be the atomic weights, so called. It is important to note that the determination of masses on the basis of gravitation, in preference to their valuation on the basis of thermal, chemical or other physical action, is a mere matter of convenience, and is not in any proper sense founded on the nature of things.

But, apart from this, and looking to the ordinary method of determining the mass of a body by its weight, the relativity of mass is equally manifest. The weight of a body is a function, not of its own mass alone, but also of that of the body or bodies by which it is attracted, and of the distance between them. A body whose weight, as ascertained by the spring-balance or pendulum, is a pound on the surface of the earth, would weigh but two ounces on the moon, less than one fourth of an ounce on several of the smaller planets, about six ounces on Mars, two and one half pounds on Jupiter, and more than twenty-seven pounds on the sun. And while the fall of bodies, in vacuo, near the surface of the earth amounts to about sixteen feet (more or less, according to the latitude) during the first second, their corresponding fall near the surface of the sun is more than four hundred and thirty-five feet.

The thoughtlessness with which it is assumed by some of the most eminent physicists that matter is composed of particles which have an absolute primordial weight persisting in all positions and under all circumstances, is one of the most remarkable facts in the history of science. ‘The absolute weight of atoms,’ says Professor Redtenbacher, [Footnote: Dynamidensystem (Mannheim, Bassermann, 1857), p. 14.] ‘is unknown’—his meaning being, as is evident from the context, and from the whole tenor of his discussion, that our ignorance of this absolute weight is due solely to the practical impossibility of insulating an atom, and of contriving instruments delicate enough to weigh it.

There is nothing absolute or unconditioned in the world of objective reality. As there is no absolute standard of quality, so there is no absolute measure of duration, nor is there an absolute system of coördinates in space to which the positions of bodies and their changes can be referred. A physical ens per se and a physical constant are alike impossible, for all physical existence resolves itself into action and reaction, and action imports change.”

Ernst Mach, perhaps in reaction to Carl Neumann’s hypothesis of the “Body Alpha”, and in agreement with Berkeley, Stallo, et al., proclaimed,

“The expression ‘absolute motion of translation’ Streintz correctly pronounces as devoid of meaning and consequently declares certain analytical deductions, to which he refers, superfluous. On the other hand,
with respect to rotation, Streintz accepts Newton’s position, that absolute rotation can be distinguished from relative rotation. In this point of view, therefore, one can select every body not affected with absolute rotation as a body of reference for the expression of the law of inertia.

I cannot share this view. For me, only relative motions exist (Erhaltung der Arbeit, p. 48; Science of Mechanics, p. 229) and I can see, in this regard, no distinction between rotation and translation. When a body moves relatively to the fixed stars, centrifugal forces are produced; when it moves relatively to some different body, and not relatively to the fixed stars, no centrifugal forces are produced. I have no objection to calling the first rotation ‘absolute’ rotation, if it be remembered that nothing is meant by such a designation except relative rotation with respect to the fixed stars. Can we fix Newton’s bucket of water, rotate the fixed stars, and then prove the absence of centrifugal forces?

The experiment is impossible, the idea is meaningless, for the two cases are not, in sense-perception, distinguishable from each other. I accordingly regard these two cases as the same case and Newton’s distinction as an illusion (Science of Mechanics, page 232).”

In 1879, Hermann Lotze, who like Faraday argued for a Boscovichian dynamism of atoms as centers of force, presented a thought experiment regarding the speed of the propagation of forces in 1879,

“206. Connected with this question is the other one: Do forces, in order to take effect, require Time? Stated in this form, indeed, as it occasionally is, the question is ambiguous. It is a universally admitted truth that, every effect, in its final result, is formed by the successive and continuous addition of infinitesimal parts which go on accumulating from zero up to the final amount. In this sense succession, in other words, expenditure of Time, is a characteristic of every effect, and this is what distinguishes an effect from a mere consequence, which holds good simultaneously with its condition. Vain, however, would it be—as we saw in our investigation of Time—to seek to go further than this, and to discover the inscrutable process by means of which succession of events in Time comes to pass at all. The question we are considering was proposed on the assumption of the diffusion of force in Space. Supposing it were possible to instance a moment of Time in which a previously non-existent force came into Being, would all the various effects which it was calculated to produce in different places, both near and remote, be at once realised? Or, would a certain interval of Time be required, just as it is in the case of Light, which transmits itself to different objects rapidly, but not instantaneously, and must first come into contact with them before it can be reflected by them.”

George-Louis Le Sage, Rudolf Mewe, S. Tolver Preston, Hendrik Antoon Lorentz, Henri Poincaré and Paul Gerber, among others, set the speed of the
The Principle of Equivalence, Etc. 2225

propagation of gravitational effects at the speed of light long before Einstein. Others opposed this view. Joseph Henry stated,

“According to the view we have given, a portion of matter consists of an assemblage of indivisible and indestructible atoms endowed with attracting and repelling forces, and with the property of obedience to the three laws of motion [viz.: inertia, coexistence of separate motions, and equality of action and reaction]. All the other properties, and indeed all the mechanical phenomena of matter, so far as they have been analyzed, are probably referable to the action of such atoms, arranged in groups of different orders, . . . the distance in all cases between any two atoms being much greater than the diameter of the atoms or molecules. We are obliged to assume the existence of an ethereal medium formed of atoms, which are endowed with precisely the same properties as those we have assigned to common matter; and this assumption leads us to the inference that matter is diffused through all space.

That something exists between us and the sun, possessing the properties of matter, may be inferred from the simple fact that time is required for the transmission of light and heat through the intervening space. . . . That the phenomena of light and heat from the sun are not the effect of the transmission of mere force (without intervening matter), such as that of attraction and repulsion, is evident from the fact that these [latter] actions require no perceptible time for their transmission to the most distant parts of the solar system. If the sun were to be at once annihilated, the planet Neptune would at the same instant begin to move in a tangent to its present orbit.”

Ernst Mach saw the notion that gravity should propagate at light speed as an indication that the æther is a medium for the propagation of gravitational effects. Gerber’s alleged theory of action at a distance at light speed was seen as untenable. Ernst Brücke wrote, in 1857,

“Let us suppose a portion of the masses which gravitate towards each other to be destroyed; then certainly not only accelerating force, but also, according to circumstances, a portion of the tension or of the vis viva, or of both, would be destroyed: but this only confirms us in our way of viewing the subject. The law of the indestructibility of matter has been proved as universally valid as that of the conservation of force. That the destruction of the one should involve that of the other, only shows us that both stand in intimate connexion with each other, and proves that we are right in placing the cause of the notion of gravity in the masses themselves, and not in the space between them.

Thus in all that has been hitherto said, so far as my consciousness reaches, so far as I am capable of distinguishing true from false, and like from unlike, all known facts are brought into complete harmony with our laws of thought when we suppose forces, as the causes of phenomena, to
reside in the masses, the spaces between these masses being traversed by the forces. If the forces could be imagined as existing in space, it must also be conceivable that matter may be annihilated without changing the sum of forces, and this, at least by me, is not conceivable.”

George Stuart Fullerton wrote in 1901,

“To the question whether the void spaces are real, we may answer: Yes, if we mean by this only that things really stand to each other in such and such relations; or in other words, that they are at such and such distances from one another. No, if we mean that the relation is to be turned into a real thing that is supposed to remain when the things between which it obtains are taken away. The real world which we build up out of our experiences is a world of things of a certain kind; it is a world of extended things separated by distances, and the things influence each other in definite ways which cannot be described if the relations of the things—their distances and directions—be left out of account. It is one thing to recognize the relations between things as real, and it is quite another to turn those relations into things of an unreal and equivocal sort. It is one thing to recognize that things are at a distance from each other, and another to turn the distance itself into the ghost of a thing.

But, it may be objected, when we speak of space we mean more than the actual system of relations which obtains between extended things. I answer, we undoubtedly do; we mean, not merely the actual system of relations, but the system of all theoretically possible relations as well. The actual relations of things are constantly changing, and the relations which happen to exist at any moment may be regarded as merely representative of an indefinite number of other relations which might just as well have been actual. We have seen that real things are never given in a single intuition, and that what may be thus given can, at best, be regarded as merely representative of an indefinite series of possible experiences which in their totality express the nature of the thing. In the same way we may say that real space, which is the whole system of relations of a certain kind between real things, cannot be the object of a single intuition. By real space we never mean only this particular distance given in this particular experience. We mean all the actual and theoretically possible space-relations of real things in the real world.

About time one may reason in precisely the same way. Space and time are, thus, abstractions. They are the plan of the real world with its actual and possible changes. But this plan is not a something of which we have a knowledge independent of our knowledge of the world. This ought, I think, to be clear to any one who has followed the reasonings of the paper on the Berkeleian Doctrine of Space. We certainly do not perceive immediately that space and time are infinitely divisible. Subdivision speedily appears to result in the simple in each case. Why, then, do we assume that they are thus divisible? No conceivable reason can be given save that, in our experience
of the world, such a system of substitutions obtains—a system within which the seemingly indivisible intuitive experience takes its place as the representative of experiences that are divisible, and, magnifying its function, sinks into individual insignificance. The plan stands out; the particular experience is lost sight of so completely that many able writers are capable of wholly misconceiving its nature. The plan is, then, abstracted from our experience of the world of things; but when we have the plan we can work more or less independently of the experiences from which it has been abstracted, and we can satisfy ourselves, by verifying our results from time to time, that we are not wandering in the region of dreams, but are doing something that has a meaning within the realm of nature. But what meaning could a millionth of a millimeter or a thousandth of a second have to one who had never had the complex series of experiences which reveals real things and real events? They are not given in any experience except symbolically, and the only thing that can give significance to our symbol is the series of experiences in which a real world is revealed.

Hence, to the question whether a vacuum can be conceived to exist within the world, I answer: Undoubtedly it can. But please do not substitute for the meaning: ‘exist as a vacuum,’ the very different meaning: ‘exist as some kind of a thing.’ It is easy to slip from the one meaning into the other, and philosophers have done it again and again. Space and time are the plan of the world-system. They really exist in the only sense in which such things can exist, i.e., they really are the plan of the system. The difficulties which seem to present themselves when men inquire whether they have real existence arise out of the fact that this truth is not clearly grasped.”

Duncan M’Laren Young Sommerville wrote in 1914,

“W. K. Clifford [Footnote: The Common Sense of the Exact Sciences (London, 1885), chap. iv. § 19.] has gone further than this and imagined that the phenomena of electricity, etc., might be explained by periodic variations in the curvature of space. But we cannot now say that this three-dimensional universe in which we have our experience is space in the old sense, for space, as distinct from matter, consists of a changeless set of terms in changeless relations. There are two alternatives. We must either conceive that space is really of four dimensions and our universe is an extended sheet of matter existing in this space; the aether [Footnote: Cf. W. W. Rouse Ball, ‘A hypothesis relating to the nature of the ether and gravity,’ Messenger of Math., 21 (1891.)] if we like; and then, just as a plane surface is to our three-dimensional intelligence a pure abstraction, so our whole universe will become an ideal abstraction existing only in a mind that perceives space of four dimensions—an argument which has been brought to the support of Bishop Berkeley! [Footnote: C. H. Hinton, Scientific Romances, First Series, p. 31 (London, 1886). For other four-dimensional theories of physical phenomena see Hinton, The Fourth Dimension (London, 1904).] Or, we must
resist our innate tendencies to separate out space and bodies as distinct entities, and attempt to build up a monistic theory of the physical world in terms of a single set of entities, material points, conceived as altering their relations with time. [Footnote: Cf. A. N. Whitehead, ‘On mathematical concepts of the material world,’ *Phil. Trans.*, A 205 (1906)] In either case it is not space that is altering its qualities, but matter which is changing its form or relations with time.

and, quoting C. D. Broad,

**“12. The inextricable entanglement of space and matter.”**

A further point—and this is the ‘vicious circle’ of which we spoke above—arises in connection with the astronomical attempts to determine the nature of space. These experiments are based upon the received laws of astronomy and optics, which are themselves based upon the euclidean assumption. It might well happen, then, that a discrepancy observed in the sum of the angles of a triangle could admit of an explanation by some modification of these laws, or that even the absence of any such discrepancy might still be compatible with the assumptions of non-euclidean geometry.

‘All measurement involves both physical and geometrical assumptions, and the two things, space and matter, are not given separately, but analysed out of a common experience. Subject to the general condition that space is to be changeless and matter to move about in space, we can explain the same observed results in many different ways by making compensatory changes in the qualities that we assign to space and the qualities we assign to matter. Hence it seems theoretically impossible to decide by any experiment what are the qualities of one of them in distinction from the other.’

Einstein made remarks in a letter in 1916 which are derivative of Berkeley’s *De Motu*, including among others,

“If I let all things vanish from the Universe, then, according to Newton, Galileo’s space of inertia lingers, but in my opinion, nothing remains.”

“Wenn ich alle Dinge aus der Welt verschwinden lasse, so bleibt nach Newton der Galileische Trägheitsraum, nach meiner Auffassung aber nichts übrig.”

Einstein was quoted in *The Chicago Tribune* on 4 April 1921 on page 6,

“Up to this time the conceptions of time and space have been such that if everything in the universe were taken away, if there was nothing left, there would still be left to man time and space. But under this theory even time and space would cease to exist, because they are unalterably bound up with the conceptions of matter.”
Einstein again took his lead from Faraday, Clifford and Brücke. Einstein changed direction from his materialistic Boscovichian misinterpretation of Mach’s theory of inertia. Einstein adopted, without any attribution, Clifford’s complete reification of abstract geometry, and stated, in 1930,

“We may summarize in symbolical language. Space, brought to light by the corporeal object, made a physical reality by Newton, has in the last few decades swallowed ether and time and seems about to swallow also the field and the corpuscles, so that it remains as the sole medium of reality.”2964

and,

“The strange conclusion to which we have come is this—that now it appears that space will have to be regarded as a primary thing and that matter is derived from it, so to speak, as a secondary result. Space is now turning around and eating up matter. We have always regarded matter as a primary thing and space as a secondary result. Space is now having its revenge, so to speak, and is eating up matter. But that is still a pious wish.”2965

14.6 The Rubber Sheet Analogy

It is interesting to note that William James gave us the “rubber sheet analogy” as a demonstrative space-time tool, in 1890, though in a different sense from the theory of relativity.2966 James wrote extensively on the nature of space and time, and on the concept of a block universe and free will. Albert Einstein was quoted in The London Times, on 13 June 1921, on page 11,

“‘My own philosophic development,’ he went on, ‘was from Hume to Mach and James.’”

James wrote,

“They are made of the same ‘mind-stuff,’ and form an unbroken stream. [***] We can easily add all these plane sections together to make a solid, one of whose solid dimensions will represent time, whilst a cut across this at right angles will give the thought’s content at the moment when the cut is made.

Let it be the thought, ‘I am the same I that I was yesterday.’ If at the fourth moment of time we annihilate the thinker and examine how the last pulsation
of his consciousness was made, we find that it was an awareness of the whole content with same most prominent, and the other parts of the thing known relatively less distinct. With each prolongation of the scheme in the time-direction, the summit of the curve of section would come further towards the end of the sentence. If we make a solid wooden frame with the sentence written on its front, and the time-scale on one of its sides, if we spread flatly a sheet of India rubber over its top, on which rectangular co-ordinates are painted, and slide a smooth ball under the rubber in the direction from 0 to ‘yesterday,’ the bulging of the membrane along this diagonal at successive moments will symbolize the changing of the thought’s content in a way plain enough, after what has been said, to call for no more explanation. Or to express it in cerebral terms, it will show the relative intensities, at successive moments, of the several nerve-processes to which the various parts of the thought-object correspond.”

14.7 Reference Frames and Covariance

In 1885, Ludwig Lange relativized Newton’s kinematic absolutism, by providing it with an experimental dynamic framework and definition, which he dubbed the “inertial system”. Lange then generalized his theory in 1902. After Einstein became famous, Lange sought in vain for widespread recognition of his insights and nomenclature and for his pioneering work against ontological absolutism.

Einstein often gave descriptions reminiscent of Berkeley’s and Lange’s writings, which work by Lange detailed the work of Mach and Budd, which Einstein repeated virtually verbatim. Before being pressed to give Mach credit, Einstein spoke as if these ideas were his own. Einstein wrote to Karl Schwarzschild and presented these ideas as if novel. Schwarzschild immediately recognized Lange’s “Inertialsystem” described by Einstein, as well as Riemann’s contributions.

For early uses of the term “Inertial System” in the theory of relativity, refer to the endnote. Max von Laue had previously called them “justified systems”, a term which Einstein soon adopted. Ernst Gehrcke insisted that Lange’s priority be recognized.

Einstein, in 1905, relied upon absolutist Newtonian kinematics and an axiomatic absolute “resting system” as opposed to “moving systems”. Einstein’s light postulate refers only to this “resting system” and the principle of relativity, for Einstein, refers only to systems in uniform motion relative to this singular system. Of those who pursued Einstein’s papers, and ignoring the fact that it was Poincaré who introduced the concept of the inertial system to the special theory of relativity, it was Jakob Laub who first came closest to comprehending the import of Lange’s “inertial system” in the theory of relativity, in 1907, with Laub’s proposed nomenclature of “System I” and “System II”, as opposed to the Einsteins’ 1905 “resting system” and “moving systems”. Laub’s nomenclature was used by Hans Strasser in 1924.

Hermann Minkowski (1905-1909), building upon Henri Poincaré’s prior works, eliminated the notion of a privileged frame of space from the Einsteins’ theory,
claiming that neither Lorentz nor Einstein made any attack on the concept of absolute space.\textsuperscript{2981} Laub failed to fully incorporate the “inertial system” concept into the theory of relativity in at least three ways, though I believe he set the movement in motion. One, while asserting that absolute space “plays no role” in the Einsteins’ theory, Laub still spoke in absolutes, and of rest, and failed to explicitly state that there is no such thing as absolute space. Two, he spoke of absolute empty space as the normal medium of the light wave. Three, had he denied the existence of absolute space, instead of merely asserting that it played no observable role (it plays no such observable role in Lorentz’ system, either), he would have been compelled to refer the “Systems” dynamically to Newton’s laws of inertia, which are kinematically understood when one proceeds from absolute space, to a moving system in uniform rectilinear translation of motion with respect to absolute space, but are by no means understood by simply asserting two arbitrary systems in uniform motion with respect to each other.

The Einsteins assert in their 1905 paper that a clock at the equator runs more slowly than a clock at one of the Earth’s poles. Langevin’s 1911 “paradox of the twins”\textsuperscript{2982} is not a paradox in the Einsteins’ 1905 paper, but rather a prediction of the effects of the absolute motion on moving bodies, for a clock at the equator necessarily has greater absolute velocity than a clock at one of the poles, due to the Earth’s absolute rotation, and the assertion is therefore not a paradox, \textit{per se}, but an express and internal contradiction of the Einsteins’ theoretical requirement that absolute space evince no characteristic properties—that it, and its effects, be indiscernible, or, as the Einsteins euphemistically disguised it, the non-paradox is an “eigentümliche Konsequenz” of absolute motion, which later became an “unabweisbare Konsequenz” in Albert’s 1911 paper. Fritz Müller put this question to Einstein in 1911, and Einstein did not dispute his analysis of the effect of absolute motion on time.\textsuperscript{2983} The Einsteins’ assertion that absolute velocity results in absolute time dilatation not only discredits Einstein’s claim of priority over Lorentz for calling “Ortszeit” simply “Zeit”, it is fatal to the 1905 paper as if a purely kinematic relativistic theory, as Herbert Dingle proved,

“I now sum up the situation by stating again what must be done to avoid my conclusion. Either my equations (3) and (4) are contradictory or they are not. If they are, at least one must be wrong, and if Einstein’s (3) is right, then a false step must exist in the deduction of (4) from the commonly agreed (1) and (2) which has no repercussions on the deduction of (3): this false step must be pinpointed. If, on the other hand, (3) and (4) are not contradictory, then it must be explained why Einstein’s deductions from (3)—for example, that an equatorial clock goes slower than a polar one—are true, while the similar but opposite deductions from (4)—for example, that an equatorial clock goes faster than a polar one—are not equally true. In each case, therefore, either the necessary physical implications of (3) must be vindicated and those of (4) discredited, or the theory fails. No solution which makes the equations equivalent, whether meaningful or meaningless, has any bearing on the matter.”\textsuperscript{2984}
We have Mileva and Albert pronouncing in 1905,

“One immediately sees, that this result is also still valid if the clock moves in an arbitrary polygonal line from $A$ to $B$, and, of course, if the points $A$ and $B$ coincide.

If one assumes that the result proved for a polygonal line is also valid for a continuously curved line, then one obtains the proposition: If at $A$ there are two synchronously running clocks and one moves one of the clocks in a closed curve with a constant velocity, until it again arrives back at $A$, which lasts for $t$ seconds, then the latter clock upon its arrival at $A$ runs $\frac{1}{2} t (\frac{v}{c})^2$ seconds slow in comparison with the unmoved clock. Therefore, one concludes that a balance-clock located at the equator must run more slowly by a very small amount, than a clock of exactly the same construction located at one of the Earth’s poles, ceteris paribus.”

The Einsteins expressly state that a clock which is (absolutely) resting records the accurate, absolute time of travel, and that a moving clock runs slow. They propose: the absolute time of the journey, the clock which has remained at rest, and the traveled clock. The Einsteins’ statement quoted above (which was published before Minkowski published his theory of “worldlines”) again proves that the “resting system” referred to in the 1905 paper is one at absolute rest. The Einsteins’ notion that the motion of the equator with respect to a pole is a curved motion refers that motion to absolute space, a privileged frame, as the relative “motion” of equator and pole is one of relative rest. The notion that clocks would show a difference of time between equator and pole is one: that the absolute motion at the equator must, of necessity, be greater than the absolute motion of the pole; and further that time dilatation is an absolute effect, and is not a reciprocal relative effect of a measurement procedure. The Einsteins’ paper is, therefore, a far more primitive understanding of relativistic concepts than Poincaré’s prior work, and the Einsteins’ principle of relativity is shown to be a fallacy, for the concept of absolute rest does indeed, in their theory, correspond to characteristic properties of the phenomena in electrodynamics.

We also know that the Einsteins believed in absolute space, because their 1905 paper is expressly based on Maxwell’s æther theory, and they stated before introducing the Lorentz Transformation that light speed is axiomatically isotropic between points $A$ and $B$ at a distance from each other in the preferred “resting system”. This is only axiomatically true if one assumes a preferred frame of absolute space and an æther at absolute rest, because the assertion depends upon source and observe speed independence of light speed which is only axiomatically true of the æther frame. The Einsteins then asserted in a non sequitur that the principle of relativity requires that if the speed of light is absolute and isotropic in absolute space, it must also be absolute and isotropic in “moving reference systems”—and on this fallacious basis they attempt to justify their repetition of Poincaré’s clock synchronization procedure in “moving systems”. The Einsteins fallacy results in a
tautology, not a scientific approach to the problem. Poincaré and Lorentz were the superior theorists, in that they realized that a scientific exposition could not be a tautology, but must proceed on an axiomatic basis from fundamental principles, not empirical observations.

Henri Poincaré knew that a serious and complete Physics required a dynamic as well as kinematic exposition of the Lorentz Transformation. Hendrik Antoon Lorentz understood that the transformations were based on the scalar $c^2$ in “moving systems of reference” and that light speed anisotropy in “moving systems”, not isotropy, is the actual basis of the special theory of relativity and of the Lorentz Transformation. The æther is detectable in the special theory of relativity even though its presumed resting frame of reference remains undetectable. In addition, the entire structure of the Lorentz Transformation is built upon the presumption of light speed anisotropy in moving frames of references, which fact is revealed by the use of the scalar $c^2$. The Einsteins’ assertion of the absolute velocity of light in the “resting system” as a given axiomatic fact is an acknowledgment that the “resting system” is an æther at absolute rest, and this is how the Einsteins’ define it in Part 1, Section 1 of their paper. If light speed were not anisotropic in moving frames of reference, the Lorentz Transformation would not work, because light speed would not then be measured to be $c$ in a moving frame of reference by observers relatively resting in that moving frame—moving with respect to the æther. This has been adequately proven by Guillaume, Jánossy and others.

Prof. Friedwardt Winterberg wrote,

“According to Einstein, two clocks, $A$ and $B$, are synchronized if

$$t_B = \frac{1}{2} \left( t_A^1 + t_A^2 \right)$$

(VII.13)

where $t_A^1$ is the time a light signal is emitted from $A$ to $B$, reflected at $B$ back to $A$, arriving at $A$ at the time $t_A^2$, and where it is assumed that the time $t_B$ at which the reflection at $B$ takes place is equal the arithmetic average of $t_A^1$ and $t_A^2$. Only by making this assumption does the velocity of light turn out always to be isotropic and equal to $c$. From an absolute point of view, the following is rather true: If $t_R$ is the absolute reflection time of the light signal at clock $B$, one has for the out and return journeys of the light signal from $A$ to $B$ and back to $A$, if measured by an observer in an absolute system at rest in the distinguished reference system:

$$\gamma \left( t_R - t_A^1 \right) = d/c_+,$$

(VII.14)

$$\gamma \left( t_A^2 - t_R \right) = d/c_-$$
where \( d \) is the distance between both clocks, and where \( c_+ \) and \( c_- \) are given by
\[
c_+ = \sqrt{c^2 - v^2 \sin^2 \psi} - v \cos \psi
\]
\[
c_- = \sqrt{c^2 - v^2 \sin^2 \psi} + v \cos \psi
\]

Adding the equations (VII.14) one obtains
\[
c \left( t^{1}_A - t^{1}_A \right) = 2 \gamma d \sqrt{1 - \left( v^2 / c^2 \right) \sin^2 \psi}
\]

(VII.15)

If an observer at rest with the clock wants to measure the distance from \( A \) to \( B \), he can measure the time it takes a light signal to go from \( A \) to \( B \) and back to \( A \). If he assumes that the velocity of light is constant and isotropic in all inertial reference systems, including the one he is in, moving together with \( A \) and \( B \) with the absolute velocity \( v \), this distance is
\[
d' = \left( c/2 \right) \left( t^{1}_A - t^{1}_A \right)
\]

(VII.16)

and because of (VII.15)
\[
d' = \gamma d \sqrt{1 - \left( v^2 / c^2 \right) \sin^2 \psi}
\]

(VII.17)

Comparing this result with,
\[
l' = l \sqrt{1 - \left( v^2 / c^2 \right) \cos^2 \psi} = \frac{l}{\gamma \sqrt{1 - \left( v^2 / c^2 \right) \sin^2 \psi}}
\]

one sees that he would obtain the same distance \( d' \), if he uses a contracted rod as a measuring stick, of Einstein’s constant light velocity postulate. The velocity of light between \( A \) and \( B \) by using a rod to measure the distance and the time it takes a light signal in going from \( A \) to \( B \) and back to \( A \), of course, will turn out to be equal to \( c \), because according to (VII.16)
\[
\frac{2d'}{t^{2}_A - t^{1}_A} = c
\]

(VII.18)

Rather than using a reflected light signal to measure the distance \( d' \), the observer at \( A \) may try to measure the one-way velocity of light by first
synchronizing the clock $B$ with $A$ and then measure the time for a light signal to go from $A$ to $B$. However, since this synchronization procedure also uses reflected light signals, the result is the same. For the velocity he finds

$$\frac{d}{t_B - t_A^1} = \frac{d'}{(1/2)(t_A^1 + t_A^2) - t_A^1} = \frac{2d'}{t_A^2 - t_A^1} = c$$  \hspace{1cm} (VII.19)$$

By subtracting the equations (VII.14) one finds that

$$t_B = t_A + (\gamma/c^2) v \cos \psi$$ \hspace{1cm} (VII.20)$$

which shows that from an absolute point of view the ‘true’ reflection time $t_B$ at clock $B$ is only then equal to $t_B$ if $v = 0$. From an absolute point of view the propagation of light is isotropic only in the distinguished reference system, but anisotropic in a reference system in absolute motion against the distinguished reference system. This anisotropy remains hidden due to the impossibility to measure the one way velocity of light. This impossibility is expressed in the Lorentz transformations themselves, containing the scalar $c^2$ rather than the vector $\mathbf{e}$, through which an anisotropic light propagation would have to be expressed.\textsuperscript{2987}

The expected anisotropy from which the transformation evolved exhibits itself in the predictions the theory makes for an interferometer constructed and calibrated in an inertial reference system $K_0$ without rigid attachments, but instead assembled with rockets or automobiles at each of the four relevant surfaces, which after being adjusted are then simultaneously and uniformly accelerated with respect to $K_0$ then allowed to travel in inertial motion in inertial reference system $K_1$, but which do not suffer a Lorentz contraction due to the lack of rigid attachments. The special theory of relativity predicts a shift in the interference fringe pattern on the interferometer, which matches the exact result for which Michelson and Morley originally sought but did not find and which confirms light speed anisotropy in at least one of the two inertial reference systems employed in the experiment.

Lajos Jánossy proved this argument,

"§7. Im vorigen Abschnitt haben wir gezeigt, wie man ein materialles Bezugssystem $K_1$ konstruieren kann, das eine vollkommene Galileische Transformation des Systems $K_0$ ist. Das System $K_1$ ist jedoch ein sehr unbequemes Bezugssystem. Wir finden nämlich, daß 1. das Licht sich in $K_1$ nicht isotrop ausbreitet, und 2. daß bewegte Uhren Phasenverschiebungen
erleiden, auch wenn sie sehr langsam in \( K_1 \) bewegt werden; die Phasenverschiebung verschwindet auch im Grenzfall der verschwindenden Verschiebungsgeschwindigkeit nicht.

Wir zeigen zunächst, daß diese erwähnte, unbequeme Eigenschaft in \( K_1 \) tatsächlich auftritt.

1. Daß Licht sich in \( K_0 \) isotrop ausbreitet, kann durch den Michelson-Morley-Versuch gezeigt werden. Betrachten wir nun ein Interferometer in \( K_0 \), das aus vier unzusammenhängenden Teilen besteht (s. Abb. 2 [Figure deleted]): Eine halbversilberte Platte \( P \), zwei Spiegel \( M_1 \) und \( M_2 \) und ein Fernrohr \( T \). Wenn wir das System drehen, so daß die relativen Entfernungen von \( M_1 \), \( M_2 \), \( P \) und \( T \) unverändert bleiben, dann wird auch das Streifensystem in \( T \) unverändert bleiben. Wenn wir nun die vier Teile des Systems unabhängig, aber gleichzeitig beschleunigen, dann bringen wir das Interferometer in des System \( K_1 \). Diese Beschleunigung wird aber das Streifensystem, das man in \( T \) sieht, beeinflussen. Diese Beschleunigung würde in der Tat eine Streifenverschiebung hervorrufen, die in Lichtzeit ausgedrückt folgenden Wert besitzt.

\[
\Delta T = I \left( \frac{4}{c} - \frac{2}{\sqrt{c^2 - v^2}} - \frac{1}{c - v} - \frac{1}{c + v} \right) = \frac{I v^2}{c^2} + \cdots, (13)
\]

Der obige Wert der Verschiebung ist nämlich genau der, den seinerzeit Michelson und Morley erwartet hatten, aber nicht fanden. Der Unterschied zwischen dem hier beschriebenen Experiment und dem wirklichen Michelson-Morley-Experiment ist nämlich der, daß das wirkliche Interferometer nicht aus unabhängigen Bestandteilen „zusammengesetzt“ ist, sondern ein festes System bildete. Wenn die Teile unseres gedachten Interferometers durch materielle Stäbe verbunden wären, dann würden die einzelnen Teile nach Vollzug der Beschleunigung durch die in den Stäben auftretenden, elastischen Kräfte verschoben werden. Wenn wir also den elastischen Kräften freies Spiel gewähren würden, dann würden sie das Interferometer im Vergleich zum System \( K_1 \) in einer solchen Weise verzerren, daß die Verzerrung die Phasenverschiebung (13) genau kompensieren würde.

Um dies ganz klar zu machen, betrachten wir schematisch ein Interferometer, dessen vier Bestandteile auf vier Autos montiert sind. Setzen wir nun voraus, daß diese Autos gleichzeitig in der in §6 beschriebenen Weise losfahren. (Wir setzen voraus, daß die Autos so glatt fahren, daß die Interferenzstreifen während der Fahrt bestehen bleiben.) Das Interferometer, das auf diese Weise in Bewegung gesetzt worden ist, wird sicher eine Phasenverschiebung zeigen. Wir haben in §6/1 darauf hingewiesen, daß
elastische Bänder, die zwischen Autos gespannt sind, in Spannung geraten, wenn die Autos sich in Bewegung setzen, weil nämlich diese Bänder sich zusammenzuziehen versuchen, aber daran verhindert werden durch die Autos. Wenn wir jetzt die Autos sich einander soweit nähern lassen, daß die elastische Spannung aufhört, dann verschieben wir damit die Spiegel genau in der richtigen Weise, um die nach der Beschleunigung aufgetretene Phasenverschiebung rückgängig zu machen. Zusammenfassend sehen wir, daß die Lichtfortpflanzung in $K_1$ nicht der isotrop erfolgt. Dieses Resultat setzt natürlich voraus, daß wir mit der Methode der Konstruktion von $K_1$, wie sie in §6 beschrieben wurde, einverstanden sind.”

In 1911, Albert Einstein (like Langevin) wrote, referring to a “purely kinematic consequence”—as opposed to a dynamic consequence,

“Were we, for example, to place a living organism in a box and make it perform the same to-and-fro motion as the clock discussed above, it would be possible to have this organism return to its original starting point after an arbitrarily long flight having undergone an arbitrarily small change, while identically constituted organisms that remained at rest at the point of origin have long since given way to new generations. The long time spent on the trip represented only an instant for the moving organism if the motion occurred with approximately the velocity of light! This is an inevitable consequence of our fundamental principles, imposed on us by experience.”

Albert Einstein told Ernst Gehrcke in 1914 that accelerated movements are absolute,

“The clock B, which was moved, runs more slowly because it has sustained accelerations in contrast to the clock A. Certainly, these accelerations are unimportant for the amount of the time difference of both clocks, however, their existence causes the slow running just of the clock B, and not of the clock A. Accelerated motions are absolute in the theory of relativity.”

“Die Uhr B, welche bewegt wurde, geht deshalb nach, weil sie im Gegensatz zu der Uhr A Beschleunigungen erlitten hat. Diese Beschleunigungen sind zwar für den Betrag der Zeitdifferenz beider Uhren belanglos, ihr Vorhandensein bedingt jedoch das Nachgehen gerade der Uhr B, und nicht der Uhr A. Beschleunigte Bewegungen sind in der Relativitätstheorie absolute.”

Gehrcke recounted that,

“Mr. Einstein recently admitted to me orally that accelerations are absolute
in Einstein’s theory of relativity, up to now, however, he has not acknowledged that speeds in his theory are absolute. It is noteworthy in this context that in Newtonian Mechanics both translation-speeds and accelerations are *relative*, on the other hand rotational-speeds and -accelerations are absolute; I am of course in agreement with Mr. Einstein on this point (regarding Newtonian mechanics) and have proven that the often heard, contrary opinion, according to which all accelerations in Newtonian mechanics are absolute and ‘inertial systems’ are left to be defined mechanically, is erroneous. [***] Minkowski’s theory of relativity places, like Einstein’s, the reference system, to which all events are referred (therefore the absolutely resting system), in the subjective standpoint of an observer. Therefore, the theory can be characterized as a subjective theory of absolutism: subjective because the point of view of the *observer* is distinguished, absolute, because all events are referred to this standpoint and no other.”

“Daß in der Relativitätstheorie EINSTEINs die Beschleunigungen absolute sind, hat mir Herr EINSTEIN neuerdings auch mündlich zugegeben, er hat jedoch bisher nicht anerkannt, daß die Geschwindigkeiten in seiner Theorie absolute sind. Im Anschluß hieran sei bemerkt, daß in der NEWTONschen Mechanik sowohl Translations-Geschwindigkeiten wie -Beschleunigungen *relative* sind, dagegen sind die Rotations-Geschwindigkeiten und -Beschleunigungen absolute; ich bin in diesem Punkte (hinsichtlich der NEWTONschen Mechanik) wohl in Übereinstimmung mit Herrn EINSTEIN, und habe bewiesen, daß die oft gehörte, gegenteilige Ansicht, nach der alle Beschleunigungen in der NEWTONschen Mechanik absolute seien und sich „Inertialsysteme“ mechanisch definieren ließen, irrtümlich ist. [***] Die Relativitätstheorie von MI NKOWSKI legt, wie die von EINSTEIN, das Bezugsystem, auf welches alles Geschehen zu beziehen ist (also das absolut ruhende System), in den subjektiven Standpunkt eines Beobachters. Daher läßt sich die Theorie als *subjektive Absoluttheorie* charakterisieren: subjektiv, weil der Standpunkt des *Beobachters* ausgezeichnet wird, absolut, weil alles Geschehen auf *diesen* Standpunkt und keinen anderen bezogen wird.”

This history has been largely forgotten, with most today mistakenly believing that Einstein had understood the full significance of Lange’s inertial systems in 1905, though Einstein had not. Einstein repeatedly described a preferred “resting system” and a particular state of motion relative to it, right up through 1916, in the special theory. Gehricke described the “theory of relativity” as subjective absolutism in 1914, and stated that in 1914 Einstein had told him that accelerations are absolute in the theory of relativity. Einstein then obstructed Gehricke’s efforts to publish that fact in *Die Naturwissenschaften*, while conceding that it was true.

Covariance was already raised, as an issue, in the Poincaré-Lorentz theory of relativity. Covariance has been a controversial subject. Kretschmann
demonstrated that covariance is a matter of human convention, and not a principle of Nature. Einstein almost immediately stole some of Kretschmann’s ideas. Dennis Overbye wrote in his book *Einstein in Love: A Scientific Romance*,

"Kretschmann’s paper, which appeared in the *Annalen der Physik* on December 21, 1915, apparently struck a chord with Einstein. By now, of course, the hole argument was an embarrassment, and he was eager for an answer. Five days later Albert wrote back to Ehrenfest, who had been pestering him about the hole problem, with an answer almost identical to Kretschmann’s. Space-time points, he said, gain their identity not from coordinates but from what happens at them. The phrase he used was ‘space-time coincidences.’

‘The physically real in the world of events (in contrast to that which is dependent upon the choice of a reference system) consists in spatiotemporal coincidences . . . and in nothing else!’ he told Ehrenfest. Reality, he repeated to Besso, was nothing less than the sum of such point coincidences, where, say, the tracks of two electrons or a light ray and a photographic grain crossed.

In his magnum opus on the new general relativity theory early in March 1916, Albert paralleled Kretschmann almost word for word: ‘All our space-time verifications invariably amount to a determination of space-time coincidences. . . . Moreover, the results of our measurings are nothing but verifications of meetings of the material points of our measuring instruments with other material points, coincidences between the hands of a clock and points on the clock dial, and observed point-events happening at the same place at the same time.’

The general theory of relativity is another absolutist theory and the general principle of relativity is an absolutist metaphysical convention, not a scientific principle.

Kamerlingh Onnes was another of Einstein’s friends who fell victim to Einstein’s career of plagiarism. Dirk van Delft wrote,

“Einstein did, however, lecture on superconductivity at Leiden in November 1921. This time he was invited to stay at Kamerlingh Onnes’s home. In November 1922, Einstein set out his ideas on superconductivity in an article for the festschrift celebrating the 40th anniversary of Onnes’s professorship. Following discussions with Ehrenfest, Einstein had arrived at a model of ‘chains of atomic electrons running almost in single file,’ as he explained it in a postcard to his friend. In the superconducting state, he went on, these chains would be ‘stable and undisturbed.’ Einstein suggested testing his theory by measuring the self-induction of a non-superconducting coil placed beneath a short-circuited superconducting coil. His festschrift article does not contain this somewhat vague suggestion, but he did stick to his electron-chain conjecture. However, after Kamerlingh Onnes found superconductivity across a lead-tin interface, Einstein did have to retract his
hypothesis that the electron chains could not consist of different types of atoms. Surprisingly, Einstein’s festschrift paper did not cite a contribution by Onnes to the 1921 Solvay conference. In it, Onnes had also come up with the idea—in much greater detail than Einstein—of electrons moving via low ‘threads’ from atom to atom. But Einstein had not attended the 1921 Solvay conference in Brussels, so he may not have known about Onnes’s contribution.

Onnes was probably aware that Einstein was plagiarist. Onnes stated,

“Einstein was led to his discoveries by building on Lorentz’s work in Leiden.”

Abraham Pais tells of Einstein’s attempted appropriation of the Kaluza-Klein theory. Pais wrote,

“There is nothing unusual in Einstein’s change of opinion about a theory being unnatural at one time and completely satisfactory some months later. What does puzzle me is a note added to the second paper [E20]: ‘Herr Mandel points out to me that the results communicated by me are not new. The entire content is found in the paper by O. Klein.’ An explicit reference is added to Klein’s 1926 paper [K3]. I fail to understand why he published his two notes in the first place.”

Poincaré stressed the importance of Riemannian geometry. Vladimir Varičak employed non-Euclidean geometry in the theory of relativity, before Einstein and Grossmann. Harry Bateman asserted his priority over Einstein in the general theory of relativity, in 1918,

“The appearance of Dr. Silberstein’s recent article on ‘General Relativity without the Equivalence Hypothesis’ encourages me to restate my own views on the subject. I am perhaps entitled to do this as my work on the subject of General Relativity was published before that of Einstein and Kottler, and appears to have been overlooked by recent writers.”

14.8 Conclusion

Kinertia refers many times to Einstein, Lorentz and Poincaré and states that he wrote to scientists around the world, presumably including Einstein. Kinertia’s work on gravity and weight preceded Einstein’s by many years.

Einstein asserted the primacy of the principle of equivalence in 1916,
The entire basis of the general theory of relativity was a plagiarized idea. Einstein’s argument in the general theory of relativity is irrational—a fallacy of *Petitio Principii*. By 1916, Einstein had repeatedly acknowledged Eötvös’ experimental results of the previous century. Therefore, there can be no disputing that Einstein argued an empirical observation, an *a posteriori* problem, as if an *a priori* first principle in order to “deduce” the principle of equivalency as a conclusion from itself. This results in a fallacy of *Petitio Principii*, in that Einstein assumes the fact in order to prove the same fact, just as Mileva and Albert had assume light speed invariance and the principle of relativity as “postulates” in order to “deduce” light speed invariance and the principle of relativity as conclusions.

Hans Reichenbach stated,

“The principle of the equality of inertial and gravitational mass, which incidently is also the reason for the equality of the velocities of falling bodies [***] has been confirmed to a high degree by experiments. It is mentioned explicitly by Einstein as an empirical principle constituting the basis of his principle of equivalence.”

Emil Wiechert stated on 26 February 1916, that the inertial-gravitational mass equivalence is an *a posteriori* problem, not an *a priori* first principle. Hermann Weyl explained,

“Eötvös has comparatively recently [in 1890] tested the accuracy of this law by actual experiments of the greatest refinement (*vide* note 3). The centrifugal force imparted to a body at the earth’s surface by the earth’s rotation is proportional to its inertial mass but its weight is proportional to its gravitational mass. The resultant of these two, the *apparent* weight, would have different directions for different bodies if gravitational and inertial mass were not proportional throughout. The absence of this difference of direction was demonstrated by Eötvös by means of the exceedingly sensitive instrument known as the torsion-balance: it enables the inertial mass of a body to be measured to the same degree of accuracy as that to which its weight may be determined by the most sensitive balance.”

Einstein, himself, stated in 1913,

“[T]he equality (proportionality) of the gravitational and inertial mass has been proved with great accuracy in an investigation of great importance to us by Eötvös [***] Eötvös’s exact experiment concerning the equality of inertial and gravitational mass supports the view that such a criterion does not exist. We see that in this regard Eötvös’s experiment plays a role similar to that of the Michelson experiment with respect to the question of whether uniform motion can be detected physically.”

Einstein stated in *The New York Times* on 3 April 1921 on pages 1 and 13,
“I first became interested in it through the question of the distribution and expansion of light in space; that is, for the first grade or step. The fact that an iron ball and a wooden ball fall to the ground at the same speed was perhaps the reason which prompted me to take the second step.”

On 13 June 1921, Einstein stated,

“The theory of general relativity owes its origin primarily to the experimental fact of the numerical equality of inertial and gravitational mass of a body, a fundamental fact for which classical mechanics has given no interpretation.”

Max Born stated on 16 July 1955,

“[The general theory of relativity] began with a paper published as early as December, 1907, which contains the principle of equivalence, the only empirical pillar on which the whole imposing structure of general relativity was built.”

Empirical observations are not a priori first principles, but are instead a posteriori problems which much be deduced from first principles. The principle of equivalence was a very old idea.

Samuel Clarke wrote, in the early 1700's,

“If he only affirms bare Matter to be Necessary: Then, besides the extreme Folly of attributing Motion and the Form of the World to Chance; (which senseless Opinion I think All Atheists have now given up; and therefore I shall not think my self obliged to take any Notice of it in the Sequel of this Discourse:) it may be demonstrated by many Arguments drawn from the Nature and Affections of the Thing itself, that Matter is not a necessary Being. For Instance, Thus. Tangibility or Resistance, (which is what Mathematicians very properly call Vis inertiæ,) is essential to Matter. Otherwise the word, Matter, will have no determinate Signification. Tangibility therefore, or Resistance, belonging to All Matter; it follows evidently, that if All Space were filled with Matter, the Resistance of All Fluids (for the Resistance of the Parts of Hard Bodies arises from Another Cause) would necessarily be Equal. For greater or less degrees of Fineness or Subtility, can in this case make no difference: Because the smaller or finer the parts of the Fluid are, wherewith any particular Space is filled, the greater in proportion is the Number of the parts; and consequently the Resistance still always Equal. But Experience shows on the contrary, that the Resistance of All Fluids is not equal: There being large Spaces, in which no sensible Resistance at all is made to the swiftest and most lasting Motion of the solidiest Bodies. Therefore All Space is not filled with Matter; but, of necessary Consequence, there must be a Vacuum.”
Thus. It appears from Experiments of falling Bodies, and from Experiments of Pendulums, which (being of equal Lengths and unequal Gravities) vibrate in equal Times; that All Bodies whatsoever, in Spaces void of sensible Resistance, fall from the same Height with equal Velocities. Now 'tis evident, that whatever Force causes unequal Bodies to move with equal Velocities, must be proportional to the Quantities of the Bodies moved. The Power of Gravity therefore in All Bodies, is (at equal Distances suppose from the Center of the Earth) proportional to the Quantity of Matter contained in each Body. For if in a Pendulum there were any Matter that did not gravitate proportionally to its Quantity, the Vis Inertiæ of that Matter would retard the Motion of the rest, so as soon to be discovered in Pendulums of equal Lengths and unequal Gravities in Spaces void of sensible Resistance. Gravity therefore is in all Bodies [Footnote: Neutoni Princip. Philosoph. Edit. Ima, p. 304. Edit. 2da, p. 272. Edit. 3ria p. 294.] proportional to the Quantity of their Matter. And consequently, all Bodies not being equally heavy, it follows again necessarily, that [Footnote: Neutoni Princip. Philosoph. Edit. Ima, p. 411. Edit. 2da, p. 368.] there must be a Vacuum. 3011

Isaac Newton wrote in Book II of his Principia,

“SECTION VI
Of the motion and resistance of funependulous bodies.

PROPOSITION XXIV. THEOREM XIX.

The quantities of matter in funependulous bodies, whose centres of oscillation are equally distant from the centre of suspension, are in a ratio compounded of the ratio of the weights and the duplicate ratio of the times of the oscillations in vacuo.

For the velocity, which a given force can generate in a given matter in a given time, is as the force and the time directly, and the matter inversely. The greater the force or the time is, or the less the matter, the greater the velocity generated. This is manifest from the second law of motion. Now if pendulums are of the same length, the motive forces in places equally distant from the perpendicular are as the weights: and therefore if two bodies by oscillating describe equal arcs, and those arcs are divided into equal parts; since the times in which the bodies describe each of the correspondent parts of the arcs are as the times of the whole oscillations, the velocities in the correspondent parts of the oscillations will be to each other, as the motive forces and the whole times of the oscillations directly, and the quantities of
matter reciprocally: and therefore the quantities of matter are as the forces and the times of the oscillations directly and the velocities reciprocally. But the velocities reciprocally are as the times, and therefore the times directly and the velocities reciprocally are as the squares of the times; and therefore the quantities of matter are as the motive forces and the squares of the times, that is, as the weights and the squares of the times. Q.E.D.

Cor. 1. Therefore if the times are equal, the quantities of matter in each of the bodies are as the weights.

Cor. 2. If the weights are equal, the quantities of matter will be as the squares of the times.

Cor. 3. If the quantities of matter are equal, the weights will be reciprocally as the squares of the times.

Cor. 4. Whence since the squares of the times, ce teris paribus, are as the lengths of the pendulums; therefore if both the times and the quantities of matter are equal, the weights will be as the lengths of the pendulums.

Cor. 5. And universally, the quantity of matter in the pendulous body is as the weight and the square of the time directly, and the length of the pendulum inversely.

Cor. 6. But in a non-resisting medium, the quantity of matter in the pendulous body is as the comparative weight and the square of the time directly, and the length of the pendulum inversely. For the comparative weight is the motive force of the body in any heavy medium, as was shewn above; and therefore does the same thing in such a non-resisting medium, as the absolute weight does in a vacuum.

Cor. 7. And hence appears a method both of comparing bodies one among another, as to the quantity of matter in each; and of comparing the weights of the same body in different places, to know the variation of its gravity. And by experiments made with the greatest accuracy, I have always found the quantity of matter in bodies to be proportional to their weight."

In Book III of the *Principia*, Newton wrote,

""PROPOSITION VI. THEOREM VI."

*That all bodies gravitate towards every Planet; and that the Weights of bodies towards any the same Planet, at equal distances from the centre of the Planet, are proportional to the quantities of matter which they severally contain.*

It has been, now of a long time, observed by others, that all sorts of heavy bodies, (allowance being made for the inequality of retardation, which they suffer from a small power of resistance in the air) descend to the Earth from equal heights in equal times: and that equality of times we may distinguish to a great accuracy, by the help of pendulums. I tried the thing in gold, silver,
lead, glass, sand, common salt, wood, water, and wheat. I provided two wooden boxes, round and equal. I filled the one with wood, and suspended an equal weight of gold (as exactly as I could) in the centre of oscillation of the other. The boxes hanging by equal threads of 11 feet, made a couple of pendulums perfectly equal in weight and figure, and equally receiving the resistance of the air. And placing the one by the other, I observed them to play together forward and backward, for a long time, with equal vibrations. And therefore the quantity of matter in the gold (by cor. 1 and 6. prop. 24. book 2.) was to the quantity of matter in the wood, as the action of the motive force (or vis motrix) upon all the gold, to the action of the same upon all the wood; that is, as the weight of the one to the weight of the other. And the like happened in the other bodies. By these experiments, in bodies of the same weight, I could manifestly have discovered a difference of matter less than the thousandth part of the whole, had any such been. But, without all doubt, the nature of gravity towards the Planets, is the same as towards the Earth. For, should we imagine our terrestrial bodies removed to the orb of the Moon, and there, together with the Moon, deprived of all motion, to be let go, so as to fall together towards the Earth: it is certain, from what we have demonstrated before, that, in equal times, they would describe equal spaces with the Moon, and of consequence are to the Moon, in quantity of matter, as their weights to its weight. Moreover, since the satellites of Jupiter perform their revolutions in times which observe the sesquiplicate proportion of their distances from Jupiter’s centre, their accelerative gravities towards Jupiter will be reciprocally as the squares of their distances from Jupiter’s centre; that is, equal, at equal distances. And, therefore, these satellites, if supposed to fall towards Jupiter from equal heights, would describe equal spaces in equal times, in like manner as heavy bodies do on our Earth. And by the same argument, if the circumsolar Planets were supposed to be let fall at equal distances from the Sun, they would, in their descent towards the Sun, describe equal spaces in equal times. But forces, which equally accelerate unequal bodies, must be as those bodies; that is to say, the weights of the Planets towards the Sun must be as their quantities of matter. Further, that the weights of Jupiter and of his satellites towards the Sun are proportional to the several quantities of their matter, appears from the exceedingly regular motions of the satellites (by cor. 3. prop. 65, Book 1.) For if some of those bodies were more strongly attracted to the Sun in proportion to their quantity of matter, than others; the motions of the satellites would be disturbed by that inequality of attraction (by cor. 2. prop. 65. Book 1.) If, at equal distances from the Sun, any satellite in proportion to the quantity of its matter, did gravitate towards the Sun, with a force greater than Jupiter in proportion to his, according to any given proportion, suppose of $d$ to $e$; then the distance between the centres of the Sun and of the satellite’s orbit would be always greater than the distance between the centres of the Sun and of Jupiter, nearly in the subduplicate of that proportion; as by some computations I have found. And if the satellite did gravitate towards the Sun with a force, lesser in the
proportion of $e$ to $d$, the distance of the centre of the satellite’s orb from the Sun, would be less than the distance of the centre of Jupiter from the Sun, in the subduplicate of the same proportion. Therefore if, at equal distances from the Sun, the accelerative gravity of any satellite towards the Sun were greater or less than the accelerative gravity of Jupiter towards the Sun, but by one $\frac{1}{1000}$ part of the whole gravity; the distance of the centre of the satellite’s orbit from the Sun would be greater or less than the distance of Jupiter from the Sun, by one $\frac{1}{2000}$ part of the whole distance; that is, by a fifth part of the distance of the utmost satellite from the centre of Jupiter; an excentricity of the orbit, which would be very sensible. But the orbits of the satellites are concentric to Jupiter, and therefore the accelerative gravities of Jupiter, and of all its satellites towards the Sun, are equal among themselves. And by the same argument, the weights of Saturn and of his satellites towards the Sun, at equal distances from the Sun, are as their several quantities of matter: and the weights of the Moon and of the Earth towards the Sun, are either none, or accurately proportional to the masses of matter which they contain. But some they are by cor. 1. and 3. prop. 5.

But further, the weights of all the parts of every Planet towards any other Planet, are one to another as the matter in the several parts. For if some parts did gravitate more, others less, than for the quantity of their matter; then the whole Planet, according to the sort of parts with which it most abounds, would gravitate more or less, than in proportion to the quantity of matter in the whole. Nor is it of any moment, whether these parts are external or internal. For, if, for example, we should imagine the terrestrial bodies with us to be raised up to the orb of the Moon, to be there compared with its body: If the weights of such bodies were to the weights of the external parts of the Moon, as the quantities of matter in the one and in the other respectively; but to the weights of the internal parts, in a greater or less proportion, then likewise the weights of those bodies would be to the weight of the whole Moon, in a greater or less proportion; against what we have shewed above.

Cor. 1. Hence the weights of bodies do not depend upon their forms and textures. For if the weights could be altered with the forms, they would be greater or less, according to the variety of forms, in equal matter; altogether against experience.

Cor. 2. Universally, all bodies about the Earth gravitate towards the Earth; and the weights of all, at equal distances from the Earth’s centre, are as the quantities of matter which they severally contain. This is the quality of all bodies within the reach of our experiments; and therefore, (by rule 3.) to be affirmed of all bodies whatsoever. If the æther, or any other body, were either altogether void of gravity, or were to gravitate less in proportion to its quantity of matter; then, because (according to Aristotle, Des Cartes, and others) there is no difference betwixt that and other bodies, but in mere form of matter, by a successive change from form to form, it might be changed at
last into a body of the same condition with those which gravitate most in proportion to their quantity of matter; and, on the other hand, the heaviest bodies, acquiring the first form of that body, might by degrees, quite lose their gravity. And therefore the weights would depend upon the forms of bodies, and with those forms might be changed, contrary to what was proved in the preceding corollary.

Cor. 3. All spaces are not equally full; for if all spaces were equally full, then the specific gravity of the fluid which fills the region of the air, on account of the extreme density of the matter, would fall nothing short of the specific gravity of quick-silver, or gold, or any other the most dense body; and therefore, neither gold, nor any other body, could descend in air. For bodies do not descend in fluids, unless they are specifically heavier than the fluids. And if the quantity of matter in a given space, can, by any rarefaction, be diminished, what should hinder a diminution to infinity?

Cor. 4. If all the solid particles of all bodies are of the same density, nor can be rarefied without pores a void space or vacuum must be granted. By bodies of the same density, I mean those whose vires inertiæ are in the proportion of their bulks.

Cor. 5. The power of gravity is of a different nature from the power of magnetism. For the magnetic attraction is not as the matter attracted. Some bodies are attracted more by the magnet, others less; most bodies not at all. The power of magnetism, in one and the same body, may be and increased and diminished; and is sometimes far stronger, for the quantity of matter, than the power of gravity; and in receding from the magnet, decreases not in the duplicate, but almost in the triplicate proportion of the distance, as nearly as I could judge from some rude observations."

In 1921, J. E. Turner said of the happiest thought in Einstein’s life,

“The famous Principle of Equivalence is exactly what it professes to be and nothing more—a principle of equivalence, but not therefore of explanation. That changes in a gravitational field may be equally well expressed in terms of acceleration neither explains gravitation nor explains it away[.]”

Lucretius argued that motion requires an empty space in which things can move. Galileo found no resistance to the motion of “material bodies” in “empty space” and concluded, in a non sequitur, that there is no æthereal medium. As Kinertia noted, Galileo, who was so courageous in most of his researches, perhaps is to blame, even more than Bacon, Newton, Hume, Mach or Einstein, for the pernicious attitude prevalent today that we need not seek the physical cause of gravitation, because we can just pretend that circularly defined geometrical laws of
its workings constitute an exposition on the effect. In his dialogues, at 202, Galileo states,

“SALV. The present does not seem to be the proper time to investigate the cause of the acceleration of natural motion concerning which various opinions have been expressed by various philosophers, some explaining it by attraction to the center, others to repulsion between the very small parts of the body, while still others attribute it to a certain stress in the surrounding medium which closes in behind the falling body and drives it from one of its positions to another. Now, all these fantasies, and others too, ought to be examined; but it is not really worth while. At present it is the purpose of our Author merely to investigate and to demonstrate some of the properties of accelerated motion (whatever the cause of this acceleration may be)—meaning thereby a motion, such that the momentum of its velocity \[i \text{ momenti della sua velocità}\] goes on increasing after departure from rest, in simple proportionality to the time, which is the same as saying that in equal time-intervals the body receives equal increments of velocity; and if we find the properties [of accelerated motion] which will be demonstrated later are realized in freely falling and accelerated bodies, we may conclude that the assumed definition includes such a motion of falling bodies and that their speed [accelerazione] goes on increasing as the time and the duration of the motion.”

In 1908, Sir Arthur Schuster spoke out against the emerging logical positivism which prevailed during the period of the development of the theory of relativity, and the negative impact of its intellectual cowardice and ontological solipsism on science. Note that Schuster correctly identifies the mathematics employed in the theory of relativity as metaphysical ontology, not science. Schuster stated,

“I have during these lectures contrasted on several occasions the former tendency to base our technical explanations of natural phenomena on definite models which we can visualise and even construct, with the modern spirit which is satisfied with a mathematical formula, and symbols which frequently have no strictly definable meaning. I ought to explain the distinction between the two points of view which represent two attitudes of mind, and I can do so most shortly by referring to the history of the electrodynamic theory of light, the main landmarks of which I have already pointed out in the second lecture. The undulatory theory—as it left the hands of Thomas Young, Fresnel and Stokes—was based on the idea that the æther possessed the properties of an elastic solid. Maxwell’s medium being quite different in its behaviour, its author at first considered it to be necessary to justify the possibility of its existence, by showing how, by means of fly wheels and a peculiar cellular construction, we might produce a composite body having the required properties. Although later Maxwell laid no further stress on the ultimate construction of the medium, his ideas remained definite
and to him the displacements which constituted the motion of light possessed a concrete reality. In estimating the importance of the support which Maxwell’s views have received from experiment, we must distinguish between the fundamental assumptions on which Maxwell based his investigations and the mathematical formulæ which were the outcome of these investigations. It is clearly the mathematical formulæ only which are confirmed and the same formulæ might have been derived from quite different premises. It has always been necessary, as a second step of great discovery, to clear away the immaterial portions which are almost invariable accessories of the first pioneer work, and Heinrich Hertz, who besides being an experimental investigator was a philosopher of great perspicacity, performed this part of the work thoroughly. The mathematical formula instead of being the result embodying the concrete ideas, now became the only thing which really mattered. To use an acute and celebrated expression of Gustav Kirchhoff, it is the object of science to describe natural phenomena, not to explain them. When we have expressed by an equation the correct relationship between different natural phenomena we have gone as far as we safely can, and if we go beyond we are entering on purely speculative ground. I have nothing to say against this as a philosophic doctrine, and I shall adopt it myself when lying on my death-bed, if I have then sufficient strength to philosophise on the limitations of our intellect. But while I accept the point of view as a correct death-bed doctrine, I believe it to be fatal to a healthy development of science. Granting the impossibility of penetrating beyond the most superficial layers of observed phenomena, I would put the distinction between the two attitudes of mind in this way: One glorifies our ignorance, while the other accepts it as a regrettable necessity. The practical impediment to the progress of physics, of what may reluctantly be admitted as correct metaphysics, is both real and substantial and might be illustrated almost from any recent volume of scientific periodicals. Everyone who has ever tried to add his mite to advancing knowledge must know that vagueness of ideas is his greatest stumbling-block. But this vagueness which used to be recognised as our great enemy is now being enshrined as an idol to be worshipped. We may never know what constitutes atoms or what is the real structure of the æther, why trouble therefore, it is said, to find out more about them. Is it not safer, on the contrary, to confine ourselves to a general talk on entropy, luminiferous vectors and undefined symbols expressing vaguely certain physical relationships? What really lies at the bottom of the great fascination which these new doctrines exert on the present generation is sheer cowardice: the fear of having its errors brought home to it. As one who believes that metaphysics is a study apart from physics, not to be mixed up with it, and who considers that the main object of the physicist is to add to our knowledge, without troubling himself much as to how that knowledge may ultimately be interpreted, I must warn you against the temptation of sheltering yourself behind an illusive rampart of safety. We all prefer being right to being wrong, but it is better to be wrong than to be neither right nor
Einstein wrote to Max Born on 7 September 1944,

“[... ]I [believe] in complete law and order in a world which objectively exists, and which I, in a wildly speculative way, am trying to capture. I firmly believe, but I hope that someone will discover a more realistic way, or rather a more tangible basis than it has been my lot to find.”

Einstein wrote to Solovine, in 1949,

“You imagine that I look back on my life’s work with calm satisfaction. But from nearby it looks quite different. There is not a single concept of which I am convinced that it will stand firm, and I feel uncertain whether I am in general on the right track.”

Einstein confessed shortly before his death,

“I consider it quite possible that physics cannot be based on the field concept, i. e., on continuous structures. In that case, nothing remains of my entire castle in the air, gravitation theory included, [and of] the rest of modern physics.”

Einstein had told the general public that only twelve persons in the world were capable of understanding the theory of relativity. After that proclamation, any person who dared contest Einstein’s priority was susceptible to being labeled as outside the 12 and incapable of understanding the theory. This ad hominem retort to challenges to the theory continues today, when pseudorelativists avoid addressing the substance of arguments against the theory and avoid addressing the facts, but instead attempt an ad hominem argument against those who question their beliefs, in an effort to discredit the critic, instead of addressing his or her complaints. There are many fatal flaws in the theory of relativity. When pressed for a substantial response, the response is too often, “What you say is true, but so what?”

When it was realized that Einstein repeated what others had written far earlier, some regarded it as an amazing coincidence that someone had already written what Einstein and others would later publish. For instance,

“[Boscovich’s] theory also suggests curious—almost uncanny—intimations of general relativity and quantum mechanics.”

The lack of footnotes in Einstein’s writings was not seen as an attempt at plagiarism, but as evidence that Einstein conceived the whole soup from scratch, even though the factual record proves that the principle of relativity via the “Lorentz Transformation” was a traditional, well-known recipe. The absurdity of assuming that a lack of references indicates the absence of a knowledge of an other’s works
degenerates into mysticism, and we are asked to accept that Einstein did not read what was famously in print in his pet field, but was inspired,

“If not [by] God, [then by] some otherworldly source” 3023

Is it not clear that Einstein’s silly and childish “Eureka!” stories of divine, or “otherworldly” inspiration, are fabrications meant to establish a record of priority, where no record in fact exists? For the first originators (a redundancy compelled by the subject matter) of relativity theory, the development was slow, progressive and well documented. It was an evolution, not a holy revelation.

Of course, the indoctrinated habit of scientists is to research the scientific literature before developing a theory. Why wouldn’t Einstein have done so? The history of science was, after all, Einstein’s passion.

Could Einstein have researched the literature on the electrodynamics of moving bodies, the relative motion of bodies and the failure to detect the motion of the Earth relative to the æther and missed the relevant works of Michelson, Larmor, Cohn, Langevin, Poincaré and Lorentz? Did God really tap Einstein on the shoulder and whisper these men’s thoughts to Einstein, but didn’t let Einstein in on the poorly kept secret that these men had already published “God’s thoughts”?

Einstein is known to have extensively read Poincaré’s work, 3024 and dedicated himself to reading everything Lorentz wrote, 3025 but denied knowledge of the so-called “Lorentz Transformation”. Is it plausible to believe that Einstein, a supposed genius and master scientist, was completely unaware of Poincaré’s, Lorentz’ and Larmor’s works containing the so-called “Lorentz Transformation”, and the principle of relativity, which were the talk of the physics community, 3026 and the then current literature on the subject of Poincaré’s “principle of relativity”, and that it is coincidental that Einstein repeated much of what they wrote virtually verbatim? Is it a coincidence that Einstein repeated the same formulæ, in the same context, based on the same explanations, and experiments? Is it a coincidence that the relativity well largely ran dry after Poincaré’s untimely death?

Why did Albert’s supposed genius appear only after his marriage to Mileva, and why did he not accomplish major breakthroughs, on the level of the special and general theories of relativity, after he divorced her?

David Hilbert, on whom Einstein went calling for help, published the generally covariant field equations of gravitation of the general theory of relativity, before Einstein. 3027 Why, after many years of failure, did Einstein suddenly realize, within a few days after David Hilbert’s work was public, the equations which Hilbert published before him, and then submit his, Einstein’s, identical formulations, inductively analyzing what Hilbert had already deduced?

Should we believe that Einstein came up with the same equations independently of Hilbert, after Einstein’s long and tortuous, fruitless years of struggling in vain, after asking Hilbert for help, within days of Hilbert’s public release? Who was the better mathematician of the two? Who presented the theory first? Who had the better understanding of the principle of least action? 3028 Who went calling on whom for help, after years of failure? And why is it that both Hilbert and Einstein publicly
acknowledged that Hilbert had the equations first?

Which one of the two had evinced a pattern of repeating the work of others, supposedly independently, later, again and again and again? What was Poincaré’s contribution to the general theory of relativity, was it not in large part his conception?

And what of the non-Euclidean geometry of al-Khayyāmī (Omar Khayyam), al-Tūṣī (Naṣīr al-Dīn), Saccheri, Gauss, Bolyai, Lobatschewsky, Riemann, Becker, Beltrami, Betti, Flye-Stegemann, Genocchi, Helmholtz, Lipschitz, Schlaefli, etc.? Albert Einstein wrote to Felix Klein, on 26 March 1917, and confessed that,

“As I have never done non-Euclidean geometry, the more obvious elliptic geometry had escaped me when I was writing my last paper.”

One may rightly ask, what, exactly, did Einstein contribute to the theory? Where, in the historic record, do we find Einstein’s contribution with established priority? Is the priority Einstein’s, merely because he claimed it, in spite of the dates of publication? Given the above list of names, which, while long, is by no means complete, why did Einstein pretend that he created the general theory of relativity? Why didn’t Einstein provide references to at least a handful of the above authors and their works? Your author intends to publish a properly referenced version of the Einsteins’ major papers on the theory of relativity. There is very little that is novel in their efforts—certainly *nothing* revolutionary.

Why did Einstein submit a nonsensical paper after his divorce, which confused renowned scientists? Was he not a great independent thinker? Is it possible that Einstein wasn’t a genius and became so full of himself that he attempted to go it alone, and failed miserably?

Of course, the “great man”, as he once called himself, was never short of material to steal when he choose to plagiarize. People from around the world wrote to him with their ideas. The thief held the keys to the vault!

Einstein evinced a career long pattern of publishing “novel” theories and formulae after others had already published similar words, then claimed priority for himself. He did it with $E = mc^2$. He did it with the so-called special theory of relativity and he did it with the general theory of relativity. Einstein often simply
changed the names for terms, then claimed that he had created a new theory, as if Einstein had called red, “blue”, and claimed to have discovered a new color. Harris A. Houghton wrote in the *New York Times* on 21 April 1923,

“[T]hat the time is still not yet ripe either to conclude that Einstein’s theory is correct or that Professor Einstein should receive much credit for calling something by a different name from that by which it has been previously designated.”

Einstein built a career out of hype and plagiarism. Arvid Reuterdahl called him, “the Barnum of science.” Einstein become a hero to many and in their minds a demi-god, seemingly the Holy Ghost incarnate, communicating God’s thoughts to man. The scientific community and the media promote Einstein as the genius who figured it all out. Do we need such heroes? Einstein is seemingly awarded credit for every scientific advancement and theory from the time of Newton up until Einstein’s death. Does Einstein deserve that credit? Is Einstein’s image more important than the progress of science, the natural rights of scientists to question his theories and the history behind them without being smeared, and the right of the public to know the truth?
“Theory of Relativity” or “Pseudorelativism”? 2255

15 “THEORY OF RELATIVITY” OR “PSEUDORELATIVISM”?  

The Theory of Relativity is in fact a theory of absolutism based on the absolute speed of light, the absolute laws of Physics, and an absolute “space-time”. The relativity of space, time and motion was known thousands of years before Einstein was born. Einstein forever failed to grasp the real meaning of relativism.

“Einstein’s theory of relativity is a misnomer, it should be called a theory of absolutivity.”—WALLACE KANTOR

15.1 Introduction

It is not surprising that advocates of the “theory of relativity” often exhibit adolescent behavior. The theory attracts people who are prone to hero worship, and who are willing to accept authority over logic, and cartoon-style Metaphysics over rigorous science. The theory of relativity contains numerous fallacies of *Petitio Principii*. It is difficult for many people to learn, because they realize that they are being taught unproven assertions, as if facts which compel a change in fundamental beliefs. Those who overcome these hurdles by deluding themselves believe that they have joined an elite club of initiates, who have the right and the duty to ridicule non-believers.

Consciously or subconsciously a large proportion of these zealot believers realize that they have been duped and are perpetuating a mythology. They relieve their sense of insecurity by condescendingly and cowardly lecturing those who disagree with them, knowing that rebuttals to their attacks will likely be censored from publication. One of their favorite methods of self-glorification is to pretend that Albert Einstein created the notion of relativism and removed absolutism from Physics.

They are wrong on both counts. There were many ancient relativistic theories. The “theory of relativity” is in fact an absolutist theory, and it is more absolutist than most of the theories of absolutism which preceded it.

15.2 The “Theory of Relativity” is an Absolutist Theory

In one sense, the so-called relativists”—they aren’t truly “relativists”, as Minkowski noted,

“This hypothesis [length contraction resulting in light speed invariance] sounds extremely fantastical, for the contraction is not to be looked upon as a consequence of resistances [sic] in the ether, or anything of that kind, but simply as a gift from above [***] [T]he word *relativity-postulate* for the requirement of an invariance with the group G, seems to me very feeble. [***] I prefer to call it the *postulate of the absolute world*. [***] Thus the essence of this postulate may be clothed mathematically in a very pregnant
manner in the mystic formula \( 3 \cdot 10^5 \text{ km} = \sqrt{-1} \text{ secs.} \)

Samuel Alexander held that,

"[I]t is clear that Space-Time takes for us the place of what is called the Absolute in idealistic systems. It is an experiential absolute."

Max Planck stated,

"Einstein’s recognition of the fact that our Newtonian-Kantian conception of space and time possesses in a certain sense only a relative value because of the arbitrary choice of the system of correlation and methods of measuring, affects the very root of our physical thought. But if space and time have been deprived of their absolute qualities, the absolute has not been disposed of finally, but has only been moved back a step to the measurement of four-dimensional multiplicity which results from the fact that space and time have been fused into one coherent continuum by means of the speed of light. This system of measurement represents something totally independent of any kind of arbitrariness and hence something absolute."

and

"For everything that is relative presupposes the existence of something that is absolute, and is meaningful only when juxtaposed to something absolute. The often heard phrase, ‘Everything is relative,’ is both misleading and thoughtless. The Theory of Relativity, too, is based on something absolute, namely, the determination of the matrix of the space-time continuum; and it is an especially stimulating undertaking to discover the absolute which alone makes meaningful something given as relative. [***] Our task is to find in all these factors and data, the absolute, the universally valid, the invariant, that is hidden in them. [sic] This applies to the Theory of Relativity, too. I was attracted by the problem of deducing from its fundamental propositions that which served as their absolute immutable foundation. [***] [T]he Theory of Relativity confers an absolute meaning on a magnitude which in classical theory has only a relative significance: the velocity of light. The velocity of light is to the Theory of Relativity [***] its absolute core. The absolute showed itself to be even more deeply rooted in the order of natural laws than had been assumed for a long time."

Bertrand Russell wrote in his book *The ABC of Relativity*,

"In fact, though few physicists in modern times have believed in absolute motion, the [special theory of relativity] still embodied Newton’s belief in [absolute motion], and a revolution in method was required to obtain a technique free from this assumption. This revolution was accomplished in
Einstein’s *general* theory of relativity [1916]. [—redacted, emphasis added]  

Ebenezer Cunningham averred,

“[I]t will be seen, the old philosophical difficulty as to *absolute direction* or *angular velocity* remains. [***] Thus we do not appear to be brought any nearer to the removal of the old-time difficulty that the physical laws which seem best to describe the phenomena of motion postulate an absolute standard of direction though not of position, while apart from the physical phenomena there is no independent means of identifying such a direction.”  

Charles Nordmann recognized that,

“Up to this point the theory of Relativity well deserves its name. But now, in spite of it and its very name, there arises something which seems to have an independent and determined existence in the external world, an objectivity, an *absolute* reality. This is the ‘Interval’ of events, which remains constant and invariable through all the fluctuations of things, however infinitely varied may be the points of view and standards of reference. From this datum, which, speaking philosophically, strangely shares the intrinsic qualities with which the older absolute time and absolute space were so much reproached, the whole constructive part of Relativity, the part which leads to the splendid verifications we described, is derived. Thus the theory of Relativity seems to deny its origin, even its very name, in all that makes it a useful monument of science, a constructive tool, an instrument of discovery. It is a theory of a new absolute: the interval represented by the geodetics of the quadri-dimensional universe. It is a new absolute theory.”  

Melchior Palágyi, from whom Minkowski took much, stated,

“The term introduced by Einstein: ‘theory of relativity’ is, of course, a most unfortunate choice; we retain it, however, like any arbitrary standard designation, which you can’t get rid of, because people have grown accustomed to using it. We restrict the meaning of the theory of relativity to: the new system of the world that arises from the monotheism of space and time and from the unification of mechanics and electrodynamics.”

“*Die durch Einstein eingeführte Benennung: ‘Relativitätstheorie’ ist zwar höchst unglücklich gewählt; wir behalten sie aber bei wie irgendeinen beliebigen Eigennamen, den man nicht abändern mag, weil man sich an ihn gewöhnt hat. Relativitätstheorie bedeutet uns immer nur so viel als: das neue Weltsystem, das aus der Einheitslehre von Raum und Zeit und das der Vereinheitlichung von Mechanik und Elektrodynamik entspringt.*”
Albert Einstein told Ernst Gehrcke in 1914 that accelerated movements are absolute,

“The clock B, which was moved, runs more slowly because it has sustained accelerations in contrast to the clock A. Certainly, these accelerations are unimportant for the amount of the time difference of both clocks, however, their existence causes the slow running just of the clock B, and not of the clock A. Accelerated movements are absolute in the theory of relativity.”

“Die Uhr B, welche bewegt wurde, geht deshalb nach, weil sie im Gegensatz zu der Uhr A Beschleunigungen erlitten hat. Diese Beschleunigungen sind zwar für den Betrag der Zeitdifferenz beider Uhren belanglos, ihr Vorhandsein bedingt jedoch das Nachgehen gerade der Uhr B, und nicht der Uhr A. Beschleunigte Bewegungen sind in der Relativitätstheorie absolute.”

Gehrcke recounted that,

“Mr. Einstein recently admitted to me orally that accelerations are absolute in Einstein’s theory of relativity, up to now, however, he has not acknowledged that speeds in his theory are absolute. It is noteworthy in this context that in Newtonian Mechanics both translation-speeds and accelerations are *relative*, on the other hand rotational-speeds and -accelerations are absolute; I am of course in agreement with Mr. Einstein on this point (regarding Newtonian mechanics) and have proven that the often heard, contrary opinion, according to which all accelerations in Newtonian mechanics are absolute and ‘inertial systems’ are left to be defined mechanically, is erroneous. [***] Minkowski’s theory of relativity places, like Einstein’s, the reference system, to which all events are referred (therefore the absolutely resting system), in the subjective standpoint of an observer. Therefore, the theory can be characterized as a subjective theory of absolutism: subjective because the point of view of the observer is distinguished, absolute, because all events are referred to this viewpoint and no other.”

“Daß in der Relativitätstheorie EINSTEINs die Beschleunigungen absolute sind, hat mir Herr EINSTEIN neuerdings auch mündlich zugegeben, er hat jedoch bisher nicht anerkannt, daß die Geschwindigkeiten in seiner Theorie absolute sind. Im Anschluß hieran sei bemerkt, daß in der NEWTONschen Mechanik sowohl Translations-Geschwindigkeiten wie -Beschleunigungen *relative* sind, dagegen sind die Rotations-Geschwindigkeiten und -Beschleunigungen absolute; ich bin in diesem Punkte (hinsichtlich der NEWTONschen Mechanik) wohl in Übereinstimmung mit Herrn EINSTEIN, und habe bewiesen, daß die oft gehörte, gegenteilige Ansicht, nach der alle Beschleunigungen in der NEWTONschen Mechanik absolute seien und sich „Inertialsysteme“ mechanisch definieren ließen, irrtümlich ist. [***] Die
Relativitätstheorie von MINKOWSKI legt, wie die von EINSTEIN, das Bezugssystem, auf welches alles Geschehen zu beziehen ist (also das absolutruhende System), in den subjektiven Standpunkt eines Beobachters. Daherläßt sich die Theorie als subjektive Absoluttheorie charakterisieren: subjektiv,weil der Standpunkt des Beobachters ausgezeichnet wird, absolut, weil allesGeschehen auf diesen Standpunkt und keinen anderen bezogen wird.”

Einstein professed, after the general theory was established, that,

“There is no absolute (independent of the space of reference) relation in space, and no absolute relation in time between two events, but there is an absolute (independent of the space of reference) relation in space and time”

and,

“The four-dimensional space of the special theory of relativity is just as rigid and absolute as Newton’s space.”

and,

“The space-time phenomenon of the special theory of relativity was something absolute in itself, inasmuch as it was independent of the particular state of motions considered in that theory.”

Einstein gave a lecture at King’s College in June of 1921. The London Times quoted Einstein, on 14 June 1921, on page 8,

“The theory of relativity endeavours to define more concisely the relationship between general scientific conceptions and facts experienced. In the realm of the special theory of relativity the space coordinates and time are still of an absolute nature in so far as they appear to be measurable by rigid bodies, rods, and by clocks. They are, however, relative in so far as they are dependent upon the motion peculiar to the inertial system that happens to have been chosen. According to the special theory of relativity the four-dimensional continuum, formed by the amalgamation of time and space, retains that absolute character which, according to the previous theories, was attributed to space as well as to time, each individually. The interpretation of the spatial coordinates and of time as the result of measurements then leads to the following conclusions: motion (relative to the system of coordinates) influences the shape of bodies and the working of clocks; energy and inertial mass are equivalent.”

In accord with Gehrcke, Wiechert and Kretschmann, Stjepan Mohorovičić averred,
“By its very nature, Einstein’s theory of relativity is a spatiotemporal theory of absolutism, which requires a four-dimensional space-time manifold for the description of natural phenomena.”

“Ihrem Wesen nach ist die Einsteinsche Relativitätstheorie eine raumzeitliche Absoluttheorie, welche bei der Beschreibung der Naturerscheinungen eine vierdimensionale Raumzeitmannigfaltigkeit nötig hat.”

J. E. Turner stated in 1921,

“Indeed, the principle, in spite of its name, does not even imply that we are wholly deprived of absolute standards; it merely means that we are free to determine these as we please, provided we accept all the results of our choice; it follows further that a proper selection will greatly simplify argument and calculation. Thus the ‘proper time’ (Eigenzeit) of a system with reference to which a body is ‘at rest,’ as measured by observers moving with the body, is unvarying and in that sense absolute; and Professor Eddington maintains that ‘One part of the World differs from another—an intrinsic absolute difference . . . [The vanishing of a tensor does actually denote an intrinsic condition quite independent of time and space, and] the equality of two tensors in the same region is [also] an absolute relation . . . the vanishing of the left-hand side denotes a definite and absolute condition of the World.’ Just as sight would discover an ‘absolute’ to our supposed blind observers, so thought may attain an absolute which is truly such for normal experience. Nor again does the manner in which the theory treats simultaneity and other space and time attributes justify the contention that space is ‘warped,’ or afford the slightest fresh ground for the view that it and time are subjective.”

Wallace Kantor noted,

“Einstein’s absolutivity postulate requires that \( c' = c = C' \) for any real values of \( v \) and \( V \). In a very real sense Einstein’s theory of relativity is a misnomer, it should be called a theory of absolutivity.”

The Encyclopedia of Philosophy discloses,

“The physical theories of Einstein, and the variants developed by others, which have each been called the ‘theory of relativity’ are so named because they have relativized some of the attributes and relations (spatial distance, time interval, mass) which the Newtonian theory had asserted to be invariant (absolute). But the theory of relativity has not relativized all of the Newtonian invariants; indeed, it has ‘absolutized’ the counterparts of some of the attributes and relations which its Newtonian precursor had affirmed to
be relative.”

Claude Kacser affirmed,

“What is absolute is stated in Einstein’s first relativity postulate: The basic laws of physics are identical for two observers who have a constant relative velocity with respect to each other.”

Joshua N. Goldberg informs us that,

“Minkowski space is an absolute space-time.”

Prof. Anatoly A. Logunov contends,

“Application of [the principle of relativity] to electromagnetic phenomena led Poincaré, and then Minkowski, to the discovery of the pseudo-Euclidean geometry of space-time and thus even more reinforced the hypothesis of inertial reference systems existing throughout the entire space. Such reference systems are physically singled out, and therefore acceleration relative to them has an absolute sense.”

Robert Resnick concluded that,

“The theory of relativity could have been called the theory of absolutism with some justification. [***] there are absolute lengths and times in relativity. [***] Where relativity theory is clearly ‘more absolute’ than classical physics is in the relativity principle itself: the laws of physics are absolute.”

It is some strange “relativity theory”, which is more absolutist than classical absolutism! . . . In one sense the pseudorelativists’ caution with respect to the ether is commendable. However, it is unscientific to refuse to speculate based on the pseudorelativists’ pretentious grounds that measurement and mathematical abstraction are the only tools of the scientist, and that their pseudorelativistic subjective comparisons and absolutist arguments by analogy are somehow “objective” and “relativistic”.

By comparing abstract space with bodily extension, and quantifying it, the “relativists” have reified that which they qualify as “void”—they have reified concepts and are brokers of Metaphysics, not science. By insisting upon the physically contradicted notion that inertial motion, rigid rods, clocks, and light waves, each map congruent spaces; they deny the dynamic and relational physical world and substitute in its place arbitrary absolutist definitions of space and time, and a “space-time”, in which these conceptions have a supposed reality beyond the observed relations of which they are physically composed. Boscovich argued against such absolutist beliefs centuries ago.

The list of true relativists is long. To name but a few: Des Cartes, Huyghens,
Locke, Leibnitz, Berkeley, Hume, Comte, Spencer, Stallo, Hamilton, Mach, Anderssohn, Avenarius, Petzoldt, etc. A real relativist, like Stallo, would never have embraced the absolutist “special theory of relativity”, with its codified absolute space and time, and absolutist “space-time” and the ontological “universal constant” speed of light and absolute laws of Nature. Stallo wrote,

“There is nothing absolute or unconditioned in the world of objective reality. As there is no absolute standard of quality, so there is no absolute measure of duration, nor is there an absolute system of coördinates in space to which the positions of bodies and their changes can be referred. A physical ens per se and a physical constant are alike impossible, for all physical existence resolves itself into action and reaction, and action imports change.”

Mach proclaimed, in his *Science of Mechanics*,

“The expression ‘absolute motion of translation’ Streintz correctly pronounces as devoid of meaning and consequently declares certain analytical deductions, to which he refers, superfluous. On the other hand, with respect to rotation, Streintz accepts Newton’s position, that absolute rotation can be distinguished from relative rotation. In this point of view, therefore, one can select every body not affected with absolute rotation as a body of reference for the expression of the law of inertia.

I cannot share this view. For me, only relative motions exist (*Erhaltung der Arbeit*, p. 48; *Science of Mechanics*, p. 229) and I can see, in this regard, no distinction between rotation and translation. When a body moves relatively to the fixed stars, centrifugal forces are produced; when it moves relatively to some different body, and not relatively to the fixed stars, no centrifugal forces are produced. I have no objection to calling the first rotation ‘absolute’ rotation, if it be remembered that nothing is meant by such a designation except relative rotation with respect to the fixed stars. Can we fix Newton’s bucket of water, rotate the fixed stars, and then prove the absence of centrifugal forces?

The experiment is impossible, the idea is meaningless, for the two cases are not, in sense-perception, distinguishable from each other. I accordingly regard these two cases as the same case and Newton’s distinction as an illusion (*Science of Mechanics*, page 232).”

It is interesting to note that was Michele Besso and Friedrich Adler who persuaded Einstein to adopt Mach’s principle and to extend the principle of relativity to rotations. Einstein had studied Mach’s work early on in 1902.

Herbert Spencer declared,

“THE RELATIVITY OF ALL KNOWLEDGE. [***] The conviction, so reached, that human intelligence is incapable of absolute knowledge, is one that has slowly been gaining ground as civilization has advanced. Each new
ontological theory, from time to time propounded in lieu of previous ones shown to be untenable, has been followed by a new criticism leading to a new skepticism.”

Comte famously avowed,

“Everything is relative, that’s the only thing absolute”

Leibnitz argued against the Newtonian religious absolutism of the reification of ontological space and time,

“As for my Own Opinion, I have said more than once, that I hold Space to be something merely relative, as Time is; that I hold it to be of an Order of Coexistences, as Time is an Order of Successions. For Space denotes, in Terms of Possibility, an Order of Things which exist at the same time, considered as existing together; without enquiring into their Manner of Existing. And when many Things are seen together, one perceives That Order of Things among themselves.”

It is wrong to attribute to Einstein the assertions that time, space and motion are relative for two reasons: One, Einstein was an absolutist, who could not comprehend relativism. Two, others argued that time, space and motion are purely relative long before Einstein was born.

Galileo, Newton and Einstein were absolutists. Though Galileo is popularly credited as the father of the “principle or relativity”; the “principle of relativity” of Galileo, Newton and the Einsteins, is an absolutist corollary to the metaphysical and ontological notions of the absolute laws of Nature, absolute space, absolute time, absolute rectilinear inertial uniform translations of absolute space, and, in Einstein’s case, the æthereal absolute speed of light, which, for Einstein, defines the absolute character of space, time and motion. However, Einstein is not alone to blame for these mythologies, because he was simply repeating the absolutist mythologies of Hendrik Antoon Lorentz and Henri Poincaré.

Speculations not yet physically contradicted can often be tested and should not be frowned upon. In insisting that any definition of the æther beyond “physical space” is taboo, the pseudorelativists are taking the hypocritical and political stance that the refusal to think is preferable to employing one’s imagination where conditions do yet allow us direct observation of those things we wish to see, but cannot; while they claim the privilege of a priori ontological principles and purely abstract dimensions, which have already been physically contradicted. There are no “inertial reference frames” in “uniform motion” such as would define a congruent time dimension. There is no observable “rectilinear uniform motion” in Nature, other than by abstract and arbitrary absolutist definition, and no arbitrarily selected “rectilinear uniform motion” maps spaces congruent to any other “rectilinear uniform motion” we have yet to observe, such that flat “space-time” is a known absolutist fallacy based upon circular definitions.
Speculations can and should be criticized, and their value is often best weighed in hindsight. Wrong ideas often inspire right ones, which insights would not likely arise other than as opposition to myth, which is to say that no subjects ought to be taboo in science, for no one can say where they might lead. It is not wise to close out wonder from science and substitute dogma in its place, which dogma says nothing substantial, on the false premise that it is wisdom to assert nothing and foolishness to propose ideas which have a physical basis. In sum, it is healthy that one dogmatic view of that which constitutes the “æther” was subjected to criticism, but it is most unhealthy that said criticisms were employed to close the subject and substitute meaningless words for otherwise scientific images.

Definitions of the æther oftentimes are somewhat archaic. Thinkers resort to false analogies based on outmoded beliefs, largely because the subject of the æther has so long been taboo, that one feels compelled to resort to those assertions made long ago. The atomists of the Nineteenth Century asserted that the elements are composed of immutable lifeless particles. This left in doubt the nature of force, and the conservation of motion. As Fechner stated,

“All that is given is what can be seen and felt, movement and the laws of movement. How then can we speak of force here? For physics, force is nothing but an auxiliary expression for presenting the laws of equilibrium and of motion; and every clear interpretation of physical force brings us back to this. We speak of laws of force; but when we look at the matter more closely, we find that they are merely laws of equilibrium and movement which hold for matter in the presence of matter. To say that the sun and the earth exercise an attraction upon one another, simply means that the sun and earth behave in relation to one another in accordance with definite laws. To the physicist, force is but a law, and in no other way does he know how to describe it... All that the physicist deduces from his forces is merely an inference from laws, through the instrumentality of the auxiliary word ‘force’.”

Leibnitz accused Newton of religiously supposing that the universe is a watch, which God winds. As many have noted, Newton, who was far more pantheistic than even Leibnitz suspected, did not conceive of the universe as a watch, for that implied a largely self-sustaining mechanism which only required intermittent divine intervention. Newton saw God as directly active in every action and reaction of bodies. However, many, among them the Newtonians, asserted that God set these bodies in motion and then imparted motion to them as the need arose—in order to keep the watch work universe of Newton all wound up. They further asserted that bodies act upon each other “at a distance”, as in the case of gravity or magnetism, by God’s will, whether they openly admitted this mystical exposition, or not. This group believed that motion compelled an absolute empty space in which things could move, and in which motion would have an absolute meaning, and, hence, force, too, would be an absolute quantity.

As a reaction to this belief system, others accepted the misbegotten notion that
“atoms” are immutable structures and concluded that force arose from a pressure in the æther. What, then, is the æther, and what, then, pressurized it? A false analogy was often then made to the false understanding of fluids prevalent at the time, that they are supposedly composed of identical and immutable particles. It is a good thing that these highly speculative and somewhat religious notions are today taken as dubious by many. Everything, which we have yet observed, changes. Perhaps, the æther, too, is change. In order to argue for an unchanging and fundamental æther by analogy, analogy should probably be had to something tangible, and to the best of your author’s knowledge and belief, no such analogy is yet to be had, other than in our sense of what our own existence, as a religious belief, means to us, as we change!"}

That “empty space” is not “vacuum”, is obvious. That it is not made of unchanging particles, seems an equally rational conclusion, unless I have missed some known phenomenon, which remains immutable. Perhaps, we have no means to perceive that which does not change. Perhaps, everything changes. Our ears cannot taste, and our tongues cannot see, and if change compels relations, it is rational to expect that the unchanging cannot affect the changing, and, therefore, cannot be perceived; but it seems more probable that we don’t yet have the ability to sense the qualities of ephemeral space, directly, than that space is a permanent entity, which exists outside of our consciousness.

In the search for (in the psychological need to resolve some illusory image of) the Urstoff of the universe, we seem too often to resort to the notion of “adamantine atoms” rearranging themselves into ever different forms in time and to too quickly give the same name to different things as if one Ding an sich. The pseudorelativists ought to abandon the notion of “World-lines” and acknowledge the multiplicity fundamental to their absolutist view. We, probably due to our sense of our own permanent Self, conceive of a set of particles as an “apple” ripe and perfect today, rearranged as the same set of particles tomorrow. However, Hume had already recognized the impossibility of this. Hume stated,

“I know there are some who pretend, that the idea of duration is applicable in a proper sense to objects, which are perfectly unchangeable; and this I take to be the common opinion of philosophers as well as of the vulgar. But to be convinc’d of its falsehood we need but reflect on the foregoing conclusion, that the idea of duration is always deriv’d from a succession of changeable objects, and can never be convey’d to the mind by any thing stedfast and unchangeable. For it inevitably follows from thence, that since the idea of duration cannot be deriv’d from such an object, it can never-in any propriety or exactness be apply’d to it, nor can any thing unchangeable be ever said to have duration. Ideas always represent the Objects or impressions, from which they are deriv’d, and can never without a fiction represent or be apply’d to any other. By what fiction we apply the idea of time, even to what is unchangeable, and suppose, as is common, that duration is a measure of rest as well as of motion, we shall consider afterwards.”
In a four-dimensional world there is no evidence that an object can have duration, nor can it change or have a history. Instead, in an absolute block universe, there is absolute multiplicity, and the apple we pick today is a different set of “particles” from the “same” apple tomorrow, just as our consciousness of each is composed of a different set of “particles” comprising our awareness. This may afford a metaphysical exposition for memory, immediate awareness and precognition, each being the composition of Self-awareness in a quadri-dimensional substratum—memory, imagination, sensation, and precognition being the gift of existence without temporal cause, but perhaps with an interconnected extension in multiplicity, one thing the outgrowth of another, but as the limb branches from the root, not in time, but in structure. Our minds as physical realms different at each “moment” or conscious phase of that which we recognize as the Self in a lifetime, may contain memory objects, sense objects and precognition objects of which Self-awareness is composed. And in this sense, it is possible to view the universe as extending from any of its “parts”, and it is a function of our human dignity to perceive ourselves as arising from ourselves, but this does not diminish the individuality of each moment, taken in a four-dimensional sense, of our existence as completely distinct and in no way displacing, replacing or creating any other experience we call Self. In the Eleatic system, nothing moves, rather motion is a delusion of consciousness resulting from the confusion of memory objects with sensual objects and with objects of precognition, or expectancies all of which coexist not only with each other but with that which they symbolize to consciousness. We have in our thoughts memories of a ball, sight of a “moving ball” and the precognition of it further on in its motion. However, to the Eleatics there is no one ball in the noumenal world, but rather a series of distinct objects confused in phenomenal language and images of memory objects, sensual object and objects of precognition as if one object moving. To the Eleatics, the conscious images of memories of the ball, sight of the ball, and precognition of the continued flight of the ball coexist with infinite distinct objects one calls the ball in motion and these are linked not in time, but simply are the structure of things which never changes and always exists. A super-consciousness linked to all things “past”, “present” and “future”—all of which coexist—would have the power of absolute cognition and “precognition”, though would seemingly be powerless to affect change or have freedom of will, a deficiency all creatures suffer in this belief system.

The Cabalistic Jews who spread their message to influential persons across Europe kept this Eleatic belief system alive to this day. In a somewhat different sense from the above, God being presumed omnipresent, Archbishop John Tillotson stated in his Sermons,

“God sees and knows future things by the presentiality and coexistence of all things in eternity[.]

Samuel Clarke stated in a sermon in 1704,

“V. Though the Substance or Essence of the Self-Existent Being, is it self
absolutely Incomprehensible to us; yet many of the Essential Attributes of his Nature, are strictly Demonstrable, as well as his Existence. {Margin note: That the Self-existent Being must be Eternal.} Thus, in the first place, the Self-Existent Being must of Necessity be Eternal. The Idea’s of Eternity and Self-Existence are so closely connected, that because Something must of necessity be Eternal *Independently and without any outward Cause of its Being*, therefore it must necessarily be Self-existent; and because ’tis impossible but Something must be Self-existent, therefore ’tis necessary that it must likewise be Eternal. To be Self-existent, is (as has been already {pag. 527, 528;} shown) to Exist by an Absolute Necessity in the Nature of the Thing itself. Now this Necessity being Absolute, and not depending upon any thing External, must be always unalterably the same; Nothing being alterable but what is capable of being affected by somewhat without itself. That Being therefore, which has no other Cause of its Existence, but the absolute Necessity of its own Nature; must of necessity have existed from everlasting, without Beginning; and must of necessity exist to everlasting without End.

As to the Manner of this Eternal Existence; ’tis manifest, it herein infinitely transcends the Manner of the Existence of all Created Beings, even of such as shall exist for ever; that whereas ’tis not possible for Their finite Minds to comprehend all that is past, or to understand perfectly all things that are at present, much less to know all that is future, or to have entirely in their Power any thing that is to come; but their Thoughts, and Knowledge, and Power, must of necessity have degrees and periods, and be successive and transient as the Things Themselves: The Eternal, Supreme Cause, on the contrary, (supposing him to be an Intelligent Being, which will hereafter be proved in the Sequel of this Discourse,) must of necessity have such a perfect, independent and unchangeable Comprehension of all Things, that there can be no One Point or Instant of his Eternal Duration, wherein all Things that are past, present, or to come, will not be as entirely known and represented to him in one single Thought or View; and all Things present and future, be equally entirely in his Power and Direction; as if there was really no Succession at all, but all things were actually present at once. Thus far we can speak Intelligibly concerning the Eternal Duration of the Self-existent Being; And no Atheist can say this is an Impossible, Absurd, or Insufficient Account. {Of the Manner of our Conceiving the Eternity of God.} It is, in the most proper and Intelligible Sense of the Words, to all the purposes of Excellency and Perfection, *Interminabilis vitae tota simul & perfecta possessio*: the Entire and Perfect Possession of an endless Life.

Others have supposed that the Difference between the Manner of the Eternal Existence of the Supreme Cause, and that of the Existence of created Beings, is this: That, whereas the latter is a continual transient *Succession of Duration*; the former in *one Point or Instant* comprehending Eternity, and wherein all Things are really co-existent. {With respect to Succession.} But this Distinction I shall not now insist upon, as being of no Use in the present
Dispute; because ’tis impossible to prove and explain it in such a manner, as ever to convince an Atheist that there is any thing in it. And besides: As, on the one hand, the Schoolmen have indeed generally chosen to defend it: so on the other hand there

I shall not trouble you with the inconsistent and unintelligible Notions of the Schoolmen; that it [the Eternity of God] is duratio tota simul, in which we are not to conceive any Succession, but to imagine it an Instant. We may as well conceive the Immensity of God to be a Point, as his Eternity to be an Instant. — And how That can be together, which must necessarily be imagined to be co-existent to Successions; let them that can, conceive. Archbishop Tillotson, Vol. VII. Serm. 13.

Others say, God sees and knows future Things by the presentiality and co-existence of all Things in Eternity; For they say, that future Things are actually present and existing to God, though not in mensura propria, yet in mensura aliena. The Schoolmen have much more of this Jargon and canting Language. I envy no Man the understanding these Phrases: But to me they seem to signify nothing, but to have been Words invented by idle and conceited Men; which a great many ever since, lest they should seem to be ignorant, would seem to understand. But I wonder most, that Men, when they have amused and puzzled themselves and others with hard Words, should call this Explaining Things. Archbishop Tillotson, Vol. VI. Serm. 6.]

are many Learned Men, of far better Understanding and Judgment, who have rejected and opposed it.]

Continuing the Eleatic-Cabalistic themes of Isaac Newton through Samuel Clarke, David Hartley wrote, inter alia, in 1749,

“For all Time, whether past, present, or future, is present Time in the Eye of God, and all Ideas coalesce into one to him; and this one is infinite Happiness, without and Mixture of Misery, viz. by the infinite Prepollence of Happiness above Misery, so as to annihilate it; and this merely by considering Time as it ought to be considered in Strictness, i. e. as a relative Thing, belonging to Beings of finite Capacities, and varying with them, but which is infinitely absorbed in the pure Eternity of God.”

Adopting the notion of “space-time”, the question of how this awareness incorporating memory, immediate awareness and precognition “came to be” ceases to have meaning. The investigation shifts to the interconnectedness of these diverse things we call through an illusion of words the same thing at different times and
implies a direct connection generating consciousness of past, present and future as sense experience. Under such a system we can sense future and past objects with the same facility by which we sense present objects, in that if we correctly conceive of them then nature has as a matter of course linked us to them as our fate, which is ever present and unchanging.

This exposes far greater interconnectivity, and yet diversity, between the phenomenal and the noumenal, than the Materialists and the Idealists were able to imagine. According to Eleatic space-time theories, when I throw a baseball from here to there, one set of particles does not move from here to there through space and time. Rather, time and space are conceptualized in consciousness to order the human image of the “motion” of “the baseball”, which is instead one set of particles here, and a completely distinct set of particles, or body, there, both of which exist “forever”. Motion does not exist. What we conceptualize as a baseball in flight is instead a series of distinct objects (no two ever exactly alike), which we imagine to be the same baseball in motion through an illusion of consciousness—and our awareness of these things is not drawn from memory nor rationalized, but is our Self at that moment as a timeless construct of images—just as my hand at this “moment” is not composed of memories but is a timeless structure in itself. This Teichmüller-like world precludes the possibility of Minkowski’s “world-lines”, because the rail holding together the point-like ties on this railroad is supplied by consciousness, which incorrectly denies the individuality of each point in an invalid Gestalt linkage.

In 1895, Edmund Montgomery wrote,

“What we perceive, all, in fact, we are in any way aware of, has only momentary existence. This not, as may perhaps be thought, in the sense that the next moment it has become transformed into something else; but in the unambiguous sense that it ceases to be anything whatever.

This utter evanescence of all that appears to us in time and space contradicts flagrantly the fundamental maxim, that nothing in existence can ever be brought wholly to naught, that complete extinction of what was once in existence is inconceivable. Yet no fact in nature is more certain, or of more frequent occurrence. Total annihilation from moment to moment is what actually takes place in the world we are conscious of.

All through life the conscious awareness of ourselves and of things in general fills only that single moment of duration we designate as ‘the present.’ Whatever has made up consciousness the moment before has, as such, for ever vanished out of being. And whatever content may rise into conscious existence the following moment is evidently as yet non-existent. What we are conscious of as existing, our own selves and the world perceived by us, is in verity, all in all, a constant creation fashioned out of precisely such stuff as dreams are made of. And who will seriously maintain that dream-pageantry has any sort of permanent existence?

Of course, something inside and outside of us seems, nevertheless, in some way identically to endure. But this is certainly not something ever forming part of what is consciously present to us. At present, for instance, I
perceive a window through the interstices of whose shutters sunlight is streaming into the room. Closing my eyes the very same perceived window—technically called an after-image—remains distinctly visible. Soon, however, it fades, and, at last, vanishes altogether. Who can deny that this special perceptual object has dwindled for ever into nothingness? Reopening my eyes, what is generally taken to be the same window is again perceived. But, surely, the window I now perceive, the window now forming part of my conscious content, cannot possibly be the same window that had completely faded away as a conscious existent after I had closed my eyes a little while ago.

In exactly the same manner the entire content, which makes up consciousness at any given moment, vanishes the next instant, irreparably, into non-existence.

Should at any future moment some apparently identical constituent of consciousness rise again into present awareness, it can nevertheless in nowise be the identical constituent that was present before, but must of necessity be newly produced. The apparently identical window consciously present to me on reopening my eyes was in reality an altogether newly produced perceptual object.

How produced?—This exactly is the burning question the widely disparate answers to which are dividing thinkers into essentially opposed schools of thought. That much, at least, is certain: our entire life-experience, all we have ever felt and seen, is never otherwise consciously present to us than only as an ever-renewed creation, condensed into transitory moments of simultaneous awareness.

To conceive, as is often done, the succession of such moments of awareness in the likeness of a thread, a stream, a series of conscious states, is to overlook completely their evanescent nature. A strange thread this, having next to no length, the one end of which vanishes the moment after it has been spun from out some invisible source of supply, and the other end of which has to be made out of material not yet in existence.

Our moment of conscious awareness, never identical, but constantly reproduced, if it adequately contained the totality of possible experience, instead of consisting merely of its most partial and remotely symbolical representation; and if it unremittingly endured, instead of emerging in casual and fitful glimpses; then such permanent totality of conscious content would indeed constitute what philosophers have conceived as the "eternal now," the all-comprising 'punctum stans' of being.

Even then, enjoying such phenomenal omniscience, we should feel compelled to enquire after the hidden source of emanation which was creatively underlying this ever renewed totality of conscious awareness'. Pure philosophical Phenomenism proves itself all too shadowy to its own votaries. They likewise assume some kind of noumenal matrix.”

The Eleatics resolved the dilemmas posed by Montgomery, but they did so
through absolute multiplicity, not through the rearrangement of permanent particles of Minkowski space. The many windows Montgomery proposes each exist and are not annihilated nor displaced, rather he is a multiplicity of consciousnesses each with its own objects, its own sense of past, present and future; each never created nor destroyed, but each feeling that it is changing. This is how we are formed in the Universe of being, to feel as if we are fleeting spirits, when we are rather multiplicity, distinct from ourselves from “moment” to “moment” not only in form, but in substance, if any distinction is to be had between the two. Are there then observable connections to the memories and premonitions which make up these individual existences? Can one detach from one course and couple to another? Surely the link to the “past” can be severed in the multiplicity—one can forget—and it is a radical view to hold that prophesy is as much a physical manifestation as memory, but these are the logical conclusions of this belief system. It affords much food for thought.

Fechner saw his immortality in this quadri-dimensional vision, because he saw each moment of his life as permanent and coexistent. Venn, Wells, and Welby saw in it the possibility of “time travel”. Though the Universe is a block for them, they should fear no contradiction that Nature might not permit in one of its aspects a clever soul to formulate a means to become aware of another set of images. But they must abandon the notion of a permanent Urstoff rearranging itself in new forms in a time dimension, and a permanent soul as one witness of its life, other than in name alone; and realize the multiplicity which composes the substratum and the Self.

In most æther theories recourse is again had to a permanent æther, our bodies are moving through this æther as a series of wave forms, substance and form left behind in time to become the wave at the shore which was once the wave far off at sea, the water comprising the wave left behind as the mere carrier of the changing form which walks as “energy” through the medium, the way the winds shows its face in a rippling flag. Hendrik Antoon Lorentz stated in 1906,

“We shall add the hypothesis that, though the particles may move, the ether always remains at rest. We can reconcile ourselves with this, at first sight, somewhat startling idea, by thinking of the particles of matter as of some local modifications in the state of the ether. These modifications may of course very well travel onward while the volume-elements of the medium in which they exist remain at rest.”

There are inadequacies in all these fictions. Edmund Montgomery wrote in 1885,

“No natural fact could be more plain and immediately certain than that you see a friend bowing to you. But is not the human form you perceive undeniably your own percept, and the movement of its head but one of those changes in the percept called vital functions? And are not these perceptual data the only manifestations present to you as percipient subject. Where then is the veritable person who recognised you and expressed this recognition by a friendly bow? Materialism and Idealism are equally far from being able to
account for the veritable nature of this necessarily assumed existent. How
infantile our little attempts at world-explanation must still be considered,
may come home to us if we remember that our most prominent scientists still
look upon the perceptual representations of their own consciousness as the
veritable foreign existents whose intimate nature they are investigating;
endeavouring to express it in terms of imagined world-stuff can be truly
nothing but shifting points of evanescent feeling, by them however
hypostatised in permanency as adamantine atoms with eternal motion.

If there is an æther, it has environmentalist implications, as well as metaphysical
implications. Changing the environment creates new entities, potentially so very
unlike what existed before (or need one say “what exists elsewhere”?) as to make us
other than what we consider to be human. The illusory surety of Self and the pretense
of a permanent substratum are perhaps a dangerous form of complacency. Can not
the waves within the “æther” be damaged, and with the sea so polluted, what will
become of us?

As to the falsifiability of “space-time” theories, Lotze wrote,

“157. I should not be surprised if the view which I thus put forward met with
an invincible resistance from the imagination. The unconquerable habit,
which will see nothing wonderful in the primary grounds of things but insists
on explaining them after the pattern of the latest effects which they alone
render possible, must here at last confess to being confronted by a riddle
which cannot be thought out. What exactly happens—such is the question
which this habit will prompt—when the operation is at work or when the
succession takes place, which is said to be characteristic of the operative
process? How does it come to pass—what makes it come to pass—that the
reality of one state of things ceases, and that of another begins? What process
is it that constitutes what we call perishing, or transition into not-being, and
in what other different process consists origin or becoming?

That these questions are unanswerable—that they arise out of the wish
to supply a prius to what is first in the world—this I need not now repeat: but
in this connexion they have a much more serious background than elsewhere,
for here they are ever anew excited by the obscure pressure of an
unintelligibility, which in ordinary thinking we are apt somewhat carelessly
to overlook. We lightly repeat the words ‘bygones are bygones’; are we quite
conscious of their gravity? The teeming Past, has it really ceased to be at all?
Is it quite broken off from connexion with the world and in no way preserved
for it? The history of the world, is it reduced to the infinitely thin, for ever
changing, strip of light which forms the Present, wavering between a
darkness of the Past, which is done with and no longer anything at all, and
a darkness of the Future, which is also nothing? Even in thus expressing
these questions, I am ever again yielding to that imaginative tendency, which
seeks to soften the ‘monstrum infandum’ which they contain. For these two
abysses of obscurity, however formless and empty, would still be there. They
would always form an environment which in its unknown within would still
afford a kind of local habitation for the not-being, into which it might have
disappeared or from which it might come forth. But let any one try to
dispense with these images and to banish from thought even the two voids,
which limit being: he will then feel how impossible it is to get along with the
naked antithesis of being and not-being, and how unconquerable is the
demand to be able to think even of that which is not as some unaccountable
constituent of the real.

Therefore it is that we speak of distances of the Past and of the Future,
covering under this spatial image the need of letting nothing slip completely
from the larger whole of reality, though it belong not to the more limited
reality of the Present. For the same reason even those unanswerable questions
as to the origin of Becoming had their meaning. So long as the abyss from
which reality draws its continuation, and that other abyss into which it lets
the precedent pass away, shut in that which is on each side, so long there may
still be a certain law, valid for the whole realm of this heterogeneous system,
according to the determinations of which that change takes place, which on
the other hand becomes unthinkable to us, if it is a change from nothing to
being and from being to nothing. Therefore, though we were obliged to give
up the hopeless attempt to regard the course of events in Time merely as an
appearance, which forms itself within a system of timeless reality, we yet
understand the motives of the efforts which are ever being renewed to
include the real process of becoming within the compass of an abiding
reality. They will not, however, attain their object, unless the reality, which
is greater than our thought, vouchsafes us a Perception, which, by showing
us the mode of solution, at the same time persuades us of the solubility of
this riddle. I abstain at present from saying more on the subject. The ground
afforded by the philosophy of religion, on which efforts of this kind have
commonly begun, is also that on which alone it is possible for them to be
continued."
Mileva Einstein-Marity and Albert Einstein published a paper in 1905, in which they unsuccessfully attempted to derive the world famous equation $E = mc^2$ by fallacy of Petitio Principii. The Einsteins did not realize the full significance of this equation, were not the first to publish it, and learned of it from Henri Poincaré’s and Fritz Hasenöhrl’s published works. Albert Einstein was repeatedly confronted with accusations of his plagiarism of this formula throughout his career.

“The relation $E = mc^2$ not derived by Einstein.”—HERBERT IVES

16.1 Introduction

Contrary to popular myth, Einstein did not usher in the atomic age. In fact, he found the idea of atomic energy to be silly. Einstein was not the first person to state the mass-energy equivalence, or $E = mc^2$. Myths such as Einstein’s supposed discoveries are not uncommon. Newton did not discover gravity, nor did he offer a viable explanation for it, nor did he believe that matter attracted other matter. Consider that few in his time knew that President Roosevelt was severely handicapped, being limited to a wheelchair, and the press cooperated in keeping Roosevelt’s disability a secret. Is it difficult to believe that this same press presented Albert Einstein as a super-hero of science, when he was in fact less than that, much less? It was a good story for them to sell. Einstein wrote to Sommerfeld,

“It is a bad thing that every utterance of mine is made use of by journalists as a matter of business.”

Einstein rarely gave filmed interviews, but when he did, he came across as something considerably less than a “genius”. Einstein’s public appearances were scripted as were his lectures. His public appearances were most often repetitions of his lectures. He appeared oblivious to the distinction between an academic lecture and a media event. He appeared rehearsed and incapable of adapting to his audience. The New York Times reported on 17 June 1930 on page 3 that Einstein spoke at the Kroll Opera House to 4,000 delegates of the World Power Conference. Einstein lectured them on Physics, as if it were a class he was hosting. In an article titled, “4,000 Bewildered as Einstein Speaks,” the New York Times reported,

“It was the first time Dr. Einstein had ever consented to speak on Einstein, and it was the first serious public utterance he ever made without recourse to gigantic equations and mystifying mathematics. [...] He gestured sometimes with his hands, indicating how clear and obvious his reasoning was, and occasionally he looked up from his paper to smile upon his intent
hearers who, he seemed to assume, were grasping everything.”

Einstein appeared to be an actor giving a performance.

The physics community and the media invented a comic book figure, “Einstein”, with “\( E = mc^2 \)” stenciled across his chest. The media and educational institutions portray this surreal and farcical image as a benevolent god to watch over us. Some modern portraits depict the man with a godly glow and all the other visual cues inspiring reverence, which paintings of Jesus have long exploited. Physics, as an institution, fostered the myth, and countless people in all walks of life have since molded themselves in the comic book image of “Einstein”, replete with the Flammarion hairdo and the Twainesque mustachio. “More Einsteinisch than he,” they pretend to the great “Einstein’s” supposed supernatural powers, and imitate his comic book persona. For some, Einstein (often together with Marx and Freud) is seen as a source of tremendous ethnic pride.

To question “Einstein”, the god, either “his” theories, or the priority of the thoughts he repeated, has become the sin of heresy. “His” writings are synonymous with truth, the undecipherable truth of a god hung on the wall as a symbol of ultimate truth, which truth is elusive to mortal man. No one is to understand or to question the arcana of “Einstein”, but must let the shepherd lead his flock, without objection. Do not bother the believers with the facts!

R. S. Shankland stated,

“About publicity Einstein told me that he had been given a publicity value which he did not earn. Since he had it he would use it if it would do good; otherwise not.”  

Albert Einstein stated on 27 April 1948,

“In the course of my long life I have received from my fellow-men far more recognition than I deserve, and I confess that my sense of shame has always outweighed my pleasure therein.”  

Albert Einstein told Peter A. Bucky,

“Peter, I fully realize that many people listen to me not because they agree with me or because they like me particularly, but because I am Einstein. If a man has this rare capacity to have such esteem with his fellow men, then it is his obligation and duty to use this power to do good for his fellow men.”

Einstein “had been given a publicity value which he did not earn” so that he could promote political Zionism among Jews. Political Zionism is a racist movement among Jews meant to segregate Jews in Palestine in order to end the assimilation of Jews into other cultures and “races”. In 1919, most Jews opposed this racist movement and the Zionists needed a famous spokesman to help overcome this
Albert Einstein confided to his old friend and confidant Michele Besso, on 12 December 1919, that he planned to attend a Zionist conference dedicated to founding a Hebrew university in Palestine. Einstein wrote,

“The reason I am going to attend is not that I think I am especially well qualified, but because my name, in high favor since the English solar eclipse expeditions, can be of benefit to the cause by encouraging the lukewarm kinsmen.”

16.2 The “Quantity of Motion”—Momentum, Vis Viva and Kinetic Energy

Consider briefly the mass-energy equivalence. Huyghens and Leibnitz presented the quantity of motion, *vis viva*, energy, $E = mv^2$, as opposed to the Aristotelian-Cartesian-Newtonian quantity of motion, $p = mv$. This mathematical identity between energy and mass, $E = mv^2$, is the mass-energy equivalence, stated as a circle function, and “celeritas”, “$c$”, is simply one state of relative velocity—a particular case of “velocity”, “$v$”.

16.3 The Atom as a Source of Energy and Explosive Force

Isaac Newton asked if mass is convertible into light, and wondered if light might be subject to gravity. From Newton’s *Opticks*,

“QUERY 1. Do not bodies act upon light at a distance, and by their action bend its rays; and is not this action (*caeteris paribus*) strongest at the least distance?”

and,

“QUERY 30. Are not gross bodies and light convertible into one another, and may not bodies receive much of their activity from the particles of light which enter their composition? [***] The changing of bodies into light, and light into bodies, is very conformable to the course of Nature, which seems delighted with transmutations. [***] why may not Nature change bodies into light, and light into bodies?”

S. Tolver Preston answered Newton’s queries with a loud, “Yes!” In anticipation of Thomson, De Pretto and the Einsteins, S. Tolver Preston formulated atomic energy, the atomic bomb and superconductivity back in the 1870's, based on the formula for *vis viva* $E = mc^2$, and the formula for *kinetic* energy $E = \frac{1}{2}mc^2$, where *celeritas*, “$c$”, signifies the speed of light. Pursuing George-Louis Le Sage’s theory, Preston believed that if mass could be attenuated into æther and acquire the normal velocity of æther particles, it would represent a tremendous store of energy;
since æther particles move at light speed—a limiting velocity, the \( \text{vis viva} \) is equal to mass times the square of the speed of light and the kinetic energy is equal to one half of the mass times the square of the speed of light.

In the 1700’s, George-Louis Le Sage proposed that gravity may propagate at light speed, in anticipation of the general theory of relativity,

““How much less therefore would they be perceived if we assume for the [gravitational] corpuscles the velocity of light, which is nine hundred thousand times as great as that of sound.”"\(^{3371}\)

The \( \text{vis viva} \) of these corpuscles is \( E = mc^2 \).

As but one example of Preston’s amazing anticipation of 20\(^{th}\) Century technology, and the powerful heuristic value of the æther-matter-energy hypothesis, Preston calculated the kinetic energy of masses moving at light speed:

“165. To give an idea, first, of the enormous intensity of the store of energy attainable by means of that extensive state of subdivision of matter which renders a high normal speed practicable, it may be computed that a quantity of matter representing a total mass of only one grain, and possessing the normal velocity of the ether particles (that of a wave of light), encloses a store of energy represented by upwards of one thousand millions of foot-tons, or the mass of one single grain contains an energy not less than that possessed by a mass of forty thousand tons, moving at the speed of a cannon ball (1200 feet per second); or otherwise, a quantity of matter representing a mass of one grain endued with the velocity of the ether particles, encloses an amount of energy which, if entirely utilized, would be competent to project a weight of one hundred thousand tons to a height of nearly two miles (1.9 miles).”\(^{3372}\)

Preston stated in 1883,

“Let us not deviate from the well-tried ground of the atomic constitution of matter, already won with so much labour, unless we are forced to do so, and let us work towards the great generalisation of the Unity of Matter and of Energy.”\(^{3373}\)

Einstein stated on 21 September 1909,

“The theory of relativity has thus changed our views on the nature of light insofar as it does not conceive of light as a sequence of states of a hypothetical medium, but rather as something having an independent existence just like matter. Furthermore, this theory shares with the corpuscular theory of light the characteristic feature of a transfer of inertial mass from the emitting to the absorbing body. Regarding our conception of the structure of light, in particular of the distribution of energy in the
irradiated space, the theory of relativity did not change anything.\footnote{3374}

The mathematical and metaphysical identity of matter and energy is the product of an ancient search for an \textit{Urstoff}, the fundamental stuff of the universe, a search critically analyzed by John E. Boodin.\footnote{3375} What is that something which we call "matter"? From at least the time of Thales onward this fundamental stuff of the Universe was seen by some as æther with our minds construing form from the motions in this hypothetical æther. Energy was an attribute of æther, the continuity of its motions. This evolved in the Monistic philosophy popular in the 1800's into the notion of the multiplicity of the Universe, with one identity, energy and matter as the conscious image of motion, which exist in the human mind as illusion drawn from multiplicity. A baseball "in motion" is not one thing which flies from place to place, but is a multiplicity of things we call "a baseball", but which is not the same stuff from place to place, all things being coexistent forever. J. J. Thomson reawoke an interest in atomism, and defined the identity he proposed between energy and matter, as the motion of the æther, leading many to the conclusion (Einstein sometimes supported, sometimes opposed) that, as John E. Boodin stated in 1908,

"The atom is no longer regarded as eternal and indifferent, but is the storehouse of pent-up energy of enormous quantity, though, as in the case of radium, it may be in a very unstable equilibrium."\footnote{3376}

Albert and Mileva also agreed with Newton’s corpuscular hypothesis, but without realizing its implications,

“When a body emits the energy $L$ in the form of radiation, it thereby reduces its mass by $\frac{L}{c^2}$."

“Gibt ein Körper die Energie $L$ in Form von Strahlung ab, so verkleinert sich seine Masse um $\frac{L}{v^2}$.\footnote{3377}"

On 15 December 1919, \textit{The New York Times} wrote on page 14:

\textbf{“Obviously a Rash Prophecy.”}

As it was before the Royal Society that Sir Oliver Lodge last week discussed atomic energies and the possibilities they offer, it is to be presumed that he spoke with some care. Yet, when he prophesied that within a century the power now derived from burning 1,000 tons of coal would be obtained by setting free the force latent in two ounces of some unnamed substance, one cannot help remembering that Sir Oliver has two personalities—that he is an eminent scientist and a credulous listener to ‘mediums.’

That the atoms, instead of being mere ultimate divisions of dead matter, are alive with force nobody now doubts, but it seems hardly scientific to emphasize as Sir Oliver did the astonishing velocity at which move the
missiles which some atoms shoot out without at the same time calling attention to the size of the missiles. He knows, of course, the formulae relating to speed, mass, and momentum, and that to get any appreciable amount of ‘work’ done by the radium particles he described it would seem that they would have to move far more rapidly than they do. And a way to harness them is hardly imaginable, as yet.”

As opposed to Lodge, Albert Einstein believed that atomic energy could not be harnessed. Moszkowski, who wrongfully attributes priority for first formulating \( E = mc^2 \) to Einstein, wrote an interesting and historically significant chapter in his book *Einstein: The Searcher*, which I reproduce here in its entirety. Sir Oliver Lodge, Alexander Wilhelm Pflüger, and Alexander Moszkowski had discussed the possibility of using the atom as a source of power, which idea Albert Einstein rejected. Moszkowski’s book is but one of many examples where Einstein tended to discount the possibility of harnessing the power of the atom, contrary to the modern misleading impression one receives from the media and large segments of the Physics community that he was the father of the idea. However, all of these works are derivative of H. G. Wells’ *The World Set Free: A Story of Mankind*, Macmillan, London, (1914); also publish in Leipzig, Germany by B. Tauchnitz; and Frederick Soddy’s *The Interpretation of Radium* of 1909 produced from lectures given in 1908. Alexander Moszkowski wrote in 1921,

“CHAPTER II

BEYOND OUR POWER

Useful and Latent Forces.—Connexion between Mass, Energy, and Velocity of Light.—Deriving Power by Combustion—One Gramme of Coal.—Unobtainable Calories—Economics of Coal.—Hopes and Fears.—Dissociated Atoms.

29th March 1920

We spoke of the forces that are available for man and which he derives from Nature as being necessary for his existence and for the development of life. What forces are at our disposal? What hopes have we of elaborating our supply of these forces?

Einstein first explained the conception of energy, which is intimately connected with the conception of mass itself. Every amount of substance (I am paraphrasing his words), the greatest as well as the smallest, may be regarded as a store of power, indeed, it is essentially identical with energy. All that appears to our senses and our ordinary understanding as the visible, tangible mass, as the objective body corresponding to which we, in virtue of our individual bodies, abstract the conceptual outlines, and become aware of the existence of a definite copy is, from the physical point of view, a complex
of energies. These in part act directly, in part exist in a latent form as strains
which, for us, begin to act only when we release them from their state of
strain by some mechanical or chemical process, that is, when we succeed in
converting the potential energy into kinetic energy. It may be said, indeed,
that we have here a physical picture of what Kant called the ‘thing in itself.’
Things as they appear in ordinary experience are composed of the sum of our
direct sensations; each thing acts on us through its outline, colour, tone,
pressure, impact, temperature, motion, chemical behaviour, whereas the thing
in itself is the sum-total of its energy, in which there is an enormous
predominance of those energies which remain latent and are quite
inaccessible in practice.

But this ‘thing in itself,’ to which we shall have occasion to refer often
with a certain regard to its metaphysical significance, may be calculated. The
fact that it is possible to calculate it takes its origin, like many other things
which had in no wise been suspected, in Einstein’s Theory of Relativity.

Quite objectively and without betraying in the slightest degree that an
astonishing world-problem was being discussed, Einstein expressed himself
thus:

‘According to the Theory of Relativity there is a calculable relation
between mass, energy, and the velocity of light. The velocity of light
(denoted by \( c \), as usual) is equal to \( 3 \times 10^{10} \) cm. per second. Accordingly the
square of \( c \) is equal to 9 times \( 10^{20} \) cm. per second, or, in round numbers, \( 10^{21} \)
 cm. per second. This \( c^2 \) plays an essential part if we introduce into the
calculation the mechanical equivalent of heat, that is, the ratio of a certain
amount of energy to the heat theoretically derivable from it; we get for each
gramme \( 20 \times 10^{12} \) that is, 20 billion calories.’

We shall have to explain the meaning of this brief physical statement in
its bearing on our practical lives. It operates with only a small array of
symbols, and yet encloses a whole universe, widening our perspective to a
world-wide range!

To simplify the reasoning and make it more evident we shall not think of
the conception of substance as an illimitable whole, but shall fix our ideas on
a definite substance, say coal.

There seems little that may strike us when we set down the words:
‘One Gramme of Coal.’

We shall soon see what this one gramme of coal conveys when we
translate the above-mentioned numbers into a language to which a meaning
may be attached in ordinary life. I endeavoured to do this during the above
conversation, and was grateful to Einstein for agreeing to simplify his
argument by confining his attention to the most valuable fuel in our
economic life.

Once whilst I was attending a students’ meeting, paying homage to
Wilhelm Dove, the celebrated discoverer took us aback with the following
remark: When a man succeed in climbing the highest mountain of Europe
he performs a task which, judged from his personal point of view, represents something stupendous. The physicist smiles and says quite simply, ‘Two pounds of coal.’ He means to say that by burning 2 lb. of coal we gain sufficient energy to lift a man from the sea-level to the summit of Mont Blanc.

It is assumed, of course, that an ideal machine is used, which converts the heat of combustion without loss into work. Such a machine does not exist, but may easily be imagined by supposing the imperfections of machines made by human hands to be eliminated.

Such effective heat is usually expressed in calories. A calorie is the amount of heat that is necessary to raise the temperature of a gramme of water by one degree centigrade. Now the theorem of the Mechanical Equivalent, which is founded on the investigations of Carnot, Robert Mayer, and Clausius, states that from one calorie we may obtain sufficient energy to lift a pound weight about 3 feet. Since 2 lb. of coal may be made to yield 8 million calories, they will enable us to lift a pound weight through 24 million feet, theoretically, or, what comes to the same approximately, to lift a 17-stone man through 100,000 feet, that is, nearly 19 miles: this is nearly seven times the height of Mont Blanc.

At the time when Dove was lecturing, Einstein had not yet been born, and when Einstein was working out his Theory of Relativity, Dove had long passed away, and with him there vanished the idea of the small value of the energy stored in substance to give way to a very much greater value of which we can scarce form an estimate. We should feel dumbfounded if the new calculation were to be a matter of millions, but actually we are to imagine a magnification to the extent of billions. This sounds almost like a fable when expressed in words. But a million is related to a billion in about the same way as a fairly wide city street to the width of the Atlantic Ocean. Our Mont Blanc sinks to insignificance. In the above calculation it would have to be replaced by a mountain 50 million miles high. Since this would lead far out into space, we may say that the energy contained in a kilogramme of coal is sufficient to project a man so far that he will never return, converting him into a human comet. But for the present this is only a theoretical store of energy which cannot yet be utilized in practice.

Nevertheless, we cannot avoid it in our calculations just as we cannot avoid that remarkable quantity \( c \), the velocity of light that plays its part in the tiny portion of substance as it does in everything, asserting itself as a regulative factor in all world phenomena. It is a natural constant that preserves itself unchanged as 180,000 miles per second under all conditions, and which truly represents what appeared to Goethe as ‘the immovable rock in the surging sea of phenomena,’ as a phantasm beyond the reach of investigators.

It is difficult for one who has not been soaked in all the elements of physical thought to get an idea of what a natural constant means; so much the more when he feels himself impelled to picture the constant, so to speak, as
the rigid axis of a world constructed on relativity. Everything, without exception, is to be subjected not only to continual change (and this was what Heraditus assumed as a fundamental truth in his assertion *panta rhei*, everything flows), but every length-measurement and time-measurement, every motion, every form and figure are dependent on and change with the position of the observer, so that the last vestige of the absolute vanishes from whatever comes into the realm of observation. Nevertheless, there is an absolute despot, who preserves his identity inflexibly among all phenomena—the velocity of light, \( c \), of incalculable influence in practice and yet capable of measurement. Its nature has been characterized in one of the main propositions of Einstein stated in 1905: ‘Every ray of light is propagated in a system at rest with a definite, constant velocity independent of whether the ray is emitted by a body at rest or in motion.’ But this constancy of the omnipotent \( c \) is not only in accordance with world relativity: it is actually the main pillar which supports the whole doctrine; the further one penetrates into the theory, the more clearly does one feel that it is just this \( c \) which is responsible for the unity, connectivity, and invincibility of Einstein’s world system.

In our example of the coal, from which we started, \( c \) occurs as a square, and it is as a result of multiplying 300,000 by itself (that is, forming \( c^2 \)) that we arrive at the thousands of milliards of energy units which we associated above with such a comparatively insignificant mass. Let us picture this astounding circumstance in another way, although we shall soon see that Einstein clips the wings of our soaring imagination. The huge ocean liner *Imperator*, which can develop a greater horsepower than could the whole of the Prussian cavalry before the war, used to require for one day’s travel the contents of two very long series of coal-trucks (each series being as long as it takes the strongest locomotive to pull). We now know that there is enough energy in two pounds of coal to enable this boat to do the whole trip from Hamburg to New York at its maximum speed.

I quoted this fact, which, although it sounds so incredibly fantastic, is quite true, to Einstein with the intention of justifying the opinion that it contained the key to a development which would initiate a new epoch in history and would be the panacea of all human woe. I drew an enthusiastic picture of a dazzling Utopia, an orgy of hopeful dreams, but immediately noticed that I received no support from Einstein for these visionary aspirations. To my disappointment, indeed, I perceived that Einstein did not even show a special interest in this circumstance which sprang from his own theory, and which promised such bountiful gifts. And to state the conclusion of the story straight away I must confess that his objections were strong enough not only to weaken my rising hopes, but to annihilate them completely.

Einstein commenced by saying: ‘At present there is not the slightest indication of when this energy will be obtainable, or whether it will be obtainable at all. For it would presuppose a disintegration of the atom
effected at will—a shattering of the atom. And up to the present there is scarcely a sign that this will be possible. We observe atomic disintegration only where Nature herself presents it, as in the case of radium, the activity of which depends upon the continual explosive decomposition of its atom. Nevertheless, we can only establish the presence of this process, but cannot produce it; science in its present state makes it appear almost impossible that we shall ever succeed in so doing.’

The fact that we are able to abstract a certain number of calories from coal and put them to practical use comes about owing to the circumstance that combustion is only a molecular process, a change of configuration, which leaves fully intact the atoms of which the molecules are composed. When carbon and oxygen combine, the elementary constituent, the atom, remains quite unimpaired. The above calculation, ‘mass multiplied by the square of the velocity of light,’ would have a technical significance only if we were able to attack the interior of the atom; and of this there seems, as I remarked, not the remotest hope.

Out of the history of technical science it might seem possible to draw on examples contradictory to this first argument which is soon to be followed by others equally important. As a matter of fact, rigorous science has often declared to be impossible what was later discovered to be within the reach of technical attainment—things that seem to us nowadays to be ordinary and self-evident. Werner Siemens considered it impossible to fly by means of machines heavier than air, and Helmholtz proved mathematically that it was impossible. Antecedent to the discovery of the locomotive the ‘impossible’ of the academicians played an important part; Stephenson as well as Riggenbach (the inventors of the locomotive) had no easy task to establish their inventions in the face of the general reproach of craziness hurled at them. The eminent physicist Babinet applied his mathematical artillery to demolish the ideas of the advocates of a telegraphic cable between Europe and America. Philipp Reis, the forerunner of the telephone, failed only as a result of the ‘impossible’ of the learned physicist Poggendorff; and even when the practical telephone of Graham Bell (1876) had been found to work in Boston, on this side of the Atlantic there was still a hubbub of ‘impossible’ owing to scientific reasons. To these illustrations is to be added Robert Mayer’s mechanical equivalent of heat, a determining factor in our above calculations of billions; it likewise had to overcome very strong opposition on the part of leading scientists.

Let us imagine the state of mankind before the advent of machines and before coal had been made available as a source of power. Even at that time a far-seeing investigator would have been able to discover from theoretical grounds the 8000 calories mentioned earlier and also their transformation into useful forces. He would have expressed it in another way and would have got different figures, but he would have arrived at the conclusion: Here is a virtual possibility which must unfortunately remain virtual, as we have no machine in which it can be used. And however far-sighted he may have
been, the idea of, say, a modern dynamo or a turbine-steamer would have been utterly inconceivable to him. He would not have dreamed such a thing. Nay, we may even imagine a human being of the misty dawn of prehistoric ages, of the diluvial period, who had suddenly had a presentiment of the connexion between a log of wood and the sun’s heat, but who was yet unaware of the uses of fire; he would argue from his primordial logic that it was not possible and never would be possible to derive from the piece of wood something which sends out warmth like the sun.

I believe now, indeed, that we have grounds for considering ourselves able to mark off the limits of possibility more clearly than the present position of science would seem to warrant. There is the same relation between such possibilities and absolute impossibilities as there is between Leibniz’s vérités de fait and the vérités éternelles. The fact that we shall never succeed in constructing a plane isosceles triangle with unequal base angles is a vérité éternelle. On the other hand, it is only a vérité de fait that science is precluded from giving mortal man eternal life. This is only improbable in the highest degree, for the fact that, up to the present, all our ancestors have died is only a finite proof. The well-known Cajus of our logic books need not die; the chances of his dying are only \( \frac{n}{n+1} \), where we denote the total of all persons that have passed away up to this moment by \( n \). If I ask a present-day authority in biology or medicine what evidence there is that it will be possible to preserve an individual person permanently from death, he would confess: not the slightest. Nevertheless, Helmholtz declared: ‘To a person who tells me that by using certain means the life of a person may be prolonged indefinitely I can oppose my extreme disbelief, but I cannot contradict him absolutely.’

Einstein himself once pointed out to me such very remote possibilities; it was in connexion with the following circumstance. It is quite impossible for a moving body ever to attain a velocity greater than that of light, because it is scientifically inconceivable. On the other hand, it is conceivable, and therefore within the range of possibility, that man may yet fly to the most distant constellations.

There is, therefore, no absolute contradiction to the notion of making available for technical purposes the billions of calories that occurred in our problem. As soon as we admit it as possible for discussion, we find ourselves inquiring what the solution of the problem could signify. In our intercourse we actually arrived at this question, and discovered the most radical answer in a dissertation which Friedrich Siemens has written about coal in general without touching in the slightest on these possibilities of the future. I imagine that this dissertation was a big trump in my hand, but had soon to learn from the reasoned contradiction of Einstein that the point at issue was not to be decided in this way.

Nevertheless, it will repay us to consider these arguments for a moment. Friedrich Siemens starts from two premises which he seemingly bases on
scientific reasoning, thus claiming their validity generally. They are: Coal is the measure of all things. The price of every product represents, directly or indirectly, the value of the coal contained in it.

As all economic values in over-populated countries are the result of work, and as work presupposes coal, capital is synonymous with coal. The economic value of each object is the sum-total of the coal that had to be used to manufacture the object in question. In over-populated states each wage is the value of the coal that is necessary to make this extra life possible. If there is a scarcity of coal, the wages go down in value; if there is no coal, the wages are of no value at all, no matter how much paper money be issued.

As soon as agriculture requires coal (this occurs when it is practised intensively and necessitates the use of railways, machines, artificial manures), coal becomes involved with food-stuffs. Thanks to industrialism, coal is involved in clothing and housing, too.

Since money is equivalent to coal, proper administration of finance is equivalent to a proper administration of coal resources, and our standard of currency is in the last instance a coal-currency. Gold as money is now concentrated coal.

The most advanced people is that which derives from one kilogramme of coal the greatest possibilities conducive to life. Wise statesmanship must resolve itself into wise administration of coal. Or, as it has been expressed in other words elsewhere: ‘We must think in terms of coal.’

These fundamental ideas were discussed, and the result was that Einstein admitted the premises in the main, but failed to see the conclusiveness of the inferences. He proved to me, step by step, that Siemens’ line of thought followed a vicious circle, and, by begging the question, arrived at a false conclusion. The essential factor, he said, is man-power, and so it will remain; it is this that we have to regard as the primary factor. Just so much can be saved to advantage as there is man-power available for purposes other than for the production of coal from which they are now released. If we succeed in getting greater use out of a kilogramme of coal by better management, then this is measurable in man-power, with which one may dispense for the mining of coal, and which may be applied to other purposes.

If the assertion: ‘Coal is the measure of all things,’ were generally valid, it should stand every test. We need only try it in a few instances to see that the thesis does not apply. For example, said Einstein: However much coal we may use, and however cleverly we may dispose of it, it will not produce cotton. Certainly the freightage of cotton-wool could be reduced in price, but the value-factor represented by man-power can never disappear from the price of the cotton.

The most that can be admitted is that an increase of the amount of power obtained from coal would make it possible for more people to exist than is possible at present, that is, that the margin of over-population would become extended. But we must not conclude that this would be a boon to mankind. ‘A maximum is not an optimum.’
He who proclaims the maximum without qualification as the greatest measure of good is like one who studies the various gases in the atmosphere to ascertain their good or bad effect on our breathing, and arrives at the conclusion: the nitrogen in the air is harmful, so we must double the proportion of oxygen to counteract it; this will confer a great benefit on humanity!

[Footnote: *The parts included between * . . . * are to be regarded as supplementary portions intended to elucidate the arguments involved in the dialogue. In many points they are founded on utterances of Einstein, but also contain reflections drawn from other sources, as well as opinions and inferences which fall to the account of the author, as already remarked in the preface. One will not get far by judging these statements as right or wrong, for even the debatable view may prove itself to be expeditious and suggestive in the perspective of these conversations. Wherever it was possible, without the connexion being broken, I have called attention to the parts which Einstein corrected or disapproved of. In other places I refrained from this, particularly when the subject under discussion demanded an even flow of argument. It would have disturbed the exposition if I had made mention of every counter-argument of the opposing side in all such cases while the explanation was proceeding along broad lines.]

*Armed with this striking analogy, we can now subject the foundation of Siemens’ theory to a new scrutiny, and we shall then discover that even the premises contain a trace of the *petitio principii* that finally receives expression in the radical and one-sided expression: ‘Coal is everything.’

As if built on solid foundations this first statement looms before us: Coal is solar energy. This is so far indisputable. For all the coal deposits that are still slumbering in the earth were once stately plants, dense woods of fern, which, bearing the burden of millions of years, have saved up for us what they had once extracted as nutrition from the sun’s rays. We may let the parallel idea pass without contention: In the beginning was not the Word, nor the Deed, but, in the beginning was the Sun. The energy sent out by the sun to the earth for mankind is the only necessary and inevitable condition for deeds. Deeds mean work, and work necessitates life. But we immediately become involved in an unjustifiable subdivision of the idea, for the propounder of the theory says next: ‘. . . Coal is solar energy, therefore coal is necessary if we are to work . . .’ and this has already thrust us from the paths of logic; the prematurely victorious ergo breaks down. For, apart from the solar energy converted into coal, the warmth of our mother planet radiates on us, and furnishes us with the possibility of work. Siemens’ conclusion, from the point of view of logic, is tantamount to: Graphite is solar energy; hence graphite is necessary, if we are to be able to work. The true expression of the state of affairs is: Coal is, for our present conditions of life, the most important, if not the exclusive, preliminary for human work.

And when we learn from political economy that “in a social state only the necessary human labour and the demand for power-installations which
require coal, and hence again labour for their production, come into question,’ this in no way implies the assertion, as Siemens appears to assume, that coal can be made out of labour. But it does signify that work founded on the sun’s energy need not necessarily be reducible to coal. And this probably coincides with Einstein’s opinion, which is so much the more significant, as his own doctrine points to the highest measure of effect in forces, even if only theoretically.*

Nevertheless, it is a fact that every increase in the quantity of power derived, when expressed per kilo, denotes a mitigation of life’s burdens; it is only a question of the limits involved.

Firstly, is technical science with its possibilities, as far as they can be judged at present, still able to guarantee the future for us? Can it spread out the effective work so far that we may rely peacefully on the treasures of coal slumbering in the interior of the earth?

Evidently not. For in this case we are dealing with quantities that may be approximately estimated. And even if we get three times, nay ten times, as many useful calories as before, there is a parallel calculation of evil omen that informs us: there will be an end to this feast of energy.

In spite of all the embarrassments due to the present shortage of coal we have still always been able to console ourselves with the thought that there is really a sufficiency, and that it is only a question of overcoming stoppages. It is a matter of fact that from the time of the foundation of the German Empire to the beginning of the World War coal production had been rising steadily, and it was possible to calculate that in spite of the stupendous quantities that were being removed from the black caves of Germany, there remained at least 2000 milliards of marks in value (taken at the nominal rate, that is, £100,000,000,000). Nevertheless, geologists and mining experts tell us that our whole supply will not last longer than 2000 years, in the case of England 500 years, and in that of France 200 years. Even if we allow amply for the opening up of new coal-fields in other continents, we cannot get over the fact that in the prehistoric fern forests the sun has stored up only a finite, exhaustible amount of energy, and that within a few hundred years humanity will be faced with a coal famine.

Now, if coal were really the measure of all things, and if the possibility of life depended only on the coal supply, then our distant descendants would not only relapse into barbarity, but they would have to expect the absolute zero of existence. We should not need to worry at all about the entropy death of the universe, as our own extinction on this earthly planet beckons to us from an incomparably nearer point of time.

At this stage of the discussion Einstein revealed prospects which were entirely in accordance with his conviction that the whole argument based on the coal assumption was untenable. He stated that it was by no means a Utopian idea that technical science will yet discover totally new ways of setting free forces, such as using the sun’s radiation, or water power, or the movement of the tides, or power reservoirs of Nature, among which the
The Manufacture and Sale of St. Einstein

The present coal supply denotes only one branch. Since the beginning of coal extraction we have lived only on the remains of a prehistoric capital that has lain in the treasure-chests of the earth. It is to be conjectured that the interest on the actual capital of force will be very much in excess of what we can fetch out of the depositories of former ages.

To form an estimate of this actual capital, entirely independent of coal, we may present some figures. Let us consider a tiny water canal, a mere nothing in the watery network of the earth, the Rhine-falls at Schaffhausen, that may appear mighty to the beholder, but only because he applies his tourist’s measure instead of a planetary one. But even this bagatelle in the household of Nature represents very considerable effectual values for us: 200 cubic metres spread over a terrace 20 metres high yield 67,000 horse-power, equivalent to 50,000 kilowatts. This cascade alone would suffice to keep illuminated to their full intensity 1,000,000 glow-lamps, each of 50 candle-power, and according to our present tariff we should have to pay at least 70,000 marks (£3500 nominally) per hour. The coal-worshipper will be more impressed by a different calculation. The Rhine-falls at Schaffhansen is equivalent in value to a mine that yields every day 145 tons of the finest brown coal. If we took the Niagara Falls as an illustration, these figures would have to be multiplied by about 80.

And by what factor would we have to multiply them, if we wished to get only an approximate estimate of the energy that the breathing earth rolls about in the form of the tides? The astronomer Bessel and the philosopher-physicist Fechner once endeavoured to get at some comparative picture of these events. It required 360,000 men twenty years to build the greatest Egyptian pyramid, and yet its cubical contents are only about the millionth of a cubic mile, and perhaps if we sum up everything that men and machinery have moved since the time of the Flood till now, a cubic mile would not yet have been completed. In contrast with this, the earth in its tidal motion moves 200 cubic miles of water from one quadrant of the earth’s circumference to another in every quarter of a day. From this we see at once that all the coal-mines in the world would mean nothing to us if we could once succeed in making even a fraction of the pulse-beat of the earth available for purposes of industry.

If, however, we should be compelled to depend on coal, our imaginations cling so much more closely to that enormous quantity given by the expression \( mc^2 \), which was derived from the theory of relativity.

The 20 billion calories that are contained in each gramme of coal exercise a fascination on our minds. And although Einstein states that there is not the slightest indication that we shall get at this supply, we get carried along by an irresistible impulse to picture what it would mean if we should actually succeed in tapping it. The transition from the golden to the iron age, as pictured in Hesiod, Aratus, and Ovid, takes shape before our eyes, and following our bent of continuing this cyclically, we take pleasure in fancying ourselves being rescued from the serfdom of the iron and of the coal age to
a new golden age. A supply, such as is piled up in an average city storing-place, would be sufficient to supply the whole world with energy for an immeasurable time. All the troubles and miseries arising from the running of machines, the mechanical production of wares, house-fires would vanish, and all the human labour at present occupied in mining coal would become free to cultivate the land, all railways and boats would run almost without expense, an inconceivable wave of happiness would sweep over mankind. It would mean an end of coal-, freight-, and food-shortage! We should at last be able to escape out of the hardships of the day, which is broken up by strenuous work, and soar upwards to brighter spheres where we would be welcomed by the true values of life. How alluring is the song of Sirens chanted by our physics with its high ‘C,’ the velocity of light to the second power, which we have got to know as a factor in this secret store of energy.

But these dreams are futile. For Einstein, to whom we owe this formula so promising of wonders, not only denies that it can be applied practically, but also brings forward another argument that casts us down to earth again. Supposing, he explained, it were possible to set free this enormous store of energy, then we should only arrive at an age, compared with which the present coal age would have to be called golden.

And, unfortunately, we find ourselves obliged to fall in with this view, which is based in the wise old saw μη δέν καί γαν, ne quid nimis, nothing in excess. Applied to our case, this means that when such a measure of power is set free, it does not serve a useful purpose, but leads to destruction. The process of burning, which we used as an illustration, calls up the picture of an oven in which we can imagine this wholesale production of energy, and experience tells us that we should not heat an oven with dynamite.

If technical developments of this kind were to come about, the energy supply would probably not be capable of regulation at all. It makes no difference if we say that we only want a part of those 20 billion calories, and that we should be glad to be able to multiply the 8000 calories required to-day by 100. That is not possible, for if we should succeed in disintegrating the atom, it seems that we should have the billions of calories rushing unchecked on us, and we should find ourselves unable to cope with them, nay, perhaps even the solid ground, on which we move, could not withstand them.

No discovery remains a monopoly of only a few people. If a very careful scientist should really succeed in producing a practical heating or driving effect from the atom, then any untrained person would be able to blow up a whole town by means of only a minute quantity of substance. And any suicidal maniac who hated his fellows and wished to pulverize all habitations within a wide range would only have to conceive the plan to carry it out at a moment’s notice. All the bombardments that have taken place ever since fire-arms were invented would be mere child’s play compared with the destruction that could be caused by two buckets of coal.

At intervals we see stars light up in the heavens, and then become
extinguished again; from these we infer that world catastrophes have occurred. We do not know whether it is due to the explosion of hydrogen with other gases, or to collisions between two stellar bodies. There is still room for the assumption that, immeasurably far away in yonder regions of celestial space, something is happening which a malevolent inhabitant of our earth, who has discovered the secret of smashing the atom, might here repeat. And even if our imaginations can be stretched to paint the blessings of this release of energy, they certainly fail to conjure up visions of the disastrous effects which would result.

Einstein turned to a page in a learned work of the mathematical physicist Weyl of Zürich, and pointed out a part that dealt with such an appalling liberation of energy. It seemed to me to be of the nature of a fervent prayer that Heaven preserve us from such explosive forces ever being let loose on mankind!

Subject to present impossibility, it is possible to weave many parallel instances. It is conceivable that by some yet undiscovered process alcohol may be prepared as plentifully and as cheaply as ordinary water. This would end the shortage of alcohol, and would assure delirium tremens for hundreds of thousands. The evil would far outweigh the good, although it might be avoidable, for one can, even if with great difficulty, imagine precautionary measures.

War technique might lead to the use of weapons of great range, which would enable a small number of adventurers to conquer a Great power. It will be objected: this will hold vice versa, too. Nevertheless, this would not alter the fact that such long-range weapons would probably lead to the destruction of civilization. Our last hope of an escape would be in a superior moral outlook of future generations, which the optimist may imagine to himself as the *force majeure*.

There are apparently only two inventions, in themselves triumphs of intellect, against which one would have no defence. The first would be thought-reading made applicable to all, and with which Kant has dealt under the term ‘thinking aloud.’ What is nowadays a rare and very imperfect telepathic ‘turn’ may yet be generalized and perfected in a manner which Kant supposed not impossible on some distant planet. The association and converse of man with his fellows would not stand the test of this invention, and we should have to be angels to survive it even for a day.

The second invention would be the solution of this $mc^2$-problem, which I call a problem only because I fail to discover a proper term, whereas so far was it from being a problem for Einstein that it was only in my presence he began to reckon it out in figures from the symbolic formula. To us average beings a Utopia may disclose itself, a short frenzy of joy followed by a cold douche: Einstein stands above it as the pure searcher, who is interested only in the scientific fact, and who, even at the first knowledge of it, preserves its essentially theoretical importance from attempts to apply it practically. If, then, another wishes to hammer out into a fantastic gold-leaf what he has
produced as a little particle of gold in his physical investigations, he offers no opposition to such thought-experiments, for one of the deepest traits of his nature is tolerance.

A. Pflüger, one of the best qualified heralds of the new doctrine, has touched on the above matter in his essay, *The Principle of Relativity*. Einstein praised this pamphlet; I mentioned that the author took a view different from that of Einstein, of the possibility of making accessible the $mc^2$. In discussing the practical significance of this eventuality, Pflüger says: ‘It will be time to talk of this point again a hundred years hence.’ This seems a short time-limit, even if none of us will live to be present at the discussion. Einstein smiled at this pause of a hundred years, and merely repeated, ‘A very good essay!’ It is not for me to offer contradictions; and, as far as the implied prognostication is concerned, it will be best for mankind if it should prove to be false. If the optimum is unattainable, at least we shall be spared the worst, which is what the realization of this prophecy would inflict on us.

Some months after the above discussion had first been put to paper, the world was confronted by a new scientific event. The English physicist Rutherford had, with deliberate intention, actually succeeded in splitting up the atom. When I questioned Einstein on the possible consequences of this experimental achievement, he declared with his usual frankness, one of the treasures of his character, that he had now occasion to modify somewhat the opinion he had shortly before expressed. This is not to mean that he now considered the practical goal of getting unlimited supply of energy as having been brought within the realm of possibility. He gave it as his view that we are now entering on a new stage of development, which may perhaps disclose fresh openings for technical science. The scientific importance of these new experiments with the atom was certainly to be considered very great.

In Rutherford’s operations the atom is treated as if he were dealing with a fortress: he subjects it to a bombardment and then seeks to fire into the breach. The fortress is still certainly far from capitulating, but signs of disruption have become observable. A hail of bullets caused holes, tears, and splinterings.

The projectiles hurled by Rutherford are alpha-particles shot out by radium, and their velocity approaches two-thirds that of light. Owing to the extreme violence of the impact, they succeeded in doing damage to certain atoms enclosed in evacuated glass tubes. It was shown that atoms of nitrogen had been disrupted. It is still unknown what quantities of energy are released in this process. This splitting up of the atom carried out with intention can, indeed, be detected only by the most careful investigations.

As far as practical applications are concerned, then, we have got no further, although we have renewed grounds for hope. The unit of measure, as it were, is still out of proportion to the material to be cut. For the forces which Rutherford had to use to attain this result are relatively very considerable. He derived them from a gramme of radium, which is able to
The Manufacture and Sale of St. Einstein

liberate several milliard calories, whereas the net practical result in Rutherford’s experiment is still immeasurably small. Nevertheless, it is scientifically established that it is possible to split up atoms of one’s own free will, and thus the fundamental objection raised above falls to the ground.

There is also another reason for increased hope. It seems feasible that, under certain conditions, Nature would automatically continue the disruption of the atom, after a human being had intentionally started it, as in the analogous case of a conflagration which extends, although it may have started from a mere spark.

A by-product of future research might lead to the transmutation of lead into gold. The possibility of this transformation of elements is subject to the same arguments as those above about the splitting up of the atom and the release of great quantities of energy. The path of decay from radium to lead lies clearly exposed even now, but it is very questionable whether mankind will finally have cause to offer up hymns of thanksgiving if this line from lead on to the precious metals should be continued, for it would cause our conception of the latter to be shattered. Gold made from lead would not give rise to an increase in the value of the meaner metal, but to the utter depreciation of gold, and hence the loss of the standard of value that has been valid since the beginning of our civilization. No economist would be possessed of a sufficiently far-sighted vision to be able to measure the consequences on the world’s market of such a revolution in values.

The chief product would, of course, be the gain in energy, and we must bear this in mind when we give ourselves up to our speculations, however optimistic or catastrophic they may be. The impenetrable barrier ‘impossible’ no longer exists. Einstein’s wonderful ‘Open Sesame,’ mass times the square of the velocity of light, is thundering at the portals.

And mankind finds a new meaning in the old saw: One should never say never!”

Moszkowski cites the work of Alexander Wilhelm Pflüger. Pflüger stated,

“Daraus folgt aber nicht, daß das RP [Relativitätsprinzip] keine praktische Bedeutung für die Technik hätte. Nach hundert Jahren wollen wir wieder darüber sprechen. Einstweilen nur dies: aus dem RP folgt, daß die Masse eines Körpers vergrößert wird, wenn man ihm Energie (etwa strahlende Wärme) zuführt. Man kann daher die Masse als Energie auffassen, und der alte Satz der Chemiker von der Erhaltung der Masse schmilzt dadurch mit dem Satz von der Erhaltung der Energie zusammen. Man findet ferner, daß jeder Körper, welcher in einem System ruht, von diesem aus beurteilt, die ungeheure Menge mc² „latente“ Energie enthält, d. h. gleich seiner Masse, gemessen in Grammen, multipliziert mit dem Quadrat der Lichtgeschwindigkeit, gemessen in cm sec. Da \[ c = 3 \cdot 10^9 \text{ cm/sec} \] ist, so enthält also ein Kilogramm eines beliebigen Körpers, z. B. der Kohle
\[ E = mc^2 \]

Moszkowski’s pontificating, which would otherwise might have been profound, appears to have been pretentiously and pompously plagiarized. It is difficult to believe that Moszkowski did not read H. G. Wells’ book *The World Set Free: A Story of Mankind*, Macmillan, London, (1914), though Moszkowski does not mention it.

H. G. Wells wrote, *inter alia*, in 1913, in light of the Balkan Wars and in anticipation of the First World War and the Second World War,

“‘And so,’ said the professor, ‘we see that this Radium, which seemed at first a fantastic exception, a mad inversion of all that was most established and fundamental in the constitution of matter, is really at one with the rest of the elements. It does noticeably and forcibly what probably all the other elements are doing with an imperceptible slowness. It is like the single voice crying aloud that betrays the silent breathing multitude in the darkness. Radium is an element that is breaking up and flying to pieces. But perhaps all elements are doing that at less perceptible rates. Uranium certainly is; thorium—the stuff of this incandescent gas mantle—certainly is; actinium. I feel that we are but beginning the list. And we know now that the atom, that once we thought hard and impenetrable, and indivisible and final and—lifeless—lifeless, is really a reservoir of immense energy. That is the most wonderful thing about all this work. A little while ago we thought of the atoms as we thought of bricks, as solid building material, as substantial matter, as unit masses of lifeless stuff, and behold! these bricks are boxes, treasure boxes, boxes full of the intensest force. This little bottle contains about a pint of uranium oxide; that is to say, about fourteen ounces of the element uranium. It is worth about a pound. And in this bottle, ladies and gentlemen, in the atoms in this bottle there slumbers at least as much energy
as we could get by burning a hundred and sixty tons of coal. If at a word, in one instant I could suddenly release that energy here and now it would blow us and everything about us to fragments; if I could turn it into the machinery that lights this city, it could keep Edinburgh brightly lit for a week. But at present no man knows, no man has an inkling of how this little lump of stuff can be made to hasten the release of its store. It does release it, as a burn trickles. Slowly the uranium changes into radium, the radium changes into a gas called the radium emanation, and that again to what we call radium A, and so the process goes on, giving out energy at every stage, until at last we reach the last stage of all, which is, so far as we can tell at present, lead. But we cannot hasten it.

‘I take ye, man,’ whispered the chuckle-headed lad, with his red hands tightening like a vice upon his knee. ‘I take ye, man. Go on! Oh, go on!’

The professor went on after a little pause. ‘Why is the change gradual?’ he asked. ‘Why does only a minute fraction of the radium disintegrate in any particular second? Why does it dole itself out so slowly and so exactly? Why does not all the uranium change to radium and all the radium change to the next lowest thing at once? Why this decay by driblets; why not a decay en masse? . . . Suppose presently we find it is possible to quicken that decay?’

The chuckle-headed lad nodded rapidly. The wonderful inevitable idea was coming. He drew his knee up towards his chin and swayed in his seat with excitement. ‘Why not?’ he echoed, ‘why not?’

The professor lifted his forefinger. ‘Given that knowledge,’ he said, ‘mark what we should be able to do! We should not only be able to use this uranium and thorium; not only should we have a source of power so potent that a man might carry in his hand the energy to light a city for a year, fight a fleet of battleships, or drive one of our giant liners across the Atlantic; but we should also have a clue that would enable us at last to quicken the process of disintegration in all the other elements, where decay is still so slow as to escape our finest measurements. Every scrap of solid matter in the world would become an available reservoir of concentrated force. Do you realise, ladies and gentlemen, what these things would mean for us?’

The scrub head nodded. ‘Oh! go on. Go on.’

‘It would mean a change in human conditions that I can only compare to the discovery of fire, that first discovery that lifted man above the brute. We stand to-day towards radio-activity as our ancestor stood towards fire before he had learnt to make it. He knew it then only as a strange thing utterly beyond his control, a flare on the crest of the volcano, a red destruction that poured through the forest. So it is that we know radio-activity to-day. This—that is the dawn of a new day in human living. At the climax of that civilisation which had its beginning in the hammered flint and the fire-stick of the savage, just when it is becoming apparent that our ever-increasing needs cannot be borne indefinitely by our present sources of energy, we discover suddenly the possibility of an entirely new civilisation. The energy we need for our very existence, and with which Nature supplies us still so
E = mc^2

grudgingly, is in reality locked up in inconceivable quantities all about us. We cannot pick that lock at present, but——'

He paused. His voice sank so that everybody strained a little to hear him.

'——we will.'

He put up that lean finger again, his solitary gesture.

'And then,' he said. . . .

'Then that perpetual struggle for existence, that perpetual struggle to live on the bare surplus of Nature's energies will cease to be the lot of Man. Man will step from the pinnacle of this civilisation to the beginning of the next. I have no eloquence, ladies and gentlemen, to express the vision of man's material destiny that opens out before me. I see the desert continents transformed, the poles no longer wildernesses of ice, the whole world once more Eden. I see the power of man reach out among the stars. . . .'

[***]

Holsten, before he died, was destined to see atomic energy dominating every other source of power, but for some years yet a vast network of difficulties in detail and application kept the new discovery from any effective invasion of ordinary life. The path from the laboratory to the workshop is sometimes a tortuous one; electro-magnetic radiations were known and demonstrated for twenty years before Marconi made them practically available, and in the same way it was twenty years before induced radio-activity could be brought to practical utilisation. The thing, of course, was discussed very much, more perhaps at the time of its discovery than during the interval of technical adaptation, but with very little realisation of the huge economic revolution that impended. What chiefly impressed the journalists of 1933 was the production of gold from bismuth and the realisation albeit upon unprofitable lines of the alchemist's dreams; there was a considerable amount of discussion and expectation in that more intelligent section of the educated publics of the various civilised countries which followed scientific development; but for the most part the world went about its business—as the inhabitants of those Swiss villages which live under the perpetual threat of overhanging rocks and mountains go about their business—just as though the possible was impossible, as though the inevitable was postponed for ever because it was delayed.

It was in 1953 that the first Holsten-Roberts engine brought induced radio-activity into the sphere of industrial production, and its first general use was to replace the steam-engine in electrical generating stations. Hard upon the appearance of this came the Dass-Tata engine—the invention of two among the brilliant galaxy of Bengali inventors the modernisation of Indian thought was producing at this time—which was used chiefly for automobiles, aeroplanes, waterplanes, and such-like, mobile purposes. The American Kemp engine, differing widely in principle but equally practicable, and the Krupp-Erlanger came hard upon the heels of this, and by the autumn of 1954 a gigantic replacement of industrial methods and machinery was in progress all about the habitable globe. Small wonder was this when the cost, even of
these earliest and clumsiest of atomic engines, is compared with that of the power they superseded. Allowing for lubrication the Dass-Tata engine, once it was started cost a penny to run thirty-seven miles, and added only nine and quarter pounds to the weight of the carriage it drove. It made the heavy alcohol-driven automobile of the time ridiculous in appearance as well as preposterously costly. For many years the price of coal and every form of liquid fuel had been clambering to levels that made even the revival of the draft horse seem a practicable possibility, and now with the abrupt relaxation of this stringency, the change in appearance of the traffic upon the world’s roads was instantaneous. In three years the frightful armoured monsters that had hooted and smoked and thundered about the world for four awful decades were swept away to the dealers in old metal, and the highways thronged with light and clean and shimmering shapes of silvered steel. At the same time a new impetus was given to aviation by the relatively enormous power for weight of the atomic engine, it was at last possible to add Redmayne’s ingenious helicopter ascent and descent engine to the vertical propeller that had hitherto been the sole driving force of the aeroplane without overweighting the machine, and men found themselves possessed of an instrument of flight that could hover or ascend or descend vertically and gently as well as rush wildly through the air. The last dread of flying vanished. As the journalists of the time phrased it, this was the epoch of the Leap into the Air. The new atomic aeroplane became indeed a mania; every one of means was frantic to possess a thing so controllable, so secure and so free from the dust and danger of the road, and in France alone in the year 1943 thirty thousand of these new aeroplanes were manufactured and licensed, and soared humming softly into the sky.

And with an equal speed atomic engines of various types invaded industrialism. The railways paid enormous premiums for priority in the delivery of atomic traction engines, atomic smelting was embarked upon so eagerly as to lead to a number of disastrous explosions due to inexperienced handling of the new power, and the revolutionary cheapening of both materials and electricity made the entire reconstruction of domestic buildings a matter merely dependent upon a reorganisation of the methods of the builder and the house-furnisher. Viewed from the side of the new power and from the point of view of those who financed and manufactured the new engines and material it required, the age of the Leap into the Air was one of astonishing prosperity. Patent-holding companies were presently paying dividends of five or six hundred per cent, and enormous fortunes were made and fantastic wages earned by all who were concerned in the new developments. This prosperity was not a little enhanced by the fact that in both the Dass-Tata and Holsten-Roberts engines one of the recoverable waste products was gold—the former disintegrated dust of bismuth and the latter dust of lead—and that this new supply of gold led quite naturally to a rise in prices throughout the world.

This spectacle of feverish enterprise was productivity, this crowding
flight of happy and fortunate rich people—every great city was as if a
crawling ant-hill had suddenly taken wing—was the bright side of the
opening phase of the new epoch in human history. Beneath that brightness
was a gathering darkness, a deepening dismay. If there was a vast
development of production there was also a huge destruction of values. These
glaring factories working night and day, these glittering new vehicles
swinging noiselessly along the roads, these flights of dragon-flies that
swooped and soared and circled in the air, were indeed no more than the
brightnesses of lamps and fires that gleam out when the world sinks towards
twilight and the night. Between these high lights accumulated disaster, social
catastrophe. The coal mines were manifestly doomed to closure at no very
distant date, the vast amount of capital invested in oil was becoming
unsaleable, millions of coal miners, steel workers upon the old lines, vast
swarms of unskilled or under-skilled labourers in innumerable occupations,
were being flung out of employment by the superior efficiency of the new
machinery, the rapid fall in the cost of transit was destroying high land values
at every centre of population, the value of existing house property had
become problematical, gold was undergoing headlong depreciation, all the
securities upon which the credit of the world rested were slipping and sliding,
banks were tottering, the stock exchanges were scenes of feverish
panic;—this was the reverse of the spectacle, these were the black and
monstrous under-consequences of the Leap into the Air.

There is a story of a demented London stockbroker running out into
Threadneedle Street and tearing off his clothes as he ran. ‘The Steel Trust is
scrapping the whole of its plant,’ he shouted. ‘The State Railways are going
to scrap all their engines. Everything’s going to be scrapped—everything.
Come and scrap the mint, you fellows, come and scrap the mint!’

In the year 1955 the suicide rate for the United States of America
quadrupled any previous record.

[***]

Viewed from the standpoint of a sane and ambitious social order, it is
difficult to understand, and it would be tedious to follow, the motives that
plunged mankind into the war that fills the histories of the middle decades of
the twentieth century.

[***]

The sky above the indistinct horizons of this cloud sea was at first starry and
then paler with a light that crept from north to east as the dawn came on. The
Milky Way was invisible in the blue, and the lesser stars vanished. The face
of the adventurer at the steering-wheel, darkly visible ever and again by the
oval greenish glow of the compass face, had something of that firm beauty
which all concentrated purpose gives, and something of the happiness of an
idiot child that has at last got hold of the matches. His companion, a less
imaginative type, sat with his legs spread wide over the long, coffin-shaped
box which contained in its compartments the three atomic bombs, the new
bombs that would continue to explode indefinitely and which no one so far
had ever seen in action. Hitherto Carolinum, their essential substance, had
been tested only in almost infinitesimal quantities within steel chambers
embedded in lead. Beyond the thought of great destruction slumbering in the
black spheres between his legs, and a keen resolve to follow out very exactly
the instructions that had been given him, the man’s mind was a blank. His
aquiline profile against the starlight expressed nothing but a profound gloom.

[***]

The gaunt face hardened to grimness, and with both hands the
bomb-thrower lifted the big atomic bomb from the box and steadied it against
the side. It was a black sphere two feet in diameter. Between its handles was
a little celluloid stud, and to this he bent his head until his lips touched it.
Then he had to bite in order to let the air in upon the inducive. Sure of its
accessibility, he craned his neck over the side of the aeroplane and judged his
pace and distance. Then very quickly he bent forward, bit the stud, and
hoisted the bomb over the side.

‘Round,’ he whispered inaudibly.

The bomb flashed blinding scarlet in mid-air, and fell, a descending
column of blaze eddying spirally in the midst of a whirlwind. Both the
aeroplanes were tossed like shuttlecocks, hurled high and sideways and the
steersman, with gleaming eyes and set teeth, fought in great banking curves
for a balance. The gaunt man clung tight with hand and knees; his nostrils
dilated, his teeth biting his lips. He was firmly strapped. . . .

When he could look down again it was like looking down upon the crater
of a small volcano. In the open garden before the Imperial castle a
shuddering star of evil splendour spurted and poured up smoke and flame
towards them like an accusation. They were too high to distinguish people
clearly, or mark the bomb’s effect upon the building until suddenly the
façade tottered and crumbled before the flare as sugar dissolves in water. The
man stared for a moment, showed all his long teeth, and then staggered into
the cramped standing position his straps permitted, hoisted out and bit
another bomb, and sent it down after its fellow.

The explosion came this time more directly underneath the aeroplane and
shot it upward edgeways. The bomb box tipped to the point of disgorgement,
and the bomb-thrower was pitched forward upon the third bomb with his face
close to its celluloid stud. He clutched its handles, and with a sudden gust of
determination that the thing should not escape him, bit its stud. Before he
could hurl it over, the monoplane was slipping sideways. Everything was
falling sideways. Instinctively he gave himself up to gripping, his body
holding the bomb in its place.

Then that bomb had exploded also, and steersman, thrower, and
aeroplane were just flying rags and splinters of metal and drops of moisture
in the air, and a third column of fire rushed eddying down upon the doomed
buildings below. . . .

§ 4.

Never before in the history of warfare had there been a continuing explosive;
indeed, up to the middle of the twentieth century the only explosives known were combustibles whose explosiveness was due entirely to their instantaneousness; and these atomic bombs which science burst upon the world that night were strange even to the men who used them. Those used by the Allies were lumps of pure Carolium, painted on the outside with unoxidised cydonator inducive enclosed hermetically in a case of membranium. A little celluloid stud between the handles by which the bomb was lifted was arranged so as to be easily torn off and admit air to the inducive, which at once became active and set up radio-activity in the outer layer of the Carolium sphere. This liberated fresh inducive, and so in a few minutes the whole bomb was a blazing continual explosion. The Central European bombs were the same, except that they were larger and had a more complicated arrangement for animating the inducive.

Always before in the development of warfare the shells and rockets fired had been but momentarily explosive, they had gone off in an instant once for all, and if there was nothing living or valuable within reach of the concussion and the flying fragments, then they were spent and over. But Carolium, which belonged to the β-group of Hyslop’s so-called ‘suspended degenerator’ elements, once its degenerative process had been induced, continued a furious radiation of energy and nothing could arrest it. Of all Hyslop’s artificial elements, Carolium was the most heavily stored with energy and the most dangerous to make and handle. To this day it remains the most potent degenerator known. What the earlier twentieth-century chemists called its half period was seventeen days; that is to say, it poured out half of the huge store of energy in its great molecules in the space of seventeen days, the next seventeen days’ emission was a half of that first period’s outpouring, and so on. As with all radio-active substances this Carolium, though every seventeen days its power is halved, though constantly it diminishes towards the imperceptible, is never entirely exhausted, and to this day the battle-fields and bomb fields of that frantic time in human history are sprinkled with radiant matter, and so centres of inconvenient rays.

What happened when the celluloid stud was opened was that the inducive oxidised and became active. Then the surface of the Carolium began to degenerate. This degeneration passed only slowly into the substance of the bomb. A moment or so after its explosion began it was still mainly an inert sphere exploding superficially, a big, inanimate nucleus wrapped in flame and thunder. Those that were thrown from aeroplanes fell in this state, they reached the ground still mainly solid, and, melting soil and rock in their progress, bored into the earth. There, as more and more of the Carolium became active, the bomb spread itself out into a monstrous cavern of fiery energy at the base of what became very speedily a miniature active volcano. The Carolium, unable to disperse, freely drove into and mixed up with a boiling confusion of molten soil and superheated steam, and so remained spinning furiously and maintaining an eruption that lasted for years or
months or weeks according to the size of the bomb employed and the chances of its dispersal. Once launched, the bomb was absolutely unapproachable and uncontrollable until its forces were nearly exhausted, and from the crater that burst open above it, puffs of heavy incandescent vapour and fragments of viciously punitive rock and mud, saturated with Carolinum, and each a centre of scorching and blistering energy, were flung high and far.

Such was the crowning triumph of military science, the ultimate explosive that was to give the ‘decisive touch’ to war. . . .

§ 5.

A recent historical writer has described the world of that time as one that ‘believed in established words and was invincibly blind to the obvious in things.’ Certainly it seems now that nothing could have been more obvious to the people of the earlier twentieth century than the rapidity with which war was becoming impossible. And as certainly they did not see it. They did not see it until the atomic bombs burst in their fumbling hands. Yet the broad facts must have glared upon any intelligent mind. All through the nineteenth and twentieth centuries the amount of energy that men were able to command was continually increasing. Applied to warfare that meant that the power to inflict a blow, the power to destroy, was continually increasing. There was no increase whatever in the ability to escape. Every sort of passive defence, armour, fortifications, and so forth, was being outmastered by this tremendous increase on the destructive side. Destruction was becoming so facile that any little body of malcontents could use it; it was revolutionising the problems of police and internal rule. Before the last war began it was a matter of common knowledge that a man could carry about in a handbag an amount of latent energy sufficient to wreck half a city. These facts were before the minds of everybody; the children in the streets knew them. And yet the world still, as the Americans used to phrase it, ‘fooled around’ with the paraphernalia and pretensions of war.

It is only by realising this profound, this fantastic divorce between the scientific and intellectual movement on the one hand, and the world of the lawyer-politician on the other, that the men of a later time can hope to understand this preposterous state of affairs. Social organisation was still in the barbaric stage. There were already great numbers of actively intelligent men and much private and commercial civilisation, but the community, as a whole, was aimless, untrained and unorganised to the pitch of imbecility. Collective civilisation, the ‘Modern State,’ was still in the womb of the future. . . .

[***]

The enemy began sniping the rifle pits from shelters they made for themselves in the woods below. A man was hit in the pit next to Barnet, and began cursing and crying out in a violent rage. Barnet crawled along the ditch to him and found him in great pain, covered with blood, frantic with indignation, and with the half of his right hand smashed to a pulp. ‘Look at
\[ E = mc^2 \]

this,’ he kept repeating, hugging it and then extending it. ‘Damned foolery! Damned foolery! My right hand, sir! My right hand!’

For some time Barnet could do nothing with him. The man was consumed by his tortured realisation of the evil silliness of war, the realisation which had come upon him in a flash with the bullet that had destroyed his skill and use as an artificer for ever. He was looking at the vestiges with a horror that made him impenetrable to any other idea. At last the poor wretch let Barnet tie up his bleeding stump and help him along the ditch that conducted him deviously out of range. . . .

When Barnet returned his men were already calling out for water, and all day long the line of pits suffered greatly from thirst. For food they had chocolate and bread. ‘At first,’ he says, ‘I was extraordinarily excited by my baptism of fire. Then as the heat of the day came on I experienced an enormous tedium and discomfort. The flies became extremely troublesome, and my little grave of a rifle pit was invaded by ants. I could not get up or move about, for some one in the trees had got a mark on me. I kept thinking of the dead Prussian down among the corn, and of the bitter outcries of my own man. Damned foolery! It \textit{was} damned foolery. But who was to blame? How had we got to this? . . .

‘Early in the afternoon an aeroplane tried to dislodge us with dynamite bombs, but she was hit by bullets once or twice, and suddenly dived down over beyond the trees.

‘From Holland to the Alps this day,’ I thought, ‘there must be crouching and lying between half a million of men, trying to inflict irreparable damage upon one another. The thing is idiotic to the pitch of impossibility. It is a dream. Presently I shall wake up. . . .’

‘Then the phrase changed itself in my mind. ‘Presently mankind will wake up.’

‘I lay speculating just how many thousands of men there were among these hundreds of thousands, whose spirits were in rebellion against all these ancient traditions of flag and empire. Weren’t we, perhaps, already in the throes of the last crisis, in that darkest moment of a nightmare’s horror before the sleeper will endure no more of it—and wakes?

‘I don’t know how my speculations ended. I think they were not so much ended as distracted by the distant thudding of the guns that were opening fire at long range upon Namur.’

[***]

‘And then, while I still peered and tried to shade these flames from my eyes with my hand, and while the men about me were beginning to stir, the atomic bombs were thrown at the dykes. They made a mighty thunder in the air, and fell like Lucifer in the picture, leaving a flaring trail in the sky. The night, which had been pellucid and detailed and eventful, seemed to vanish, to be replaced abruptly by a black background to these tremendous pillars of fire. . . .

‘Hard upon the sound of them came a roaring wind, and the sky was
2302   The Manufacture and Sale of St. Einstein

filled with flickering lightnings and rushing clouds. . . .

‘There was something discontinuous in this impact. At one moment I was a lonely watcher in a sleeping world; the next saw every one about me afoot, the whole world awake and amazed. . . .

‘And then the wind had struck me a buffet, taken my helmet and swept aside the summerhouse of *Vreugde bij Vrede*, as a scythe sweeps away grass. I saw the bombs fall, and then watched a great crimson flare leap responsive to each impact, and mountainous masses of red-lit steam and flying fragments clamber up towards the zenith. Against the glare I saw the country-side for miles standing black and clear, churches, trees, chimneys. And suddenly I understood. The Central Europeans had burst the dykes. Those flares meant the bursting of the dykes, and in a little while the sea-water would be upon us. . . .’

[***]

‘I do not think any of us felt we belonged to a defeated army, nor had we any strong sense of the war as the dominating fact about us. Our mental setting had far more of the effect of a huge natural catastrophe. The atomic bombs had dwarfed the international issues to complete insignificance. When our minds wandered from the preoccupations of our immediate needs, we speculated upon the possibility of stopping the use of these frightful explosives before the world was utterly destroyed. For to us it seemed quite plain that these bombs and the still greater power of destruction of which they were the precursors might quite easily shatter every relationship and institution of mankind.

[***]

For a time in western Europe at least it was indeed as if civilisation had come to a final collapse. These crowning buds upon the tradition that Napoleon planted and Bismarck watered, opened and flared ‘like waterlilies of flame’ over nations destroyed, over churches smashed or submerged, towns ruined, fields lost to mankind for ever, and a million weltering bodies. Was this lesson enough for mankind, or would the flames of war still burn amidst the ruins?

[***]

Leblanc was one of those ingenuous men whose lot would have been insignificant in any period of security, but who have been caught up to an immortal rôle in history by the sudden simplification of human affairs through some tragical crisis, to the measure of their simplicity. Such a man was Abraham Lincoln, and such was Garibaldi. And Leblanc, with his transparent childish innocence, his entire self-forgetfulness, came into this confusion of distrust and intricate disaster with an invincible appeal for the manifest sanities of the situation. His voice, when he spoke, was ‘full of remonstrance.’ He was a little, bald, spectacled man, inspired by that intellectual idealism which has been one of the peculiar gifts of France to humanity. He was possessed of one clear persuasion, that war must end, and that the only way to end war was to have but one government for mankind.
He brushed aside all other considerations. At the very outbreak of the war, so soon as the two capitals of the belligerents had been wrecked, he went to the president in the White House with this proposal. He made it as if it was a matter of course. He was fortunate to be in Washington and in touch with that gigantic childishness which was the characteristic of the American imagination. For the Americans also were among the simple peoples by whom the world was saved. He won over the American president and the American government to his general ideas; at any rate they supported him sufficiently to give him a standing with the more sceptical European governments, and with this backing he set to work—it seemed the most fantastic of enterprises—to bring together all the rulers of the world and unify them. He wrote innumerable letters, he sent messages, he went desperate journeys, he enlisted whatever support he could find; no one was too humble for an ally or too obstinate for his advances; through the terrible autumn of the last wars this persistent little visionary in spectacles must have seemed rather like a hopeful canary twittering during a thunderstorm. And no accumulation of disasters daunted his conviction that they could be ended.

‘Do you really think, Firmin, that I am here as—as an infernal politician to put my crown and my flag and my claims and so forth in the way of peace? That little Frenchman is right. You know he is right as well as I do. Those things are over. We—we kings and rulers and representatives have been at the very heart of the mischief. Of course we imply separation, and of course separation means the threat of war, and of course the threat of war means the accumulation of more and more atomic bombs. The old game’s up. But, I say, we mustn’t stand here, you know. The world waits. Don’t you think the old game’s up, Firmin?’

Firmin adjusted a strap, passed a hand over his wet forehead, and followed earnestly. ‘I admit, sir,’ he said to a receding back, ‘that there has to be some sort of hegemony, some sort of Amphictyonic council——’

‘Manifestly war has to stop for ever, Firmin. Manifestly this can only be done by putting all the world under one government. Our crowns and flags are in the way. Manifestly they must go.’

‘Yes, sir,’ interrupted Firmin, ‘but what government? I don’t see what government you get by a universal abdication!’

‘Well,’ said the king, with his hands about his knees, ‘We shall be the government.’

‘The conference?’ exclaimed Firmin.

‘Who else?’ asked the king simply.

‘It’s perfectly simple,’ he added to Firmin’s tremendous silence.

‘But,’ cried Firmin, ‘you must have sanctions! Will there be no form of election, for example?’
‘Why should there be?’ asked the king, with intelligent curiosity.
‘The consent of the governed.’
‘Firmin, we are just going to lay down our differences and take over government. Without any election at all. Without any sanction. The governed will show their consent by silence. If any effective opposition arises, we shall ask it to come in and help. The true sanction of kingship is the grip upon the sceptre. We aren’t going to worry people to vote for us. I’m certain the mass of men does not want to be bothered with such things. . . . We’ll contrive a way for any one interested to join in. That’s quite enough in the way of democracy. Perhaps later—when things don’t matter. . . . We shall govern all right, Firmin. Government only becomes difficult when the lawyers get hold of it, and since these troubles began the lawyers are shy. Indeed, come to think of it, I wonder where all the lawyers are. . . . Where are they? A lot, of course, were bagged, some of the worst ones, when they blew up my legislature. You never knew the late Lord Chancellor. . . .

‘Necessities bury rights. And create them. Lawyers live on dead rights disinterred. . . . We’ve done with that way of living. We won’t have more law than a code can cover and beyond that government will be free. . . .

‘Before the sun sets to-day, Firmin, trust me, we shall have made our abdications, all of us, and declared the World Republic, supreme and indivisible. I wonder what my august grandmother would have made of it! All my rights! . . . And then we shall go on governing. What else is there to do? All over the world we shall declare that there is no longer mine or thine, but ours. China, the United States, two-thirds of Europe, will certainly fall in and obey. They will have to do so. What else can they do? Their official rulers are here with us. They won’t be able to get together any sort of idea of not obeying us. . . . Then we shall declare that every sort of property is held in trust for the Republic. . . .’

[***]

The members of the new world government dined at three long tables on trestles, and down the middle of these tables Leblanc, in spite of the barrenness of his menu, had contrived to have a great multitude of beautiful roses.

[***]

On this first evening of all the council’s gatherings, after King Egbert had talked for a long time and drunken and praised very abundantly the simple red wine of the country that Leblanc had procured for them, he fathered about him a group of congenial spirits and fell into a discourse upon simplicity, praising it above all things and declaring that the ultimate aim of art, religion, philosophy, and science alike was to simplify. He instanced himself as a devotee to simplicity. And Leblanc he instanced as a crowning instance of the splendour of this quality. Upon that they all agreed.

[***]

They arranged with a certain informality. No Balkan aeroplane was to adventure into the air until the search was concluded, and meanwhile the
fleets of the world government would soar and circle in the sky. The towns were to be placarded with offers of reward to any one who would help in the discovery of atomic bombs. . . .

[***]

The task that lay before the Assembly of Brissago, viewed as we may view it now from the clarifying standpoint of things accomplished, was in its broad issues a simple one. Essentially it was to place social organisation upon the new footing that the swift, accelerated advance of human knowledge had rendered necessary. The council was gathered together with the haste of a salvage expedition, and it was confronted with wreckage; but the wreckage was irreparable wreckage, and the only possibilities of the case were either the relapse of mankind to the agricultural barbarism from which it had emerged so painfully or the acceptance of achieved science as the basis of a new social order. The old tendencies of human nature, suspicion, jealousy, particularism, and belligerency, were incompatible with the monstrous destructive power of the new appliances the inhuman logic of science had produced. The equilibrium could be restored only by civilisation destroying itself down to a level at which modern apparatus could no longer be produced, or by human nature adapting itself in its institutions to the new conditions. It was for the latter alternative that the assembly existed.

Sooner or later this choice would have confronted mankind. The sudden development of atomic science did but precipitate and render rapid and dramatic a clash between the new and the customary that had been gathering since ever the first flint was chipped or the first fire built together. From the day when man contrived himself a tool and suffered another male to draw near him, he ceased to be altogether a thing of instinct and untroubled convictions. From that day forth a widening breach can be traced between his egotistical passions and the social need. Slowly he adapted himself to the life of the homestead, and his passionate impulses widened out to the demands of the clan and the tribe. But widen though his impulses might, the latent hunter and wanderer and wonderer in his imagination outstripped their development. He was never quite subdued to the soil nor quite tamed to the home. Everywhere it needed teaching and the priest to keep him within the bounds of the plough-life and the beast-tending. Slowly a vast system of traditional imperatives superposed itself upon his instincts, imperatives that were admirably fitted to make him that cultivator, that cattle-mincer, who was for twice ten thousand years the normal man.

And, unpremeditated, undesired, out of the accumulations of his tilling came civilisation. Civilisation was the agricultural surplus. It appeared as trade and tracks and roads, it pushed boats out upon the rivers and presently invaded the seas, and within its primitive courts, within temples grown rich and leisurely and amidst the gathering medley of the seaport towns rose speculation and philosophy and science, and the beginning of the new order that has at last established itself as human life. Slowly at first, as we traced it, and then with an accumulating velocity, the new powers were fabricated.
Man as a whole did not seek them nor desire them; they were thrust into his hand. For a time men took up and used these new things and the new powers inadvertently as they came to him, recking nothing of the consequences. For endless generations change led him very gently. But when he had been led far enough, change quickened the pace. It was with a series of shocks that he realised at last that he was living the old life less and less and a new life more and more.

Already before the release of atomic energy the tensions between the old way of living and the new were intense. They were far intenser than they had been even at the collapse of the Roman imperial system. On the one hand was the ancient life of the family and the small community and the petty industry, on the other was a new life on a larger scale, with remoter horizons and a strange sense of purpose. Already it was growing clear that men must live on one side or the other. One could not have little tradespeople and syndicated businesses in the same market, sleeping carters and motor trolleys on the same road, bows and arrows and aeroplane sharpshooters in the same army, or illiterate peasant industries and power-driven factories in the same world. And still less it was possible that one could have the ideas and ambitions and greed and jealousy of peasants equipped with the vast appliances of the new age. If there had been no atomic bombs to bring together most of the directing intelligence of the world to that hasty conference at Brissago, there would still have been, extended over great areas and a considerable space of time perhaps, a less formal conference of responsible and understanding people upon the perplexities of this world-wide opposition. If the work of Holsten had been spread over centuries and imparted to the world by imperceptible degrees, it would nevertheless have made it necessary for men to take counsel upon and set a plan for the future. Indeed already there had been accumulating for a hundred years before the crisis a literature of foresight; there was a whole mass of ‘Modern State’ scheming available for the conference to go upon. These bombs did but accentuate and dramatise an already developing problem.

[***]

Coming in still closer, the investigator would have reached the police cordon, which was trying to check the desperate enterprise of those who would return to their homes or rescue their more valuable possessions within the ‘zone of imminent danger.’

That zone was rather arbitrarily defined. If our spectator could have got permission to enter it, he would have entered also a zone of uproar, a zone of perpetual thunderings, lit by a strange purplish-red light, and quivering and swaying with the incessant explosion of the radio-active substance. Whole blocks of buildings were alight and burning fiercely, the trembling, ragged flames looking pale and ghastly and attenuated in comparison with the full-bodied crimson glare beyond. The shells of other edifices already burnt rose, pierced by rows of window sockets against the red-lit mist.

Every step farther would have been as dangerous as a descent within the
crater of an active volcano. These spinning, boiling bomb centres would shift or break unexpectedly into new regions, great fragments of earth or drain or masonry suddenly caught by a jet of disruptive force might come flying by the explorer’s head, or the ground yawn a fiery grave beneath his feet. Few who adventured into these areas of destruction and survived attempted any repetition of their experiences. There are stories of puffs of luminous, radio-active vapour drifting sometimes scores of miles from the bomb centre and killing and scorching all they overtook. And the first conflagrations from the Paris centre spread westward half-way to the sea.

Moreover, the air in this infernal inner circle of red-lit ruins had a peculiar dryness and a blistering quality, so that it set up a soreness of the skin and lungs that was very difficult to heal. . . .

Such was the last state of Paris, and such on a larger scale was the condition of affairs in Chicago, and the same fate had overtaken Berlin, Moscow, Tokio, the eastern half of London, Toulon, Kiel, and two hundred and eighteen other centres of population or armament. Each was a flaming centre of radiant destruction that only time could quench, that indeed in many instances time has still to quench. To this day, though indeed with a constantly diminishing uproar and vigour, these explosions continue. In the map of nearly every country of the world three or four or more red circles, a score of miles in diameter, mark the position of the dying atomic bombs and the death areas that men have been forced to abandon around them. Within these areas perished museums, cathedrals, palaces, libraries, galleries of masterpieces, and a vast accumulation of human achievement, whose charred remains lie buried, a legacy of curious material that only future generations may hope to examine. . . .

[***]

Thence he must have assisted in the transmission of the endless cipher messages that preceded the gathering at Brissago, and there it was that the Brissago proclamation of the end of the war and the establishment of a world government came under his hands.

[***]

And now it was that the social possibilities of the atomic energy began to appear. The new machinery that had come into existence before the last wars increased and multiplied, and the council found itself not only with millions of hands at its disposal, but with power and apparatus that made its first conceptions of the work it had to do seem pitifully timid. The camps that were planned in iron and deal were built in stone and brass; the roads that were to have been mere iron tracks became spacious ways that insisted upon architecture; the cultivations of foodstuffs that were to have supplied emergency rations, were presently, with synthesisers, fertilisers, actinic light, and scientific direction, in excess of every human need.

The government had begun with the idea of temporarily reconstituting the social and economic system that had prevailed before the first coming of the atomic engine, because it was to this system that the ideas and habits of the
great mass of the world’s dispossessed population was adapted. Subsequent rearrangement it had hoped to leave to its successors—whoever they might be. But this, it became more and more manifest, was absolutely impossible. As well might the council have proposed a revival of slavery. The capitalist system had already been smashed beyond repair by the onset of limitless gold and energy; it fell to pieces at the first endeavour to stand it up again. Already before the war half of the industrial class had been out of work, the attempt to put them back into wages employment on the old lines was futile from the outset—the absolute shattering of the currency system alone would have been sufficient to prevent that, and it was necessary therefore to take over the housing, feeding, and clothing of this worldwide multitude without exacting any return in labour whatever. In a little while the mere absence of occupation for so great a multitude of people everywhere became an evident social danger, and the government was obliged to resort to such devices as simple decorative work in wood and stone, the manufacture of hand-woven textiles, fruit-growing, flower-growing, and landscape gardening on a grand scale to keep the less adaptable out of mischief, and of paying wages to the younger adults for attendance at schools that would equip them to use the new atomic machinery. . . So quite insensibly the council drifted into a complete reorganisation of urban and industrial life, and indeed of the entire social system.

[***]

The world had already been put upon one universal monetary basis. For some months after the accession of the council, the world’s affairs had been carried on without any sound currency at all. Over great regions money was still in use, but with the most extravagant variations in price and the most disconcerting fluctuations of public confidence. The ancient rarity of gold upon which the entire system rested was gone. Gold was now a waste product in the release of atomic energy, and it was plain that no metal could be the basis of the monetary system again. Henceforth all coins must be token coins. Yet the whole world was accustomed to metallic money, and a vast proportion of existing human relationships had grown up upon a cash basis, and were almost inconceivable without that convenient liquidating factor. It seemed absolutely necessary to the life of the social organisation to have some sort of currency, and the council had therefore to discover some real value upon which to rest it. Various such apparently stable values as land and hours of work were considered. Ultimately the government, which was now in possession of most of the supplies of energy-releasing material, fixed a certain number of units of energy as the value of a gold sovereign, declared a sovereign to be worth exactly twenty marks, twenty-five francs, five dollars, and so forth, with the other current units of the world, and undertook, under various qualifications and conditions, to deliver energy upon demand as payment for every sovereign presented. On the whole, this worked satisfactorily. They saved the face of the pound sterling. Coin was rehabilitated, and after a phase of price fluctuations began to settle down to
definite equivalents and uses again, with names and everyday values familiar to the common run of people. . . .

[***]

‘You know, sir, I’ve a fancy—it is hard to prove such things—that civilisation was very near disaster when the atomic bombs came banging into it, that if there had been no Holsten and no induced radio-activity, the world would have—smashed—much as it did. Only instead of its being a smash that opened a way to better things, it might have been a smash without a recovery. It is part of my business to understand economics, and from that point of view the century before Holsten was just a hundred years’ crescendo of waste. Only the extreme individualism of that period, only its utter want of any collective understanding or purpose can explain that waste. Mankind used up material—insanely. They had got through three-quarters of all the coal in the planet, they had used up most of the oil, they had swept away their forests, and they were running short of tin and copper. Their wheat areas were getting weary and populous, and many of the big towns had so lowered the water level of their available hills that they suffered a drought every summer. The whole system was rushing towards bankruptcy. And they were spending every year vaster and vaster amounts of power and energy upon military preparations, and continually expanding the debt of industry to capital. The system was already staggering when Holsten began his researches. So far as the world in general went, there was no sense of danger and no desire for inquiry. They had no belief that science could save them, nor any idea that there was a need to be saved. They could not, they would not, see the gulf beneath their feet. It was pure good luck for mankind at large that any research at all was in progress. And as I say, sir, if that line of escape hadn’t opened, before now there might have been a crash, revolution, panic, social disintegration, famine, and—it is conceivable—complete disorder. . . . The rails might have rusted on the disused railways by now, the telephone poles have rotted and fallen, the big liners dropped into sheet-iron in the ports; the burnt, deserted cities become the ruinous hiding-places of gangs of robbers. We might have been brigands in a shattered and attenuated world. Ah, you may smile, but that had happened before in human history. The world is still studded with the ruins of broken-down civilisations. Barbaric bands made their fastness upon the Acropolis, and the tomb of Hadrian became a fortress that warred across the ruins of Rome against the Colosseum. . . . Had all that possibility of reaction ended so certainly in 1940? Is it all so very far away even now?’

‘It seems far enough away now,’ said Edith Haydon.

‘But forty years ago?’

‘No,’ said Karenin with his eyes upon the mountains, ‘I think you underrate the available intelligence in those early decades of the twentieth century. Officially, I know, politically, that intelligence didn’t tell—but it was there. And I question your hypothesis. I doubt if that discovery could have been delayed. There is a kind of inevitable logic now in the progress of
research. For a hundred years and more thought and science have been going their own way regardless of the common events of life. You see—they have got loose. If there had been no Holsten there would have been some similar man. If atomic energy had not come in one year it would have come in another. In decadent Rome the march of science had scarcely begun. . . . Nineveh, Babylon, Athens, Syracuse, Alexandria, these were the first rough experiments in association that made a security, a breathing-space, in which inquiry was born. Man had to experiment before he found out the way to begin. But already two hundred years ago he had fairly begun. . . . The politics and dignities and wars of the nineteenth and twentieth centuries were only the last phoenix blaze of the former civilisation flaring up about the beginnings of the new. Which we serve. . . .

‘Man lives in the dawn for ever,’ said Karenin. ‘Life is beginning and nothing else but beginning. It begins everlastingly. Each step seems vaster than the last, and does but gather us together for the next. This Modern State of ours, which would have been a Utopian marvel a hundred years ago, is already the commonplace of life. But as I sit here and dream of the possibilities in the mind of man that now gather to a head beneath the shelter of its peace, these great mountains here seem but little things. . . .’

While undoubtedly visionary, Wells’ book was more of a road map to the future, than a prophecy. It led Leo Szilard and Werner Heisenberg toward the development of an “atomic bomb”, as Wells called it, after Otto Hahn discovered nuclear fission. Wells was very much aware of the impact his work might have on the future. He wrote,

“Man began to think. There were times when he was fed, when his lusts and his fears were all appeased, when the sun shone upon the squattting-place and dim stirrings of speculation lit his eyes. He scratched upon a bone and found resemblance and pursued it and began pictorial art, moulded the soft, warm clay of the river brink between his fingers, and found a pleasure in its patternings and repetitions, shaped it into the form of vessels, and found that it would hold water. He watched the streaming river, and wondered from what bountiful breast this incessant water came; he blinked at the sun and dreamt that perhaps he might snare it and spear it as it went down to its resting-place amidst the distant hills. Then he was roused to convey to his brother that once indeed he had done so—at least that some one had done so—he mixed that perhaps with another dream almost as daring, that one day a mammoth had been beset; and therewith began fiction—pointing a way to achievement—and the august prophetic procession of tales.”

Much of what Wells proposed on the scientific front was eventually fulfilled, and much of what he predicted may yet take place. Albert Einstein, picking up the theme from Emory Reves’ The Anatomy of Peace of 1945, took his script as the protagonist “Leblanc” in the atomic age from Wells’ A World Set Free of 1913, and stated, inter
alía,

“The release of atomic energy has not created a new problem. It has merely made more urgent the necessity of solving an existing one. One could say that it has affected us quantitatively, not qualitatively. So long as there are sovereign nations possessing great power, war is inevitable. That is not an attempt to say when it will come, but only that it is sure to come. That was true before the atomic bomb was made. What has been changed is the destructiveness of war. [***] The secret of the bomb should be committed to a world government, and the United States should immediately announce its readiness to give it to a world government.”

Both Wells’ and Einstein’s call for a world government matched Judaic Messianic prophecies. Einstein promoted the two most fundamental goals of Jewish prophecy, the “restoration of the Jews to Palestine” and the formation of a world government after an apocalyptic war to end all wars.

Wells dedicated his book of 1913 not to Albert Einstein, but,

“TO FREDERICK SODDY’S ‘INTERPRETATION OF RADIUM’ THIS STORY, WHICH OWES LONG PASSAGES TO THE ELEVENTH CHAPTER OF THAT BOOK, ACKNOWLEDGES AND INSCRIBES ITSELF”

Frederick Soddy opposed Einstein and the theory of relativity. Soddy stated at the fourth gathering of Nobel Prize winners in Lindau on 30 June 1954 that the theory of relativity is a “swindle”—“an orgy of amateurish metaphysics” (Soddy’s lecture criticizing Einstein and the theory of relativity was “revised” before publication). Soddy stated in 1908:

“CHAPTER XI.

Why is radium unique among the elements?—Its rate of change only makes it remarkable—Uranium is more wonderful than radium—The energy stored up in a pound of uranium—Transmutation is the key to the internal energy of matter—The futility of ancient alchemy—The consequences if transmutation were possible—Primitive man and the art of kindling fire—Modern man and the problem of transmutation—Cosmical evolution and its sinews of war—Atomic disintegration a sufficient, if not the actual primary source of natural energy—Radioactivity and geology—Quantity of radium in the earth’s crust—The earth probably not a cooling globe—Mountain formation by means of radium—The temperature of the moon and planets—Ancient mythology and radioactivity—The serpent ‘Ouroboros’—The ‘Philosopher’s Stone’ and the ‘Elixir of Life’—The ‘Fall of Man’ and the ‘Ascent of Man’—The great extension in the possible duration of past time—Speculations on possible forgotten races of men—Radium and the struggle for existence—Existence as a struggle for physical energy—The new prospect.
THIS interpretation of radium is drawing to a close, but perhaps the more generally interesting part of it remains to be dealt with. We have steadily followed out the idea of atomic disintegration to its logical conclusions, so far as they can at present be drawn, and we have found it able to account for all the surprising discoveries that have been made in radioactivity, and capable of predicting many, and perhaps even more unexpected, new ones. Let us from the point of vantage we have gained return to the starting point of our inquiries and see what a profound change has come over it since the riddle has been read. Radium, a new element, giving out light and heat like Aladdin’s lamp, apparently defying the law of the conservation of energy, and raising questions in physical science which seemed unanswerable, is no longer the radium we know. But although its mystery has vanished, its significance and importance have vastly gained. At first we were compelled to regard it as unique, dowered with potentialities and exhibiting peculiarities which raised it far above the ordinary run of common matter. The matter was the mere vehicle of ultra-material powers. If we now ask, why is radium so unique among the elements, the answer is not because it is dowered with any exceptional potentialities or because it contains any abnormal store of internal energy which other elements do not possess, but simply and solely because it is changing comparatively rapidly, whereas the elements before known are either changing not at all or so slowly that the change has been unperceived. At first sight this might seem an anti-climax. Yet it is not so. The truer view is that this one element has clothed with its own dignity the whole empire of common matter. The aspect which matter has presented to us in the past is but a consummulate disguise, concealing latent energies and hidden activities beneath an hitherto impenetrable mask. The ultra-material potentialities of radium are the common possession of all that world to which in our ignorance we used to refer as mere inanimate matter. This is the weightiest lesson the existence of radium has taught us, and it remains to consider the easy but remorseless reasoning by which the conclusion is arrived at.

Two considerations will make the matter clear. In the first place, the radioactivity of radium at any moment is, strictly speaking, not a property of the mass of the radium at all, although it is proportional to the mass. The whole of the new set of properties is contributed by a very small fraction of the whole, namely, the part which is actually disintegrating at the moment of observation. The whole of the rest of the radium is as quiescent and inactive as any other non-radioactive element. In its whole chemical nature it is an ordinary element. The new properties are not contributed at all by the main part of the matter, but only by the minute fraction actually at the moment disintegrating.

Let us next compare and contrast radium with its first product, the emanation, and with its original parent, uranium. Uranium on the one hand, and the emanation on the other, represent, compared with radium, diametrically opposed extremes. Uranium is changing so slowly that it will
last for thousands of millions of years, the emanation so rapidly that it lasts only a few weeks, while radium is intermediate with a period of average life of two thousand five hundred years.

We have seen that in many ways the emanation is far more wonderful than radium, as the rate its energy is given out is relatively far greater. But this is compensated for by the far shorter time its activity lasts. Also, if we compared uranium with radium, we should say at once that radium is far more wonderful than the uranium, whereas in reality it is not so, as the uranium, changing almost infinitely more slowly, lasts almost infinitely longer.

The arresting character of radium is to be ascribed solely to the rate at which it happens to be disintegrating. The common element uranium, well known to chemists for a century before its radioactivity was suspected, is in reality even more wonderful. It is only very feebly radioactive, and therefore is changing excessively slowly, but it changes, we believe, into radium, expelling several α-particles and so evolving large amounts of energy in the process. Uranium is a heavier element than radium, and the relative weights of the two atoms, which is a measure of their complexity, is as 238 is to 226. This bottle contains about a pound of an oxide of uranium which contains about seven-eighths of its weight of the element uranium. In the course of the next few thousand million years, so far as we can tell, it will change, producing over thirteen ounces of radium, and, in that change into radium alone, energy is given out, as radioactive energy, aggregating of itself an enormous total, while the radium produced will also change, giving out a further enormous aggregate quantity of energy.

So that uranium, since it produces radium, contains all the energy contained in a but slightly smaller quantity of radium and more. It may be estimated that uranium evolves during complete disintegration at least some fourteen per cent more energy than is evolved from the same weight of radium. But what are we to say about the other heavy elements — lead, bismuth, mercury, gold, platinum, etc.—although their atoms are not quite so heavy as uranium or radium, and although none of them, so far as we yet know, are disintegrating at all? Is this enormous internal store of energy confined to the radioactive elements, that is to the few which, however slowly, are actually changing? Not at all, in all probability. Regarded merely as chemical elements between radioactive elements and non-radioactive elements, there exists so complete a parallelism that we cannot regard the radioactive elements as peculiar in possessing this internal store of energy, but only as peculiar in evolving it at a perceptible rate. Radium especially is so completely analogous in its whole chemical nature, and even in the character of its spectrum, to the non-radioactive elements, barium, strontium, and calcium, that chemists at once placed radium in the same family as these latter, and the value of its atomic weight confirms the arrangement in the manner required by the Periodic Law. It appears rather that this internal store of energy we learned of for the first time in connection with radium is
possessed to greater or lesser degree by all elements in common and is part and parcel of their internal structure.

Let us, however, for the sake of conciseness, leave out of account altogether the non-radioactive elements, of which as yet we know nothing certainly. At least we cannot escape from the conclusion that the particular element uranium has relatively more energy stored up within it even than radium. Uranium is a comparatively common element. The mines of Cornwall last year produced, I believe, over ten tons of uranium.

I have already referred to the total amount of energy evolved by radium during the course of its complete change. It is about a quarter of a million times as much energy as is evolved from the same weight of coal in burning. The energy evolved from uranium would be some fourteen per cent greater than from the same weight of radium. This bottle contains about one pound of uranium oxide, and therefore about fourteen ounces of uranium. Its value is about £1. Is it not wonderful to reflect that in this little bottle there lies asleep and waiting to be evolved the energy of at least one hundred and fifty tons of coal? The energy in a ton of uranium would be sufficient to light London for a year. The store of energy in uranium would be worth a thousand times as much as the uranium itself, if only it were under our control and could be harnessed to do the world’s work in the same way as the stored energy in coal has been harnessed and controlled.

There is, it is true, plenty of energy in the world which is practically valueless. The energy of the tides and of the waste heat from steam fall into this category as useless and low-grade energy. But the internal energy of uranium is not of this kind. The difficulty is of quite another character. As we have seen, we cannot yet artificially accelerate or influence the rate of disintegration of an element, and therefore the energy in uranium, which requires a thousand million years to be evolved, is practically valueless. On the other hand, to increase the natural rate, and to break down uranium or any other element artificially, is simply transmutation. If we could accomplish the one so we could the other. These two great problems, at once the oldest and the newest in science, are one. Transmutation of the elements carries with it the power to unlock the internal energy of matter, and the unlocking of the internal stores of energy in matter would, strangely enough, be infinitely the most important and valuable consequence of transmutation.

Let us consider in the light of present knowledge the problem of transmutation, and see what the attempt of the alchemist involved. To build up an ounce of a heavy element like gold from a lighter element like silver would require in all probability the expenditure of the energy of some hundreds of tons of coal, so that the ounce of gold would be dearly bought. On the other hand, if it were possible artificially to disintegrate an element with a heavier atom than gold and produce gold from it, so great an amount of energy would probably be evolved that the gold in comparison would be of little account. The energy would be far more valuable than the gold. Although we are as ignorant as ever of how to set about transmutation, it
cannot be denied that the knowledge recently gained constitutes a very great help towards a proper understanding of the problem and its ultimate accomplishment. We see clearly the magnitude of the task and the insufficiency of even the most powerful of the forces at our disposal in a way not before appreciated, and we have now a clear perception of the tremendous issues at stake. Looking backwards at the great things science has already accomplished, and at the steady growth in power and fruitfulness of scientific method, it can scarcely be doubted that one day we shall come to break down and build up elements in the laboratory as we now break down and build up compounds, and the pulses of the world will then throb with a new force, of a strength as immeasurably removed from any we at present control as they in turn are from the natural resources of the human savage.

It is, indeed, a strange situation we are confronted with. The first step in the long, upward journey out of barbarism to civilisation which man has accomplished appears to have been the art of kindling fire. Those savage races who remain ignorant of this art are regarded as on the very lowest plane. The art of kindling fire is the first step towards the control and utilisation of those natural stores of energy on which civilisation even now absolutely depends. Primitive man existed entirely on the day-to-day supply of sunlight for his vital energy, before he learned how to kindle fire for himself. One can imagine before this occurred that he became acquainted with fire and its properties from naturally occurring conflagrations.

With reference to the newly recognised internal stores of energy in matter we stand to-day where primitive man first stood with regard to the energy liberated by fire. We are aware of its existence solely from the naturally occurring manifestations in radioactivity. At the climax of that civilisation the first step of which was taken in forgotten ages by primitive man, and just when it is becoming apparent that its ever-increasing needs cannot indefinitely be borne by the existing supplies of energy, possibilities of an entirely new material civilisation are dawning with respect to which we find ourselves still on the lowest plane—that of onlookers with no power to interfere. The energy which we require for our very existence, and which Nature supplies us with but grudgingly and in none too generous measure for our needs, is in reality locked up in immense stores in the matter all around us, but the power to control and use it is not yet ours. What sources of energy we can and do use and control, we now regard as but the merest leavings of Nature’s primary supplies. The very existence of the latter till now have remained unknown and unsuspected. When we have learned how to transmute the elements at will the one into the other, then, and not till then, will the key to this hidden treasure-house of Nature be in our hands. At present we have no hint of how even to begin the quest.

The question has frequently been discussed whether transmutation, so impossible to us, is not actually going on under the transcendental conditions obtaining in the sun and the stars. We have seen that it is actually going on in the world under our eyes in a few special cases and at a very slow rate.
The possibility now under consideration, however, is rather that it may be
going on universally or at least much more generally, and at much more rapid
rate under celestial than under terrestrial conditions. From the new point of
view it may be said at once that if it were so, many of the difficulties
previously experienced in accounting for the enormous and incessant
dissipation of energy throughout the universe would disappear.

Last century has wrought a great change in scientific thought as to the
nature of the gigantic forces which have moulded the world to its present
form and which regulated the march of events throughout the universe. At
one time it was customary to regard the evolution of the globe as the result
of a succession in the past times of mighty cataclysms and catastrophes
beside which the eruptions of a Krakatao or Peke would be insignificant.
Now, however, we regard the main process of moulding as due rather to
ever-present, continuous, and irresistible actions, which, though operating so
slowly that over short periods of time their effect is imperceptible, yet in the
epochs of the cosmical calendar effected changes so great and complete that
the present features of the globe are but a passing incident of a continually
shifting scene. Into the arena of these silent world-creating and destroying
influences and processes has entered a new-corner—'Radioactivity'—and
it has not required long before it has come to be recognised that in the
discovery of radioactivity, or rather of the sub-atomic powers and processes
of which radioactivity is merely the outward and visible manifestation, we
have penetrated one of Nature’s innermost secrets.

Whether or no the processes of continuous atomic disintegration bulk
largely in the scheme of cosmical evolution, at least it cannot be gainsaid that
these processes are at once powerful enough and slow enough to furnish a
sufficient and satisfactory explanation of the origin of those perennial
outpourings of energy by virtue of which the universe to-day is a going
concern rather than a cold, lifeless collocation of extinct worlds. Slow,
irresistible, incessant, unalterable, so apparently feeble that it has been
reserved to the generation in which we live to discover, the processes of
radioactivity, when translated in terms of a more extended scale of space and
time, appear already as though they well may be the ultimate controlling
factors of physical evolution. For slow processes of this kind do the effective
work of Nature, and the occasional intermittent displays of Plutonic activity
correspond merely to the creaking now and again of an otherwise silent
mechanism that never stops.

It is one of the most pleasing features of this new work that geologists
have been among the very first to recognise the applicability and importance
of it in their science. I am not competent to deal adequately with or discuss
the geological problems that it has raised. But this story would be incomplete
if I did not refer, though it must be but briefly, to the labours of Professor
Strutt who initiated the movement and to those of Professor Joly who has
carried it on. These workers carried out careful analyses of the representative
rocks in the earth’s crust for the amount of radium they contained.
Absolutely, the quantity of radium in common rocks is of course very small, although with the refined methods now at the disposal of investigators it is quite measurable. The important fact which has transpired, however, is that the rocks examined contain on the average much larger quantities of radium, and therefore necessarily of its original parent uranium, than might be expected. The amount of heat which finds its way in a given time from the interior of the globe to the surface and thence outwards into external space has long been accurately known. Strutt concluded that if there existed only a comparatively thin crust of rocks less than fifty miles thick of the same composition, as regards the content of radium, as the average of those he examined, the radium in them would supply the whole of the heat lost by the globe to outer space. He concluded that the surface rocks must form such a thin crust, and that the interior of the globe must be an entirely different kind of material, free from the presence of radium. Otherwise the world would be much hotter inside than is known to be the case. So far then as the earth is concerned, a quantity of radium less than in all probability actually exists would supply all the heat lost to outer space. So that there is no difficulty in accounting for the necessary source of heat to maintain the existing conditions of temperature on the earth over a period of past time as long as the uranium which produces the radium lasts, that is to say, for a period of thousands of millions of years.

Professor Joly in his Presidential Address to the Geology section of the British Association at Dublin in 1908 has considered in detail the effect of the radium in the rocks of the Simplon Tunnel in producing the unexpectedly high temperatures there encountered, and has come to the conclusion that without undue assumptions it is possible to explain the differences in the temperature of the rocks by the differences in their radium content. He went on to propound a new theory of mountain formation on the lines that local concentrations of radium, brought about by sedimentation, cause local increases of temperature in the earth’s crust. At these places the strength of the crust to stress is weakened, conditioning its upheaval and folding and even over-thrusting for many miles, with the formation of mountain ranges. The rhythmic succession of periods of sedimentation followed by upheaval many times repeated is the common theory of mountain formation. In the concentration of radium in the sedimentary deposit Joly finds a sufficient explanation of and cause for the next subsequent upheaval.

Leaving this globe and taking a survey of the solar system, it has always struck me as remarkable that the temperature of the constituent worlds so far as we know them seems to be roughly in proportion to their size. The moon we regard as quite cold. The Earth and Mars have similar temperatures, while Jupiter and Saturn are probably nearly red-hot. Of course this agrees well enough with the old idea that these bodies were steadily cooling, the process being the slower the greater the mass. But it agrees also with the newer idea that the temperature is probably more or less constant, as the result of an equilibrium in which the heat lost by radiation is counterbalanced by new
internal sources of heat provided by slow atomic disintegrations.

With regard to the sun itself, it is certain that the loss of heat cannot be supplied by the presence of radium. For this to be the case a very large part of the sun’s mass must consist of uranium, and this we know from the spectroscope is very improbable. Still it is by no means to be concluded that the heat of the sun and stars is not in the first place of internal rather than, as has been the custom to regard it, of external origin. Obviously we are only at the beginning of our knowledge of the internal stores of energy in matter, and the mere fact that these stores existed, and in a few actual cases within our knowledge were slowly evolved and became available for the purposes of cosmical evolution, justified us in regarding them as the probable, as they were certainly the sufficient, first source from which the available energy of all Nature was derived.

There is one other sphere in which these discoveries touch human life strangely into which I cannot forbear altogether from entering, although I am all unfitted to act as guide. Radioactivity has accustomed us in the laboratory to the matter-of-fact investigation of processes which require for their completion thousands of millions of years. In one sense the existence of such processes may be said largely to have annihilated time. That is to say, at one bound the limits of the possible extent of past and future time have been enormously extended. We are no longer merely the dying inhabitants of a world itself slowly dying, for the world, as we have seen, has in itself, in the internal energy of its own material constituents, the means, if not the ability, to rejuvenate itself perennially. It is, of course, true, upon present existing knowledge, that the extent of the possible duration of time is merely increased and that on the new scale exactly the same principles apply as before. Yet the increase is so extensive that it practically constitutes a reversal of the older views. At the same time, it will be admitted that physical science can no longer, as at one time she felt justified in doing, impose a definite limit to the continuance of the existing conditions of things. The idea that evolution is proceeding in continuous cycles, without beginning and without end, in which the waste energy of one part of the cycle is transformed in another part of the cycle back into available forms, is at least as possible and conceivable in the present state of knowledge as the older idea, which was based on a too wide application of those laws of the availability of energy we have found to hold within our own experience. It remains for the future to decide whether what happens to be at present our sole experience of the laws of energy does apply, as has hitherto been quite definitely assumed, to the universe as a whole, and to all the conditions therein within which it is impossible for us to perform our experiments. This reservation is one legitimate consequence of the recent ideas, for we have learnt from them how easy it is to give to the generalisations of physical science a universal application they do not in fact possess.

If, then, the world is no longer slowly dying from exhaustion, but bears within itself its own means of regeneration, so that it may continue to exist
in much the same physical condition as at present for thousands of millions of years, what about Man? The revelations of radioactivity have removed the physical difficulties connected with the sufficiency of the supply of natural energy, which previously had been supposed to limit the duration of man’s existence on this planet, but it adds of itself nothing new to our knowledge as to whether man has shared with the world its more remote history. Here again it is interesting and harmless to indulge in a little speculation, and I may mention one rather striking point.

It is curious how strangely some of the old myths and legends about matter and man appear in the light of the recent knowledge. Consider, for example, the ancient mystic symbol of matter, known as Ouroboros—‘the tail devourer’—which was a serpent, coiled into a circle with the head devouring the tail, and bearing the central motto ‘The whole is one.’ This symbolises evolution, moreover it is evolution in cycle—the latest possibility—and stranger still it is evolution of matter—again the very latest aspect of evolution—the existence of which was strenuously denied by Clerk Maxwell and others of only last century. The idea which arises in one’s mind as the most attractive and consistent explanation of the universe in light of present knowledge, is perhaps that matter is breaking down and its energy being evolved and degraded in one part of a cycle of evolution, and in another part still unknown to us, the matter is being again built up with the utilisation of the waste energy. The consequence would be that, in spite of the incessant changes, an equilibrium condition would result, and continue indefinitely. If one wished to symbolise such an idea, in what better way could it be done than by the ancient tail-devouring serpent?

Some of the beliefs and legends which have come down to us from antiquity are so universal and deep-rooted that we are accustomed to consider them almost as old as the race itself. One is tempted to inquire how far the unsuspected aptness of some of these beliefs and sayings to the point of view so recently disclosed is the result of mere chance or coincidence, and how far it may be evidence of a wholly unknown and unsuspected ancient civilisation of which all other relic has disappeared. It is curious to reflect, for example, upon the remarkable legend of the philosopher’s stone, one of the oldest and most universal beliefs, the origin of which, however far back we penetrate into the records of the past, we do not seem to be able to trace to its source. The philosopher’s stone was accredited the power not only of transmuting the metals, but of acting as the elixir of life. Now, whatever the origin of this apparently meaningless jumble of ideas may have been, it is really a perfect and but very slightly allegorical expression of the actual present views we hold to-day. It does not require much effort of the imagination to see in energy the life of the physical universe, and the key to the primary fountains of the physical life of the universe to-day is known to be transmutation. Is then this old association of the power of transmutation with the elixir of life merely a coincidence? I prefer to believe it may be an echo from one of many previous epochs in the unrecorded history of the world, of an age of men
which have trod before the road we are treading to-day, in a past possibly so remote that even the very atoms of its civilisation literally have had time to disintegrate.

Let us give the imagination a moment’s further free scope in this direction, however, before closing. What if this point of view that has now suggested itself is true, and we may trust ourselves to the slender foundation afforded by the traditions and superstitions which have been handed down to us from a prehistoric time? Can we not read into them some justification for the belief that some former forgotten race of men attained not only to the knowledge we have so recently won, but also to the power that is not yet ours? Science has reconstructed the story of the past as one of a continuous Ascent of Man to the present-day level of his powers. In face of the circumstantial evidence existing of this steady upward progress of the race, the traditional view of the Fall of Man from a higher former state has come to be more and more difficult to understand. From our new standpoint the two points of view are by no means so irreconcilable as they appeared. A race which could transmute matter would have little need to earn its bread by the sweat of its brow. If we can judge from what our engineers accomplish with their comparatively restricted supplies of energy, such a race could transform a desert continent, thaw the frozen poles, and make the whole world one smiling Garden of Eden. Possibly they could explore the outer realms of space, emigrating to more favourable worlds as the superfluous to-day emigrate to more favourable continents. One can see also that such dominance may well have been short-lived. By a single mistake, the relative positions of Nature and man as servant and master would, as now, become reversed, but with infinitely more disastrous consequences, so that even the whole world might be plunged back again under the undisputed sway of Nature, to begin once more its upward toilsome journey through the ages. The legend of the Fall of Man possibly may indeed be the story of such a past calamity.

I cannot fittingly conclude this series of lectures without, however inadequately, directing attention to one further outstanding feature of general interest, which this interpretation of radium will in the course of time bring home to all thoughtful minds.

The vistas of new thought which have opened out in all, directions in the physical sciences, to which man is merely incidental and external, have in turn reacted powerfully upon those departments of thought in which man is central and supreme. I am aware that in this field, concerned with the most profound of all questions — the relation of man to his external environment — it has lately been the custom for the physicist not to intrude. This phase of opinion is perhaps somewhat of the nature of a reaction from the other extreme of an earlier generation, in which science arrogated to itself the right to pronounce the final judgment upon the questions in dispute. At least it will be admitted that if the progress of physical science completely transforms, as it has recently so transformed, our notions of the outer world in which we
live, its claim to be heard upon the relations of this world to its inhabitants cannot be resisted. Another reason why perhaps the physicist has hesitated to encroach too directly upon the eternal problems of life has been that he could contribute little of hope or comfort for the race from his philosophy. In the past his conclusions concerning physical evolution and destiny have intensified rather than lightened the existing gloom. To what purpose is the incessant upward struggle of civilisation which history and the biological sciences has made us aware of, if its arena is a slowly dying world, destined to carry ultimately all it bears to one inevitable doom? At least this reason for silence no longer exists. We find ourselves in consequence of the progress of physical science at the pinnacle of one ascent of civilisation, taking the first step upwards out on to the lowest plane of the next. Above us still rises indefinitely the ascent to physical power—far beyond the dreams of mortals in any previous system of philosophy. These possibilities of a newer order of things, of a more exalted material destiny than any which have been foretold, are not the promise of another world. They exist in this, to be fought and struggled for in the old familiar way, to be wrung from the grip of Nature, as all our achievements and civilisation have, in the past, been wrung by the labour of the collective brain of mankind guiding, directing, and multiplying the individual’s puny power. This is the message of hope and inspiration to the race which radium has contributed to the great problems of existence. No attempt at presentation of this new subject could be considered complete which did not, however imperfectly, suggest something of this side.

Released as physical science now is from the feeling of hopelessness in dealing with such matters, and at the same time in possession of vast generalisations concerning matter and energy of more than mere abstract significance to the race, it is fitting to attempt to see how far purely physical considerations will take us in delimiting the major controlling influences which regulate our existence.

It is possible, without breaking any of the new ground, to go a long way. Just as you must feed a child at school before it can be educated, as you must provide a man with the possibility of something more than a brute struggle for life before he can be civilised, so generally in the same sense the physical conditions which encircle existence of necessity take precedence over every other consideration. Whatever other aspect of life is considered, and they are many and as yet but little dealt with by science for the most part, the physical aspect comes first, in the sense that if the physical conditions of life are unfavourable, nothing can be expected of any higher aspect.

Surveying the long chequered, but on the whole continuous, ascent of man from primeval conditions to the summit of his present-day powers, what has it all been at bottom but a fight with Nature for energy—for that ordinary physical energy of which we have said so much? Physical science sums up exactly in that one generalisation the most fundamental aspect of life in the sense already defined.

Of course life depends also on a continual supply of matter as well as on
a continual supply of energy, but the struggle or physical energy is probably the more fundamental and general aspect of existence in all its forms. The same matter, the same chemical elements, serve the purposes of life over and over again, but the supply of fresh energy must be continuous. By the law of the availability of energy, which, whether universal or not, applies universally within our own experience, the transformations of energy which occur in Nature are invariably in the one direction, the more available forms passing into the waste and useless unavailable kind, and this process, so far as we yet know, is never reversed. The same energy is available but once. The struggle for existence is at the bottom a continuous struggle for fresh physical energy.

This is as far as the knowledge available last century went. What is now the case? The aboriginal savage, ignorant of agriculture and of the means of kindling fire, perished from cold and hunger unless he subsisted as a beast of prey and succeeded in plundering and devouring other animals. Although the potentialities of warmth and food existed all round him, and must have been known to him from natural processes, he knew not yet how to use them for his own purposes. It is much the same to-day. With all our civilisation, we still subsist, struggling among ourselves for a sufficiency of the limited supply of physical energy available, while all around are vast potentialities of the means of sustenance, we know of from naturally occurring processes, but do not yet know how to use or control. Radium has taught us that there is no limit to the amount of energy in the world available to support life, save only the limit imposed by the boundaries of knowledge.

It cannot be denied that, so far as the future is concerned, an entirely new prospect has been opened up. By these achievements of experimental science Man’s inheritance has increased, his aspirations have been uplifted, and his destiny has been ennobled to an extent beyond our present power to foretell. The real wealth of the world is its energy, and by these discoveries it, for the first time, transpires that the hard struggle for existence on the bare leavings of natural energy in which the race has evolved is no longer the only possible or enduring lot of Man. It is a legitimate aspiration to believe that one day he will attain the power to regulate for his own purposes the primary fountains of energy which Nature now so jealously conserves for the future. The fulfilment of this aspiration is, no doubt, far off, but the possibility alters somewhat the relation of Man to his environment, and adds a dignity of its own to the actualities of existence."

16.4 The Inertia of Energy

Maxwell’s equations implicitly contain the formula \( E = mc^2 \). Simon Newcomb pioneered the concept of relativistic energy in 1889. Preston, J. J. Thomson, Olinto De Pretto, Fritz Hasenöhrl, [etc. etc. etc.] each effectively (Albert Einstein, himself, did not expressly state it in 1905), or directly, presented
the formula $E = mc^2$, before 1905, and Max Planck refined the concept in 1906-1908, including Galileo’s, Huyghens’, Newton’s, Boscovich’s, Schopenhauer’s, Mach’s, Bolliger’s, Geissler’s, Bessel’s, Stas’, Eötvös’, Kreichgauer’s, Landolt’s, Heydweiller’s and Hecker’s implications that inertial mass and gravitational mass are equivalent—before Albert Einstein. Einstein was familiar with Poincaré’s 1900 paper, which implicitly contained the formula $E = mc^2$, and which presented the method for synchronizing clocks with light signals that Einstein copied without an attribution.

With respect to Planck’s equation, G. N. Lewis gave us relativistic mass in 1908, and in 1909,

“drew attention to the formula for the kinetic energy

$$\frac{m_0 c^2}{\left(1 - \frac{v^2}{c^2}\right)^{1/2}} - m_0 c^2$$

and suggested that the last term should be interpreted as the energy of the particle at rest.”

Louis Rougier’s *Philosophy and the New Physics* contains much useful information on this subject. Max Jammer’s *Concepts of Mass in Classical and Modern Physics* is yet more detailed, and Whittaker’s *A History of the Theories of Aether and Electricity* in two volumes is phenomenal.

Poincaré, merely reiterating a common conception at the time, stated in 1904,

“The calculations of Abraham and the experiments of Kaufmann have then shown that the mechanical mass, properly so called, is null, and that the mass of the electrons, or, at least, of the negative electrons, is of exclusively electro-dynamic origin. This forces us to change the definition of mass; we cannot any longer distinguish mechanical mass and electrodynamic mass, since then the first would vanish; there is no mass other than electrodynamic inertia. But, in this case the mass can no longer be constant, it augments with the velocity, and it even depends on the direction, and a body animated by a notable velocity will not oppose the same inertia to the forces which tend to deflect it from its route, as to those which tend to accelerate or to retard its progress.”

Alexander Bain expressly stated in 1870 that,

“matter, force, and inertia, are three names for substantially the same fact”

and,
“force and matter are not two things, but one thing”

and,

“force, inertia, momentum, matter, are all but one fact”.

For Oliver Heaviside, in 1889, this fact was electromagnetism, the “electric force of inertia.”

Schopenhauer stated the mass energy equivalence in 1819 in his book *The World as Will and Representation*,

“Force and substance are inseparable, because at bottom they are one; for, as Kant has shown, matter itself is given to us only as the union of forces, that of expansion and that of attraction. Therefore there exists no opposition between force and substance; on the contrary, they are precisely one.”

While discussing Schopenhauer’s system, William Caldwell stated in 1893,

“But some physicists have maintained that matter itself may be reduced to force, and modern psycho-physics has suggested that consciousness may be regarded as only psychical force—a higher kind of force doubtless than the various forms of energy with which we are familiar, but still a force which may be determined both qualitatively and quantitatively.”

Stephen Moulton Babcock stated that the mass of a body was a function of its energy content in 1903, though he claimed that as a body absorbed energy its mass decreased,

“PROFESSOR Stephen Moulton Babcock, who recently gave the world a new scientific truth in proving, after twenty years of research, that objects vary in weight according to their temperature, thus capped a long career of successful invention and discovery. [***] Scientists, however, have of late been concerned more with Doctor Babcock’s recent discovery involving the origin and nature of matter. Always observing and with a mind ‘budding and sprouting’ with new ideas, Doctor Babcock more than twenty years ago took issue with that feature of the atomic theory which assumes that the atoms of a given element are all precisely alike. His doubts led him into a series of experiments which finally brought him to the surprising conclusion that when a chemical change takes place within a hermetically sealed flask the substances within lose in weight if heat is absorbed in the process and increase in weight if heat is given off.

To test this result on a larger scale and with greater accuracy than had hitherto been possible, Doctor Babcock invented a form of hydrostatic balance which makes it possible to detect a difference of weight in a given substance amounting to only one unit in a hundred million. With such a
balance he found a perceptible difference between the weight of a piece of ice and that of the water resulting from the melting of the same ice.

This change of weight appears to depend solely upon the increase or decrease in the quantity of heat, or, in other words, in the energy inherent in the substance tested, and Doctor Babcock, therefore, summarizes his results in this far-reaching formula: ‘The weight of a body is an inverse function of its inherent energy.’ In other words, elements in combining or in changing their physical condition change in weight as they change in heat—they grow lighter as they grow hotter, and heavier as they cool. By implication this theory may be extended to include all matter, and if further experiments justify such a daring generalization we may go a step further and assume that, by a sufficient increase in the inherent energy of what we call matter, its weight, and therefore its mass—for weight is but a measure of mass—will entirely disappear.

If these revolutionary views can maintain themselves against the criticism which they are certain to arouse they may be justly said to constitute one of the greatest of scientific generalizations. It is an interpretation of the law of gravitation and, indeed, stands next to it in importance. The physical theory that all interstellar space is filled with ether, to which is attributed the properties of infinite energy and of absolute lack of weight, is corroborated by Doctor Babcock’s theory: ‘Since, when the energy stored upon any given atom is increased, its weight is thereby diminished, and infinite energy means of necessity zero weight.”

Frederick Soddy stated in 1904,

“The work of Kaufmann may be taken as an experimental proof of the increase of apparent mass of the electron when its speed approaches that of light. Since during disintegration electrons are expelled at speeds very near that of light, which, after expulsion, experience resistance and suffer diminution of velocity, the total mass must be less after disintegration than before. On this view atomic mass must be regarded as a function of the internal energy, and the dissipation of the latter in radio-activity occurs at the expense, to some extent at least, of the mass of the system”.

Thomson defined the inertia of his vortex atom based on its energy content. A. E. Dolbear wrote in this context that,

“Hence, inertia, too, must be looked upon as probably due to motion”,

and,

“It is not simply an amount of material, but the energy the material has, which gives it its characteristic properties.”
Sir Oliver Lodge wrote,

“[The theory of relativity] attributes inertia to energy (not for the first time).”\(^{3419}\)

Boscovich claimed that inertia is a relative quantity, and is not absolute.\(^{3420}\) The pantheist John Toland argued that energy is essential to matter in his *Letters to Serena* in 1704.\(^{3421}\) These same concepts are to be found in Heraclitus and in Aristotle, for example,

“Wherefore, it is evident, that substance and form are each of them a certain energy. And therefore, according to this reasoning, it is evident that in substance energy is prior to potentiality. And, as we have stated, one energy invariably is antecedent to another in time, up to that which is primarily and eternally the moving cause.”\(^{3422}\)

### 16.5 The Einsteins’ Energy Fudge

Herbert Ives published a paper in 1952, which argued that Einstein employed the irrational method of *Petitio Principii* in “deriving” the mass-energy equivalence in 1905. This evinces a repeated pattern of Einstein’s irrationality, on top of his pattern of unoriginality, each signifying one goal—plagiarism,

“In 1905 Einstein published a paper with the interrogatory title ‘Does the Inertia of a Body Depend upon its Energy Content?’, [A. Einstein, Ann. Physik 18, 639 (1905).] a question already answered in the affirmative by Hasenöhrl. This paper, which has been widely cited as being the first proof of the ‘inertia of energy as such,’ describes an emission process by two sets of observations, in different units, the resulting equations being then subtracted from each other. It should be obvious *a priori* that the only proper result of such a procedure is to give \(0 = 0\), that is, no information about the process can be so obtained. However the fallacy of Einstein’s argument not having been heretofore explicitly pointed out, the following analysis is presented: [***] What Einstein did by setting down these equations (as ‘clear’) was to *introduce* the relation

\[
\frac{L}{m - m'} c^2 = 1.
\]

Now *this is the very relation the derivation was supposed to yield*. It emerges from Einstein’s manipulation of observations by two observers because it has been slipped in by the assumption which Planck questioned. The relation \(E = m c^2\) was not derived by Einstein.”\(^{3423}\)

Following Ives, Max Jammer wrote that,
“the mass of the body relative to $S$, before and after the emission,

$$T'_0 = m_0 c^2 \left[ \frac{1}{\left(1 - \frac{v^2}{c^2}\right)^{1/2}} - 1 \right]$$

(7)

and

$$T'_1 = m_1 c^2 \left[ \frac{1}{\left(1 - \frac{v^2}{c^2}\right)^{1/2}} - 1 \right].$$

(8)

Einstein now mistakenly put $E'_0 - E_0$ equal to $T'_0 + C$ ($C$ is a constant) and $E'_1 - E_1$ equal to $T'_1 + C$, and thus obtained by subtraction and in virtue of Eq. (6),

$$T'_0 - T'_1 = E \left[ \frac{1}{\left(1 - \frac{v^2}{c^2}\right)^{1/2}} - 1 \right]$$

(9)

[. . .] whereas, in view of Eqs. (7) and (8) he should have obtained

$$T'_0 - T'_1 = \left( m_0 - m_1 \right) c^2 \left[ \frac{1}{\left(1 - \frac{v^2}{c^2}\right)^{1/2}} - 1 \right],$$

(11)

[. . .] we see that Einstein unwittingly assumed that

$$\frac{E}{\left( m_0 - m_1 \right) c^2} = 1,$$

(14)

which is exactly the contention to be proved.”

Lloyd S. Swenson, Jr. wrote,

“Curiously, Einstein’s own first derivation of the famous formula $E = m c^2$ was incorrect in the sense of begging the question of what was to be proved. Growing out of Einstein’s subliminal obsession with the operational meaning of the constancy of the velocity of light, the mass-energy equivalence

$$m = \frac{E}{c^2}$$

had been assumed in interior calculations as
The Manufacture and Sale of St. Einstein

\[
\frac{E}{mc^2} = 1
\]

and thus the equivalences

\[
E = mc^2
\]

\[
\frac{E}{c^2} = m
\]

and

\[
\sqrt{E/m} = c
\]

were embedded in the premises, therefore predetermined in the conclusion. Though right for the wrong reasons at first, Einstein caught his mistakes and redressed his deductions in further publications in 1906 and 1907.**

16.6 Hero Worship

Webster’s New World Dictionary defines “relativity” as, *inter alia,*

“4. Physics the fact, principle, or theory of the relative [***] as developed and mathematically formulated by Albert Einstein and H. A. Lorentz in the special (or restricted) theory of relativity”.*

Grolier’s *Encyclopedia International*, states, under “Relativity, Theory of”, as follows,

“To explain this paradoxical result, G. F. FitzGerald and, independently, H. A. Lorentz suggested that the effect of the ether flow on the speed of light was masked by a contraction of the measuring apparatus caused by its motion through the ether. But J. H. Poincaré and Einstein independently realized that, since all efforts to detect the earth’s absolute motion had failed, the principle of relativity must somehow be valid after all, despite the ether.”**

Subsequent to learning of FitzGerald’s prior work, Lorentz never failed to acknowledge that FitzGerald had anticipated him, unlike Albert Einstein, who failed to cite Poincaré’s work, which we know Einstein had read before 1905, in the Einsteins’ 1905 paper, or in any of the expositions on the subject which Einstein later published in 1907, 1910, 1911, 1912 or 1916. Poincaré published his conclusions in 1895, ten years before Einstein, and repeated them often in widely read books and journals.

We know, from Solovine’s accounts,* that Einstein had extensively read
Poincaré. Poincaré first stated the principle of relativity ten years before Mileva and Albert, who then parroted one version of Poincaré’s principle in almost identical form in 1905, and certainly not “independently”. The Einsteins copied Poincaré’s clock synchronization with lights signals procedure virtually verbatim, as well as his exposition on relative simultaneity and we know that Albert had read Poincaré’s explanations before copying them without an attribution.

Why is Albert Einstein’s name associated with the “principle of relativity”, and not Poincaré’s? Poincaré stated it first, ten years before the Einsteins, and the Einsteins copied it from him.

Who is to blame for this injustice? What could possibly motivate them, other than ethnic bias, ethnic guilt, self-doubt and/or hero worship? The facts are clear to all who are willing to look. Albert Einstein did not originate the special theory of relativity. That is clear.

Grolier’s *Encyclopedia International* states under “Poincaré, Jules Henri”,

“In 1905 Poincaré showed that Maxwell’s equations suggested a theory different from classical Newtonian mechanics. He thus anticipated an aspect of the theory of relativity derived independently by Einstein in the same year.”

Poincaré, Lorentz, Larmor, Langevin, FitzGerald, Lange and Voigt anticipated Einstein on all important aspects of the theory.

Grolier’s *Encyclopedia International* states in its article “Lorentz, Hendrik Antoon”,

“By extending Maxwell’s electromagnetic theory of light, [Lorentz] incorporated many phenomena that it so far had failed to explain—in particular, the optical and electrical phenomena associated with moving bodies. His name is most widely known for the Lorentz contraction (or the Lorentz-Fitzgerald contraction), which says that a body moving with a velocity near that of light contracts in the direction of its motion. This forms an important part of the special theory of relativity.”

The facts stated together record that, as Whittaker stated,

“Einstein published a paper which set forth the relativity theory of Poincaré and Lorentz with some amplifications, and which attracted much attention. He asserted as a fundamental principle the *constancy of the velocity of light*, i.e. that the velocity of light *in vacuo* is the same in all systems of reference which are moving relatively to each other: an assertion which at the time was widely accepted, but has been severally criticized by later writers.”

Instead of proving that Einstein was a pioneer, the facts indicate that, as Max Born stated,
“[Einstein’s] paper ‘Zur Elektrodynamik bewegter Körper’ in Annalen der Physik [***] contains not a single reference to previous literature. It gives you the impression of quite a new venture. But that is, of course, [***] not true.”

Since Poincaré and Lorentz developed the theory, why aren’t their names not only linked to the theory, but universally linked together? What makes the image of “Einstein” so sacrosanct, that it is today virtually a crime to tell the truth about the history of the special theory of relativity? Why, in the majority of the histories of the special theory of relativity, isn’t Einstein, with his minor contribution of the relativistic equations for aberration and the Doppler-Fizeau effect (together with his many blunders), the curious footnote of a persistent copycat, and not the central theme? Certainly, it is more convenient to briefly credit Einstein with everything, but, since the ideas are considered so significant, one would think the originators deserve their due credit.

Many people knew that Einstein did not hold priority for much of what he wrote. Einstein, himself, was keenly aware of it. R. S. Shankland stated,

“About publicity Einstein told me that he had been given a publicity value which he did not earn. Since he had it he would use it if it would do good; otherwise not.”

Einstein stated on 27 April 1948,

“In the course of my long life I have received from my fellow-men far more recognition than I deserve, and I confess that my sense of shame has always outweighed my pleasure therein.”

Einstein told Peter A. Bucky,

“Peter, I fully realize that many people listen to me not because they agree with me or because they like me particularly, but because I am Einstein. If a man has this rare capacity to have such esteem with his fellow men, then it is his obligation and duty to use this power to do good for his fellow men.”

It is not uncommon for grandiose myths to accrue to overly idealized popular figures, including Albert Einstein. Theoretical Physics, as a field, was small, and not well known in the period from 1905-1919. Theoretical physicists were not well known, and, since those in the field knew that Einstein was a plagiarist, they largely ignored him.

In 1919, (on dubious grounds) Dyson, Davidson and Eddington, made Einstein internationally famous by affirming that experiment had confirmed, without an attribution to Soldner, Soldner’s 1801 hypothesis, that the gravitational field of the sun should curve the path of light from the stars. Shortly after that, Einstein
won the Nobel Prize, though it is unclear why he won it, other than as a reward for his new-found fame for reiterating Soldner’s ideas, and for his pacifist stance during the First World War.

Einstein did not invent the atomic bomb. In fact, he was ignorant of the concepts behind the bomb. However, with the help of Alexander Sachs, Einstein was asked to sign a letter to President Roosevelt urging him to instigate what would eventually become the “Manhattan Project”, the effort to develop an atomic bomb before the Nazis. Due to his ignorance, Leo Szilard and Eugene Wigner had to explain the concepts of the atomic bomb to Einstein, before he would sign the letter.\textsuperscript{3436}

Einstein stated on 20 September 1952,

“My part in producing the atomic bomb consisted in a single act: I signed a letter to President Roosevelt, pressing the need for experiments on a large scale in order to explore the possibilities for the production of an atomic bomb.”\textsuperscript{3437}

Note that Einstein signed, but did not write, the letter; and that his only contribution to the development of the bomb was his signature.

Given Einstein’s rôle as a spokesperson for those who knew of the concept of the bomb, one may wonder, did Einstein frequently become the political toy of others? Consider Joffe’s description of the man,

“Einstein’s thoughts were far away from political problems and this is why many of Einstein’s speeches in this field were poorly thought out. For example: Once in the late twenties, a group of German scientists published an anti-Soviet appeal at the end of which I found Einstein’s signature. When I showed this to him, and asked why he did it, he answered that he did not think about it, but he signed it because Planck telephoned him. I asked Einstein if he is on the side of Prussian capitalism in this fight for the new socialistic state against the old. And he replied, ‘Of course not, I would not have signed it if I knew about the consequences. In the future, I will not participate in any political movements without consulting you.’ And also, in my opinion, Einstein’s support of Zionism was ill-conceived. His wife even convinced him to participate in a concert, which Zionists had organized in a synagogue. And one more example is Einstein’s fascination with the American idea of a ‘single state’, which idea in essence was created in order to discredit each nation’s movement toward independence, and to make it easier for big and rich countries to take over and exploit small ones. And Einstein, in the beginning, would only look at the façade of things and not look deeper into their true meaning.”\textsuperscript{3438}

Einstein, according to Joffe, was political “play dough”.

On 15 March 1921, Kurt Blumenfeld warned Chaim Weizmann that it would be unwise to let Einstein make speeches during his trip to America on behalf of the Zionists,
“Einstein is a poor speaker and often says things out of naiveté that are unwelcome to us.”

In December of 1930, the National German-Jewish Union told Einstein to stop prostituting science for his political agenda and to stop stereotyping Jewish people with his bigoted segregationalist Zionist nationalism. Einstein was forced to defend himself after World War II from the charges of Jewish anti-Zionists that his Zionism was destructive nationalism.

Why was Einstein, who had not known of, or understood, the concept of an atomic bomb, chosen to write to the President of the United States in an effort to persuade him to pursue research to make one? Was the popular image of the man far more potent than his mind?

When said program to develop an atomic bomb began, Einstein was not asked to participate, but rather was excluded from the research team. Why was Einstein, supposedly the most brilliant human being of all time, not a member of the team which developed the bomb, and upon whose work the fate of all of humanity might rest? Did Oppenheimer know that Einstein lacked the abilities needed to contribute to the research? It was apparently enough that Einstein’s celebrity was exploited to draw attention to the need for research. That was Einstein’s only rôle in the development of the atomic bomb. His ideas were not welcomed.

Einstein stated in 1945,

“I do not consider myself the father of the release of atomic energy. My part in it was quite indirect. I did not, in fact, foresee that it would be released in my time. I believed only that it was theoretically possible. It became practical through the accidental discovery of chain reaction, and this was not something I could have predicted. It was discovered by Hahn in Berlin, and he himself misinterpreted what he discovered. It was Lise Meitner who provided the correct interpretation, and escaped from Germany to place the information in the hands of Niels Bohr. [***] I am not able to speak from any firsthand knowledge about the development of the atomic bomb, since I do not work in this field.”

Otto Hahn’s work was the critical factor in the development of the atomic bomb. Hahn considered Lise Meitner a minor figure—though she and Niels Bohr did work against Germany and assisted the Allies to develop the bomb, not so much as scientists, but rather as spies who betrayed Otto Hahn and Werner Heisenberg. In 1944, Otto Hahn won the Nobel Prize “for his discovery of the fission of heavy nuclei”. It was a chemist, not a physicist, who let the genie out of the bottle.

16.7 Conclusion

How has the popular history become so corrupted as to ignore these facts? Why do we feel the need to perpetuate the comic book legend of “Einstein”, as if he were the great discoverer of all physical truths? Einstein did not invent, nor predict the atomic
bomb. Einstein did not derive or originate the formula $E = m c^2$. The awesome image of a thermonuclear explosion is spuriously used to promote Einstein as the god who supposedly unlocked the secrets of the atom, which he did not do. This is well known in the Physics community and yet the media continue to misinform the public about these facts just as they continue to that Einstein created the theory of relativity and was the first person to propose the idea of space-time. What motivates them to misinform the public? Why are the voices of those who tell the truth generally suppressed?
17 EINSTEIN’S MODUS OPERANDI

Einstein and his followers promoted and promote the theory of relativity as if it were perfectly logical. The theory is demonstrably irrational. In his efforts to hide his plagiarism, Einstein confused induction with deduction; and, like many of his predecessors, Einstein made too hasty of generalizations out of specific experimental results.

“Die Relativitätstheorie ist aus einigen mißverstandenen Anregungen des philosophischen Physikers MACH und aus Gedanken des mathematischen Physikers LORENTZ entstanden, die ins Groteske weitergesponnen wurden.”—ERNST GEHRCKE

“I don’t find Einstein’s Relativity agrees with me. It is the most unnatural and difficult to understand way of representing facts that could be thought of. [***] And I really think that Einstein is a practical joker, pulling the legs of his enthusiastic followers, more Einsteinisch than he.”—OLIVER HEAVISIDE

“Einstein simply postulates what we have deduced, with some difficulty and not altogether satisfactorily, from the fundamental equations of the electromagnetic field. [***] I have not availed myself of his substitutions, only because the formulae are rather complicated and look somewhat artificial”.—HENDRIK ANTOON LORENTZ

17.1 Introduction

Logic forbids a theorist from asserting as a premise that which she wishes to deduce as a conclusion. Such is the fallacy of “begging the question” or *Petitio Principii*. One cannot logically assert that light speed is invariant as a premise in order to deduce from that premise the conclusion that light speed is invariant. One cannot logically assert that the laws of physics are invariant in inertial systems in order to deduce from that premise that the laws of physics are invariant in inertial systems. One cannot assume that $\frac{E}{(m_0 - m_1)c^2} = 1$, in order to prove that $\frac{E}{(m_0 - m_1)c^2} = 1$. One cannot logically assert a gravitational and inertial mass equivalence in order to deduce from that premise the conclusion that gravitational and inertial mass are equivalent. However, Albert Einstein committed all of these sins against reason, and more.
A logical synthesis proceeds from the most general and simple (as opposed to complex—singular as opposed to compound) *a priori* statements made in the theory, to the specific conclusions of the theory, which are empirically observable. The supposed empirical fact that light speed is invariant cannot logically be taken as an *a priori* principle. Speed is composed of the more fundamental elements of space and time; and a physical observation is the point of departure for an *a posteriori* analysis, not an *a priori* synthesis. The more fundamental elements of the Lorentz Transformation deduce all velocity comparisons, and are more general and fundamental than the specific speed of light. Likewise, the principle of relativity is an alleged empirical observation, which depends upon the more general and fundamental elements of that which defines an inertial system, the laws of Physics, the definitions of measurement procedures, etc.; and it is a corollary to these, not an *a priori* principle.

### 17.2 “Mach’s” Principle of Logical Economy

Following David Hume, Ernst Mach argued from the 1860’s on that,

“There is no cause nor effect in nature; nature has but an individual existence; nature simply *is*.”

Mach, who was not a materialist, a point Einstein missed, wrote,

“Nature is composed of sensations as its elements. [***] In nature there is no law of refraction, only different cases of refraction. [***] We must admit, therefore, that there is no result of science which in point of principle could not have been arrived at wholly without methods. But, as a matter of fact, within the short span of a human life and with man’s limited powers of memory, any stock of knowledge worthy of the name is unattainable except by the greatest mental economy. Science itself, therefore, may be regarded as a minimal problem, consisting of the completest possible presentment of facts with the least possible expenditure of thought.”

In 1853, Sir William Hamilton called this the “law of parsimony”, and phrased it as follows,

“Neither more, nor more onerous, causes are to be assumed, than are necessary to account for the phenomena.”

Albert Einstein liked to appear wise. One of his ploys was to repeat the principle of logical economy as if it were his own. Here are but a few examples of many to be found in his writings and the accounts of others:

“The aim of science is, on the one hand, a comprehension, as *complete* as possible, of the connection between the sense experiences in their totality,
and, on the other hand, the accomplishment of this aim by the use of a minimum of primary concepts and relations. (Seeking, as far as possible, logical unity in the world picture, i.e., paucity in logical elements).”  

and,

“...The grand aim of all science is to cover the greatest number of empirical facts by logical deduction from the smallest number of hypotheses or axioms.”

and,

“A theory is the more impressive the greater the simplicity of its premises, the more different kinds of things it relates, and the more extended its area of applicability.”

As Abram Joffe noted, Albert Einstein held no priority for the principle of logical economy, could not comprehend it, and certainly did not fulfill it,

“As regards Einstein’s philosophical views, in my judgement, they were as inconsistent as his political positions. Obviously [Einstein] was raised in the period of Mach and so [Einstein] accepted [Mach’s] concept of physics, but on the other hand, ideas on the economy of thought such as the justification of theoretical physics, were foreign to [Einstein]. The reality of the outside world and understanding the outside world were the real truths, which called for this need of a single picture of the outside world [Unified Theory of an absolute universe]. It seemed to me that when we touched upon these questions, and that was very rarely and without any interest from Einstein’s side, in Einstein one found both a materialist and an admirer of Mach, whose system seemed nicely built to Einstein.”

Though Einstein cited Mach as a source of ideas, Mach rejected Einstein’s relativity theory and asked not to be associated with the “dogmatic” and “paradoxical” “nonsense”, in spite of the fact that Joseph Petzoldt sought to give Mach his due credit for major elements of the theory of relativity. Traugott Konstantin Oesterreich wrote in the fourth volume of Friedrich Ueberwegs Grundriss der Geschichte der Philosophie published in Berlin in 1923,

“...Zur Relativitätstheorie verhielt sich Mach (im Gegensatz zu der von Petzoldt (s. S. 394f.) gegebenen Interpretation seiner Lehren persönlich ablehnend.”

Einstein initially adored Mach, and asked for his guidance and help. When it became known, after Mach’s death, that Mach rejected Einstein and his views, Einstein ridiculed Mach.
Einstein was interviewed in *The London Times*, on 13 June 1921, pages 11 and 12, and expressed the principle of logical economy; but Einstein failed in his theories to distinguish what was assumed from what was empirical, and stated empirical facts as if assumptions, to then introduce very complicated geometries without acknowledging that these complications were the fundamental assumptions of his theories and violated the principle of logical economy,

"‘My own philosophic development,’ [Einstein] went on, ‘was from Hume to Mach and James.’

This was illuminating. James, I reflected, is the philosopher who held that we take to be true what we find it most convenient to believe. This had always struck me as a very sensible philosophy, and accordingly I asked Einstein whether he considered Relativity to be true in the sense that it leads to a more convenient set of mathematical expressions for natural phenomena, or whether he held that it actually penetrated deeper into reality.

He smiled broadly at this question, and then gave a little chuckle. ‘That is very complicated,’ he said, with evident enjoyment, and sat thinking. At these moments his eyes have a still, but very living expression, reminding one of Carlyle’s description of the eyes of Herr Teufelsdröck, which had the deceptive peace of a ‘sleeping’ top, spinning so rapidly as to appear immobile. There is no look of strain in the face, as there is with so many scientific men, and a little smile comes and goes perpetually at the corners of his mouth, as one implication after another opens before him.

When he did answer the question his answer was rather technical, dealing with the assumptions which lie at the base of Euclidean geometry. He gave me to understand, however, that his general attitude towards this question of convenience or deeper reality was the same as that of the late Henri Poincaré, the great French mathematician, who regarded the fundamental assumptions of geometry as *conventions*, but not as arbitrary conventions.

‘An infinite number of theories can always be devised,’ said Einstein, ‘which will serve to describe natural phenomena. We can invent as many different theories as we like, and any one can be made to fit the facts.’

‘Then perhaps the essentials of the old Newtonian assumptions could still be preserved,’ I said, ‘by endowing the ether with a sufficient number of extraordinary properties. Why do you prefer your theory of Relativity to one which assumes a very complicated ether?’

His answer was emphatic. ‘That theory is always to be preferred,’ he said, ‘which makes the fewest number of assumptions. Amongst the innumerable theories which can be constructed to fit the facts of science we choose the theory which starts off with the fewest assumptions. That is the criterion of theories.’"

Newton’s gravitational inverse square law of universal attraction is considered by many to be the epitome of “universality and simplicity” in Natural Philosophy. Einstein sought in vain for a similar law of such universality and simplicity. H. A.
Lorentz wrote in *The New York Times* on 21 December 1919 page 20,

“For centuries Newton’s doctrine of the attraction of gravitation has been the most prominent example of a theory of natural science. Through the simplicity of its basic idea, an attraction between two bodies proportionate to their mass and also proportionate to the square of the distance; through the completeness with which it explained so many of the peculiarities in the movement of the bodies making up the solar system; and, finally, through its universal validity, even in the case of the far-distant planetary systems, it compelled the admiration of all.”

“**R U L E I.**

*We are to admit no more causes of natural things, than such as are both true and sufficient to explain their appearances.*

To this purpose the philosophers say, that Nature do’s nothing in vain, and more is in vain, when less will serve; For Nature is pleas’d with simplicity, and affects not the pomp of superfluous causes.

**R U L E II.**

*Therefore to the same natural effects we must, as far as possible, assign the same causes.*

As to respiration in a man, and in a beast; the descent of stones in *Europe* and in *America*; the light of our culinary fire and of the Sun; the reflection of light in the Earth, and in the Planets.

**R U L E III.**

*The qualities of bodies, which admit neither intension nor remission of degrees, and which are found to belong to all bodies within the reach of our experiments, are to be esteemed the universal qualities of all bodies whatsoever.*

For since the qualities of bodies are only known to us by experiments, we are to hold for universal, all such as universally agree with experiments; and such as are not liable to diminution, can never be quite taken away. We are certainly not to relinquish the evidence of experiments for the sake of dreams and vain fictions of our own devising; nor are we to recede from the analogy of Nature, which uses to be simple, and always consonant to itself. We no other ways know the extension of bodies, than by our senses, nor do these reach it in all bodies; but because we perceive extension in all that are sensible, therefore we ascribe it universally to all others also. That abundance of bodies are hard we learn by experience. And because the hardness of the whole arises from the hardness of the parts, we therefore justly infer the hardness of the undivided particles not only of the bodies we feel but of all
others. That all bodies are impenetrable, we gather not from reason, but from sensation. The bodies which we handle we find impenetrable, and thence conclude impenetrability to be an universal property of all bodies whatsoever. That all bodies are moveable, and endow’d with certain powers (which we call the \textit{vires inertiæ}) of persevering in their motion or in their rest we only infer from the like properties observ’d in the bodies which we have seen. The extension, hardness, impenetrability, mobility, and \textit{vis inertiæ} of the whole, result from the extension, hardness, impenetrability, mobility, and \textit{vires inertiæ} of the parts: and thence we conclude the least particles of all bodies to be also all extended, and hard, and impenetrable, and moveable, and endow’d with their proper \textit{vires inertiæ}. And this is the foundation of all philosophy. Moreover, that the divided but contiguous particles of bodies may be separated from one another, is matter of observation; and, in the particles that remain undivided, our minds are able to distinguish yet lesser parts, as is mathematically demonstrated. But whether the parts so distinguish’d, and not yet divided, may, by the powers of nature, be actually divided and separated from one another, we cannot certainly determine. Yet had we the proof of but one experiment, that any undivided particle, in breaking a hard and solid body, suffer’d a division, we might by virtue of this rule, conclude, that the undivided as well as the divided particles, may be divided and actually separated to infinity.

Lastly, If it universally appears, by experiments and astronomical observations, that all bodies about the Earth, gravitate towards the Earth; and that in proportion to the quantity of matter which they severally contain; that the Moon likewise, according to the quantity of its matter, gravitates towards the Earth; that on the other hand our Sea gravitates towards the Moon; and all the Planets mutually one towards another; and the Comets in like manner towards the Sun; we must, in consequence of this rule, universally allow, that all bodies whatsoever are endow’d with a principle of mutual gravitation. For the argument from the appearances concludes with more force for the universal gravitation of all bodies, than for their impenetrability; of which among those in the celestial regions, we have no experiments, nor any manner of observation. Not that I affirm gravity to be essential to bodies. By their \textit{vis insita} I mean nothing but their \textit{vis inertiæ}. This is immutable. Their gravity is diminished as they recede from the Earth.

\textbf{RULE IV.}

\textit{In experimental philosophy we are to look upon propositions collected by general induction from phenomena as accurately or very nearly true, notwithstanding any contrary hypotheses that may be imagined, till such time as other phenomena occur, by which they may either be made more accurate, or liable to exceptions.}

This rule we must follow that the argument of induction may not be evaded by hypotheses.”
Newton wrote, in his *Opticks*,

“As in Mathematicks, so in Natural Philosophy, the Investigation of difficult Things by the Method of Analysis, ought ever to precede the Method of Composition. This Analysis consists in making Experiments and Observations, and in drawing general Conclusions from them by Induction, and admitting of no Objections against the Conclusions, but such as are taken from Experiments, or other certain Truths. For Hypotheses are not to be regarded in experimental Philosophy. And although the arguing from Experiments and Observations by Induction be no Demonstration of general Conclusions; yet it is the best way of arguing which the Nature of Things admits of, and may be looked upon as so much the stronger, by how much the Induction is more general.”

William of Occam (ca. 1285-1348) iterated “Occam’s Razor”,

“Entia non sunt multiplicanda praeter necessitatem.”

“Pluralitas non est ponenda sine necessitate.”

“Frustra fit per plura quod potest fieri per pauciora.”

And from the Scholasticism of the medieval period, we have,

“Principia non sunt cumulanda.”

“Natura horret superfluum.”

Today, we simply say, “Keep it simple, stupid!”

Einstein was fond of copying William Kingdon Clifford, Karl Pearson and Henri Poincaré, when Einstein wished to play the rôle of savant. Karl Pearson wrote long before Einstein, and Einstein had read him,

“The laws of science are, as we have seen, products of the creative imagination. They are the mental interpretations—the formulæ under which we resume wide ranges of phenomena, the results of observation on the part of ourselves or of our fellow men.”

Henri Poincaré averred,

“This principle of physical relativity can serve to define space; it provides us, so to speak, with a new measuring instrument. [***] Moreover, the new convention not only defines space, it also defines time. It teaches us what two simultaneous instants are, what two equal intervals of time are or what double an interval of time is of another. [***] Only then does the principle
present itself as a convention, and this removes it from the attacks of
experience. [The principle of physical relativity] is a convention which is
suggested to us by experience, but which we freely adopt.”

and,

“We are, therefore, forced to conclude that this notion has been created
totaly by the mind, but that experience has given the occasion.”

Einstein was quite familiar with Poincaré’s views on the rôle of experience in
science and knew that Poincaré stated the principle of relativity and the relativity of
simultaneity, which appear in Science and Hypothesis, before him. Contrary to
Stanley Goldberg’s assertions that Einstein’s views differed from Poincaré’s,
Einstein stated,

“We now come to our conceptions and judgements of space. It is essential
here also to pay strict attention to the relation of experience to our concepts.
It seems to me Poincaré clearly recognized the truth in the account he gave
in his book, ‘La Science et l’Hypothèse.’ Among all the changes which we
can perceive in a rigid body those which can be cancelled by a voluntary
motion of our body are marked by their simplicity; Poincaré calls these,
changes in position.”

Einstein was interviewed in The London Times, on 13 June 1921, pages 11 and
12,

“‘My own philosophic development,’ [Einstein] went on, ‘was from
Hume to Mach and James.’

This was illuminating. James, I reflected, is the philosopher who held that
we take to be true what we find it most convenient to believe. This had
always struck me as a very sensible philosophy, and accordingly I asked
Einstein whether he considered Relativity to be true in the sense that it leads
to a more convenient set of mathematical expressions for natural phenomena,
or whether he held that it actually penetrated deeper into reality.

He smiled broadly at this question, and then gave a little chuckle. ‘That
is very complicated,’ he said, with evident enjoyment, and sat thinking. At
these moments his eyes have a still, but very living expression, reminding
one of Carlyle’s description of the eyes of Herr Teufelsdröck, which had the
deceptive peace of a ‘sleeping’ top, spinning so rapidly as to appear
immobile. There is no look of strain in the face, as there is with so many
scientific men, and a little smile comes and goes perpetually at the corners
of his mouth, as one implication after another opens before him.

When he did answer the question his answer was rather technical, dealing
with the assumptions which lie at the base of Euclidean geometry. He gave
me to understand, however, that his general attitude towards this question of
convenience or deeper reality was the same as that of the late Henri Poincaré, the great French mathematician, who regarded the fundamental assumptions of geometry as *conventions*, but not as arbitrary conventions.

‘An infinite number of theories can always be devised,’ said Einstein, ‘which will serve to describe natural phenomena. We can invent as many different theories as we like, and any one can be made to fit the facts.’

‘Then perhaps the essentials of the old Newtonian assumptions could still be preserved,’ I said, ‘by endowing the ether with a sufficient number of extraordinary properties. Why do you prefer your theory of Relativity to one which assumes a very complicated ether?’

His answer was emphatic. ‘That theory is always to be preferred,’ he said, ‘which makes the fewest number of assumptions. Amongst the innumerable theories which can be constructed to fit the facts of science we choose the theory which starts off with the fewest assumptions. That is the criterion of theories.’”

William Kingdon Clifford, who died in 1879, held that,

“§ 19. *On the Bending of Space*

The peculiar topic of this chapter has been position, position namely of a point \( p \) relative to a point \( A \). This relative position led naturally to a consideration of the geometry of steps. I proceeded on the hypothesis that all position is relative, and therefore to be determined only by a stepping process. The relativity of position was a postulate deduced from the customary methods of determining position, such methods in fact always giving relative position. *Relativity of position is thus a postulate derived from experience.* The late Professor Clerk-Maxwell fully expressed the weight of this postulate in the following words:—

All our knowledge, both of time and place, is essentially relative. When a man has acquired the habit of putting words together, without troubling himself to form the thoughts which ought to correspond to them, it is easy for him to frame an antithesis between this relative knowledge and a so-called absolute knowledge, and to point out our ignorance of the absolute position of a point as an instance of the limitation of our faculties. Any one, however, who will try to imagine the state of a mind conscious of knowing the absolute position of a point will ever after be content with our relative knowledge.

It is of such great value to ascertain how far we can be certain of the truth of our postulates in the exact sciences that I shall ask the reader to return to our conception of position albeit from a somewhat different standpoint. I shall even ask him to attempt an examination of that state of mind which Professor Clerk-Maxwell hinted at in his last sentence.

In typical fashion Einstein would later repeat these ideas without citation to Maxwell, Clifford or Poincaré,
“In the previous paragraphs we have attempted to describe how the concepts of space, time and event can be put psychologically into relation with experiences. Considered logically, they are free creations of the human intelligence”.

and,

“The most satisfactory situation is evidently to be found in cases where the new fundamental hypotheses are suggested by the world of experience itself.”

and Einstein stated together with Infeld,

“Physical concepts are free creations of the human mind, and are not, however it may seem, uniquely determined by the external world.”

Einstein stated, in 1911,

“The principle [of relativity] is logically not necessary: it would be necessary only if it would be made such by experience. But it is made only probable by experience.”

17.3 Einstein’s Fallacies of Petition Principii

Einstein’s arguments were almost always fallacies of Petition Principii. Einstein avowed that,

“[A]ll knowledge of reality starts from experience and ends in it. [***]
[E]xperience is the alpha and omega of all our knowledge of reality.”

In order to mask his plagiarism, Einstein would irrationally state the experimental results others had obtained before him—the phenomena, per se, as his “first principles” or “postulates”. He would then conduct an analysis of the problem, as if he were proposing a synthesis of the solution—he knowingly confused induction with deduction, and analysis with synthesis. Then he would slip in the hypotheses of others in the middle of his theories, as if “derivations”, or “natural consequences”, of the phenomena, which he had also proposed as “postulates”, in order to deduce the same “postulates/phenomena” as conclusions, in an Argumentum in Circulo. Friedrich Paschen described Einstein as, “the theoretician who conceived the novel ideas of relativity theory from the finest analysis of empirical facts[.]” However, Einstein pretended that analysis was synthesis and induction, deduction. The ideas had already been published before Einstein copied them.

Einstein was accused of plagiarism from 1905 onward throughout his career. His friends leveled the same charges against him as those who opposed him. His closest
friends knew that he had re-derived Gerber’s solution, working inductively from Gerber’s solution. Gerber’s work was common knowledge and the plagiarism was obvious. Einstein wrote in his private correspondence that his theory of the bending of the path of light around the Sun was an exact repetition of the Newtonian prediction made long before he copied it without an attribution—this long before the accusations of plagiarism were made against Einstein in public. And, of course, Einstein is proven to have plagiarized the generally covariant field equations of gravitation from David Hilbert by taking Hilbert’s finalized equations as a point of departure for a pseudo-inductive analysis, whereby he merely asserted Hilbert’s equations without an attribution, and showed that they solved many problems.

Einstein wanted it to appear that he was following Newton’s fourth rule, but Einstein was really simply disguising his piracy of the hypotheses of others through illogical fallacies. In so doing, Einstein would claim the priority that he had “derived” what his predecessors were forced to “hypothesize”. Einstein turned the synthetic scientific theories of his predecessors on their heads rendering them bizarre metaphysical delusions in order to steal credit for them. Einstein avowed that all scientists should abandon induction, state phenomena as premises, and use his method of divine inspiration, instead of induction. Even here Einstein plagiarized the thoughts of others.

In a work somewhat reminiscent of Duhem’s The Aim and Structure of Physical Theory, Einstein disclosed his modus operandi for manipulating credit for the synthetic theories of others, when he stated in 1936,

“There is no inductive method which could lead to the fundamental concepts of physics. Failure to understand this fact constituted the basic philosophical error of so many investigators of the nineteenth century. [***] Logical thinking is necessarily deductive; it is based upon hypothetical concepts and axioms. How can we expect to choose the latter so that we might hope for a confirmation of the consequences derived from them? The most satisfactory situation is evidently to be found in cases where the new fundamental hypotheses are suggested by the world of experience itself.”

Einstein wanted people to believe that it is irrelevant that his predecessors induced the theories he later copied, because Einstein just invented them, sua sponte, irrationally, after he had read them, and therefore deserved credit for them,

“Invention is not the product of logical thought, even though the final product is tied to a logical structure.”

Many philosophers have stressed the importance of “experience” and an Experimentum Crucis, which excludes an unsuccessful theory in science. Bacon wrote about it in his Novum Organum. Robert Boyle explained it in his work Some Considerations Touching the Usefulness of Experimental Natural Philosophy. Propos’d in a Familiar Discourse to a Friend, by Way of Invitation to the Study of It. Sir John F. W. Herschel explained it in his A Preliminary Discourse on the
Study of Natural Philosophy. Lord Kelvin and Peter Guthrie Tait had their Elements of Natural Philosophy. David Hume wrote a great deal about induction and its validity. Jevons, in the Nineteenth Century, in response to Mill’s admiration for induction, provided us with a more lucid and prior statement than Einstein’s regarding the deductive aspect of induction, and keep in mind that Jevons was busying himself with the invention of the computer, a machine without creative reasoning powers,

“In a certain sense all knowledge is inductive. We can only learn the laws and relations of things in nature by observing those things. But the knowledge gained from the senses is knowledge only of particular facts, and we require some process of reasoning by which we may collect out of the facts the laws obeyed by them. Experience gives us the materials of knowledge: induction digests those materials, and yields us general knowledge. When we possess such knowledge, in the form of general propositions and natural laws, we can usefully apply the reverse process of deduction to ascertain the exact information required at any moment. In its ultimate foundation, then, all knowledge is inductive—in the sense that it is derived by a certain inductive reasoning from the facts of experience. It is nevertheless true,—and this is a point to which insufficient attention has been paid, that all reasoning is founded on the principles of deduction. I call in question the existence of any method of reasoning which can be carried on without a knowledge of deductive processes. I shall endeavor to show that induction is really the inverse process of deduction. There is no mode of ascertaining the laws which are obeyed in certain phenomena, unless we have the power of determining what results would follow from a given law. Just as the process of division necessitates a prior knowledge of multiplication, or the integral calculus rests upon the observation and remembrance of the results of the differential calculus, so induction requires a prior knowledge of deduction. An inverse process is the undoing of the direct process. A person who enters a maze must either trust to chance to lead him out again, or he must carefully notice the road by which he entered. The facts furnished to us by experience are a maze of particular results; we might by chance observe in them the fulfilment of a law, but this is scarcely possible, unless we thoroughly learn the effects which would attach to any particular law. Accordingly, the importance of deductive reasoning is doubly supreme. Even when we gain the results of induction they would be of no use unless we could deductively apply them. But before we can gain them at all we must understand deduction, since it is the inversion of deduction which constitutes induction. Our first task in this work, then, must be to trace out fully the nature of identity in all its forms of occurrence. Having given any series of propositions we must be prepared to develop deductively the whole meaning embodied in them, and the whole of the consequences which flow from them."
Jevons asserts that, “An inverse process is the undoing of the direct process. [***] The facts furnished to us by experience are a maze of particular results; we might by chance observe in them the fulfilment of a law, but this is scarcely possible, unless we thoroughly learn the effects which would attach to any particular law.”

The particular results cited in the 1905 paper on the “principle of relativity” are the failure of experiments to detect the æther wind on Earth, viz. the Michelson experiments, and the symmetry of phenomena in alleged violation of Maxwell’s equations. In other words, the alleged particular results are the phenomenon of invariant light speed, and the phenomena of the identity of inertial systems.

These phenomena are automatically taken to be general in science, because,

“from a series of similar events we may infer the recurrence of like events under identical conditions [***] all science implies generalization.”

There is an ancient occult belief, which asserts, “as above, so below”, meaning that the laws of nature are universal and uniform, and that the microscopic world mirrors the macroscopic world. The Hekaloth in the Zohar states,

“Said Rabbi Simeon: It is a tradition from the most ancient times that when the Holy One created the world he engraved and impressed on it in letters of brilliant light, the law by which it is sustained and governed. Above, below and on every side of it, it is engraved on every atom that man, by research and discovery, might become wise and conform himself to it as the rule of his life. The world below is, in shape and form, the reflection and copy of the world on high, so that there may be no discontinuity between them, but reciprocally act and react upon each other. This being so, we purpose to show that the same principle or law that operated in the creation of the physical world, operated also in the origin of man, and that both alike are manifestations of one and the same law. That this great fact may be more fully perceived, let us first consider the esoteric meaning of the words, ‘But they, like Adam, have transgressed the covenant, there have they dealt treacherously against me’ (Hos. vi. 7).”

In the tradition of Plato’s call for a search for the one among the many, the identities of Nature, Jevons asserted,

“The general principle of inference, that what we know of one case must be true of similar cases, so far as they are similar, prevents our asserting anything which we cannot apply time after time under the same circumstances.”

Ernst Mach wrote,

The so-called “Principle of Relativity” is just this “law of causality”, this primary generalization upon which all science is founded. However, it has no meaning in the special theory of relativity, unless and until the “same circumstances” are defined in an experimentally meaningful way. This is why the Einsteins required two postulates. One to establish a resting system of æther in which the velocity of light is axiomatically constant and a vector, and a second postulate to assert that the speed of light must also be constant in a second, moving, system—though this is a non sequitur. The generalization is already present in the resting system and does not logically lead to the conclusion that the speed of light must also be the same constant in a moving system. That broader generalization does not result from logic or from the principle of relativity, but instead from a too hasty generalization of experience based on the false premise that the Michelson experiments contain two reference systems in relative motion to each other in which light speed is measured to be invariant, when it has not been proven that they do. That interpretation of the Michelson experiment presumes an æther at absolute rest in which light speed is axiomatically constant. Robert A. Millikan wrote in 1949,

“The special theory of relativity may be looked upon as starting essentially in a generalization from Michelson’s experiment. And here is where Einstein’s characteristic boldness of approach came in, for the distinguishing feature of modern scientific thought lies in the fact that it begins by discarding all a priori conceptions about the nature of reality—or about the ultimate nature of the universe—such as had characterized practically all Greek philosophy and all medieval thinking as well, and takes instead, as its starting point, well-authenticated, carefully tested experimental facts, no matter whether these facts seem at the moment to be reasonable or not. In a word, modern science is essentially empirical, and no one has done more to make it so than the theoretical physicist, Albert Einstein. [***] Then Einstein called out to us all, ‘Let us merely accept this as an established experimental fact and from there proceed to work out its inevitable consequences.’

Again, the Einsteins, Lorentz and Poincaré were irrational to so generalize the Michelson results in the way that they did, and even if it had been rational to generalize the empirical result in the way that they did those empirical results would not have been a priori principles, but a posteriori problems. The only revolution that took place was the Einsteins’ and their followers misuse of terms.

Robertson points out (though, as Millikan made clear, Robertson mistakenly asserts that Einstein deduced what he clearly induced, in that the Einsteins “starting point” was empirical not a priori; and the operational interpretation asserted by Poincaré and parroted by the Einsteins without an attribution is dynamic not
kinematic, in that it depends upon dynamic light signals for measurement, dynamic clocks, dynamic measuring rods, dynamic observers in a dynamic inertial reference system, etc.),

“The kinematical background for this theory, an operational interpretation of the Lorentz transformation, was obtained deductively by Einstein from a general postulate of concerning the relativity of motion and a more specific postulate concerning the velocity of light. At the time this work was done an inductive approach could not have led unambiguously to the theory proposed, for the principal relevant observations of Michelson and Morley [Footnote: A. A. Michelson and E. H. Morley, Am. J. Sci. 34, 333 (1887).] (1886), could be accounted for in other, although less appealing, ways.”

Michelson would likely have said “less appalling!” The Lorentz transformation was obtained inductively, not deductively, from the empirical results of Michelson’s experiments, which results were not postulates, but rather they were physical observations.

One must first establish the definition of an “inertial system”, the means of finding it in Nature and of measuring it. This “principle” of relativity thereby becomes a corollary to these prior definitions, one that states that light speed is invariant and the laws of physics are covariant in these dynamic “inertial systems”. The “principle of relativity” is in no sense a postulate in the theory, for it is deducible from the light postulate, which is deducible from the hypotheses of the Lorentz transformations and Lange’s theoretical “inertial systems”. Therefore, neither of the Einsteins’ “postulates” is in fact a postulate, because both are deducible from more fundamental terms and both are summations of supposed physical facts.

It is irrational to assert the phenomena as causes of the same phenomena. There is no inverse process in “postulating” that light speed is invariant, and that under like conditions like results ensue; in order to “deduce” that those assumptions that light speed is invariant and that under like conditions like results ensue, for such is a redundancy, not a deduction. In a truly scientific approach to the problem, one must induce the postulates which then deduce the phenomenon of invariant light speed and deduce the like conditions and like results, from these same postulates of length contraction, time dilatation, relative simultaneity, inertial motion, etc. Jevons is not telling us to abandon induction, but to realize that it has an eye toward deduction, i.e. that it must be rational, and that our minds draw from experience. In Einstein’s case, the experience of reading the writings of his predecessors and then restating them in irrational terms, without citation to the prior works.

Jevons,

“It cannot be said that the Inductive process is of greater importance than the Deductive process already considered, because the latter process is absolutely essential to the existence of the former. Each is the compliment and counterpart of the other. The principles of thought and existence which underlie them are at bottom the same, just as subtraction of numbers
necessarily rests upon the same principles as addition [both deduction and induction must be rational]. Induction is, in fact, the inverse operation of deduction [Jevons contradicts himself again with his wavering analogies. Both induction and deduction rely upon the same principles of rationality. They are really convertible. Induction is not, in practice, the inverse process undoing prior direct deduction. Induction is a method in science of discovering more general truths from particular ones, which, if the more general truths were already known, it would not be necessary to induce them. Of course, when presenting a theory after it has been created, it is not necessary to demonstrate the induction, but simply the deduction to phenomena from first principles.], and cannot be conceived to exist without the corresponding operation, so that the question of relative importance cannot arise [Jevons’ conclusion is a non sequitur. Induction is of greater importance, because it delves into the unknown, developing rational inferences, a posteriori. Deduction truly is the inverse process undoing prior direct induction, and should not proceed a priori, without prior induction. However, should deduction predict as yet unobserved, but observable, phenomena, it then becomes quite significant, though yet relying on the induction which preceded it.]. Who thinks of asking whether addition or subtraction is the more important process in arithmetic? But at the same time much difference in difficulty may exist between a direct and inverse operation; the integral calculus, for instance, is infinitely more difficult than the differential calculus of which it is the inverse. Similarly, it must be allowed that inductive investigations are of a far higher degree of difficulty and complexity than any questions of deduction”.

Einstein lacked the insight and reasoning skills needed to induce hypotheses, so he condemned the practice. He was forced, due to his inability to cope with the “higher degree of difficulty and complexity” needed to induce hypotheses, to copy hypotheses from others, but sought to disguise the fact. Einstein insisted that empirical results be argued as first principles in order to deduce the same phenomena as results, which are argued as first principles, in a fallacy of Petitio Principii. This is the method he used in his “theories” in order to assume credit for the induced hypotheses of others, which he then slipped into the theories somewhere in the middle, without rational justification, calling them “derivations”.

Einstein wrote in the London Times of 28 November 1919, on page 13,

“There are several kinds of theory in Physics. Most of them are constructive. These attempt to build a picture of complex phenomena out of some relatively simple proposition. The kinetic theory of gases, for instance, attempts to refer to molecular movement the mechanical, thermal, and diffusional properties of gases. When we say that we understand a group of natural phenomena, we mean that we have found a constructive theory which embraces them.

THEORIES OF PRINCIPLE
But in addition to this most weighty group of theories, there is another
group consisting of what I call theories of principle. These employ the
analytic, not the synthetic method. Their starting-point and foundation are not
hypothetical constituents, but empirically observed general properties of
phenomena, principles from which mathematical formulae are deduced of
such a kind that they apply to every case which presents itself.”

Note that while Einstein correctly stated that his arguments were analytic, not
synthetic, Einstein confused induction, working from specific known facts to general
principles and hypotheses which account for all facts, with deduction, working from
the general principles and hypotheses to account for all known specifics and perhaps
to predict others. Einstein calls “induction”, “deduction”. Note that Einstein
acknowledges that it is the plagiarized mathematical hypotheses he employed, which
generally account for all specific cases and it is these fundamental hypotheses which
build the synthetic and deductive theory, as opposed to the inductive analysis he
deliberately confuses with deduction. Einstein continued,

“Thermodynamics, for instance, starting from the fact that perpetual motion
never occurs in ordinary experience, attempts to deduce from this, by
analytical process, a theory which will apply in every case. The merit of
constructive theories is their comprehensiveness, adaptability, and clarity,
that of the theories of principle, their logical perfection, and the security of
their foundation. The theory of relativity is a theory of principle.”

Note that Einstein admits that his theories analytically (not synthetically) argue from
specific known facts to the general hypotheses, which fundamental hypotheses then
deduce these same specific facts, which were fallaciously argued as if first principles
to in order begin the analysis in the first place. Einstein styles fallacies of Petito
Principii as “logical perfection” and admits that the same dreaded ad hoc hypotheses
are found in his theory as in Lorentz’ theory, though Lorentz follows proper
scientific procedure in constructing a synthetic theory which deduces the observed
phenomena from the ad hoc hypotheses, while Einstein merely analyzes Lorentz’
theory after the fact to arrive at Lorentz’ same ad hoc hypotheses, and then Einstein
restates Lorentz’ synthetic theory proceeding from the same ad hoc hypotheses to
deduce the phenomena in a merry-go-round whirl in which Einstein pretends to have
eliminated hypotheses which he has not eliminated. All Einstein has done is provide
an analysis to show how Lorentz arrived at his ad hoc hypotheses, and then Einstein
repeats Lorentz’ theory and uses these ad hoc to deduce the phenomena. Mileva and
Albert were expositors at best and not rational theoreticians.

Einstein professed in his article “Induction and Deduction in Physics” in the
Berliner Tageblatt of 25 December 1919,

“So, while the researcher always starts out from facts, whose mutual
connections are his aim, he does not find his system of ideas in a methodical,
inductive way; rather, he adapts to the facts by intuitive selection among the
conceivable theories that are based upon axioms.\textsuperscript{3490}

But Einstein’s axioms are those facts and his method is, therefore, \textit{inductive}, not deductive, \textit{analytical}, not synthetic. Since Einstein was not clever at induction, he simply chose among extant synthetic theories and turned them on their heads in order to manipulate credit for them. The only way Einstein’s method can be successful as an approach to formulating a theory is to plagiarize the inductive ideas of others, so it does not appear likely that Einstein could have created much, if anything, on his own. Since he was clever at theft, Einstein would often simply repeat the known facts as if “axioms”, then induce the plagiarized hypotheses of his predecessors from these well known facts, then deduce the known facts from these hypotheses. Is this guile a form of genius? Perhaps, but it seems Einstein always had someone behind the scenes, or as coauthor, doing the work for him. First it was Mileva Marić, then Jacob Laub, then Marcel Grossmann, then Erwin Freundlich, then Walther Mayer, etc.

It was necessary for Einstein to discourage scientists from using proper method, lest they discover the irrationality of his unoriginal works. In so doing, he converted the scientific method into a method of redundancy, whereby an empirical fact is deduced from itself. Carmichael, then later Moritz Schlick, took up the challenge of untangling Einstein’s fallacies and were always forced to confront Einstein’s confusion of induction with deduction.

The Michelson experimental result of invariant light speed was irrationally taken as a postulate to “derive” (in fact, induce) the Lorentz Transformation hypotheses, which general \textit{a priori} hypotheses then deduce \textit{all} velocity comparisons, not just invariant light speed. The Einsteins irrationally argued that invariant light speed deduces invariant light speed, in order to disguise the Lorentz Transformation hypotheses as “derivations”, which general hypotheses are, in truth, induced \textit{a posteriori}, not deduced \textit{a priori}, from the specific speed of invariant light speed. Albert Einstein was well aware of the confusion he had caused, and he wrote to Paul Ehrenfest, who was having a difficult time explaining the theory of relativity,

“It simply comes from your wanting to base the innovation of 1905 on epistemological reasons (nonexistence of the ether at rest) instead of on empirical ones (equivalence of all inertial systems against light). The epistemological requirement starts only in 1907.”\textsuperscript{3490}

Franz Kleinschrod wrote in 1920,

“Aber auch das RP [Relativitätsprinzip] erscheint uns dadurch in einer neuen Beleuchtung, nicht als ein allgemeingültiges Naturgesetz, wie Einstein und seine Anhänger glauben, sondern als die erkenntnistheoretische induktive Formel der Erforschung der Naturgesetze der leblosen Natur in Raum und Zeit, im Gegensatz zur Erforschung der Naturgesetze der lebendigen Natur in Zeit und Raum.—[***] In dem Additionstheorem der Geschwindigkeit rechnet er die
Selbstbewegung des im Eisenbahnzug gehenden Mannes zur mechanischen Geschwindigkeit des Eisenbahnzuges, und setzt dann die mechanische Lichtausbreitung, relativ zum bewegten Eisenbahnzug betrachtet, wieder an die Stelle der Selbstbewegung des Mannes, und kommt dadurch zu zwei sich widersprechenden Formeln und zur Annahme der scheinbaren Unvereinbarkeit des Ausbreitungsgesetzes des Lichtes mit dem RP. (Einstein, l. c. Seite 10-13. [Über die spezielle und die allgemeine Relativitätstheorie]) Eine petitio principii in optima forma."

Herbert Ives published a paper in 1952, which argued that Einstein employed the same irrational method of Petitio Principii in deriving the mass-energy equivalence. This evinces a repeated pattern of Einstein’s irrationality, on top of his pattern of unoriginality, each signifying one goal—plagiarism,

“In 1905 Einstein published a paper with the interrogatory title ‘Does the Inertia of a Body Depend upon its Energy Content?’, [A. Einstein, Ann. Physik 18, 639 (1905).] a question already answered in the affirmative by Hasenöhrl. This paper, which has been widely cited as being the first proof of the ‘inertia of energy as such,’ describes an emission process by two sets of observations, in different units, the resulting equations being then subtracted from each other. It should be obvious a priori that the only proper result of such a procedure is to give 0 = 0, that is, no information about the process can be so obtained. However the fallacy of Einstein’s argument not having been heretofore explicitly pointed out, the following analysis is presented: [***] What Einstein did by setting down these equations (as ‘clear’) was to introduce the relation

\[ \frac{L}{(m - m')} c^2 = 1. \]

Now this is the very relation the derivation was supposed to yield. It emerges from Einstein’s manipulation of observations by two observers because it has been slipped in by the assumption which Planck questioned. The relation \( E = m \gamma c^2 \) was not derived by Einstein."
Landolt, Heydweiller and Hecker had experimentally demonstrated before him, and Hecker had experimentally demonstrated before him,

“I was in the highest degree amazed at its existence and guessed that in it must lie the key to a deeper understanding of inertia and gravitation. I had no serious doubts about its strict validity even without knowing the results of the admirable experiments of Eötvös, which—if my memory is right—I only came to know later.”

This experimental fact, generalized into a universal law by Planck, became Einstein's sole first principle for the general theory of relativity,

“This opinion must be based upon the fact that we both do not denote the same thing as ‘the principle of equivalence’; because in my opinion my theory rests exclusively upon this principle.”

Einstein stated in 1913,

“[T]he equality (proportionality) of the gravitational and inertial mass has been proved with great accuracy in an investigation of great importance to us by Eötvös. Eötvös’s exact experiment concerning the equality of inertial and gravitational mass supports the view that such a criterion does not exist. We see that in this regard Eötvös’s experiment plays a role similar to that of the Michelson experiment with respect to the question of whether uniform motion can be detected physically.”

Einstein gave a lecture at King’s College in June of 1921. The London Times reported on 14 June 1921, on page 8,

“PROFESSOR EINSTEIN said it gave him special pleasure to lecture in the capital of that country from which the most important and fundamental ideas of theoretical physics had spread throughout the world—the theories of motion and gravitation of Newton and the proposition of the electro-magnetic field on which Faraday and Maxwell built up the theories of modern physics. It might well be said that the theory of relativity formed the finishing stone of the elaborate edifice of the ideas of Maxwell and Lorentz by endeavouring to apply physics of ‘fields’ to all physical phenomena, including the phenomena of gravitation.

Professor Einstein pointed out that the theory of relativity was not of any speculative origin, but had its origin solely in the endeavour to adapt the theory of physics to facts observed. It must not be considered as an arbitrary act, but rather as the result of the observations of facts, that the conceptions of space, time, and motion, hitherto held as fundamental, had now been abandoned.

Two main factors, continued Professor Einstein, have led modern science
to regard time as a relative conception in so far as each inertial system had to be coupled with its own peculiar time: the law of constancy of the velocity of light in vacuo, sanctioned by the development of the sciences of electrodynamics and optics, and in connexion therewith the equivalence of all inertial systems (special principle of relativity) as clearly shown by Michelson’s famous experiment. In developing this idea it appeared that hitherto the interconnexion between direct events on the one hand, and the space coordinates and time on the other, had not been thought out with the necessary accuracy.

The theory of relativity endeavours to define more concisely the relationship between general scientific conceptions and facts experienced. In the realm of the special theory of relativity the space coordinates and time are still of an absolute nature in so far as they appear to be measurable by rigid bodies, rods, and by clocks. They are, however, relative in so far as they are dependent upon the motion peculiar to the inertial system that happens to have been chosen. According to the special theory of relativity the four-dimensional continuum, formed by the amalgamation of time and space, retains that absolute character which, according to the previous theories, was attributed to space as well as to time, each individually. The interpretation of the spatial coordinates and of time as the result of measurements then leads to the following conclusions: motion (relative to the system of coordinates) influences the shape of bodies and the working of clocks; energy and inertial mass are equivalent.

GRavitational fields.

The general theory of relativity owes its origin, continued Professor Einstein, primarily to the experimental fact of the numerical equivalence of the inertial and gravitational mass of a body; a fundamental fact for which the classical science of mechanics offered no interpretation. Such an interpretation is arrived at by extending the application of the principle of relativity to systems of coordinates accelerated with reference to one another. The introduction of systems of co-ordinates accelerated with reference to inertial systems causes the appearance of gravitational fields relative to the systems of coordinates. That is how the general theory of relativity, based on the equality of inertia and gravity, offers a theory of the gravitational field.

Now that systems of co-ordinates, accelerated with reference to one another, have been introduced as equivalent systems of co-ordinates, based on the identity of inertia and gravity, it follows that the laws governing the position of rigid bodies in the presence of gravitational fields do not conform to the rules of Euclidean geometry. The results as regards the working of clocks is analogous. These conclusions lead to the necessity of once more generalizing the theories of space and time, because it is no longer possible directly to interpret the co-ordinates of space and time by measurements with measuring rods and clocks. This generalization of metrics, which in the sphere of pure mathematics dates back to Gauss and Riemann, is based largely on the fact that the metrics of the special theory of relativity may be
considered to apply in certain cases also to the general theory of relativity. In consequence, the co-ordinate system of space and time is no longer a reality in itself. Only by connecting the space and time co-ordinates with those mathematical figures which define the gravitational field can the objects which may be measured by measuring rods and by clocks be determined.

The idea of the general theory of relativity has yet another basis. As Ernst Mach has already emphasized, the Newtonian theory of motion is unsatisfactory in the following point:—if motion is regarded not from the casual but from the purely description point of view it will be found that there exists a relative motion of bodies with reference to each other. But the conception of relative motion does not of itself suffice to formulate the factor of acceleration to be found in Newton’s equations of motion. Newton was forced to introduce a fictitious physical space with reference to which an acceleration was supposed to exist. This conception of absolute space introduced by Newton ad hoc is unsatisfactory, although it is logically correct. Mach, therefore, endeavoured so to alter the mechanical equations that the inertia of bodies is attributed to their relative motion with reference not to absolute space but with reference to the sum total of all other measurable bodies. Mach was bound to fail considering the state of knowledge at his time. But it is quite reasonable to put the problem as he did. In view of the general theory of relativity this line of thought comes more and more to the fore, because according to the theory of relativity the physical properties of space are influenced by matter.

Professor Einstein said he was of the opinion that the general theory of relativity could only solve this problem satisfactorily by regarding the universe as spatially finite and closed. The mathematical results of the theory of relativity forced scientists to this view, if they assumed that the average density of matter within the universe was of finite, if ever so small a value.”

On 13 June 1921, Einstein had stated,

“Turning to the subject of the theory of relativity, I want to emphasize that this theory has no speculative origin, it rather owes its discovery only to the desire to adapt theoretical physics to observable facts as closely as possible. [***] The law of the constancy of the speed of light, corroborated through the development of electrodynamics and optics, combined with Michelson’s famous experiment that decisively demonstrated the equality of all inertial systems (principle of special relativity), relativized the concept of time, where every inertial system had to be given its own special time. [***] The theory of general relativity owes its origin primarily to the experimental fact of the numerical equality of inertial and gravitational mass of a body, a fundamental fact for which classical mechanics has given no interpretation.”

On 13 June 1921, Einstein had stated,
Einstein irrationally argued known empirical results as first principles to “prove” phenomena by themselves, slipping in the “derivations” (induced hypotheses) in the middle, *Petitio Principii*. Of course, the principle of equivalence cannot be a fundamental *a priori* simple principle, simply because it is complex in its structure, containing more than one element, and it is deducible from more fundamental principles. It is a deduction, not a first principle, and it is irrationally the conclusion of the general theory of relativity, as well as its “premise”; just as the Michelson result of alleged invariant light speed is an alleged empirical fact, not an *a priori* principle, and signifies both the “premise” and the conclusion of the special theory of relativity.

Paul Gerber established an axiomatic scientific theory which predicted the perihelion of Mercury in 1898, a feat Einstein was never able to accomplish even after having the benefit of Gerber’s equations. David Hilbert deduced the field equations of general relativity in an axiomatic synthesis, a feat Einstein was never able to accomplish even after having the benefit of Hilbert’s equations.

Einstein published a childish, sophistic, arrogant and evasive polemic against his critics in 1918 and elected to completely hide from the accusations of plagiarism that Ernst Gehrcke had leveled against him for years, and instead relied upon self-contradictory Metaphysics to obfuscate the issues. In this polemic, Einstein copied Galileo’s satiric style of speaking for his critics in a mock dialogue which bitterly degraded them, without acknowledging that he was copying Galileo. After Ernst Gehrcke had publicly confronted Einstein in the Berlin Philharmonic in 1920 with the fact that Gerber had published Gerber’s formula first, Einstein again sought priority, based on his absurd Metaphysics, not on the science, in a frantic and arrogant hand-waving attack.

“...Gerber, who has given the correct formula for the perihelion motion of Mercury before I did. The experts are not only in agreement that Gerber’s derivation is wrong through and through, but the formula cannot be obtained as a consequence of the main assumption made by Gerber. Mr. Gerber’s work is therefore completely useless, an unsuccessful and erroneous theoretical attempt. I maintain that the theory of general relativity has provided the first real explanation of the perihelion motion of mercury. I have not mentioned the work by Gerber originally, because I did not know it when I wrote my work on the perihelion motion of Mercury; even if I had been aware of it, I would not have had any reason to mention it.”

Einstein’s standards for awarding priority came back to haunt him. The 1905 paper on relativity, and the 1905 paper on the inertia of energy, were both fallacies of *Petitio Principii*, and the paper on relativity contains numerous acknowledged errors. Einstein’s 1915 paper on the motion of the planet Mercury is a flawed and obsolete derivation. His theory prior to plagiarizing David Hilbert’s generally covariant field equations of gravitation is untenable. There is an ongoing controversy as to whether or not Gerber’s derivation is justifiable, but the charge of plagiarism is the accusation that Einstein took over Gerber’s solution without acknowledgment,
and used it *inductively* to develop a different “derivation” of the identical solution. As Hubert Goenner has noted, Gehrcke had pointed out that the eclipse observations did not establish the general theory of relativity as sound, and Einstein launched a condescending and accusatorial attack against Gehrcke on this point, though at other times Einstein himself admitted that the eclipse observations were not conclusive. It is widely known today that Gehrcke was absolutely correct. The eclipse observations which propelled Einstein to international fame in 1919 were a sham.

The theory of relativity is internally inconsistent in its ontology. Einstein stated,

“With Lorentz [the ether] was rigid and it embodied the ‘resting’ coordinate system, a preferred state of motion in the world. According to the special theory of relativity there was no longer any preferred state of motion; this meant denial of the ether in the sense of the previous theories. For if an ether existed, it would have to have at every space-time point a definite state of motion, which would have to play a role in optics. But such a preferred state of motion does not exist, as shown by the special theory of relativity and therefore there also does not exist any ether in the old sense. The general theory of relativity, as well, knows of no preferred state of motion of a point, which one could possibly interpret as the velocity of an ether. But while according to the special theory of relativity, a portion of space without matter and without an electromagnetic field appears as simply empty, i.e., characterized by no physical quantities whatever, according to the general theory of relativity space that is empty in this sense also has physical qualities, which are characterized mathematically by the components of the gravitational potential, which determine the metric behavior of this portion of space, as well as its gravitational field. One can very well conceive this state of affairs by speaking of an ether, whose state varies continuously from point to point But one must be on one’s guard not to attribute to this ‘ether’ matter-like properties (e.g., a definite velocity at every place).”

The special theory of relativity requires that masses in inertial motion relative to each other map, by their mutual motion, Galileo’s equal spaces in equal times—spaces and times congruent to distance and times mapped by rigid rods and clocks. According to the general theory of relativity, this is a condition which cannot be met.

The theory of relativity is self-contradictory in many other ways. The theory of relativity depends upon “resting clocks”. A clock must move in order to be a clock, and, therefore, cannot be a “resting clock”. The theory of relativity depends upon “resting rigid rods”. A “rod” is a mental abstraction of moving particles. No rod is rigid or resting. The theory of relativity pretends to be “kinematic”, but requires that “inertial systems” be those in which Newton’s laws attain their simplest form. Newton’s laws are dynamic, not kinematic. In order to define an “inertial motion”, *masses* must be *dynamically* set into motion—there is no kinematics in the theory of relativity, lest it be Newtonian absolutism with absolute space and absolute time as
a substratum and uniform translations of absolute space as a kinematic \textit{absolutist} definition.\textsuperscript{3515} While the general theory compels an æther, the special theory is allegedly incompatible with the concept. The theory requires that light signal clock synchronization procedures be performed, which cannot be performed. The theory irrationally requires that \textit{dynamic} measurement procedures, which do not, and cannot take place, cause rigid rods, which do not exist, to “kinematically” contract, and relatively resting clocks, which cannot relatively rest, to “kinematically” desynchronize and dilate. In order for light speed to be a \textit{measured} unit, length and time must first be \textit{measured}, because light speed is a derived unit; but, in the theory, length and time cannot be \textit{measured} until light speed is known—totally unworkable method, which precludes \textit{measurement}.\textsuperscript{3516}

Just as the pseudorelativists pretend that the dynamics of moving and accelerated masses signifies “relativistic kinematics”, they confound unilateral dynamic effects, with pretend “reciprocal” “kinematic” effects. There is yet to be an experiment which tests, let alone establishes, \textit{reciprocal or kinematic} length contraction, \textit{reciprocal or kinematic} time dilatation, or \textit{reciprocal or kinematic} relative simultaneity.

\textbf{17.4 Conclusion}

Historians all too often look to the conclusions of previous historians, rather than to the \textit{complete} historic record, itself.\textsuperscript{3517} Historians record their impressions and not history itself. They are politically motivated. Later historians all too often record the works of earlier historians, and the truth is lost in the process.

Bias is a double-edged sword, which cuts both ways. Many who are aware that Einstein was not an original thinker wrongly attribute the special theory of relativity to Hendrik Antoon Lorentz, often believing that Minkowski first set in cement the notion of the uniform translation of space and the concept of four-dimensional being. Many worship Hendrik Antoon as a hero, just as many worship Einstein as a hero. However, Lorentz and Minkowski deserve little more credit than does Albert Einstein.

The real “credit” for the relativistic notions of space and time substantially belongs to Roger Joseph Boscovich, Ludwig Lange, Woldemar Voigt, George Francis FitzGerald, Heinrich Hertz, Joseph Larmor, Henri Poincaré, Emil Cohn\textsuperscript{3518} and Jakob Laub, who are, with the possible exceptions of FitzGerald and Poincaré, almost never cited in the popular literature as contributors to the theory. And, of course, the theory would not exist without James Clerk Maxwell.

The so-called “Lorentz Transformation” is by no means proprietary to Lorentz. The much touted modern “Principle of Relativity”—the belief that an æther in absolute space is, in principle, undetectable—was nothing more than one very common interpretation of the negative result of Michelson’s experiment, though not the conclusion Michelson, himself, reached. He believed his experiment discredited the then standard explanation of aberration via a resting æther. Einstein said that Michelson regretted that his experiment began the “monster” of the special theory of relativity.\textsuperscript{3519}
Michelson turned to Stokes’ theory of aberration\textsuperscript{3520} and a “dragged æther” to explain the negative result of his experiments.\textsuperscript{3521} Michelson was disciplined enough to realize that $c' = c$ amongst the two pencils of light passing through his interferometer on Earth was a particular case of velocity comparison in a unique system, not an inductively arrived at, synthetic general principle.

We observe a phenomenon and try to come up with rational possibilities as to how it occurs. This is an analysis of the problem which induces our first principles, which are better the more general and fundamental they are. This methodical analytical process is not a theory, but is an inductive analysis. The synthesis comes in forming the theory and arguing from the principles, which were arrived at through induction, deductively to the known phenomenon, such as the supposed phenomenon of the supposed observation that light speed is invariant.

If the Einsteins’ 1905 relativity paper, as it is popularly interpreted to be a deduction of the Lorentz Transformation, truly were a synthetic theory, we would have to assume that it was the Lorentz Transformation which was observed, and not invariant light speed. We would have to assume that observed Lorentz Transformations led us through analysis to the unobserved, but induced, “principle of the invariance of light speed.”

That is not what occurred. We supposedly observed invariant light speed, and given that science assumes Nature is predictable and universal, and since no experiment was taken to contradict the supposed observation of invariant light speed, this observed phenomenon was analyzed; and the analysis induced, as one approach, the \textit{ad hoc} Lorentz Transformation, the elements of which are the true postulates of the synthetic Poincaré-Lorentz theory of relativity. The Einsteins simply disguised this synthetic theory as a quasi-positivistic analysis, using Poincaré’s dynamics and nomenclature, which they called “kinematics”.

In Einstein’s famous lecture of 1922 in Japan,\textsuperscript{3522} he recounts that he derived inspiration from “Michelson’s experiment”. On 21 September 1909, Einstein stated,

“Michelson’s experiment suggested the assumption that, relative to a coordinate system moving along with the earth, and, more generally, relative to any system in nonaccelerated motion, all phenomena proceed according to exactly identical laws. Henceforth, we will call this assumption in brief ‘the principle of relativity.’”\textsuperscript{3523}

R. S. Shankland recorded a letter Einstein had sent him in 1952, in which Einstein stated,

“I learned of [the Michelson-Morley experiment] through H. A. Lorentz’ decisive investigation of the electrodynamics of moving bodies, with which I was acquainted before developing the special theory of relativity.”\textsuperscript{3524}

However, on other occasions, Einstein denied having known of the experiment before the 1905 paper appeared.\textsuperscript{3525}

He may have had grounds to lie. Einstein rarely cited papers which appeared
before the 1905 paper, and which presented the image of “relativity”, as did Michelson’s papers, *The Relative Motion of the Earth and the Luminiferous Ether*, and *On the Relative Motion of the Earth and the Luminiferous Ether*. Einstein pretended that he invented the concept of relative motion, and by this I mean $c' = c$. But that, on its own, is a trivial matter.

Significantly, admitting to a knowledge of Michelson’s work was an admission that Mileva and Albert based their supposedly deductive theory, which tacitly and incorrectly takes $c' = c$ as a general principle, on a particular case, the Michelson result, thereby admitting that their theory was in truth an inductive argument for Lorentz’ deductive synthesis of 1904, and that $c' = c$ was a particular case of a given velocity comparison in a given static system, not a general principle; the actually held general principles being the hypotheses of the Lorentz Transformation, which deductively result in the particular case of Michelson’s $c' = c$, whether there is relative motion in Michelson’s experiments, or not. Furthermore, there is a tenuous connection between Michelson’s experiments and the special theory of relativity, for pointing to said experiments as evidence in support of the theory admits of absolute space, for without absolute space, and given the supposedly superfluous nature of the æther, there is no relative motion in the Michelson experiments. Where is the “resting system” in the experiment? Where is the “moving system” in the experiment?

The Michelson-Morley experiment only signifies relative motion in Lorentz’ theory, despite the fact that it has long been cited as supporting the Einsteins’ theory. Of course, Albert’s expressed policy was, “If the facts don’t fit the theory, change the facts.” Einstein told R. S. Shankland not to perform an experiment which might falsify the special theory of relativity,

“[Einstein] again said that more experiments were not necessary, and results such as Synge might find would be ‘irrelevant.’ [Einstein] told me not to do any experiments of this kind.”

After more than one hundred years, noted experts in the field are still in a quandary to establish any relative motion in the Michelson experiments, such as would place the same events in two systems in relative motion to each other *in the same experiment* in order to justify Poincaré’s notion of relative simultaneity. Others take a different approach. The book *Spacetime Physics*, by Edwin F. Taylor and John Archibald Wheeler, which is perhaps the most respected introductory text to the field, argues for at least two separate experiments, but such is not a test of the special theory of relativity, *per se*, but is, in fact, more likely to detect or disprove any relative motion between the æther and the Earth.

From *Spacetime Physics*:

“The Michelson-Morley experiment and its modern improvements tell us that in every inertial frame the round-trip speed of light is the same in every direction—the speed of light is *isotropic* in both laboratory and rocket frames
as predicted by the principle of relativity.”

How can such a limited set of experiments, which can be explained in so many other ways with greater logical economy, tell us what happens at all times in all places in the universe? This is clearly “too hasty a generalization”. Where is the “laboratory frame” and the “rocket frame” in the Michelson-Morley experiment? Unless one supposes a resting æther, as did Lorentz; or an absolute space filled with a resting æther, as did Mileva and Albert (they called the light medium “superfluous” while using it as the basis of their theory); there is only the effectively static frame of the laboratory.

From Spacetime Physics:

“(1) The round-trip speed of light measured on earth is the same in every direction—the speed of light is isotropic. (2) The speed of light is isotropic not only when Earth moves in one direction around Sun in, say, January (call Earth with this motion the ‘laboratory frame’), but also when Earth moves in the opposite direction around Sun six months later, in July (call Earth with this motion the ‘rocket frame’).”

Are we to assume that we have the “resting system” in one experiment, and the “moving frame” in an entirely different experiment? Where is the “resting frame” and where is the “moving frame” in any given experiment, such that there is a transformation of coordinates, which would compel or give evidence of the Lorentz Transformation and relative simultaneity? Where are the observers positioning events, the clocks, and the relatively moving rods? For that matter, where are the inertial reference systems?

From Spacetime Physics:

“(3) The generalization of this result to any pair of inertial frames in relative motion. . .”

How are the lab and rocket frames, which are not inertial frames if they rest on the Earth, in relative motion, when they are the same laboratory at two distinct periods of time? The “frame” is composed of the laboratory equipment, not translations of absolute space, through absolute time. Not only is their argument a fallacy of “too hasty a generalization”; the premises, themselves, are false. There is no “pair of inertial frames in relative motion” in the experiment, from a relativistic perspective, which perspective denies the æther. A train leaving Chicago is not moving relative to the same train arriving in Denver.

From Spacetime Physics:

“. . .in relative motion is contained in the statement, The round-trip speed of light is isotropic both in the laboratory frame and in the rocket frame.”

Which are the same laboratory with two names at two different times.
From *Spacetime Physics*:

“An experiment to test the assumption of the equality of the round-trip speed of light in two inertial frames in relative motion was conducted in 1932 by Roy J. Kennedy and Edward M. Thordike.”

This experiment, likewise, contains no “resting system” and no “moving system” without the assumption of an absolute space, or a “resting” æther, or an æther resting in absolute space.

Einstein’s fame is built upon fantasies, not facts. The events which led to Einstein’s rise to fame are a fascinating story of hero worship and historic revisionism. The ongoing disclosure of documents related to Einstein’s life raise many new questions. Was the man we are led to envision, with the Mark Twain persona and charisma, in fact a stumbling sadistic brute, who wrested his fame from his wife Mileva’s misery?"
18 Mileva Einstein-Marity

Mileva Marić and Albert Einstein married in 1903. They had already spent many years working together on Lorentz’ theory of relativity. In 1905, the Einsteins published their first paper on the Poincaré-Lorentz theory of relativity.

“We have recently completed a very important work, which will make my husband world-famous.”—MILEVA EINSTEIN-MARITY

“The author of these articles—an unknown person at that time, was a bureaucrat at the Patent Office in Bern, Einstein-Marity (Marity—the maiden name of his wife, which by Swiss custom is added to the husband’s family name).”—ABRAM JOFFE

“How happy and proud I will be, when we two together have victoriously led our work on relative motion to an end!”—ALBERT EINSTEIN

18.1 Introduction

There is abundant evidence that Mileva Marić, Albert Einstein’s first wife, collaborated with Albert on the production and publication of their most famous papers of 1905, and may even have been the sole author of those works.

18.2 Witness Accounts and the Evidence

In 1905, several articles bearing the name of Albert Einstein appeared in a German physics journal, *Annalen der Physik*. The most fateful among these was a paper entitled “Zur Elektrodynamik bewegter Körper; von A. Einstein”, Einstein’s supposedly breakthrough paper on the “principle of relativity”. Though it was perhaps submitted as coauthored by Mileva Einstein-Marity and Albert Einstein, or solely by Mileva Einstein-Marity, as some scholars believe, Albert’s name appeared in the journal as the exclusive author of their works. Abram Fedorovich Joffe (Ioffe) recounts that the papers were signed “Einstein-Marity”. “Marity” is a variant of the Serbian “Marić”, Mileva’s maiden name. Joffe, who had seen the original 1905 manuscript, is on record as stating,

“For Physics, and especially for the Physics of my generation—that of Einstein’s contemporaries, Einstein’s entrance into the arena of science is unforgettable. In 1905, three articles appeared in the ‘Annalen der Physik’,
which began three very important branches of 20th Century Physics. Those were the theory of Brownian movement, the theory of the photoelectric effect and the theory of relativity. The author of these articles—an unknown person at that time, was a bureaucrat at the Patent Office in Bern, Einstein-Marity (Marity—the maiden name of his wife, which by Swiss custom is added to the husband’s family name)."

There is an obvious contradiction between Joffe’s statement that the author of three famous papers in Annalen der Physik in 1905 was an unknown patent clerk, and Joffe’s statement that the author of these works was “Einstein-Marity”. Albert Einstein is not known to have ever gone by the Allianzname “Einstein-Marity”. Mileva Marić did go by the Allianzname “Einstein-Marity” and Abram Joffe was aware of this fact. Abram Fedorovich Joffe did not title his obituary “In Remembrance of Albert Einstein-Marity”, but rather “In Remembrance of Albert Einstein” and Joffe is not known to have ever referred to Albert Einstein as “Einstein-Marity”, nor is he ever known to have used the Allianzname “Einstein-Marity” other than to identify the author of the 1905 papers.

We cannot examine Joffe’s statements in a vacuum, but rather we must take into account the well-known and vicious attacks that have been made against Einstein’s critics, which have had a chilling effect on criticism of Einstein and the exposure of facts which are detrimental to Albert Einstein’s image. Joffe may have felt inhibited from more openly stating that Mileva Marić was the true author of the 1905 papers published in Annalen der Physik under Albert Einstein’s name. No one has yet offered an explanation as to why Joffe identified the author of the papers as “Einstein-Marity” other than as attempt to identify the true author of the papers as Mileva Marić. We must also take into account the fact that the Einsteins themselves often referred to their working collaboration, as did many others. The Einsteins’ private correspondence was not available to Joffe and it proves that Mileva and Albert were collaborators. The fact that these various independent accounts point to the same conclusion is not coincidental. Therefore, barring the appearance of conclusive evidence to the contrary, it is safe to say that Joffe meant to disclose the fact that Mileva was the true author of the papers, when Joffe stated that the author of the works was “Einstein-Marity”.

Joffe knew that Mileva went by the Allianzname Einstein-Marity and that he, Joffe, could subtly disclose the fact that she was the true author, or a co-author, of
the paper, without risking the fanatical wrath and retaliation which has so often followed the disclosure of facts unfavorable to Einstein’s image. Such subtleties were common practice in the Soviet Union, where the government imposed harsh penalties on dissidents. Fanatics in the Physics community and the international press have viciously attacked Einstein’s critics. The situation has been described as the “Einstein terror”, which terrorism was openly acknowledged by Einstein’s advocates. Stjepan Mohorovičić received anonymous threats when he criticized Einstein, and the progress of his career was impeded. Ernst Gehrcke’s career advancement was also impeded after he called attention to Albert Einstein’s plagiarism and irrationality. Albert Einstein publicly defamed Gehrcke, Lenard and others. The international press and press agencies echoed Einstein’s lies around the world, and refused to publish Gehrcke’s and Lenard’s responses. The terrorist and censorship tactics used against Einstein’s critics are typical Zionist behavior. Zionists have perpetrated countless assassinations, both character and bodily assassinations. The State of Israel officially sanctions and commits murder. Numerous Jewish organizations regularly defame their opponents. Zionists and Jewish organizations have criminalized speech, which refutes their lies, in several nations. They seek universal criminal statutes proscribing speech that would contradict their mandated official opinions on historical, religious and political matters.

One must assume that the submitted works were signed. Since Joffe stated that the author was “Einstein-Marity”, it is logical to conclude that the papers were signed “Einstein-Marity”. Daniil Semenovich Danin explicitly stated that the papers were “signed Einstein-Marity”. Prof. Dr. Margarete Maurer has argued that Danin may well have discussed the matter with Joffe.

In 1962, Daniil Semenovich Danin expressly stated,

“The unsuccessful teacher, who, in search of a reasonable income, had become a third class engineering expert in the Swiss Patent Office, this yet completely unknown theoretician in 1905 published three articles in the same volume of the famous ‘Annalen der Physik’ signed ‘Einstein-Marity’ (or Marić—which was his first wife’s family name).”

“Невезучий школьный учитель, в поисках сносного заработка ставший инженером-экспертом третьего класса в Швейцарском бюро патентов, еще никому не ведомый теоретик опубликовал в 1905 году в одном из томов знаменитых "Газет физики" три статьи за подписью Эйнштейн-Мари (или Мари — это была фамилия его первой жены).”

If “Einstein-Marity” refers to a sole person, that person is Mileva Einstein-Marić, not Albert Einstein.

Desanka Trbuhović-Gjurić’s interpretation of the facts are found in her book, *Im Schatten Albert Einsteins, Das tragische Leben der Mileva Einstein-Marić, (In the Shadow of Albert Einstein, The Tragic Life of Mileva Einstein-Marić)*, in which she
discusses Mileva’s rôle in the development of the special theory of relativity, and states, *inter alia,*

“The distinguished Russian physicist [***] Abraham F. Joffe (1880-1960), pointed out in his ‘In Remembrance of Albert Einstein’, that Einstein’s three epochal articles in Volume 17 of ‘Annalen der Physik’ of 1905 were originally signed ‘Einstein-Marië’. Joffé had seen the originals as assistant to Röntgen, who belonged to the Board of the ‘Annalen’, which had examined submitted contributions for editorial purposes. Röntgen showed his *summa cum laude* student this work, and Joffe thereby came face to face with the manuscripts, which are no longer available today.”

Wilhelm Conrad Röntgen was one of the referees of the Einsteins’ 1905 paper on the electrodynamics of moving bodies, which reiterate Lorentz’ equations and FitzGerald’s contraction hypothesis, as if unprecedented ideas. Abram Joffe was Röntgen’s assistant until 1906. Joffe wrote in 1960,

“Therefore Röntgen suggested to me that when I defended my doctoral dissertation in May of 1905, that I ought to discuss what one could now look upon as the prehistory of the theory of relativity: the Lorentz-equations and the hypothesis of FitzGerald. And then he asked me a question, ‘Do you believe that there are spheres which are flattened when they move? Can you confirm the fact that such electrons will forever remain a part of Physics?’—I answered, ‘Yes, I am convinced that they exist, only we don’t yet know everything about them. Consequently, we must study them further.’

When I defended my dissertation, something remarkable happened. The dean gave the welcoming address in Latin, which I did not understand. The only thing I could fathom was that my defense had gone well, because the speech ended with a handshake. But when I met Röntgen in the laboratory, he was indignant at the cold response I had given to the dean’s speech. It turned out that the faculty had awarded me the degree of ‘summa cum laude’—‘with the highest praise possible’—for the first time in 20 years. This degree awarded me the right to give lectures. It was to be expected that I would have been overwhelmed with joy—and I did not know at that time that there were four levels of evaluation and I had received the highest. For
a long time Röntgen refused to believe that I had not known of the rankings of the evaluation levels when I was presenting my defense. Afterwards, he reminded me of this incident, ‘You are really a ridiculous person.’

In August of 1906, I traveled to Russia and witnessed the intelligentsia leaving the revolution with my own eyes. Given my Marxist convictions, I felt that at such a time I did not have the right to only concern myself with Physics far away from my homeland in Munich. I wrote Röntgen that I would not return and that my conscience would not allow me to leave the homeland while the reactionaries triumphed.**3543

Given that Joffe was familiar with Lorentz’ work and the Lorentz transformation at least as early as May of 1905, he must have known that the Einsteins were plagiarists. The Einsteins’ paper was not submitted until at least 30 June 1905 (perhaps much later), and was not published until 26 September 1905, and it is possible that substantial changes were made after the paper was submitted. Joffe, like Röntgen, also must have had an intense interest in the Poincaré-Lorentz special theory of relativity and would have been eager to have studied the Einsteins’ paper. Röntgen also must have known that the Einsteins were plagiarists, and as a referee of their paper, he was guilty of complicity in their plagiarism, as were Paul Drude and Max Planck—one wonders if these men even participated in the fraud from the beginning.

Joffe knew that his statement that the papers were authored by Einstein-Marity would be noticed. Though Joffe’s statement superficially indicates that it was Albert who went by the name of “Einstein-Marity”, such a claim, and the parenthetical explanation it compelled, were extraordinary—an express contradiction—and are belied by the fact that Mileva, not Albert, went by the name of “Einstein-Marity” and Joffe knew it. Joffe was probably, as imperceptibly as his conscience would allow, disclosing to the world that Albert was not the author; or, not the sole author of the works in question.

Joffe’s statements appeared fifty years after he had read the 1905 papers. It stuck with him all those many years that the papers were indelibly signed “Einstein-Marity”—the manuscripts have long ago disappeared. Joffe titled his obituary “In Remembrance of Albert Einstein”, not “In Remembrance of Albert Einstein-Marity” and Joffe does not refer to “Einstein-Marity” other than in the context of the 1905 papers. The contradiction between Joffe’s claim that the author of the works was Einstein-Marity, which was Mileva’s name, and Joffe’s claim that the author was a male patent clerk have not been explained other than by the fact that Mileva was the author, or coauthor of the papers.

Though some try to examine Joffe’s statement, and all the other specific facts, individually and in a vacuum, Joffe’s statement must be examined in light of the many facts which prove that Mileva and Albert worked together on the theory of relativity. There is no coincidence in the fact that, unbeknownst to Joffe, Mileva and Albert had discussed their working collaboration on Lorentz’ theory in their private correspondence. It is not a coincidence, nor an irrelevant fact, that Albert discussed his collaboration with Mileva with Alexander Moszkowski. It cannot be ignored that
these isolated facts are consistent, and prove individually and collectively that Mileva was at least the coauthor of the 1905 papers the Einsteins published in *Annalen der Physik*.

How could Joffe have known that Mileva Marić went by the name of Einstein-Marity, if the name had not appeared on the 1905 papers and why would he tie that name to the 1905 papers? Joffe could not have known that Albert went by the name of “Einstein-Marity”, because Albert Einstein never did. Perhaps, Mileva introduced herself to Joffe as the “Einstein-Marity” who had written and signed the papers. Joffe recorded his attempts to discuss the 1905 papers with their author—a fact I pointed out in 2002, which others have since adopted,

“I did not come to know Albert Einstein, until I met him in Berlin. [***] I wanted very much to talk to Einstein [***] and visited him in Zurich together with my friend Wagner. But we did not find him home, so we did not have a chance to talk, and his wife told us that, according to his own words, he is only a civil servant in the patent office, and he has no serious thoughts about science, much less about experiments.”

Joffe states that he wanted to visit Albert in Zurich, but met with Mileva and gave up on meeting Albert; but did he, in fact, travel to Zurich to meet Mileva? Why would Joffe, upon meeting with Mileva, simply have abandoned his quest to meet Albert? After all, Joffe and Wagner went out of their way to visit him in Zurich. Why not make any further effort to find him? Would it have been so difficult to have found Albert at the patent office, or the local bar? Joffe does not state that Albert was “out of town”, but was merely “not home”.

Why weren’t Joffe and Wagner shocked by Mileva’s comments? Did Mileva have all the answers to their questions? Why, after having read the original papers of 1905, and likely other published articles, would Joffe have accepted Mileva’s account that Albert was a nothing? Was Mileva really something? Would not the natural reaction to Mileva’s statements have been, “Then, who wrote the papers?” Or, did Joffe already know? Perhaps, Joffe wanted to confront both Mileva and Albert with the fact that their papers were unoriginal. He knew Lorentz’ theory and FitzGerald’s hypothesis and was pursuing Lorentz’ theory before the Einsteins’ plagiarized Lorentz’ work. Perhaps, Albert was hiding from Joffe and Wagner. The only thing certain is that Joffe’s story, as he told it, makes no sense, other than as odd images, which stuck with Joffe for many, many years and were fundamental to his vision of Einstein and Marić.

There is no Swiss custom by which the husband automatically adds his wife’s maiden name to his, and even if there were, neither Albert nor Mileva were Swiss. Albert Einstein never signed his name “Einstein-Marity”. Swiss law permits the male, the female, or both, to use a double last name, but this must be declared before the marriage, and it was Mileva, not Albert, who opted for the last name “Einstein-Marity”. A married person may use the hyphenated *Allianzname* in everyday use, but it was Mileva who went by “Einstein-Marity”, not Albert. Albert signed his marriage records simply “Einstein”. Mileva’s death notice reads “Einstein-Marity”.

...
Joffe, who had handled the original manuscripts, recounts that,

“The author of these articles [***] was [***] Einstein-Marity”.

It was perhaps subtly amusing to Joffe to point out that Albert’s wife had written, or coauthored, the Annalen papers. There is apparently no other plausible reason for Joffe to have made this allusion. Even if Joffe had encountered Mileva’s name “Einstein-Marity” elsewhere, perhaps when they first met, there is no grounds for his associating it with the author of the work of 1905 and only with the work of 1905, other than the name’s having appeared on the work.

Why did Albert’s name appear in the published papers, but not Mileva’s? Did Mileva lose her nerve in the end and ask not to be named as the author of the unoriginal works? Did Mileva have moral objections to the plagiarism? Were the works submitted as coauthored works, but the couple was persuaded that it would be better to have a male name in print? Was there a printing error? Why, after fifty years, would Joffe come out with the disclosure that the papers were submitted by “Einstein-Marity”? Why did that fact nag him for fifty years, and why did he feel compelled to publicly express it, after Albert Einstein had died?

An early Einstein biographer, Alexander Moszkowski, wrote in 1921,

“[Einstein] found consolation in the fact that he preserved a certain independence, which meant the more to him as his instinct for freedom led him to discover the essential things in himself. Thus, earlier, too, during his studies at Zürich he had carried on his work in theoretical physics at home, almost entirely apart from the lectures at the Polytechnic plunging himself into the writings of Kirchhoff, Helmholtz, Hertz, Boltzmann, and Drude. Disregarding chronological order, we must here mention that he found a partner in these studies who was working in a similar direction, a Southern Slavonic student, whom he married in the year 1903. This union was dissolved after a number of years. Later he found the ideal of domestic happiness at the side of a woman whose grace is matched by her intelligence, Else Einstein, his cousin, whom he married in Berlin.”

On 3 April 1921, *The New York Times* quoted Chaim Weizmann,

“When [Einstein] was called ‘a poet in science’ the definition was a good one. He seems more an intuitive physicist, however. He is not an experimental physicist, and although he is able to detect fallacies in the conceptions of physical science, he must turn his general outlines of theory over to some one else to work out.”

Einstein told Leopold Infeld, “I am really more of a philosopher than a physicist.” It is well-established that Einstein had relied upon collaborators to accomplish the mathematical work for which he would sometimes take sole credit. Einstein admitted to Peter A. Bucky that he relied upon experts to do his mathematical work,

“[E]ven after I became well-known I many times made use of experts to assist me in complicated calculations in order to prove certain physics problems. Also, I have always strongly believed that one should not burden his mind with formulae when one can go to a textbook and look them up. I have done that, too, on many occasions.”

Einstein collaborated with Mileva Marić, Jacob Laub, Walter Ritz, Ludwig Hopf, Otto Stern, Marcel Grossmann, Michele Besso, Adriaan Fokker, and Wander de Haas. He had copied the formulae of Lorentz, Poincaré, Wien, Gerber, and countless others, without an attribution.

Einstein biographer Peter Michelmore interviewed the Einsteins’ son Hans Albert Einstein and wrote that,

“[Mileva Maric] was as good at mathematics as Marcel [Grossmann] and she, too, helped in the weekend coaching sessions. [***] She tried to bring a sense of order into Albert’s life, too. The mathematics instruction was only part of it. [***] Mileva helped him solve certain mathematical problems, but nobody could assist with the creative work, the flow of fresh ideas. [***] Mileva checked the article again and again, then mailed it. [***] Einstein’s mathematics failed him. The problem was too complex for Mileva. He called on Marcel Grossmann [***] It was a year later, when Einstein hit a snag in his research, that he went to Switzerland to visit Mileva and the boys.”

There is an apparent contradiction in Michelmore’s statement, in that he stated that Mileva Marić was as a good a mathematician as Marcel Grossmann, then claimed that Grossmann was able to solve a problem Marić could not. This related not to ability, but to training. Grossmann had specialized in non-Euclidean geometry, and Marić had not. Einstein plagiarized the work of both his wife Mileva Marić and his friend Marcel Grossmann.

Albert Einstein was not a mathematically minded person. Einstein confessed to Abraham Pais,
“I am not a mathematician.”

Albert Einstein also stated,

“Since the mathematicians have attacked the relativity theory, I myself no longer understand it anymore.”

Anton Reiser (Rudolf Kayser) records that, while Albert Einstein was studying,

“He showed very little love for [the] study [of mathematics], which seemed to him rather limitless in relation to other sciences. No one could stir him to visit the mathematical seminars.”

While still a child, Albert’s parents and teachers suspected that he was mentally retarded. Abraham Pais tells a revealing story of one of Albert Einstein’s blunders.

We have direct evidence from Albert’s own pen that the work on relativity theory was a collaboration between Mileva and him,

“How happy and proud I will be, when we two together have victoriously led our work on relative motion to an end!”

“Wie glücklich und stolz werde ich sein, wenn wir beide zusammen unsere Arbeit über die Relativbewegung siegreich zu Ende geführt haben!”

This letter from Albert to Mileva came between two relevant others; one circa 10 August 1899, in which Albert discusses the electrodynamics of moving bodies in “empty space”; and another dated 28 December 1901, in which Albert pleads with Mileva to agree to a collaboration in marriage on their scientific work.

Albert’s plea of 1901 is made in the express context of Lorentz’ and Drude’s writings on the “electrodynamics of moving bodies”—which is the very title of the Einsteins’ 1905 paper on the theory of relativity. After the publication of the 1905 article, Albert Einstein repeatedly stated that he had taken the light postulate of special relativity from Lorentz’ theory, and professed that the Lorentz transformation is the “real basis” of the special theory of relativity. Lorentz had published the Lorentz transformation in near modern form in 1899 (Joseph Larmor published the modern transformation in 1900). Albert Einstein had studied Lorentz’ work from the age of 16 as a student in 1895. Drude featured Lorentz’ theories in Drude’s famous book of 1900 Lehrbuch der Optik. Albert Einstein owned a copy of Drude’s book, which featured Lorentz’ theories. Albert wrote to Mileva in this context,

“As my dear wife, we will want to engage in a quite diligent scientific collaboration, so that we don’t become old Philistines, isn’t it so?”
“Bis Du mein liebe Weiberl bist, wollen wir recht eifrig zusammen wissenschaftlich arbeiten, daß wir keine alten Philistersleut werden, gellst.”

This letter referred directly to a collaboration that would ultimately lead to the publication of the Einsteins’ paper on the special theory of relativity in 1905.

Evan Harris Walker, who argued that Mileva was co-author, or sole author, of the 1905 papers, quoted some of Albert’s statements as found in the *The Collected Papers of Albert Einstein*, and bear in mind that the vast majority of Mileva’s letters to Albert were destroyed long ago, with there being no more likely reasons for their destruction than to hide her contributions to their works and the fact that the works were largely unoriginal,

“I find statements in 13 of [Albert’s] 43 letters to [Mileva] that refer to her research or to an ongoing collaborative effort—for example, in document 74, ‘another method which has similarities with yours.’

In document 75, Albert writes: ‘I am also looking forward very much to our new work. You must now continue with your investigation.’ In document 79, he says, ‘we will send it to Wiedermann’s *Annalen.*’ In document 96, he refers to ‘our investigations’; in document 101, to ‘our theory of molecular forces.’ In document 107, he tells her: ‘Prof. Weber is very nice to me. . . . I gave him our paper.’

Though some have suggested that Albert was condescending to Mileva by referring to the works as “theirs”; it is far more likely, from a sociological point of view, that the opposite occurred, and Albert was Mileva’s lackey, fetching notes for her. In order to spare Albert’s male ego, and in order to further Albert’s career, Mileva perhaps referred to the work as “theirs”—just as female nurses have been observed to instruct male doctors on the diagnosis and viable treatment for a patient, only to have the male doctor then pretend to that patient, and in front of the nurse, that the ideas were his—even to lecture the female nurse with her own words. It does not seem plausible, most especially not in that era, that Albert would call the work joint if it were not—and it was absolutely against Albert’s nature to award due credit to others, unless forced to do so. Albert professed,

“Man usually avoids attributing cleverness to somebody else—unless it is an enemy.”

Albert lacked the mathematical skills and intellectual abilities needed to have written the 1905 paper alone. Mileva was exceptionally bright, and all indications are that those who knew her throughout her life found her the more intelligent one of the pair. She had the needed intellectual prowess to have written the 1905 paper on the principle of relativity. Given the many blunders in the paper, it is safe to assume that neither one of them was a superlative mathematician, nor logician. It also appears that publication of the paper may have been rushed—perhaps the couple had
corresponded with Poincaré and he had informed them of his results, and when he would publish them.

Mileva and Albert had coauthored papers before and Albert had assumed credit for that which Mileva had accomplished without him. Senta Troemel-Ploetz presented a thorough account of Albert’s appropriation of Mileva’s work and of Mileva’s acquiescence. Troemel-Ploetz’ insights into the cultural barriers Marić faced, and the reasons for Marić’s lack of success at the ETH, form a persuasive argument that Mileva was discriminated against, and faced other enormous challenges, which must be taken into account when comparing Mileva’s accomplishments with those of her fellow students.

Mileva Marić was the more likely one of the couple to have reviewed the English language literature for the reviews published under Albert’s name in the *Beiblätter zu den Annalen der Physik* and *Fortschritte der Physik*. Einstein published 21 reviews in the *Beiblätter* in 1905. Mileva could speak English and Albert could not. R. S. Shankland recounts that,

“[Albert Einstein] told me that when he came to the United States that year [1921], he did not know a word of English. On the trip he picked up some by ear. He told me, ‘I am the acoustic type; I learn by ear and give by word. When I read I hear the words. Writing is difficult, and I communicate this way very badly.’ He added that he never really felt sure of the spelling of any English word. He told me that he even hated to write his *Autobiographical Notes* in German.”

*The Chicago Tribune* reported on 3 April 1921 on page 6 that,

“[Albert Einstein] does not speak English and answered through an interpreter.”

*The New York Times Book Review and Magazine* on 1 May 1921 published an interview with Albert Einstein and his second wife, and Dan Arnald recorded that Einstein’s second wife interrupted the interview and was concerned by Albert’s inability to speak English,

“‘Maybe I can help you,’ she said kindly. ‘I speak English, and I can interpret for him.’ The interview up to that point had been in German.”

Albert Einstein wrote to Michele Besso in 1914,

“I am studying English (with Wohlend), slowly but thoroughly.”

Apparently, the lessons did not take. Mileva had the ability to have read the important English and Slavic works of Gibbs, Larmor, Smoluchowski, Varičak, etc., which the couple copied.

Albert would often simply agree with whomever he had last spoken, and it is
likely that he was little more than a mere parrot. Upon meeting with colleagues, he would often grill them for information on their theories, seemingly soaking it all in to repeat it later as if the ideas were his own.

Numerous eyewitnesses (literally) described Albert Einstein’s vacant childlike eyes and childlike behavior and naïveté. For example, when Albert Einstein arrived in America in 1921, *The New York Times*, (3 April 1921), described Einstein on the front page:

“Under a high, broad forehead are large and luminous eyes, almost childlike in their simplicity and unworldliness.”

Charles Nordmann, who chauffeured Albert Einstein around France, sarcastically described him as a vacant-eyed simian clod. Nordmann sarcastically ranked him with Newton, Des Cartes or Henri Poincaré—from whom Einstein had copied the principle of relativity. Like Rabelais and Voltaire before him, Nordmann lavished sarcastic praise on the new hero and derided him in ways which would elude the unsophisticated, but which were clear to those knowledgeable of the facts. Nordmann was careful not to be too blunt, for he wished to advocate the theory of relativity, and it was politically expedient for him to ride on Einstein’s coat tails, but Nordmann never failed to get his digs in. Charles Nordmann wrote,

“Einstein is big (he is about 1 m 76), with large shoulders and the back only very slightly bent. His head, the head where the world of science has been re-created, immediately attracts and fixes the attention. His skull is clearly, and to an extraordinary degree, brachycephalic, great in breadth and receding towards the nape of the neck without exceeding the vertical. Here is an illustration which brings to nought the old assurances of the phrenologists and of certain biologists, according to which genius is the prerogative of the dolichocephales. The skull of Einstein reminds me, above all else, of that of Renan, who was also a brachycephale. As with Renan the forehead is huge; its breadth exceptional, its spherical form striking one more than its height. A few horizontal folds cross this moving face which is sometimes cut, at moments of concentration or thought, by two deep vertical furrows which raise his eyebrows.

His complexion is smooth, unpolished, of a certain duskiness, bright. A small moustache, dark and very short, decorates a sensual mouth, very red, fairly large, whose corners gradually rise in a smooth and permanent smile. The nose, of simple shape, is slightly acquiline.

Under his eyebrows, whose lines seem to converge towards the middle of his forehead, appear two very deep eyes whose grave and melancholy expression contrast with the smile of this pagan mouth. The expression is usually distant, as though fixed on infinity, at times slightly clouded over. This gives his general expression a touch of inspiration and of sadness which accentuates once again the creases produced by reflection and which, almost linking with his eyelids, lengthen his eyes, as though with a touch of kohl.
Very black hair, flecked with silver, unkempt, falls in curls towards the nape of his neck and his ears, after having been brought straight up, like a frozen wave, above his forehead.

Above all, the impression is one of disconcerting youth, strongly romantic, and at certain moments evoking in me the irrepressible idea of a young Beethoven, on which meditation had already left its mark, and who had once been beautiful. And then, suddenly, laughter breaks out and one sees a student. Thus appeared to us the man who has plumbed with his mind, deeper than any before him, the astonishing depths of the mysterious universe."

Certain anecdotal accounts paint Albert Einstein in a bad light. Upon refusing to brush his teeth, Einstein allegedly proclaimed that, “pigs’ bristles can drill through diamond, so how should my teeth stand up to them?” Explaining why he didn’t wear a hat in the rain, he asserted that hair dries faster than hats, and irritably asserted that such was obvious. It apparently eluded him that the objective was, in the first place, to keep the hair dry. Explaining why he didn’t wear socks, Einstein commented, “When I was young I found out that the big toe always ends up by making a hole in the sock. So I stopped wearing socks” and “What use are socks? They only produce holes.” Felix Klein told Wolfgang Pauli that Einstein wrote to him that Klein’s paper delighted him like a child given a bar of chocolate by his mommy. The New York Times reported on 6 November 1927 on page 22 that Einstein forgot his bags in the waiting room when boarding a train in Gare de l’Est. The New York Times reported on 13 July 1924 on page 22 in an article entitled, “Einstein Counted Wrong”, that Einstein counted the change a street car conductor had given him:

“After counting it hurriedly, Einstein insisted that the conductor had made a mistake. The latter recounted the change deliberately, explaining to Herr Einstein that it was correct, and then turned to the next passenger with a shrug of his shoulders and the remark:

‘His arithmetic is weak.’”

Einstein’s private physician Prof. Janos Plesch wrote,

“Einstein never took any exercise beyond a short walk when he felt like it (which wasn’t often, because he has no sense of direction, and therefore would seldom venture far afield), and whatever he got sailing his boat, though that was sometimes quite arduous—not the sailing exactly, but the rowing home of the heavy yacht in the evening calm when there wasn’t a breath of air to stretch the sails.”

Peter A. Bucky recounted many such anecdotes and told of how Albert Einstein had decided to live in one room as opposed to four so that the next time he lost a button from his shirt it would be easier to find.
Albert Einstein was taken in by a con man named Otto Reiman, who convinced Einstein that he could describe a person after blindly touching a sample of his or her handwriting. Many physicists including Albert Einstein, A. E. Dolbear and Sir Oliver Lodge, believed in telepathy; but Einstein was perhaps the only one to find proof of it in the fact that we humans do not have skins as thick as an elephant’s hide. Albert Einstein was taken in by the psychic Roman Ostoja and attended a séance with Upton Sinclair. Einstein wrote a preface for the Thomas edition of Upton Sinclair’s book on telepathy, *Mental Radio*, in which Einstein—“the greatest mind in the world”—asked that psychologists seriously consider Sinclair’s findings.

Elsa Einstein was Albert Einstein’s second wife and his cousin and they were related by blood through both her mother and father. The inbred Einsteins were as arrogant as they were ridiculous. Denis Brian wrote in his book *Einstein: A Life*, “The Sinclairs arranged for Einstein to meet some of their distinguished writer friends for dinner at the exclusive Town House in Los Angeles. When Einstein arrived, he somehow missed the cloakroom and appeared in the dining room wearing a ‘humble’ black overcoat and a much-worn hat. In what might have been a scene from a Chaplin film, he removed his overcoat, ‘folded it neatly, and laid it on the floor in a vacant corner and set the hat on top of it. Then he was ready to meet the literary elite of Southern California.’ There was even something Chaplinesque in the way Einstein flirted with the attractive women, while Elsa—‘my old lady’ he called her—was at his elbow.

Elsa confirmed Mrs. Sinclair’s view of her as a dutiful and utterly devoted German hausfrau during a discussion about God. Einstein had stated his belief in God, but not a personal God—a distinction which Mrs. Sinclair didn’t get. She replied, ‘Surely the personality of God must include all other personalities.’ Afterwards, Elsa gently admonished Mrs. Sinclair for arguing with Albert, adding, ‘You know, my husband has the greatest mind in the world.’ ‘Yes, I know,’ said Mrs. Sinclair, ‘but surely he doesn’t know everything!’

Though Roman Ostoja was unable to conjure up a ghost for Albert Einstein, the media were able to put America into a trance-like state of adulation. Brian continued, “Back in his gift-strewn cottage Einstein found tangible evidence that ‘America was prepared to go mad over him.’ A millionairess gave Caltech $10,000 for the privilege of meeting him.”

Peter Michelmore tells a story of how Einstein dropped his saliva saturated cigar butt into the dust, then unashamedly picked up the gritty stub and shoved it back into his mouth defiantly declaring, “I don’t care a straw for germs.” R. S. Shankland records that Einstein,
“apparently put his cigarette into his coat pocket, and as we took off our coats he had a small conflagration in his.”

Einstein wasn’t too handy around the house, and seemingly had a difficult time conceptualizing geometric problems. In a joke perhaps first told of Ampère, it was said that Einstein insisted that two holes be bored through his front door, one larger than the other, so that both the large cat, and the small cat, could pass through the door. This anecdote is significant, because it is a historical indication of the low esteem in which some of the people who had met Einstein held his intelligence.

After meeting Einstein, Max von Laue found it difficult to believe that Einstein had written the 1905 paper,

“[T]he young man who met me made such an unexpected impression on me, that I did not believe him to be capable of being the father of the theory of relativity.”

“[D]er junge Mann, der mir entgegen kam, machte mir einen so unerwarteten Eindruck, daß ich nicht glaubte, er könne der Vater der Relativitätstheorie sein.”

Minkowski, who had been Einstein’s professor, found it difficult to believe that “lazy” Einstein had written the 1905 paper. Minkowski did not think Einstein capable of it. According to both Heaviside and Born, Minkowski anticipated Einstein. Max Born wrote in his autobiography,

“I went to Cologne, met Minkowski and heard his celebrated lecture ‘Space and Time’, delivered on 21 September 1908. Outside the circle of physicists and mathematicians, Minkowski’s contribution to relativity is hardly known. Yet it is upon his work that the imposing structures of modern field theories have been built. He discovered the formal equivalence of the three space coordinates and the time variable, and developed the transformation theory in this four-dimensional universe. He told me later that it came to him as a great shock when Einstein published his paper in which the equivalence of the different local times of observers moving relative to each other was pronounced; for he had reached the same conclusions independently but did not publish them because he wished first to work out the mathematical structure in all its splendour. He never made a priority claim and always gave Einstein his full share in the great discovery. After having heard Minkowski speak about his ideas, my mind was made up at once. I would go to Göttingen and to help him in his work.”

On 2 February 1920, Albert Einstein wrote a letter to Paul Ehrenfest in which Einstein made obvious blunders in his arithmetic,
“I have received the 10000 marks. The accounting now looks like this: 16500 marks is what the grand piano costs, 239 marks is the cost of packing, delivery to the train station, and export permit. Remainder is 111 marks, which is consequently being applied toward the violins.”

Ehrenfest’s response to Einstein of 8 February 1920 is telling and hints that he knew that Einstein was incompetent beyond mere questions of finances,

“We had a great laugh today about your brilliant miscalculation. You write the following, verbatim:

‘I have received the 10000 marks. The acct. looks like this: 16500 marks is what the grand piano costs, 239 marks is the cost of packing, delivery —. Remainder is 111 marks, which is consequently being applied toward the violins’

God said, ‘Let Einstein be’ and all was skew! —A nice non-Euclidity in the series of numbers!! —After this exercise, I understand perfectly why destitution [Dallessicität] is your normal state!"

Einstein, himself, described his goals, strengths and limitations in an essay dated 18 September 1896,

“They are, most of all, my individual inclination for abstract and mathematical thinking, lack of imagination and of practical sense.”

Einstein later found himself in deeper waters and wrote to Paul Hertz on 22 August 1915,

“You do not have the faintest idea what I had to go through as a mathematical ignoramus before coming into this harbor.”

Albert Einstein wrote to Felix Klein, on 26 March 1917, and confessed that,

“As I have never done non-Euclidean geometry, the more obvious elliptic geometry had escaped me when I was writing my last paper.”

Einstein often tried to justify his enormous difficulties in school and his ignorance by admitting that he had thought mathematics unimportant and thought that formulas and facts need not be memorized because one can simply look them up in textbooks.

Dr. Tilman Sauer stated,

“[Hilbert] would soon [. . .] pinpoint flaws in Einstein’s rather pedestrian way of dealing with the mathematics of his gravitation theory.”

It is well-established that Einstein had relied upon collaborators to accomplish
the mathematical work for which he would sometimes take sole credit. Einstein admitted to Peter A. Bucky that he relied upon experts to do his mathematical work,

"[E]ven after I became well-known I many times made use of experts to assist me in complicated calculations in order to prove certain physics problems. Also, I have always strongly believed that one should not burden his mind with formulae when one can go to a textbook and look them up. I have done that, too, on many occasions."\(^{3607}\)

Einstein hid from the many accusations that his theory was metaphysical nonsense—an inconsistent jumble of fallacies of *Petitio Principii*—nothing but an excuse to plagiarize. A meeting had been arranged to discuss Vaihinger’s theory of fictions in 1920, and Einstein pledged that he would attend this meeting. Knowing that Einstein would be devoured in a debate over his mathematical fictions, which confused induction with deduction, Wertheimer and Ehrenfest helped Einstein fabricate an excuse to miss the meeting he had agreed to attend. Einstein was proven a liar.\(^{3608}\) He also hid from many other criticisms, and Einstein refused to answer T. J. J. See’s many charges of plagiarism,\(^{3609}\) and refused to debate Reuterdahl or to answer his many charges of plagiarism.\(^{3610}\) Einstein hid from the French Academy of Sciences.\(^{3611}\) Einstein hid from Cardinal O’Connell.\(^{3612}\) Einstein hid from Dayton C. Miller’s falsification of the special theory of relativity.\(^{3613}\) Einstein hid from Cartmel.\(^{3614}\) Miller hammered Einstein in the press over the course of many years. *The New York Times Index* list several articles in which Miller’s and William B. Cartmels’ falsifications of the special theory of relativity are discussed. Einstein and Lorentz were very worried by Miller’s results and could not find fault with them.\(^{3615}\) Einstein told R. S. Shankland not to perform an experiment which might falsify the special theory of relativity,

"[Einstein] again said that more experiments were not necessary, and results such as Synge might find would be ‘irrelevant.’ [Einstein] told me not to do any experiments of this kind."\(^{3616}\)

Einstein knew he was caught at the Arbeitsgemeinschaft deutscher Naturforscher meeting in the Berlin Philharmonic, and wanted to run away from Germany. Einstein desired to hide from the Bad Nauheim debate at which he had threatened to devour his opponents,\(^{3617}\) then Einstein—after being talked into appearing and after much hype promoting the event which attracted thousand of visitors—then Einstein, when losing the debate, ran away during the lunch break and again wanted to run away from Germany. Einstein prospered from hype and had no legitimacy as a supposed “genius”. The press rescued him again and again, while he hid. Einstein was unable to defend his theories in the light of strict scrutiny.

**18.3 Prophets of the Prize**

Is there any evidence that Albert Einstein wrote unoriginal works as a pattern? By
1905, before the appearance of the Einsteins’ first paper on the principle of relativity, Albert Einstein had already exhibited a penchant for plagiarism.\textsuperscript{3618} His early papers were thoroughly unoriginal. Einstein derived these papers from the works of Gibbs and Boltzmann, without giving them their due credit.

The Einsteins’ “miraculous year” of 1905 is most notable for three papers on the photo-electric effect, Brownian motion and special relativity. However, the Einsteins’ plagiarized their 1905 paper on the theory of Brownian motion from Gouy, Nernst, Smoluchowski, Sutherland and Bachelier, among others.\textsuperscript{3619} The Einsteins’ 1905 paper on the photo-electric effect was derived from the works of Newton, Maxwell, Boltzmann, Hertz, Hallwachs, Wien, Planck, Lenard, Rayleigh, Stark, and many others.\textsuperscript{3620} And the Einsteins plagiarized their paper on the principle of relativity chiefly from Poincaré and Lorentz.

Though the law of the photo-electric effect was mentioned as grounds for the award of Albert Einstein’s Nobel Prize, Nobel Prizes were meant to be awarded for scientific discoveries and the Nobel Prize was also awarded to the experimentalists Lenard and Millikan—as was more appropriate than the award to Einstein for deriving a law, which award violated many of the fundamental rules of the prize. The Einsteins’ 1905 paper on the photo-electric effect was better referenced than were their papers on Brownian motion and the electrodynamics of moving bodies. This may have been at Max Planck’s insistence, because he had accomplished much of the work which led to the Einsteins’ paper, and Max Planck had considerable influence at \textit{Annalen der Physik}. The 1905 paper on the principle of relativity wanted for a single reference. The Einsteins simply copied the then famous papers of noted scientists. They acted like a teenager, who opens an encyclopedia article, changes a few words and copies the rest, then submits the finished forgery as his own term paper.

But was it Albert who was fitting the formulæ others had published before him into a new dress to call his own, or was it his brilliant wife Mileva? Albert’s supposed genius diminished after his divorce from Mileva in 1919. Why would that be so? He died in 1955, and produced nothing extraordinarily significant after his divorce, in my opinion, and who were closest to Albert have agreed.

After winning the Nobel Prize in 1922, Albert paid his former wife the money which he had won in the prize, but why? Why pay Mileva the winnings? Albert was not overly generous in the support of his family. Peter Michelmore argues that Albert paid Mileva the monies in order to protect the funds from his reckless second wife, but Michelmore notes that in the exchange from one currency to another \textit{half of the value of the prize was lost}—hardly an action taken to preserve value.\textsuperscript{3621} Evan Harris Walker stresses this fact and notes the pains Albert took to conceal the transfer of the winnings to Mileva.\textsuperscript{3622}

Why did the Nobel Committee not award Einstein the Nobel Prize for his work on relativity theory? It is supposedly unclear, but many parts of the puzzle present an image of political motivation, and not merit, being the impetus behind Einstein’s award. All who were familiar with the facts knew that Einstein did not originate the major concepts behind relativity theory. Nobel Prize judge Sven Hedin told Irving Wallace that Nobel Prize laureate Phillip Lenard had informed the Nobel Prize
judges that the theory of relativity,

“was not actually a discovery, had never been proved, and was valueless.”

Professor Oskar Edvard Westin, of Stockholm, informed the Nobel Foundation Directorate of the unoriginality of Einstein’s work, its metaphysical delusions, and of the accusations of plagiarism outstanding against Einstein, some of which Einstein never denied. Prof. Westin published a very important article in the *Nya Dagligt Allehanda* on 22 October 1922 leveling these charges at Einstein and calling him a dishonest investigator and a plagiarist, undeserving of the Nobel Prize premium.

Some ten years prior to the award, Wilhelm Wien had recommended that the Nobel Prize be given to both Hendrik Antoon Lorentz and Albert Einstein in 1912, on the grounds that,

“While Lorentz must be considered as the first to have found the mathematical content of the relativity principle, Einstein succeeded in reducing it to a simple principle. One should therefore assess the merits of both investigators as being comparable.”

However, Einstein’s share by all rights belonged to Poincaré, who died in 1912, and it would have been in exceedingly bad taste to have exploited his death in order to award the Nobel Prize to Einstein; and Boscovich, Voigt, FitzGerald and Larmor had rights to Lorentz’ share. Wien knew Poincaré’s work well, and, thus, knew that Einstein had done little but parrot Poincaré.

Wien, in recommending Lorentz and Einstein for the special theory, effectively disclosed that Einstein held no priority for it, as everyone knew that Poincaré stated the principle of relativity long before Einstein, and Lorentz had published the mathematical formalisms of the theory before the Einsteins copied them without an attribution. Ernst Gehrcke demonstrated that Paul Gerber had anticipated the general theory of relativity, as had Johann Georg von Soldner, making a Nobel Prize for that theory impossible. It is clear that the Nobel Committee simply manufactured an excuse to award the then celebrity, Albert Einstein, a prize, merely mentioning the photo-electric effect, for which Einstein held no priority, as a possible excuse.

Robert A. Millikan had argued that Einstein’s formulation of the law of the photo-electric effect was untenable. Millikan changed his position when Einstein’s Nobel Prize award was attacked on this basis, but cited no experimental basis for his change of view. Millikan was then himself awarded the Nobel Prize in 1923. Millikan’s integrity has been questioned by numerous sources.

Could the Nobel Prize monies Albert paid to Mileva have been “hush money”? Though the payment was made pursuant to a divorce agreement, would not a divorce agreement typically stipulate that the male was indebted to the female and must pay her regardless of the means by which the money was obtained? Mileva had children to feed, Albert’s children. When the divorce agreement was reached, it was far from certain that Albert would ever win the Nobel Prize. Why would Mileva risk the future of her children?
Why would they reach an agreement which stipulated that the monies be paid if and only if Albert might someday win the Nobel Prize? Could the agreement have related not to the responsibilities of marriage, but to potential monetary gain derived from Mileva’s efforts? Is it possible that if it were Mileva’s work, and that work paid off, Albert would pay her off, and then only to keep her silent? Could it have been Mileva’s way of saying, “Hey, if you ever get any serious money out of my work, I deserve the money, because it was my work!”

Mileva once hinted to Albert that she was contemplating publishing her memoirs. Albert told her to stay silent, and may have intimated that he, an innocent idiot, would suffer less than she, the incorrigible plagiarist, from any public disclosures. That is but one of many plausible interpretations of Albert’s words, which were nebulous in the sense that threats often are. Albert believed, “If A equals success, then the formula is A equals X plus Y plus Z. X is work. Y is play. Z is keep your mouth shut.”

Why didn’t Mileva come forward with the fact that she was the one who had written the work, if in fact she had? Did Albert buy Mileva’s silence? Even if he had, was there more to hold Mileva back from exposing Albert than the desperate need for monies?

Albert would have been able to prove to the world that the theory was largely unoriginal when *Annalen der Physik* first published the 1905 paper, which merely condensed the works of Lange, Voigt, Hertz, FitzGerald, Larmor, Cohn, Langevin, Lorentz and Poincaré. What would Mileva have stood to gain by revealing that Albert had taken credit for her work, when she herself had merely repeated what others had already published? Neither of the Einsteins, not Albert, not Mileva, “thought God thought’s”, as popular myth now holds. They read scientists’ papers and books, rewrote them, and attached their name to what was not theirs.

Had anyone ever repeated what Albert Einstein had earlier published, and then claimed priority for thoughts which Albert had first published? Would Albert have tolerated such misbehavior? He was aggressive in response to challenges to his priority and the issue of priority was very important to him. Albert stated that it is wrong not to give credit where credit is due,

“That, alas, is vanity. You find it in so many scientists. You know, it has always hurt me to think that Galileo did not acknowledge the work of Kepler.”

When one thief steals a stolen purse from another thief, then offers to split the purse, what option does either thief have but to keep silent and spend the money? Mileva knew that she had written the work for which Albert took credit. Albert knew that Mileva had copied the ideas, examples, explanations, equations and phrases, from Lange, Voigt, Hertz, FitzGerald, Larmor, Cohn, Langevin, Lorentz and Poincaré. In such a scenario, what else could Mileva have done? What else would have been in her self-interest, other than to keep silent and collect the Nobel Prize
Mileva had hoped that Albert would rise to fame and she would lead a charmed life with her famous husband,

“We have recently completed a very important work, which will make my husband world-famous.”

“We have recently completed a very important work, which will make my husband world-famous.”

Serbian women had little chance at fame in those times, other than as ornaments attached to their husbands’ arms. Nikola Tesla, a Serbian genius born in Croatia, was unfairly treated in the West. What chance did Mileva stand?

Albert was cruel to Mileva. He may have destroyed her self-confidence. Albert once demanded in writing that Mileva obey his cruel and degrading orders in a letter which can only be described as shocking and revolting. If Mileva had hoped that Albert would someday acknowledge her, she was mistaken. Albert, a misogynist, degraded her in a letter to Michele Besso,

“We men are deplorable, dependent creatures. But compared with these women, every one of us is king, for he stands more or less on his own two feet, not constantly waiting for something outside of himself to cling to. They, however, always wait for someone to come along who will use them as he sees fit. If this does not happen, they simply fall to pieces.”

It is probable that Marić believed that her only hope for fame and fortune was to build up Albert and use him for her ends. Albert did not have strong morals. Albert was certainly fit for the rôle as cohort to plagiarism.

There are allegations that Albert Einstein may have beaten his first wife Mileva Marić and their children. Einstein’s son, Hans Albert Einstein, stated,

“Oh, he beat me up, just like anyone else would do.”

Albert Einstein cruelly abandoned Mileva Marić during her pregnancy with their first child Lieserl. The fate of this poor child, who vanished from the record early in life, is to this day a mystery.

Brutality was nothing new to Albert Einstein. As a child, Albert Einstein physically abused his sister Maja, and physically attacked his violin instructor. Maja Winteler-Einstein wrote in her biography of her brother Albert,

“The usually calm small boy had inherited from grandfather Koch a tendency toward violent temper tantrums. At such moments his face would turn completely yellow, the tip of his nose snow-white, and he was no longer in control of himself. On one such occasion he grabbed a chair and struck at his teacher, who was so frightened that she ran away terrified and was never seen
again. Another time he threw a large bowling ball at his little sister’s head; a third time he used a child’s hoe to knock a hole in her head.”

There are many accounts which portray Einstein as incontinent. According to some accounts, Einstein was perhaps even a foul-mouthed syphilitic, who contracted the disease from his many encounters with prostitutes—he was by his own admission on 23 December 1918 an incestuous adulterer. Einstein stated,

“It is correct that I committed adultery. I have been living together with my cousin, Elsa Einstein, divorced Löwenthal, for about 4 1/2 years and have been continuing these intimate relations since then.”

Albert Einstein was a blood relative with his second wife Elsa Einstein through both his mother and his father. Einstein felt that he had the option to choose between a marriage with his cousin Elsa, or one of her young daughters, whom he also aggressively pursued, much to her disgust. Dismayed, Ilse Einstein wrote to Georg Nicolai about Albert Einstein’s sexual advances toward her,

“I have never wished nor felt the least desire to be close to [Albert Einstein] physically. This is otherwise in his case—recently at least.—He himself even admitted to me once how difficult it is for him to keep himself in check.”

Dennis Overbye tells the story of Ilse Einstein’s letter to Georg Nicolai of 22 May 1918 in which she complains of Albert Einstein’s sexual advances towards her. Albert Einstein was conducting an incestuous and adulterous relationship with her mother Elsa Einstein at the time. Overbye states that Wolf Zue1zer preserved the letter,

“despite pressure from Margot Einstein, Helen Dukas, and lawyers representing the Einstein estate to surrender it or destroy it. The tale, an example of the difficulties scholars have faced in telling the Einstein story, is preserved in Zuelzer’s correspondence in the American Heritage archive at the University of Wyoming.”

Marrying his cousin Else Einstein enabled Albert Einstein to have her and her daughters. Albert Einstein referred to his wife and cousin Elsa Einstein and her two daughters as his “small harem”. Einstein wrote to Max Born, in an undated letter thought to have been written sometime between 24 June 1918 and 2 August 1918,

“We are well, and the small harem eat well and are thriving.”

Philipp Frank wrote,

“Einstein’s wife Elsa died in 1936. [***] Of Einstein’s two stepdaughters, one died after leaving Germany; the other, Margot, a talented sculptress, was
divorced from her husband and now lives mostly with Einstein in Princeton. Even this might not have been enough for Albert Einstein. There are reasons to believe he had an affair with Elsa Einstein’s sister, Paula, another of Albert Einstein’s cousins. Einstein’s son, Hans Albert Einstein, believed that his father was also having an affair with his secretary Helen Dukas.

The facts present Einstein as an odd being who was sadistically cruel to his family. Should his perversions be considered the benefit of his genius, and a sacrifice he made for the good of mankind? Was their suppression from public view an indication that the popular image of the “great man” is a well-nurtured myth? Might there be other myths about the man, or truths which have been covered up?

18.4 Conclusion

Did Albert Einstein have no choice but to copy what others had published before him? Was he of sub-average intelligence? Given that this issue is controversial, I’ll give Albert the benefit of the doubt and regard the 1905 paper on the principle of relativity as a coauthored work. However, that which was new in the paper, the “relativistic” equations for aberration and the Doppler-Fizeau Effect, were likely derived by Mileva Marić, the superior mathematician of the two. If the Einsteins had properly referenced their work, and claimed priority only for that which was new in the paper, one wonders if Mileva, who had far more character than Albert—she cared for their children while he abandoned them—would have insisted that her rôle be acknowledged.
19 Albert Einstein’s Nobel Prize

At a time when the Zionist movement was falling apart and Albert Einstein’s fame was diminishing, Albert Einstein was awarded the Nobel Prize. The decision to award Einstein the prize came first, and then an excuse was manufactured to justify the unjustified award. The entire process was artificial. Far from celebrating a specific discovery Einstein had made—he had made none—those who decided that Einstein would be given a prize attempted to present a non-controversial excuse for awarding the prize. They failed and it was obvious that Einstein was given the prize not because he deserved it, but because influential persons had insisted that he be given it.

“Recently the Nobel Foundation Directorate awarded the Nobel premium for distinguished achievement in physical science to Albert Einstein. Uninformed and uncritical opinion will, undoubtedly, concur with the directorate in this choice. Biased opinion, created by world-wide propaganda, will heartily agree with the directorate in its decision. In this instance, however, the directorate has deliberately conferred a unique distinction and set its seal of approval upon a man who has been definitely and publicly charged with plagiarism through the medium of the international press and in such scientific journals as still retain their freedom of expression. It may be thought that the award to Einstein was based upon ignorance of the actually involved facts and that the directorate may be exonerated on the plea of lack of information. It must be admitted, however, that in this case ignorance of facts should not and cannot be accepted as a defense of the award. The plea of ignorance cannot be allowed because of the all-important reason that the directorate’s attention had been definitely called both to the charges made against Einstein and also to the unbiased appraisal of his alleged achievements.”—Arvid ReuterdaHL

19.1 Introduction

Albert Einstein had accomplished nothing which merited a Nobel Prize. Influential persons who wanted to give him the prize were forced to manufacture an excuse so as to justify the unjustified award. They eventually settled upon the nebulous declaration that Einstein deserved the Nobel Prize merely because he deserved it, and that the law of the photo-electric effect was perhaps one reason why, or as the Nobel Committee phrased it, Einstein won the prize,
“for his services to Theoretical Physics, and especially for his discovery of the law of the photoelectric effect”

This excuse posed a difficulty for those who first determined that Einstein would be given a prize and then attempted to manufacture a reason why. Nobel Prizes could only be awarded for physical discoveries. The law of the photo-electric effect did not constitute an experimental discovery. The experimental discovery was allegedly made by Robert Andrews Millikan and he was slated to receive a Nobel Prize for it before Einstein.

19.2 The Nobel Foundation Directorate Learns that Einstein is a Plagiarist

Ernst Gehrcke demonstrated that Paul Gerber had anticipated the general theory of relativity, as had Johann Georg von Soldner, making a Nobel Prize for the general theory of relativity impossible. Gehrcke and others also proved that the special theory of relativity was published by Lorentz and Poincaré, before Einstein, which made it impossible for the Nobel Committee to award Einstein a prize for the special theory of relativity.

Gösta Mittag-Leffler was the founding editor of the journal *Acta Mathematica* published in Sweden. On 7 July 1909, Mittag-Leffler wrote to Poincaré that Ivar Fredholm recognized Poincaré’s priority for the theory of relativity over that of Lorentz, Einstein and Minkowski. In 1914, Mittag-Leffler arranged for a special volume of the *Acta Mathematica* (Volume 38) devoted to honoring Henri Poincaré and his achievements with articles by his peers. Lorentz, Wien, Planck, and others, contributed articles, which acknowledged the fact that Poincaré had anticipated Einstein and Minkowski. Mittag-Leffler delayed publication of the tribute until after the French and their allies had won the war. He wrote to Albert Einstein on 16 December 1919, soon after Einstein had become internationally famous, and asked Einstein to contribute an article for the memorial volume—an article on Poincaré’s contributions to the theory of relativity. Mittag-Leffler also told Max Planck that he would like Einstein to contribute such an article. Einstein delayed answering Mittag-Leffler until Einstein believed it would be too late for him to publish an article, and then stated that he would be happy to write such an article if there was still an opportunity to see it published.

As with his 1907 review article on the theory of relativity in the *Jahrbuch der Radioaktivität und Elektronik*, and as with the republication of the Einsteins’ 1905 paper on special relativity in the book *Das Relativitätsprinzip: eine Sammlung von Abhandlungen* in 1913, Albert Einstein had a golden opportunity to redeem himself for his lies and his theft of Poincaré’s ideas. When Mittag-Leffler informed Einstein that there was still time left for him to make a contribution, Einstein reneged on his promise and did not submit an article to honor Poincaré, whose ideas had given him his career.

Einstein would have been forced to have acknowledged that Poincaré was the father of the theory of relativity. Volume 38 of the *Acta Mathematica* was published in 1921 and it undoubtedly had an impact on the decision of the Nobel Prize
The Manufacture and Sale of St. Einstein

Committee not to award Einstein a prize for the theory of relativity. Wolfgang Pauli’s article “The Theory of Relativity” in the *Enzyklopädie der mathematischen Wissenschaften mit Einschluss ihrer Anwendungen* in 1921 must also have made it clear to all that Einstein could not be awarded a prize for the theory of relativity.3659

Professor Oskar Edvard Westin, of Stockholm, informed the Nobel Foundation Directorate of the unoriginality of Einstein’s work, its alleged metaphysical delusions, and of the accusations of plagiarism outstanding against Einstein, some of which Einstein never denied. Westin published a very important article in the *Nya Dagligt Allehanda* on 22 October 1922 leveling these charges against Einstein and Westin called Einstein a dishonest investigator, undeserving of the Nobel Prize premium.3660 Westin’s article stated:

(Unfortunately, my photocopy of this article is taken from a low-quality microfilm, which is very difficult to read and contains many gaps in the text. Therefore, the attempted reproduction here is only an approximation and the original must be consulted for an absolutely accurate and complete knowledge of Westin’s words.—My apologies to the reader.)

“Einstein blifvande Nobelpristagare?

Kan A. Einstein med fog betecknas som en vetenskapsman af rang? — Och har han visat sig ärlig i sin forskning?

För N. D. A. af professor O. E. Westin.

Herr redaktör!

Enar den tid nu stundar, då inom k. vetenskapsakademien erforderliga förberedelser skola vidtagas i fråga om utdelandet af nobelpriset i fysik, och enär vissa tecken tyda därpå, att man på visat håll egendomligt nog vill försöka förmå akademien att tilldela Einstein detta pris, så torde det måhända kunna vara af gagn att göra några erinringar om denne mans vetenskapliga författarverksamhet. Därigenom kunde kanske förebyggas ett förhastande, som, om det komme att ske, sedan medförde mindre behagliga följder. Med edert benägna medgivande vill jag därför här i största korthet beröra dels några elementära detaljer af Einsteins så mycket omtalade och för honom karaktäristiska s. k. ‘relativitetsteori’ och dels vissa andra omständigheter.

Einstein framträdare i bemälda teori med betydande anspråk, och han och hans anhängare söka nedriva verkligt värdefulla och bepröfvade vetenskapliga rön och i stället sätta fantastiska funderingar, stridande mot
sunda förnuftet; de göra sig stundom skyldiga till vantolkningar än i ett hänseende än i ett annat.

Den ‘klassiska mekaniken’ säges vara störtad, men giltiga skäl för detta påstående äro icke anförda. Einstein, som anser sig ha skapat en ny rörelselära bättre än den äldre, har tydligt icke en klar förhållning om innebörden af begreppet rörelse, hvarken den enskilda eller den sammansatta; detsamma gäller äfven andra mekaniska grundbegrepp. Hans skrifter visa detta och f. ö. äfven att han saknar erforderlig förmåga af själfkritik och att han icke kan med erforderlig objektivitet bedöma hithörande förhållanden.

Einstein har upptäckt, att det icke finnes någon absolut rörelse. Han kan emellertid icke tillerkännas prioritet i det afseendet, ty den upptäckten var gjord före hans tid; han har icke fört den frågan ens ett tuppfjät framåt.

Minkowski kom ock på grund af nämnda matematiska otillbörlighet till det resultatet, att rymden är fyrdimensionell. Einstein antog visserligen, att det förhöll sig så, men var icke mera fast i sin ståndpunkt, än att han, anfört av en annan mening, enligt hvilken rymddimensionernas antal är — endast två! Han anser, att världen i geometriskt hanseende förhåller sig ungefär som den svag krusade vattenytan af en sjö. Befintligheten af de oändliga vidderna där ofvan fattar han icke. Han har kommit till det underbara resultatet, att kvadraten på ‘världsradien’ är = jordklotets volym, uttryckt i kbcm. [????] dividerad med materiens medeltäthet och en angiven i gram. Detta [????] är ju förbluffande, dels däruft[????]an att rymden anses vara en yta — en yta, som har en radie och förmodligen icke en medelpunkt, men icke; är blögsam nog att icke omtala hvad denna punkt är belägen — och dels däri, att en ytas storlek, uppges bestämd af kvoten av en v o l y m och en v i k t. Här ser man ett nytt [????] på relativitetsmatematik. Dettorde vara tillåtet fråga pur, kan en man, som besitter någon insikt i hithörande förhållanden, komma fram med något sådant, om hare har sitt förnuft i behåll? Det är f. ö. mer än lofligt naivist att vilja söka uttrycka världsrymdens utsträckning i centimeter, då afstånden i n o m densamma i åtskilliga fall lämpligen anges i ljusår eller t. o. m. i ännu större längdenhet.

Den hastighet, 300,000km. i sek., hvarmed ljuset utgår från en lysande kropp, anser Einstein, stödjande sig dels på H. A. Lorentz’ hypotes om maximivärdet för allt hvad hastigheter heter och dels på den s. k. Lorentztransformationen, vara den största i världsrymden föremöyande, men han beaktar icke, att den hastighet ljuset har relativt det belysta föremålet i vissa viktiga fall är ofantligt mycket större än den det har rel. ljuskällan. Stjärnljusets i initialhastighet rel. jorden t. ex., dess resulterande

Stjärnljusets bana rel. stjärnan är rätlinjig så länge den går genom ett medium af koncentriska lager, hvart och ett med konstant eller t. o. m. försvinnande täthet, men ljusbanan rel. jorden har samtidigt, vid konstant stjärnastånd från polaraxeln och bana vinkelrätt mot densamma, formen af en archimedes’ spiral, som är lindad hundrafals hvarf omkring jorden, i viss mån likt tråden i ett nystan och hastigheten i denna resulterande bana aftar dervid mer och mer, så att den vid ankomsten hit har sjunkit ned till det nämnda jämförelsevis obetydliga beloppet 300,000 km. i. sek. — Jämförelsevis obetydliga? frågar någon. Ja, allting är relativt. — Då strålen i sned riktning genomtränger ett medium af variabel täthet såsom solatmosfären, böjas de båda ljusbanorna och få hvar sin puckel.

Lorentztransformationen gäller rörelsen för elektroner i vacuumrör. Lorentz’ antagande, att deras hastigheter där icke kunna uppgå till mer än högst 300,000 km. i sek. och att de undergå en med hastigheten växande afplattning, så att dimensionen i rörelseriktningen närmar sig värdet noll, må gälla för dem, men det gäller ingalunda kroppars rörelse i allmänhet; det nyss anförda beträffande storleken af de i världsrymden förekommande långt större hastigheterna visar detta. Afplattningen, som för hvarje kropp skulle vid den nämnda hastigheten bli så stor, att kroppens volym blefve försvinnande, öfverensstämmer icke med verkligheten, den visar sig icke af himlakroppar, som ha en långt större hastighet rel. jorden än den nämnda. Och då de f. ö. liksom alla andra föremål ha oändligt många samtidiga verkliga hastigheter i olika riktningar, så skulle det af dem icke bli någonting kvar, men verkligheten upplyser oss om, att det icke förhåller sig så. Hypotesen, hvarpå den ifrågavarande såsom allmänt gällande antagna afplattningsteorien hvilar, är ohållbar, och med den faller Einsteins af en del okritiska beundrare nästan gränslöst lofprisade relativitetsteori. Einstein anser sig visserligen ha matematiskt bevisat lorentztransformationens allmängiltighet, men han har kommit med ett cirkelbevis, och det bevisar ingenting.

Einstein anser sig, afven nu med stöd af lorentztransformationen, ha visit,
att hvarje materiell kropp kropps kinetiska energi skulle bli oändlig, om dess hastighet närmade sig 300,000 km. i sek., men han uppgör icke, hvilken hastighet det är fråga om, och han har tydliga ingen aning om, att det för hvarje kropp vid hvarje tillfälle finns många hastigheter att välja på. Han dekreterar helt enkelt, att h v a r j e hastighet måste vara mindre än den nämnda, och skälet är helt enkelt det, af honom dock ej nämnda, att eljest håller hans teori icke streck, men det är tydliga icke ett giltigt skäl.

Hans ifriga utropare och förespråkare A. Pflüger ordar i sin skrift om relativitetsteorien välaltlig om bl. a den i materien magasinerade energien. Han berättar, att h v a r j e  k r o p p, som befinner sig i hvila i ett system — i hvila i ett system! . . . — äger en latent energi af:

\[ 23,000,000,000,000 \text{ v. e. pr kg}. \]

Detta belopp är ju visserligen icke oändligt stort men betydande nog ändå. Om det därvid är fråga om ett kg. afskräde på en sophög eller något annat, der är enligt den anförda förf. likgiltigt!! . . . resultatet skulle ju gälla hvarje kropp. Att våga tvifla härpå vore väl hädiskt, då han låter oss veta, att ett kg. prima stenkol, som förut ej utvecklade mer än [???] 7,000 v. e. vid fullständig förbränning, nu är tillräckligt för att drifva [???] atlanterångare om 50,000 khr. oafbrutet under en tid af tio år!! Frågan är emellertid den: hur skall denna energi frigöras? Ombudet i nobelkommittén kommer förmodligen att där lämna upplysning i detta afseende.

Pflüger ger anvisning på, huru relativitetsteorien skall tolkas. Det lönar sig mycket litet, säger han, att försöka komma till klarhet i saken genom logiskt tänkande, och däri har han rätt, ty att genom logiskt tänkande komma till insikt beträffande Einsteins fantasier, därtill finnes ingen utsikt. Pflüger varnar på det enträgnaste för sådana försök, men rekommenderar i stället användningen af den ofelbara tänkemaskinen matematiken, som, enligt hans uppgift, med en för bluffande snabbhet öfvervinner svårigheterna: den behöfver endast matas med problemen i form af ekvationer, och de bli lösta, försäkrar han. Exempel på i relativitetsteorien använd matematik äro ju lämnade i det föregående. Kommer sådan matematik till användning, ja, då går det väl med största lättthet att utreda spörsmålen!! . . .

Koordinataxlar, d. v. a. geometriska linjer, hvilka i saknad af hvarje spår af materia åro synliga, dem menar sig Einstein kunna se; h a n s e r d e m r i n g l a s i g s o m o r m a r n a på ett M e d u s a h u f v u d. Pflüger upplyser, att dessa linjer åro synliga, om de betraktas — på afstånd!! . . .

Rymden är enligt einsteinärnas uppfattning k r o k i g. Pflüger är uppriktig nog att erkänna, att den krokiga rymden icke kan uppfattas förnuftsnligt, den måste behandlas matematiskt, säger han. Räta linjer och plan finnas där icke. Användningen af dem är förmodligen för einsteinarna en övervunnen ståndpunkt.

Mycket kunde vara att tillägga såsom bidrag till belysningen af beskaffenheten af Einsteins relativitetsteori, men jag fruktar, att jag, genom att komma med mera än det anförda, skulle inkräkta alltför mycket på tidningens utrymme. Mina i Nya Dagligt Allehanda den 17 sistlidne aug.
intagna anmärkningar beträffande C. W. Oseens afhandling ‘O m k r i n g r e l a t i v i t e t s t e o r i e n’, tillsända denne förf. och af honom emottagna men ej besvarade, kunna ock i visa mån bidraga till den föreliggande frågans belysning, och jag hänvisar till desamma.

Denne Einstein-lofsångare, som förklarat, att man kan ersätta de vanliga naturlagarna med andra lagar efter behag, har visserlingen blivit ins att i vetenskapsakademiens nobelkommitté, men äfven om han där kan göra proselyser, så är det lyckligtvis så, att naturföreteelserna förlöpa på samma från all godtycklighet fria sätt nu som förr, obe roende af de nonsens relativisterna bjudit på.

Jag inskränker mig nu f. ö. att till det redan anförda påpeka ett faktum, som är belysande för ärligheten i Einsteins forskning. I The Minneapolis Journal för den 10 sisttidne sept. lämnar A. Reuterdahl ett meddelande, enligt hvilket P. Lenard har funnit, att E i n s t e i n s s å h ö g t b e p r i s a d e f o r m e l f ö r b e r ä k n i n g a f s t j är n l j u s e t s b ö j n i n g v i d g å n g e n f ö r b i s o l e n endast är ett pl a g i a t a f e n a f J. Soldner för mer än hundra år sedan för samma ändamål härledd formel. Nu har i N. D. A. prof. E. Gehrcke i Berlin vittnat om att formlerna äro identiska. En i Soldners formel förekommande numerisk felaktighet har äfven gått igen i kopian. En olikhet förefinnes emellertid: för beteckningarna äro, enligt hvad Reuterdahl uppgifver, andra bokstäfver använda af Einstein än de Soldner betjänade sig af. Fusket skulle alltså på sådant sätt döljas. En i sanning snygg historia!

Jag inskränker mig nu f. ö. att till det redan anförda påpeka ett faktum, som är belysande för ärligheten i Einsteins forskning. I The Minneapolis Journal för den 10 sisttidne sept. lämnar A. Reuterdahl ett meddelande, enligt hvilket P. Lenard har funnit, att E i n s t e i n s s å h ö g t b e p r i s a d e f o r m e l f ö r b e r ä k n i n g a f s t j är n l j u s e t s b ö j n i n g v i d g å n g e n f ö r b i s o l e n endast är ett pl a g i a t a f e n a f J. Soldner för mer än hundra år sedan för samma ändamål härledd formel. Nu har i N. D. A. prof. E. Gehrcke i Berlin vittnat om att formlerna äro identiska. En i Soldners formel förekommande numerisk felaktighet har äfven gått igen i kopian. En olikhet förefinnes emellertid: för beteckningarna äro, enligt hvad Reuterdahl uppgifver, andra bokstäfver använda af Einstein än de Soldner betjänade sig af. Fusket skulle alltså på sådant sätt döljas. En i sanning snygg historia!

Af det anförda synes mig med fog kunna dragas den slutsatsen, dels att Einstein icke är en vetenskapsman af rang och dels att han icke heller är en ärlig forskare samt att giltig anledning saknas att förorda homom till erhållande af nobelpriset.

Ännu en sak anser jag mig bör omnämna. Från ett håll, hvars trovärdighet jag icke har anledning betvifla, har jag erfari, att E i n s t e i n s f o r m e l f ö r b e r ä k n i n g a f M e r c u r i u s’ p e r i h e l f ö r f l y t t n i n g också den är ett pl a g i a t, nämligen af en af Gerber för detta ändamål härledd formel. Den af Oseen i Kosmos för i är högt lofprisade formel, som han kallat ‘D e n E i n s t e i n s k a l a g e n’, lär icke kunna helt tillerkännas Einstein. För den händelse denne nu föreslås som nobelpriskandidat, har vetenskapsakademien gifvetvis att låta med erforderlig sorgfullhet pröfva, huruvida påståendena, att han är en plagiar, kunna anses befogade eller icke.

Åmål den 20 okt. 1922.

O. E. Westin.
Professor.”

The Hamburger Fremdenblatt mentioned Westin’s article the next day on 23 October 1922, in an article entitled “Einstein Nobel-Preisträger?” It reported that Prof. Westin had stated that Einstein was a plagiarist, not a scientist of note, and not an honest researcher.

Nobel Prize judge Sven Hedin told Irving Wallace that Nobel Prize laureate
Philipp Lenard had informed the Nobel Prize judges that the theory of relativity,

“was not actually a discovery, had never been proved, and was valueless.”

The Hannover Kurier of 4 February 1923 in article entitled “Lenard gegen Einstein” confirms that Lenard sent such a letter to the Nobel Prize Committee. This article was followed by another in the Hannover Kurier, “Einstein und der Nobelpreis” on 5 May 1923, which mentioned Westin’s article in the Nya Dagligt Allehanda.

On 29 April 1922, Westin published an article in the Svenska Dagbladet calling attention to Reuterdahl’s work. The Norwegian Aftenposten interviewed Einstein and detailed Reuterdahl’s work on relativity theory, on 18 June 1920, while Einstein was in Oslo. Reuterdahl accused Einstein of plagiarizing Reuterdahl’s theory of a “space-time potential”, a copy of which theory was in the possession of Mittag-Leffler, who corresponded extensively with Einstein. Arvid Reuterdahl’s accusations also received attention in Sweden, his native land. The Stockholms-Tidningen featured Reuterdahl’s accusations against Einstein on 27 April 1922, and the Svenska Dagbladet lampooned Einstein in a cartoon on 30 April 1922. Nobel Prize laureate Philipp Lenard informed the broader scientific community that Einstein was a career plagiarist.

The judges could not have missed the public humiliation Einstein faced in the period from 1920 to 1922. They simply could not award Einstein the prize for the theory of relativity, but some of them were determined that Einstein would be given a prize whether he deserved one or not. Though the judges wanted to give Millikan the prize for the photo-electric effect, they fabricated an excuse to give Einstein a prize by awarding him a Nobel Prize to him, in part, for the law of the photo-electric effect. In 1923, the Committee then gave Millikan the Nobel Prize for the photo-electric effect in 1923, as they phrased it,

“For his work on the elementary charge of electricity and on the photoelectric effect”

The bogus award given to Einstein was outrageous. Arvid Reuterdahl wrote in early 1923,

“Recently the Nobel Foundation Directorate awarded the Nobel premium for distinguished achievement in physical science to Albert Einstein. Uninformed and uncritical opinion will, undoubtedly, concur with the directorate in this choice. Biased opinion, created by world-wide propaganda, will heartily agree with the directorate in its decision. In this instance, however, the directorate has deliberately conferred a unique distinction and set its seal of approval upon a man who has been definitely and publicly charged with plagiarism through the medium of the international press and in such scientific journals as still retain their freedom of expression.

It may be thought that the award to Einstein was based upon ignorance
of the actually involved facts and that the directorate may be exonerated on the plea of lack of information. It must be admitted, however, that in this case ignorance of facts should not and cannot be accepted as a defense of the award. The plea of ignorance cannot be allowed because of the all-important reason that the directorate’s attention had been definitely called both to the charges made against Einstein and also to the unbiased appraisal of his alleged achievements."

19.3 “The Thomson-Einstein Theory” Makes a Convenient Excuse

Robert Andrews Millikan argued that Einstein’s formulation of the law of the photo-electric effect was “untenable”. Millikan was himself awarded the Nobel Prize in 1923 for his work on the photo-electric effect. Whether or not Millikan achieved the results he claimed to have achieved is an open question. Millikan’s integrity has been questioned, and his “confirmation” of the law of the photoelectric effect is suspect.3665 This, however, is a separate question from Millikan’s well-founded on Albert Einstein’s work. Millikan was an outspoken critic of Einstein and opposed the hype surrounding the eclipse observations of 1919 and wrote in 1917 (Figures and tables have been omitted. One must bear in mind that the alleged confirmation of “Einstein’s equation” brought Millikan international fame.),

“Ill. EINSTEIN’S QUANTUM THEORY OF RADIATION

Yet the boldness and the difficulties of Thomson’s ‘ether-string’ theory did not deter Einstein [Footnote: Ann. d. Phys. (4), XVII (1905), 132; XX (1906), 199.] in 1905 from making it even more radical. In order to connect it up with some results to which Planck of Berlin had been led in studying the facts of black-body radiation, Einstein assumed that the energy emitted by any radiator not only kept together in bunches or quanta as it traveled through space, as Thomson had assumed it to do, but that a given source could emit and absorb radiant energy only in units which are all exactly equal to $\hbar \nu$, $\nu$ being the natural frequency of the emitter and $\hbar$ a constant which is the same for all emitters.

I shall not attempt to present the basis for such an assumption, for, as a matter of fact, it had almost none at the time. But whatever its basis, it enabled Einstein to predict at once that the energy of emission of corpuscles under the influence of light would be governed by the equation

$$\frac{1}{2}mv^2 = Ve = \hbar \nu - p \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots (41)$$

in which $\hbar \nu$ is the energy absorbed by the electron from the light wave or light quantum, for, according to the assumption it was the whole energy contained in that quantum, $p$ is the work necessary to get the electron out of
the metal, and $\frac{1}{2}mv^2$ is the energy with which it leaves the surface—an energy evidently measured by the product of its charge $e$ by the potential difference $\mathcal{V}$ against which it is just able to drive itself before being brought to rest.

At the time at which it was made this prediction was as bold as the hypothesis which suggested it, for at that time there were available no experiments whatever for determining anything about how the positive potential $\mathcal{V}$ necessary to apply to the illuminated electrode to stop the discharge of negative electrons from it under the influence of monochromatic light varied with the frequency $\nu$ of the light, or whether the quantity $h$ to which Planck had already assigned a numerical value appeared at all in connection with photo-electric discharge. We are confronted, however, by the astonishing situation that after ten years of work at the Ryerson Laboratory and elsewhere upon the discharge of electrons by light this equation of Einstein’s seems to us to predict accurately all of the facts which have been observed.

IV. THE TESTING OF EINSTEIN’S EQUATION

The method which has been adopted in the Ryerson Laboratory for testing the correctness of Einstein’s equation has involved the performance of so many operations upon the highly inflammable alkali metals in a vessel which was freed from the presence of all gases that it is not inappropriate to describe the present experimental arrangement as a machine-shop in vacuo. Fig. 27 shows a photograph of the apparatus, and Fig. 28 is a drawing of a section which should make the necessary operations intelligible.

One of the most vital assertions made in Einstein’s theory is that the kinetic energy with which monochromatic light ejects electrons from any metal is proportional to the frequency of the light, i.e., if violet light is of half the wave-length of red light, then the violet light should throw out the electron with twice the energy imparted to it by the red light. In order to test whether any such linear relation exists between the energy of the escaping electron and the light which throws it out it was necessary to use as wide a range of frequencies as possible. This made it necessary to use the alkali metals, sodium, potassium, and lithium, for electrons are thrown from the ordinary metals only by ultra-violet light, while the alkali metals respond in this way to any waves shorter than those of the red, that is, they respond throughout practically the whole visible spectrum as well as the ultra-violet spectrum. Cast cylinders of these metals were therefore placed on the wheel $W$ (Fig. 28) and fresh clean surfaces were obtained by cutting shavings from each metal in an excellent vacuum with the aid of the knife $K$, which was operated by an electromagnet $F$ outside the tube. After this the freshly cut surface was turned around by another electromagnet until it was opposite the point $O$ of Fig. 28 and a beam of monochromatic light from a spectrometer...
was let in through $O$ and allowed to fall on the new surface. The energy of the electrons ejected by it was measured by applying to the surface a positive potential just strong enough to prevent any of the discharged electrons from reaching the gauze cylinder opposite (shown in dotted lines) and thus communicating an observable negative charge to the quadrant electrometer which was attached to this gauze cylinder. For a complete test of the equation it was necessary also to measure the contact-electromotive force between the new surface and a test plate $S$. This was done by another electromagnetic device shown in Fig. 27, but for further details the original paper may be consulted. [Footnote: Phys. Rev., VII (1916), 362.] Suffice it here to say that Einstein’s equation demands a linear relation between the applied positive volts and the frequency of the light, and it also demands that the slope of this line should be exactly equal to $\frac{\hbar}{e}$. Hence from this slope, since $e$ is known, it should be possible to obtain $\hbar$. How perfect a linear relation is found may be seen from Fig. 29, which also shows that from the slope of this line $\hbar$ is found to be $6.26 \times 10^{-27}$, which is as close to the value obtained by Planck from the radiation laws as is to be expected from the accuracy with which the experiments in radiation can be made. The most reliable value of $\hbar$ obtained from a consideration of the whole of this work is

$$\hbar = 6.56 \times 10^{-27}.$$

In the original paper will be found other tests of the Einstein equation, but the net result of all this work is to confirm in a very complete way the equation which Einstein first set up on the basis of his semi-corpuscular theory of radiant energy. And if this equation is of general validity it must certainly be regarded as one of the most fundamental and far-reaching of the equations of physics, and one which is destined to play in the future a scarcely less important rôle than Maxwell’s equations have played in the past, for it must govern the transformation of all short-wave-length electromagnetic energy into heat energy.

V. OBJECTIONS TO AN ETHER-STRING THEORY

In spite of the credentials which have just been presented for Einstein’s equation, we are confronted with the extraordinary situation that the semi-corpuscular theory out of which Einstein got his equation seems to be wholly untenable and has in fact been pretty generally abandoned, though Sir J. J. Thomson [Footnote: Proc. Phys. Soc. of London, XXVII (December 15, 1914), 105.] and a few others [Footnote: Modern Electrical Theory, Cambridge, University Press, 1913, p. 248.] seem still to adhere to some form of ether-string theory, that is, to some form of theory in which the energy remains localized in space instead of spreading over the entire wave
Two very potent objections, however, may be urged against all forms of ether-string theory, of which Einstein’s is a particular modification. The first is that no one has ever yet been able to show that such a theory can predict any one of the facts of interference. The second is that there is direct positive evidence against the view that the ether possesses a fibrous structure. For if a static electrical field has a fibrous structure, as postulated by any form of ether-string theory, ‘each unit of positive electricity being the origin and each unit of negative electricity the termination of a Faraday tube,’ [Footnote: J. J. Thomson, Electricity and Matter, p. 9.] then the force acting on one single electron between the plates of an air condenser cannot possibly vary continuously with the potential difference between the plates. Now in the oil-drop experiments [Footnote: Phys. Rev., II (1913), 109.] we actually study the behavior in such an electric field of one single, isolated electron and we find, over the widest limits, exact proportionality between the field strength and the force acting on the electron as measured by the velocity with which the oil drop to which it is attached is dragged through the air.

When we maintain the field constant and vary the charge on the drop, the granular structure of electricity is proved by the discontinuous changes in the velocity, but when we maintain the charge constant and vary the field the lack of discontinuous change in the velocity disproves the contention of a fibrous structure in the field, unless the assumption be made that there are an enormous number of ether strings ending in one electron. Such an assumption takes all the virtue out of an ether-string theory.

Despite then the apparently complete success of the Einstein equation, the physical theory of which it was designed to be the symbolic expression is found so untenable that Einstein himself, I believe, no longer holds to it, and we are in the position of having built a very perfect structure and then knocked out entirely the underpinning without causing the building to fall. It stands complete and apparently well tested, but without any visible means of support. These supports must obviously exist, and the most fascinating problem of modern physics is to find them. Experiment has outrun theory, or, better, guided by erroneous theory, it has discovered relationships which seem to be of the greatest interest and importance, but the reasons for them are as yet not at all understood.

VI. ATTEMPTS TOWARD A SOLUTION

It is possible, however, to go a certain distance toward a solution and to indicate some conditions which must be satisfied by the solution when it is found. For the energy $\hbar \nu$ with which the electron is found by experiment to escape from the atom must have come either from the energy stored up inside of the atom or else from the light. There is no third possibility. Now the fact that the energy of emission is the same, whether the body from which it is emitted is held within an inch of the source, where the light is very intense,
or a mile away, where it is very weak, would seem to indicate that the light simply pulls a trigger in the atom which itself furnishes all the energy with which the electron escapes, as was originally suggested by Lenard in 1902, [Footnote: Ann. d. Phys. (4), VIII (1902), 149.] or else, if the light furnishes the energy, that light itself must consist of bundles of energy which keep together as they travel through space, as suggested in the Thomson-Einstein theory.

Yet the fact that the energy of emission is directly proportional to the frequency $\nu$ of the incident light spoils Lenard’s form of trigger theory, since, if the atom furnishes the energy, it ought to make no difference what kind of a wave-length pulls the trigger, while it ought to make a difference what kind of a gun, that is, what kind of an atom, is shot off. But both of these expectations are the exact opposite of the observed facts. The energy of the escaping corpuscle must come then, in some way or other, from the incident light.

When, however, we attempt to compute on the basis of a spreading-wave theory how much energy a corpuscle can receive from a given source of light, we find it difficult to find anything more than a very minute fraction of the amount which the corpuscle actually acquires.

Thus, the total luminous energy falling per second from a standard candle on a square centimeter at a distance of 3 m. is 1 erg. [Footnote: Drude, Lehrbuch der Optik, 1906, p. 472.] Hence the amount falling per second on a body of the size of an atom, i.e., of cross-section $10^{-15}$ cm., is $10^{-15}$ ergs, but the energy $h\nu$ with which a corpuscle is ejected by light of wave-length $500 \mu \mu$ (millionths millimeter) is $4 \times 10^{-12}$ ergs, or 4,000 times as much. Since not a third of the incident energy is in wave-lengths shorter than $500 \mu \mu$, a surface of sodium or lithium which is sensitive up to $500 \mu \mu$ should require, even if all this energy were in one wave-length, which it is not, at least 12,000 seconds or 4 hours of illumination by a candle 3 m. away before any of its atoms could have received, all told, enough energy to discharge a corpuscle. Yet the corpuscle is observed to shoot out the instant the light is turned on. It is true that Lord Rayleigh has recently shown [Footnote: Phil. Mag. XXXII (1916), 188.] that an atom may conceivably absorb wave-energy from a region of the order of magnitude of the square of a wave-length of the incident light rather than of the order of its own cross-section. This in no way weakens, however, the cogency of the type of argument just presented, for it is only necessary to apply the same sort of analysis to the case of $\gamma$-rays, the wave-length of which is of the order of magnitude of an atomic diameter ($10^{-8}$ cm.), and the difficulty is found still more pronounced. Thus Rutherford [Footnote: Radioactive Substances and the Radiations, p. 288.] estimates that the total $\gamma$-ray energy radiated per second by one gram of radium cannot possibly be more than $4.7 \times 10^4$ ergs. Hence at a distance of 100 meters, where the $\gamma$-rays from a gram of radium would
be easily detectable, the total $\gamma$-ray energy falling per second on a square millimeter of surface, the area of which is ten-thousand billion times greater than that either of an atom or of a disk whose radius is a wave-length, would be $4\pi \times 10^{10} = 4 \times 10^{-7}$ ergs. This is very close to the energy with which $\beta$-rays are actually observed to be ejected by these $\gamma$-rays, the velocity of ejection being about nine-tenths that of light. Although, then, it should take ten thousand billion seconds for the atom to gather in this much energy from the $\gamma$-rays, on the basis of classical theory, the $\beta$-ray is observed to be ejected with this energy as soon as the radium is put in place. This shows that if we are going to abandon the Thomson-Einstein hypothesis of localized energy, which is of course competent to satisfy these energy relations, there is no alternative but to assume that at some previous time the corpuscle had absorbed and stored up from light of this or other wave-length enough energy so that it needed but a minute addition at the time of the experiment to be able to be ejected from the atom with the energy $\hbar \nu$.

Now the corpuscle which is thus ejected by the light cannot possibly be one of the free corpuscles of the metal, for such a corpuscle, when set in motion within a metal, constitutes an electric current, and we know that such a current at once dissipates its energy into heat. In other words, a free corpuscle can have no mechanism for storing up energy and then jerking itself up ‘by its boot straps’ until it has the huge speed of emission observed.

The ejected corpuscle must then have come from the inside of the atom, in which case it is necessary to assume, if the Thomson-Einstein theory is rejected, that within the atom there exists some mechanism which will permit a corpuscle continually to absorb and load itself up with energy of a given frequency until a value at least as large as $\hbar \nu$ is reached. What sort of a mechanism this is we have at present no idea. Further, if the absorption is due to resonance—and we have as yet no other way in which to conceive it—it is difficult to see how there can be, in the atoms of a solid body, corpuscles having all kinds of natural frequencies so that some are always found to absorb and ultimately be ejected by impressed light of any particular frequency. But apart from these difficulties, the thing itself is impossible if these absorbing corpuscles, when not exposed to radiation, are emitting any energy at all; for if they did so, they would in time lose all their store and we should be able, by keeping bodies in the dark, to put them into a condition in which they should show no emission of corpuscles whatever until after hours or years of illumination with a given wave-length. Since this is contrary to experiment, we are forced, even when we discard the Thomson-Einstein theory of localized energy, to postulate electronic absorbers which, during the process of absorbing, do not radiate at all until the absorbed energy has reached a certain critical value when explosive emission occurs.

However, then, we may interpret the phenomenon of the emission of corpuscles under the influence of ether waves, whether upon the basis of the Thomson-Einstein assumption of bundles of localized energy traveling
through the ether, or upon the basis of a peculiar property of the inside of an atom which enables it to absorb continuously incident energy and emit only explosively, the observed characteristics of the effect seem to furnish proof that the emission of energy by an atom is a discontinuous or explosive process. This was the fundamental assumption of Planck’s so-called quantum theory of radiation. The Thomson-Einstein theory makes both the absorption and the emission sudden or explosive, while the loading theory first suggested by Planck, though from another view-point, makes the absorption continuous and only the emission explosive.

The \( \hbar \) determined above with not more than one-half of 1 per cent of uncertainty is the explosive constant, i.e., it is the unchanging ratio between the energy of emission and the frequency of the incident light. It is a constant the existence of which was first discovered by Planck by an analysis of the facts of black-body radiation, though the physical assumptions underlying Planck’s analysis do not seem to be longer tenable. For the American physicists Duane and Hunt [Footnote: Phys. Rev., VI (1915), 166.] and Hull [Ibid., VII (1916), 157.] have recently shown that the same quantity \( \hbar \) appears in connection with the impact of corpuscles against any kind of a target, the observation here being that the highest frequency in the general or white-light X-radiation emitted when corpuscles impinge upon a target is found by dividing the kinetic energy of the impinging corpuscle by \( \hbar \). Since black-body radiation is presumably due to the impact of the free corpuscles within a metal upon the atoms, it is probable that the appearance of \( \hbar \) in black-body radiation and in general X-radiation is due to the same cause, so that, contrary to Planck’s assumption, there need not be, in either of these cases, any coincidence between natural and impressed periods at all. The \( \hbar \) which here appears is not a characteristic of the atom, but merely a property of the ether pulse which is generated by the stopping of a moving electron. Why this ether pulse should be resolvable into a continuous, or white-light spectrum which, however, has the peculiar property of being chopped off sharply at a particular limiting frequency given by \( \hbar \nu = PD \times e \) is thus far a complete mystery. All that we can say is that experiment seems to demand a sufficient modification of the ether-pulse theory of white-light and of general X-radiation to take this experimental fact into account.

On the other hand, the appearance of \( \hbar \) in connection with the absorption and emission of monochromatic light (photo-electric effect and Bohr atom) seems to demand some hitherto unknown type of absorbing and emitting mechanism within the atom. This demand is strikingly emphasized by the remarkable absorbing property of matter for X-rays, discovered by Barkla [Footnote: Phil. Mag., XVII (1909), 749.] and beautifully exhibited in De Brogue’s photographs opposite p. 197. It will be seen from these photographs that the atoms of each particular substance transmit the general X-radiation up to a certain critical frequency and then absorbs all radiations of higher frequency than this critical value. The extraordinary significance of this
Albert Einstein’s Nobel Prize 2401

discovery lies in the fact that it indicates that there is a type of absorption which is not due either to resonance or to free electrons. But these are the only types of absorption which are recognized in the structure of modern optics. We have as yet no way of conceiving of this new type of absorption in terms of a mechanical model.

There is one result, however, which seems to be definitely established by all of this experimental work. Whether the radiation is produced by the stopping of a free electron, as in Duane and Hunt’s experiments, and presumably also in black-body experiments, or by the absorption and re-emission of energy by bound electrons, as in photo-electric and spectroscopic work, Planck’s \( h \) seems to be always tied up in some way with the emission and absorption of energy by the electron. \( h \) may therefore be considered as one of the properties of the electron.

The new facts in the field of radiation which have been discovered through the study of the properties of the electron seem, then, to require in any case a very fundamental revision or extension of classical theories of absorption and emission of radiant energy. The Thomson-Einstein theory throws the whole burden of accounting for the new facts upon the unknown nature of the ether and makes radical assumptions about its structure. The loading theory leaves the ether as it was and puts the burden of an explanation upon the unknown conditions and laws which exist inside the atom, and have to do with the nature of the electron. I have already given reasons for discrediting the first type of theory. The second type, though as yet very incomplete, seems to me to be the only possible one, and it has already met with some notable successes, as in the case of the Bohr atom. Yet the theory is at present woefully incomplete and hazy. About all that we can say now is that we seem to be driven by newly discovered relations in the field of radiation either to the Thomson-Einstein semi-corpuscular theory, or else to a theory which is equally subversive of the established order of things in physics. For either one of these alternatives brings us to a very revolutionary quantum theory of radiation. To be living in a period which faces such a complete reconstruction of our notions as to the way in which ether waves are absorbed and emitted by matter is an inspiring prospect. The atomic and electronic worlds have revealed themselves with beautiful definiteness and wonderful consistency to the eye of the modern physicist, but their relation to the world of ether waves is still to him a profound mystery for which the coming generation has the incomparable opportunity of finding a solution.

In conclusion there is given a summary of the most important physical constants the values of which it has become possible to fix, [Footnote: See Proc. Nat. Acad. Sci., III (1917), 236; also Phil. Mag., July, 1917.] within about the limits indicated, through the isolation and measurement of the electron.”

Arvid Reuterdahl noted that Millikan changed his stance in an international radio
broadcast in 1924, after Millikan had won the Nobel Prize. Reuterdahl also noted that Millikan did not reveal what had occurred in the interim that rendered Einstein’s previously untenable theory, tenable. Reuterdahl pointed out that the Nobel Committee irrationally used Millikan’s original declaration as if it were a justification for the reward of an “untenable” Thomson-Einstein theory, instead of excluding Einstein from consideration, as would have been appropriate.

Millikan stated in 1949,

“Their third 1905 paper reveals more strikingly than either of the foregoing his boldness in breaking with tradition and setting up a photoelectric stopping potential \( P \cdot D \cdot e = \frac{1}{2} m v^2 = h \nu - \mathbf{p} \) which at the time seemed completely unreasonable because it apparently ignored and indeed seemed to contradict all the manifold facts of interference and thus to be a straight return to the corpuscular theory of light which had been completely abandoned since the times of Young and Fresnel around 1800 A.D. [***]

These contradictions have now partially disappeared, however, through the development of the so-called ‘wave mechanics’ by the work of Louis De Broglie, Schroedinger, Heisenberg, and Dirac.”

It appears that Einstein’s Nobel Prize was the product not of merit, but of politics and of the Einstein mania which followed the eclipse observations of 1919 that had made Einstein an international celebrity. They insisted on giving Einstein a prize not because of his alleged achievements, but because it would increase the prestige of the Committee and further the cause of rapprochement among the post-war nations, as well as promote Einstein’s friends, like Max Planck, as well as promote Einstein’s political cause of Zionism.

Carl Wilhelm Oseen joined the Nobel Committee in 1922 in order to see to it that Albert Einstein was awarded a prize. Oseen was a corrupting influence on the Nobel Prize Committee. He attempted to base the prizes on political considerations, personal friendships and other corrupt motivations. He ridiculously parsed words and sophistically contradicted himself, while applying double standards to award the prizes to those who did not deserve them, or withhold them from those who did. Given that it was impossible to award Einstein the prize for his plagiarism of the theory of relativity, Oseen manufactured the excuse of giving Einstein the Nobel Prize for the law of the photo-electric effect. However, the prize for the photo-electric was rightfully owed to Millikan, the experimentalist—as opposed to theorist, because the express purpose of the prize was to reward physical discoveries, not theories; and it was Millikan, not Einstein, who had allegedly made the physical discovery. In addition, it was well-known that the Einsteins’ contribution to the ultimate form of the law was not revolutionary but evolutionary, and their derivation was flawed and based upon an “untenable” theory—as Millikan had stated.

19.4 The Origins of the Law of the Photo-Electric Effect
Even if the Einsteins’ work on the photo-electric effect had met the requirements for the awarding of a prize, it did not merit a Noble Prize. It was for the most part unoriginal. All of the foundational work had been accomplished by others, and the Einsteins forced their derivations in order to achieve a known result.

Albert Einstein’s Nobel Prize 2405

<http://fisicavolta.unipv.it/percorsi/pdf/napesi.pdf>

**19.5 Einstein’s Nobel Prize was Undeserved**

Why did the Nobel Committee not award Einstein the Nobel Prize for his work on relativity theory? All who were familiar with the facts knew that Einstein did not originate the major concepts behind relativity theory. Political motives, and not merit, were the impetus behind Einstein’s award. Max Planck, who had selfish interests in the award, placed heavy pressure on the Committee to award Einstein the prize.

Some ten years prior, Wilhelm Wien had recommended that the Nobel Prize for Physics be given to both Hendrik Antoon Lorentz and Albert Einstein in 1912, on the grounds that,
“While Lorentz must be considered as the first to have found the mathematical content of the relativity principle, Einstein succeeded in reducing it to a simple principle. One should therefore assess the merits of both investigators as being comparable.”

However, Einstein’s half of the relativity pie by all rights belonged to Poincaré, who died in 1912. It would have been in exceedingly bad taste to have exploited Poincaré’s death in order to award the Nobel Prize to Einstein; and Boscovich, Voigt, FitzGerald and Larmor held rights to Lorentz’ share. Wien knew Poincaré’s work well, and, thus, knew that Einstein had done little other than copy Poincaré’s principle of relativity. Wien’s recommendation of Lorentz and Einstein for the special theory of relativity could not be seriously considered. Too many knew that Poincaré stated the principle of relativity long before Einstein, and many others had published the theory’s fundamental mathematical formalisms long before Einstein or Lorentz.

Since Einstein was ineligible for a Nobel Prize for the theory of relativity on account of his well-known plagiarism of the theory, and since influential persons compelled the Committee to award him a prize, Carl Wilhelm Oseen nominated Einstein for a prize for the photo-electric effect. This also presented the Committee with several dilemmas, and one notes that the photo-electric effect was merely mentioned as an aside, an aside to the otherwise completely nebulous statement that the award was made “for his services to Theoretical Physics”.

Einstein’s equations were not sufficient to merit a prize, in that the prizes were intended only for inventions and experimental discoveries, and the formal mathematical expression of a law was not appropriate grounds for a prize. Einstein had also had many predecessors who had worked out the formalisms before him, and Millikan had stated that the theory behind Einstein’s equations was “untenable”. Theoretical work was also not a valid basis for the awarding of a prize. In addition, the Nobel Committee sought to award Millikan the prize for his experimental work on the photo-electric effect, which was the appropriate award. Ultimately, Nobel Prizes were awarded to both Einstein (1921), “for his services to Theoretical Physics, and especially for his discovery of the law of the photoelectric effect”; and Millikan (1923), “for his work on the elementary charge of electricity and on the photoelectric effect”.

The question naturally arises, did the Einsteins’ work on the photo-electric effect merit an award of the magnitude of a Nobel Prize? And should any such award have been awarded exclusively to the Einsteins’; or, instead, to a group of physicists, including the Einsteins, who developed the theory over the course of many years?

Professor Friedwardt Winterberg, theoretical physicist at the University of Nevada, Reno, argues in a private communication that Planck, not Einstein, was the founder of quantum mechanics—contrary to the opinions of Kragh, Kuhn and Hermann. Prof. Winterberg, who has permitted me to reproduce some of his arguments here, calls attention to the fact that one of the fundamental elements of quantum theory is the assertion that there is a smallest action. Neither Planck (1900), nor Einstein (1905), had yet incorporated this fundamental property of quantum
mechanics into their work. According to Prof. Winterberg, the principle of a smallest action first appeared in quantum theory in Planck’s,

“1911 paper, where he replaced,

\[ \varepsilon_n = n\hbar\nu, \quad n = 1, 2, \ldots \]

for the discrete energy steps of a harmonic oscillator, with,

\[ \varepsilon_n = \left( n + \frac{1}{2} \right) \hbar\nu \]

with the zero point energy \( \varepsilon_0 = \left( \frac{1}{2} \right) \hbar\nu \) for \( n = 0 \), which was later shown to be a consequence of Heisenberg’s uncertainty principle.”

The postulation of discrete energy levels leads to the conclusion that light must be emitted, or absorbed, through a discrete change in the energy of the oscillator,

“for example, from \( n + 1 \) to \( n \) with \( \Delta\varepsilon = \hbar\nu \) the energy of the emitted radiation.”

Prof. Winterberg concludes,

“Planck’s black body radiation formula is the interpolation between wave-like (Rayleigh-Jeans) and particle-like (Wien) behavior for the long-wave and short-wave limit and thus a direct expression of the wave-particle duality of quantum mechanics. Wien, in arriving at his 1896 radiation law, was guided by the similarity of the high frequency tail of the black body radiation with the Maxwell-Boltzmann distribution of a gas, and Wien found that the energy of the corresponding particles would have to be proportional to \( \nu \), in different notation, equal to \( \hbar\nu \). Therefore, a case can be made that the photon concept should be shared by Wien and Planck, with Einstein having made the connection between the two.”

Prof. Winterberg raises three points, which justify his contentions:

“1. We begin with Wien’s displacement law of black body radiation for the distribution of the energy \( u(\nu) \) over the frequency \( \nu \),

\[ u(\nu) = \nu^2 f \left( \frac{\nu}{T} \right), \quad (1) \]
where \( T \) is the absolute temperature and \( f \) a universal function which is yet to be determined. Equation (1) is an exact statement for black body radiation.

2. Experimentally, it was found that for large frequencies,

\[
U \sim \nu^3 e^{-\frac{\hbar \nu}{kT}},
\]

where \( \hbar \) is a constant, which is today called ‘Planck’s constant’.

3. Wien then compares (2) with the Maxwell-Boltzmann distribution for the kinetic energy of gas molecules, setting,

\[
U \sim \nu^2 e^{-\frac{\varepsilon}{kT}} d\nu
\]

\[
\sim \varepsilon e^{-\frac{\varepsilon}{kT}} d\nu
\]

where \( \nu \) is the velocity and \( \varepsilon \) the kinetic energy of the gas molecules. He then conjectures that the molecules emit a radiation of the intensity \( j = j(\varepsilon) \) and a frequency \( \nu = \nu(\varepsilon) \), whereby, one has,

\[
U \sim j(\nu)\varepsilon(\nu) \frac{d\nu(\nu)}{d\nu} e^{-\frac{\varepsilon(\nu)}{kT}} d\nu.
\]

However, this is compatible with (1) if, and only if,

\[
U \sim \nu^3 e^{-\frac{\hbar \nu}{kT}}
\]

\[
\varepsilon = \hbar \nu.
\]

Therefore, the radiation behaves like the energy from a gas with the molecules having the energy \( \hbar \nu \), as in Einstein’s theory.”

**19.6 Einstein Breaks the Rules**

In late 1922, the Nobel Prize Committee awarded Albert Einstein the Nobel Prize for 1921. The award was mired in controversy. Einstein’s Nobel Prize was not awarded for the theory of relativity, because everyone involved knew that Einstein had plagiarized the theory. Einstein, the nature of his prize, and the method by which his prize was awarded, broke many of the rules the Nobel Committee was duty bound to uphold.

Einstein was touring the globe when his award was announced. Confusion arose from Einstein’s self-declared status as a citizen of the world. The Nobel Committee
asked the German ambassador to accept the prize on Einstein’s behalf. The Committee determined that Einstein was both a Swiss and a German citizen, and the German Ambassador made mention of Switzerland when accepting the prize for Einstein, who was traveling abroad. Einstein maintained that he was a Swiss citizen and not a German citizen.

The Committee violated the rules by awarding Einstein a prize for a non-discovery. Alfred Nobel did not create a Nobel Prize for Mathematics and was not interested in theoretical work, but instead intended his prizes to be given out for inventions and experimental discoveries that benefitted humanity. Nobel did this to deliberately encourage the development of inventions and experimental discoveries.

Einstein violated the rules by giving an acceptance speech on the theory of relativity, instead of the photo-electric effect; which unwarranted speech gave the public the false and misleading impression that Einstein had won the Nobel Prize for the theory of relativity. Einstein had not won a Nobel Prize for the theory of relativity, though his speech made it appear to the world that he had. The award specifically stated that it was awarded, “irrespective of such value which, after eventual substantiation, may be assigned to his relativity and gravitational theories”. Einstein also broke the rules by giving his speech in Göteborg. The Constitution of the Nobel Directorate required that Einstein must give a lecture in Stockholm on the subject for which the award was made. He never did.

Arvid Reuterdahl protested in The Dearborn Independent on 6 January 1923,

“Recently the Nobel Foundation Directorate awarded the Nobel premium for distinguished achievement in physical science to Albert Einstein. Uninformed and uncritical opinion will, undoubtedly, concur with the directorate in this choice. Biased opinion, created by world-wide propaganda, will heartily agree with the directorate in its decision. In this instance, however, the directorate has deliberately conferred a unique distinction and set its seal of approval upon a man who has been definitely and publicly charged with plagiarism through the medium of the international press and in such scientific journals as still retain their freedom of expression.

It may be thought that the award to Einstein was based upon ignorance of the actually involved facts and that the directorate may be exonerated on the plea of lack of information. It must be admitted, however, that in this case ignorance of facts should not and cannot be accepted as a defense of the award. The plea of ignorance cannot be allowed because of the all-important reason that the directorate’s attention had been definitely called [by Prof. O. E. Westin] both to the charges made against Einstein and also to the unbiased appraisal of his alleged achievements.

[***]

Was Einstein brought before this tribunal to defend himself against these charges of plagiarism? We understand that he was far away from Sweden at the time the award was made. Has Einstein ever flatly denied the charges made against him and has he ever tried to show that they are not true? If he had, the world would have known it by every means under the control of his
It would seem the same sinister influence which forced Einsteinism upon the world has controlled the decision of the Nobel directorate in its recent award. In view of the timely warning of the fearless and honest savant, Professor O. E. Westin, it is difficult to find any justification for the directorate in bestowing the Nobel premium in physics upon Albert Einstein."

Peter A. Bucky stated that Einstein later showed no interest in his Nobel Prize, which his wife kept in cabinet.\textsuperscript{3676}

\section*{19.7 Conclusion}

Personality cults are common in the history of Physics. This hero worship has a deleterious effect on the progress of science. Galileo Galilei nearly lost his life for opposing the many myths of the beloved Aristotle, who was considered a divine philosopher by the Church. Had the Church succeeded in its promotion of Aristotle and its suppression of the truth, teachers would to this day be teaching students that the Earth did not orbit the Sun. John Toland complained in 1704 that the cult of personality which had grown up around Spinoza’s dogma was as destructive to rational thought, as it was distasteful to free-thinking philosophers.\textsuperscript{3677} Eugen Karl Dühring registered the same complaint and attributed it to shameless ethnically-biased advertising and was himself ethnically-biased.\textsuperscript{3678} Spinoza plagiarized his philosophy from better minds such as David of Dinant,\textsuperscript{3679} Amalric of Chartres and the Amalricians, John Scotus Eriugena, “Alexander a disciple of Xenophanes”, Archdeacon Gundisalvi of Segovia, Avicebron, Giordano Bruno and René Des Cartes. George Berkeley (followed by Colin Maclaurin, and the less religiously inclined T. H. Pasley, Ernst Mach, and many others) opposed the myths of Sir Isaac Newton, and fought hard to free Physics from the authority of Newton’s Cabalistic religious beliefs, which had inspired a fervent following, which group of tacit pantheists attributed physical phenomena to the active governance of God and declared all contrary beliefs to be heresy, thereby forbidding the search for the causal mechanism behind gravitation. Hermann Boltzmann predicted in 1904 that the authority of Newton and others would someday fall, but that it had ruined his attempts to interject more science into Physics. Boltzmann then took his own life. Newton, in order to achieve his cult status, had to overcome the fame of Des Cartes, who is today, outside of France, known almost exclusively for his Mathematics and Philosophy, not his Physics, though at the time, he was world-renowned for his Physics.

One hero gives way to another, often based upon arguments which have little or nothing to do with science. The success of a theory sometimes depends more upon its widespread publication and promotion in several languages, particularly in the \textit{Lingua Franca} of the day, than it does upon the merits of the theory. Voltaire played no small role in the promotion of Newton by bringing him to France and ridiculing Des Cartes, who was then the leading authority in Physics. Voltaire also lampooned
Newton’s staunchest critic, Leibnitz.

Knowing this history, and knowing how to manufacture and destroy heroes in science, and knowing how to hide the achievements of their predecessors, Albert Einstein, Max Planck, Max Born, Erwin Freundlich, Arnold Sommerfeld, Max von Laue, Alexander Moszkowski, and others, deliberately set out to create a “star cult” around Albert Einstein and the “theory of relativity”. We know this from their words and from their deeds. Moszkowski, for example, wrote to Einstein that he had made it his life’s goal to promote Einstein, and was good to his word in his book *Einstein: The Searcher* of 1921, which presented Einstein as an arrogant demi-god with the full right to pass judgement on all things and the just power to censor out opposition, as a matter of course, while denying that he was doing so. Freundlich and Born gave credence to the myths of Moszkowski, and they each profited financially from the Einstein name.

Einstein and Moszkowski discussed the “Valhalla” of great thinkers, and who it was that St. Einstein, like St. Peter before him, would allow into the hall, and who it was that he would exclude. Moszkowski coolly calculated that eclipse observations of starlight could be used in comic book fashion to hype Einstein as a super-human hero, who had deduced God’s secrets through pure thought. Even as early as 1916, Moszkowski uttered the prophecy that Einstein would someday be referred to as Abertus Maximus, and called him the Galileo of the Twentieth Century—a “prophecy” Moszkowski, himself, set out to fulfill. Moszkowski kicked off his campaign to make Einstein a superstar with an article in the *Berliner Tageblatt* on 8 October 1919, “Die Sonne bracht’ es an den Tag!” and set the stage for all the shameless promotion of Einstein that soon followed. Just as Theodor Herzl took his racist plans from Dühring, Einstein’s promoters, who sought to make pro-Zionist propaganda with Einstein, took taken their promotional plans from Dühring, who believed that ethnic bias led to the shameless promotion of Lessing. Dühring wrote in 1881,

> “One needs only to consider the advertisements with which the Jews seek at present, at any cost, to raise their Lessing up to a god after they have for a century raised his fame ten times more than what he is worth with all the arts of false praise. The business which the Jewish press and Jewish literature have always systematically made out of bringing a powerful overvaluation of Lessing into the public has recently been carried out indeed to the point of disgust. The Jewish newspaper writers have raised the author of that flat Jewish piece which is entitled *Nathan der Weise* over the greatest authors and poets and declared him to be, for example, the greatest German, to say something against whom would be a *lèse Majésté*."

Indeed, such talk may have caused Paul Ehrenfest doubts. He wrote to Einstein,

> “I just read a few novellas by Zangwill (Tauchnitz Edition). Artistically worthless ghetto scenes. Where is the literature concerning Jews that, if only on a reduced scale, does to some extent what Dostoyevsky has done for
Russians, or at least Tolstoy, or Turgenev, or Gorky or at the very least Herzen? 

The weariness of the world after the dreariness of World War I made fertile ground for the publicity stunts used to promote Einstein as the new Newton—the new heroic cult figure of science. As Arvid Reuterdal aptly phrased it, Einstein was the P. T. Barnum of the scientific world and basked in the circus limelight he focused narrowly on himself—Valhalla ultimately only had room for one. Never before had a hero in the world of science been so quickly and cleverly manufactured from plagiarism, false data and sophistry, and never before had intellectual opposition to the absurd been so effectively suppressed by race-baiting and brow-beating, as was done by Einstein and his cronies, deliberately and in the knowledge of the historical forces at play and how they might be manipulated to fit the purpose.

Accounts from Einstein’s contemporaries disclose that many were aware that Einstein was not the genius he was made out to be, and that his world-wide fame resulted from media hype, not merit. Gertrude Besse King wrote in the early 1920’s of the immoderate promotion of Einstein in the popular press in America and of the untruths that Einstein’s promoters told the public. Felix Klein also wrote of the awful hype wasted on Einstein, and how it failed to capture his true persona, which was in reality that of a silly child—and many who had met him described Einstein as childlike.

Ernst Gehrcke and Paul Weyland gave public lectures in the 1920’s informing the world that Einstein was a fraud and a plagiarist, and that his ill begotten fame was the product of a marketing campaign based on public ignorance of the facts—a mass-suggestion to accept the absurd, because it was unintelligible, and therefore somehow worthy of worship. While privately agreeing with these accusations, Einstein largely hid from them in public. Einstein sometimes quietly conceded that he was overrated as a physicist, and the cult of personality surrounding him was unjustified. The press claimed that Einstein was the greatest and most original thinker the world had ever seen. However, Albert Einstein wrote to Hendrik Antoon Lorentz on 19 January 1920,

“Nevertheless, unlike you, nature has not bestowed me with the ability to deliver lectures and dispense original ideas virtually effortlessly as meets your refined and versatile mind. [***] This awareness of my limitations pervades me all the more keenly in recent times since I see that my faculties are being quite particularly overrated after a few consequences of the general theory stood the test.”

Oskar Edvard Westin, of Stockholm, published important newspaper articles informing the Nobel Prize Committee of Einstein’s plagiarism, and thereby prevented him from receiving the Nobel Prize for the theory of relativity. In the 1920’s and 1930’s, Arvid Reuterdal, Charles Lane Poor and Thomas Jefferson Jackson See informed the American public that Einstein was a sophist, a plagiarist and a self-promoter. It is amazing that during his lifetime, Einstein’s fame was...
always attended by widespread accusations among leading authorities that he was a plagiarist, a sophist and a con man, yet few today know this important history.

Einstein has become a cartoon hero, which is reflective of the increasingly anti-intellectual trends of the Twentieth Century—trends sponsored by the same people who sponsored Einstein. Awestruck and fawning students are attracted to a comic book type of Physics, where they expect to learn the divine truths of the fuzzy-haired messiah and are indoctrinated to refuse to respect disagreements. Our brightest and best, those who have the ability to think independently, creatively and skeptically, those who would most likely succeed as our innovators and discoverers, suffer under a religious horde, who have fallen for the myth, and will do everything in their power to perpetuate it. The rich history of Physics is being stolen from us as the lineage is broken off in the popular press, and now in the text books, at St. Einstein, who is simplistically portrayed as our comic book hero—a legend and approach to science and history that does not appeal to sophisticated and creative minds.

Einstein’s papers were not only not original, they are not the best work on the subjects he addressed. Our rich legacy is stolen from us and the insights and expositions of Poincaré, Hilbert, Riemann, Mach, Berkeley, Locke, Hume, Parmenides, Fechner, etc., which are vastly superior to anything Einstein ever produced, are less likely to be read and cited. The long and involved history, which has led to the many difficulties facing modern Physics, has lost its context, making it more difficult for us to discover where we have erred and how to fix Physics and free it from the ontology of hyperspace. We are not likely to accomplish this most desirable result in a climate of hero worship, censorship and a comic book level understanding of the history of science.

In addition, a terrible injustice is being perpetrated against the legacies of many scientists, philosophers and mathematicians of the past. Our children are being lied to and asked to believe in a Santa Claus scientist, who understood the truth that they never can. Science and history are degraded into hero worship and the many wonderful and educational facts and stories of history are distilled into an infantile comic strip featuring only one character. Our children deserve to be told the truth. Science must progress and be treated in a dignified and worthy manner. We cannot expect great things from our children if we teach them from comic books and insist that they believe in a myth. On the other side of Einstein await many wonderful stories in the history of Physics and promising analog models of gravity and electromagnetism which offer tangible explanations of the phenomena.
NOTES:

8. Adelbert von Chamisso:

Die Sonne bringt es an den Tag

Gemächlich in der Werkstatt saß
Zum Frühtrunk Meister Nikolas,
Die junge Hausfrau schenkt’ ihm ein,
Es war im heitern Sonnenschein. —
Die Sonne bringt es an den Tag.

Die Sonne blinkt von der Schale Rand,
Malt zitternde Kringeln an die Wand,
Und wie den Schein er ins Auge faßt,
So spricht er für sich, indem er erbläßt:
“Du bringst es doch nicht an den Tag” —

“Wer nicht? was nicht?’, die Frau fragt gleich,
“Was stierst du so an? was wirst du so bleich?’
Und er darauf: “Sei still, nur still!
Ich’s doch nicht sagen kann noch will.
Die Sonne bringt’s nicht an den Tag.”

Die Frau nur dringender forscht und fragt,
Mit Schmeicheln ihn und Hadern plagt,
Mit süßem und mit bitterm Wort;
Sie fragt und plagt ihn Ort und Ort:
“Was bringt die Sonne nicht an den Tag?”

“Nein nimmermehr!” — “Du sagst es mir noch.”
Da ward zuletzt er müd und schwach
Und gab der Ungestümen nach. —
Die Sonne bringt es an den Tag.

“Auf der Wanderschaft, ’s sind zwanzig Jahr,
Da traf es mich einst gar sonderbar.
Ich hatt nicht Geld, nicht Ranzen, noch Schuh,
War hungrig und durstig und zornig dazu. —
Die Sonne bringt’s nicht an den Tag.

Da kam mir just ein Jud in die Quer,
Ringsher war’s still und menschenleer,
‘Du hilfst mir, Hund, aus meiner Not!
Den Beutel her, sonst schlag ich dich tot!’
Die Sonne bringt’s nicht an den Tag.

Und er: ‘Vergieße nicht mein Blut,
Acht Pfennige sind mein ganzes Gut!’
Ich glaubt ihm nicht und fiel ihn an ;
Er war ein alter, schwacher Mann —
Die Sonne bringt’s nicht an den Tag.

So rücklings lag er blutend da;
Sein brechendes Aug in die Sonne sah;
Noch hob er zuckend die Hand empor,
Noch schrieb er röchelnd mir ins Ohr.
‘Die Sonne bringt es an den Tag!’

Ich macht ihn schnell noch vollends stumm
Und kehrt ihm die Taschen um und um:
Acht Pfenn’ge, das war das ganze Geld.
Ich scharrt ihn ein auf selbigem Feld —
Die Sonne bringt’s nicht an den Tag.

Dann zog ich weit und weiter hinaus,
Kam hier ins Land, bin jetzt zu Haus. —
Du weißt nun meine Heimlichkeit,
So halte den Mund und sei gescheit!
Die Sonne bringt’s nicht an den Tag.

Wann aber sie so flimmernd scheint,
Ich merk es wohl, was sie da meint,
Wie sie sich müht und sich erboest, —
Du, schau nicht hin und sei getrost :
Sie bringt es doch nicht an den Tag.”

So hatte die Sonn eine Zunge nun,
Der Frauen Zungen ja nimmer ruhn. —
“Gevatterin, um Jesus Christ!
Laßt Euch nicht merken, was Ihr nun wißt!” —
Nun bringt’s die Sonne an den Tag.

Die Raben ziehen krächzend zumal
Nach dem Hochgericht, zu halten ihr Mahl.
Wen flechten sie aufs Rad zur Stund?
Was hat er getan? wie ward es kund?
Die Sonne bringt es an den Tag.

50. G. Dalman, *Jesus Christ in the Talmud, Midrash, Zohar, and the Liturgy of the Synagogue*, Deighton Bell, Cambridge, (1893), p. 40. Though work is given an ancient attribution by its “discoverer”, the Muhammadans are also mentioned in *Zohar*, II, 32a. Some consider the author to have been divinely inspired, some say the work evolved over time, some say the work is a fabrication—in any event, it is an a now a very old writing and was very influential in Jewish political movements like the Frankists.

If we were obliged to cover with one word the development of Germany in the four decades between the two great wars, that word would certainly be “socialism.” It is not merely that in philosophy, literature and art the welfare of the masses is the leading motif running through the eighties and nineties until it became lost after 1900 in the swelling music of national ambition. In the field of political economy also socialist ideas marked the age. They began by conquering the professorial chairs in the universities in the seventies, where such “socialists of the chair” as Adolf Wagner of the university of Berlin set their stamp on the generation of political economists which followed the war with France, and they found expression in the compulsory insurance measures and similar legislation of the following decade. Such ideas were indeed nothing new in Germany since the sixteenth century, when cities such as Augsburg and Strasbourg were models of a hard and fast organization, in which capital played a small part and the workers formed the commonwealth on the principle of a closed shop, where communal undertakings largely supplanted private enterprise and every detail of life, including the details of food and dress, was fixed by law. The paternalism of the petty despotisms which preceded German unity had disciplined the Germans to live
under efficient supervision, and the ideals of the Manchester school of British economists did not take lasting hold on German economic life.

Socialism then grew in Germany on well-prepared soil. State ownership of railroad and telegraph had come naturally soon after the coming of these utilities, and municipal control of many forms of enterprise descended as a tradition from the later middle ages. That the individual should look to the government to provide for his welfare and that state and communal funds should supplant private capital in many undertakings had long been the case when Bismarck undertook his compulsory insurance policy in the eighties. This program was, as we have seen, an effort to strike the ground from beneath the Social Democrats by removing some of the causes of proletarian dissatisfaction. Here and there Bismarck’s successors went further on the road, with such measures as the purchase of the Hercynia potash mine (cf. page 166). That they did not go still further in this and other fields of state socialism was due in large measure to the existence of the Social Democratic party. This Ishmael in Germany’s political life by its very advocacy of measures made them impossible for the government.

What is it that has made the Socialist unfitted to be an ally and unwelcome as a coworker with nearly all other parties? What is there in the advocacy by the Social Democrats of any reform that has caused not only the East Elbian Junker and the Westphalian manufacturer, but even the National Liberal physician and shopkeeper to look askance at it? The answer is to be found both in the doctrinaire character of the party and in the violence of Socialist editors and orators. Karl Lamprecht has shown that all German political parties are antiquated in that all cling to formulas and doctrines that have outlived their applicability to present-day affairs. In this sense the Social Democratic party is the most antiquated and the least opportunist. In this has lain its strength as a class party and its weakness in electoral and parliamentary strategy. Beginning with the removal of the coercive laws in 1890, it cast at all national elections the largest vote of any party, and after 1903 held under its discipline nearly one-third of all the electors to the national parliament, more than all the other Liberal fractions combined. Nevertheless it exercised less influence on legislation than any other of the major groups in the empire. To understand the reason for this one must glance at the development of socialism as a political force.

When in 1867 Friedrich Liebknecht and August Bebel were elected to the first Reichstag of the new-born North German Confederation, they found ready at hand both the gospel of socialism in the works of Karl Marx and the needed fighting force in the German Workingmen’s Party (Allgemeiner Deutscher Arbeiter-Verein), which had been founded four years earlier by Ferdinand Lassalle. Two years later at the famous Eisenach Convention Liebknecht and Bebel called the Social Democratic Workingmen’s Party into existence, on a platform built of Marx’ theory of the destructive rule of capital and his call to the workingmen of all lands to unite, and finally in 1875 the followers of Lassalle forsook their nationalistic ideals and were won over to the internationalism of the Marxists. Immediately the triumphal march of the Social Democrats began, a march which has continued with few halts since. Aided by the hardships brought on by the financial crises of the seventies, the Marxian theories of the misery caused by the capitalistic state and the exploitation of the working class through the capitalistic organization of society found eager acceptance in all quarters of industrial Germany. Already in 1876 there were twenty-four papers and journals published in the interest of the party with nearly one hundred thousand subscribers: by the next year the number of party periodicals had increased to forty-one, and that year the party cast nearly half a million votes and elected twelve members to the national legislature. From that time the Social Democracy kept pace closely with the forward movement of industrial Germany. Wherever factories sprang up and workmen came to live together, the theories of
Marx took root. The workingmen were organized into Socialist unions, which became at once fighting units in the industries and the elections; with the capacity for organization so characteristic of an industrial age and of German society in particular, the Social Democracy was solidified by the establishment of central bureaus under the control of secretaries. These latter quickly developed into a class of experienced leaders, at once clever agitators in the industries and skillful strategists in political campaigns.

Bismarck watched the rise of the party and its often unscrupulous means of agitation with growing distrust. He put no confidence in the alleged peaceful program of socialism: for him the party bore nothing but red revolution on its banners. In 1878 two attempts were made on the life of Emperor William which were unjustly ascribed to the effect of socialist agitation; and the Chancellor took advantage of the popular outcry to dissolve the Liberal Reichstag and appeal to the electors on an anti-socialist program. The result was the enactment of rigid laws forbidding Socialist propaganda. The following ten years, 1880 to 1890, were for the party a period of almost subterranean existence. Clubs were suppressed, newspapers and journals confiscated, many of the leaders, Liebknecht and Bebel among them, went to prison. In spite of prosecution and imprisonment, however, the propaganda went straight ahead. Political clubs were reorganized as singing societies and bowling clubs and the party organization was perpetuated by these and by the trade unions, which continued to spread like a vast network throughout industrial Germany. During the ten years of the anti-socialist laws the total vote of the party increased, a larger number of deputies was chosen to the Reichstag, and more important still, the inner organization and solidity of the party gained tremendously under persecution. This was shown immediately on the expiration of the anti-socialist laws in 1890. In that year the party cast nearly one and one-half million votes in the national elections, and became thereby the strongest party in the empire. In 1898 the Social Democratic vote had risen to two millions, in 1907 to three and one-quarter millions, in 1912 to more than four and one-quarter millions, more than one-third of all votes cast in the imperial elections of that year.

The great Chancellor was, however, too far-seeing a statesman to think that the mere forbidding of socialist propaganda would stop the growth of socialism, which to his mind was only revolution in disguise. He set out, as we have seen, to cut the ground from beneath the feet of the proletarian agitators by a system of legislation which should ban from the empire the direst poverty by insuring to the working class compensation in case of injury and care in sickness and old age. These needs, which were outlined in an imperial message of 1881, formed the basis of debate and experiment through the following eight years and were finally met in the various compulsory insurance measures which, so to speak, set their stamp upon Germany’s internal politics in the eighties. In the Workingmen’s Compensation or Accident Insurance Act of 1884, the burden of insurance was laid entirely upon the employer; the cost of the Sick Insurance Act of 1883 fell upon both employer and employee; for carrying out the provisions of the Old Age Pension Act of 1889, the empire joined with both capital and labor in providing for the veterans of labor. By this legislation, which though several times amended in minor parts, has remained essentially the same, Germany took a long step in the direction of state socialism and assumed the first place among nations in the protection of its army of labor. Both Radical and Socialist have found much to criticise in the laws, and the amendments which reformers suggested should long ago have received attention at the hands of the government; nevertheless, with all of their imperfections, the compulsory insurance acts have been a guiding star for the social legislation of other lands and one of the brightest decorations on the bosom of modern Germania. They are no less a superb monument to the liberal view and modern spirit of Bismarck in social legislation.

But they did not win over the Socialists. The representatives of the fourth estate
accepted the socialistic laws of the eighties not as a gift from the hands of benevolent capital, but as a right conceded through the fear of the rising strength of the proletariat. There is evidence that the old Chancellor had wearied of the struggle to win the working classes to a national and patriotic spirit and that at the expiration of the anti-socialist laws in 1890 he was preparing a stroke against the constitution, which by the abolition of manhood suffrage should undo the work of 1866 and exclude the non-propertied classes from a share in government (cf. page 127). However, young Emperor William thought otherwise, and with the fall of Bismarck, legislation against the Social Democracy was dropped and the Emperor sought to accomplish by conciliation what suppressive laws had failed to do. He summoned an international congress in Berlin to consider measures for the further welfare of the working classes, and outlined for adoption various propositions, such as a complete Sunday holiday, which had been advocated in the Socialist platform. But the effort to win the workingmen to fealty to monarch and Fatherland by kindness broke against the hard class consciousness of the fourth estate. No royal enticements could prevail against the teachings of Marx, ably and speciously interpreted by Socialist speakers, no words of the sovereign could make progress against the class feeling which had been bred in the industrial proletariat for two decades in trade union, tavern debating club and Socialist journal. From that day on the crown and indeed all of the upper classes and a large part of the middle classes in Germany parted company with the proletariat. Henceforth every representative of the existing organization of society from the sovereign to the Rhenish crockery dealer denounced the Social Democrats as enemies of the Fatherland. But whether ridiculed as a “transitory phase” or threatened with a holy war of extermination by “all lovers of God and Fatherland,” the Socialist forces marched on in ever increasing numbers, a solid phalanx of industrial workers, soaked with the doctrines of Marx and Engel and ably led by labor secretary and editor.

In his opposition to the monarchy and the entire capitalistic state, the Social Democrat included of course the army, under feudal and capitalistic leadership. Nowhere, however, has the German military spirit found better expression than in the organization and discipline of the Social Democratic party. Who could watch the orderly, shoulder to shoulder march of tens of thousands of workingmen through the streets of Berlin on the occasion of the burial of a leader or on the anniversary of the “victims of March,” the revolutionists who fell in the street fighting of March 1848, without seeing in imagination these same men clad in the blue and red or khaki of active soldiers? And who could see the eyes-to-the-front, fingers-on-the-trouser-seam carriage with which the individual workman follows his leader in strike or electoral campaign without recalling the Prussian military discipline? In August 1911 at Treptow, a suburb of Berlin, a mighty Socialist demonstration was made against the threatened war with France and England over the Morocco affair. A vast crowd of men and women, estimated at eighty thousand, gathered on a Sunday afternoon about a tribune to hear their leaders denounce war as a diabolical game at which the capitalist must win and the proletarian lose. Only a few of the mighty audience could hear a word of the orators, but all stood at respectful attention in the intense heat until the speeches were over and then at a given signal waved their arms in a mighty storm wave, voting affirmatively on a resolution which protested in the name of labor against the threatened war. And throughout the day not one case of disorder, scarcely even a chance hard word at an over-officious policeman, among the tens of thousands of workingmen and working women who spent the hot Sunday journeying back and forth from their homes in almost all parts of Greater Berlin!

The same iron discipline that has taught moulder and stoker and street paver that he owes it to his class to suppress even a natural outburst of resentment, because it may give the representatives of feudalism and capitalism an advantage, holds sway over leader and editor.
The annual party convention, the Parteitag, is the court of last resort, before which even those highest in the councils of the party must appear and justify their actions. Prominent Socialists, including some of the leading parliamentarians of the party and the editors of such journals as Vorwärts and the Sozialistische Monatshefte, have been called upon to defend the orthodoxy of their faith, and prominent leaders have been unceremoniously thrust out of the party. It became an accepted canon that when a man found that his position, reached after scientific inquiry, was no longer that of the party, and when he could not persuade the party to accept his position, he was by that very fact no longer a Social Democrat. This tyranny of the majority was due not merely to a democratic intolerance of strong individualities, it proceeded also from the extreme doctrinarianism of the party.

This doctrinarianism is the very bone of the Social Democracy. No orthodox theologian of years ago ever clung to the verbal inspiration of Holy Writ with greater zeal than Socialist orator and editor and private soldier have held to every jot and title of the Erfurt Platform. This declaration of faith was adopted in 1891, soon after the expiration of the anti-socialist laws, and has had no official revision since. It could not be expected, however, that the Marxian theories, as enunciated in that instrument, would stand unimpaired by the experience of the passing years, and even the most devout Socialist must acknowledge that some planks in the Erfurt Platform have been shown to be fallacies by the industrial history of the past few decades in Germany. Of none is this more strikingly true than of the so-called “iron law of wages,” according to which the condition of the workingman under the capitalistic system must constantly grow worse. This dogma has been absolutely contradicted by the facts. The general condition of industrial labor in Germany has constantly grown better, and as the years have passed not a few of the proletariat have become themselves members of the capitalistic class.

These conditions were recognized quite early by Social Democrats of more liberal training. The first bold reformer to attempt to bring socialism down from the domain of dreams to economic reality was Edward Bernstein in a memorable brochure published in 1899 (Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie).[Footnote: The Basis of Socialism and the Task of the Social Democracy.] The author, who had suffered in his own person for his adherence to the Marxian faith in the days of the anti-Socialist laws, proposed a revision of the old Marxian theories in the light of present day economic and social life, “the development of the theory and practice of the Social Democracy in an evolutionistic sense.” The first point of his attack was the time-honored premise of the “iron law of wages.” The condition of the working classes, he contended, is not growing worse but better. Furthermore, not all means of production are to be socialized, as is demanded in the Erfurt Platform, but only land and the larger means of production, and as a very important reservation, one must avoid anything which would injure the nation in its competition for trade with foreign countries. This attack on the major premise of the Erfurt Platform and this modification of its first article instantly called into the ring a host of defenders of socialistic orthodoxy. August Bebel, the parliamentary generalissimo, Karl Kautsky, the learned dogmatist, and others rushed to arms in defense of the Marxian theories and the battle was on between “Radicals” and “Revisionists,” the former ably led by Kautsky in the Neue Zeit, the latter by Bernstein in the Sozialistische Monatshefte. The struggle reached its culmination in the Dresden convention of 1903, a convention which will long be remembered in German political annals as the highwater mark of violence and “rough-house” tactics. The result was a defeat for the “Revisionists,” less on scientific than on tactical grounds, the “Radicals” claiming that any concession to the “middle-class parties,” whether in theory or practice, would result in weakening the feeling of class consciousness upon which the Social Democracy is built.
In the meantime, however, practice ran away with theory. The exigencies of electoral and parliamentary struggles drew the party more and more into coöperation with the Liberal Left, and tended more and more to transform the revolutionary Socialists, despite themselves, into political democrats. Liebknecht, the founder, with truly doctrinaire consistency, had held that the party existed as a protest against the capitalistic organization of society and should therefore take no part in parliamentary affairs, except in protest. In the days of the anti-socialist laws, the Social Democratic members of the Reichstag refused to accept membership on committees. The first break in this policy of simple negation came from South Germany, where as a result of more democratic constitutions, the working classes had been accustomed to a share in governmental responsibilities. A Bavarian deputy, Vollmar, as early as 1891, came out strongly against the attitude of sulking, and demanded that the party, deferring its ultimate aim, the socialization of industry, should coöperate with the middle-class parties in winning immediate advantages for the working class. In spite of the bitter opposition of the Prussian irreconcilables, a revision of the party's program in this respect actually took place. With the growth of Socialist representation in the Reichstag, their work on the committees became more and more important, and at the beginning of the session of 1912 a Socialist presided for a time over the national parliament. While the fraction continued to vote steadily against all military and naval supplies and against the prosecution of colonial development, signs multiplied that the opposition to these national undertakings had lost its ferocity, and Socialist votes in committee repeatedly brought about modifications in military and naval bills.

When finally under the shadow of a great national danger in May 1913 the Social Democrats accepted the national Defense Bill, which in its system of direct property taxation coincided with their theories, it was plain that a considerable breach had at last been made in the doctrinaire internationalism of the party and that it had at last begun to catch the national spirit. That this was true found complete confirmation at the outbreak of the war, when disappointment came to those who had counted upon socialism as a weakness in Germany's hour of trial. The Social Democratic workman threw down his tools and rushed to obey the order of mobilization with the same patriotic enthusiasm as inspired shopkeeper and reserve officer. The party leaders, speaking through their papers, reaffirmed the faith of the Socialists in the ideals of peace and international brotherhood among workers, but put the defense of German culture from Russian barbarism as a first life-consideration; and the Socialist members of the Reichstag followed the direction of the party councils in voting with practical unanimity for the government war measures. The same hail which had resounded so often with attacks on the spirit of militarism, and Prussian militarism in particular, now heard from the Social Democratic leaders words of patriotic devotion scarcely less ardent than those which came from Conservative and Liberal benches. That there were still elements of dissent and that the hatred of feudalism and capitalism still burned brightly could not be doubted, but for the present these were lost to view in the national enthusiasm which made many Socialist leaders answer the first call for volunteers.

In South Germany, indeed, even before the "revision" crusade the Socialists had become to all intents and purposes a national party. In Württemberg, Baden and Bavaria they repeatedly voted for the budget, including the supplies for the royal family, a proceeding which stirred the radical Socialists to the bitterest attacks. In Baden in 1906 the leader of the party in the Chamber paid a visit of respect to the Grand Duke on the birth of a prince; in the Grand Duchy of Hesse in 1907 the fraction voted an address to the sovereign. In the diminutive principality of Schwarzburg-Rudolstadt the Socialists had in 1912 a majority of the Chamber and elected one of their number president. In the same year in nineteen states of the empire one hundred and eighty-eight Socialist deputies sat in the legislative chambers.
The increasing participation in government which such a large number of representatives must bring with it on more than one occasion excited the Prussian radicals to the boiling point and more than one national party convention resounded with wild scenes of disorder over the struggle as to how far a Social Democrat might participate in government. Under the sting of the radical lash the South German delegates revolted at the Nuremberg Convention of 1908 and announced their intention of proceeding independently of the party in state affairs, submitting themselves to the national convention only in matters of national issue.

That the process of Mauserung of the Social Democrats, that is, a gradual conversion to the practical coworking with other liberal groups, did not go further and faster was chiefly due to conditions in Prussia. It is not an accident that most of the radicals among the Social Democratic leaders have been Prussians and that the worship of an idea among the serried thousands of followers has gone further and the collisions between the proletarian and propertied classes have been more numerous in Prussia than elsewhere in the empire. It is true that the Prussian, whether capitalist or proletarian, has a real gift for discipline, whether it be the discipline of the drill sergeant, of the manufacturers’ association, or the Social Democratic party leader. But the existence of a sharp and obdurate class feeling in Prussia is to be explained most of all by the constitution of the kingdom. Under the provisions of this constitution, as we have seen, a property qualification for the vote exists, and the working classes are almost entirely excluded from participation in government, whether it be the government of parish, province or kingdom. Of the three classes (cf. page 143) which by indirect means choose the representatives in local and municipal council, in provincial assembly and national Landtag, the first class has included in the elections since 1903 from three to five per cent of the total vote, the second class from ten to fourteen per cent, the third class from eightyone to eighty-seven per cent. Since the Socialists from the nature of things fall almost entirely in the third class, it will be seen what a small chance they have of securing adequate representation in any elective body. The industrial workers are placed at a further disadvantage in elections to the Landtag by a system of electoral districts which has remained, with minor alterations, that of sixty years ago. Thus while in the agrarian districts of East Prussia in 1908, 63,000 persons elected a deputy, in Berlin the average was one deputy to 170,000. It is not surprising that the Conservative agrarians, who are most bitterly opposed to the interests of the industrial workers, have a far greater number of seats than their vote entitles them to. In 1903 the Conservatives, polling 19.4 per cent of the vote, elected 33 per cent of the deputies in the Landtag.

It is not to be wondered at that when in 1908 for the first time Social Democrats, seven in number, found their way into the lower house of the Prussian parliament, they were received with scant courtesy. The Conservative Kreuzzeitung protested against their being assigned to any committees, and in fact something very like a boycott was exercised against them. The election of 1913 brought only a slight increase in numbers; but the Socialist deputies made up in noise what they lacked in voting strength, and in spite of the iron rod of Conservative presiding officers, they made themselves as obnoxious as ever did the Irish Nationalists at Westminster in the palmy days of Parnell and Healy. Thus in the spring of 1912 a scandalous scene was precipitated on the floor of the Landtag, during which the presiding officer was obliged to send for the police. The minions of the law forcibly removed a refractory Herr Borchardt and played hide-and-seek a while with him in the corridors, a comical scene which found its epilogue in the law courts, where the liberties of the house were finally vindicated by Herr Borchardt paying a small fine. During the same session a Socialist was called to order for saying that “war is a mockery against God” on the ground that this was “an insult to the memory of Emperor William the Great, who waged three
wars, and to the chivalrous and patriotic spirit of the German people." The Socialist members are obliged to hear from the ministerial benches that the government regards all Socialists as enemies of God and Fatherland, and that any official, civil or military, breaks his oath to the sovereign when he affiliates himself in any way with the anti-monarchical party.

It was the same bitter impatience against the Prussian constitution that accounted for many of the violent outbreaks of representatives of the fourth estate in the Reichstag. Here, backed by crowded benches of applauding colleagues, the fiery champions of the proletariat have reaped a harvest of calls to order in every session for their attacks on the sovereign, the ministry, the army, the Prussian constitution and the entire Prussian system. Some of the party manifestations have been even less excusable, and their childishness can only be explained by political immaturity or demagogery run mad, as the habit which the Socialist members have had of leaving the hall of parliament when the obligato Hoch! is given in honor of the Kaiser at the close of the session. When with the Liberal-Radical-Socialist victory of 1912 the Clerical party was obliged to resign to Radical hands the presidency of the Reichstag, attacks on the Emperor himself became less restrained than ever. Each public speech of the monarch found its echo in some choice epigram from the Socialist benches. Thus in the debate on the Kaiser’s threat against the constitution of Alsace-Lorraine the printer Scheidemann, erstwhile president of the assembly, aroused an uproar by characterizing the Emperor as a “crowned dilettante,” and the intellectual free lance Ledebour earned a call to order by declaring that if the king of England had spoken as Kaiser Wilhelm did, he would be straightway shut up in Balmoral, like the crazy king of Bavaria or Abdul Hamid of Turkey. It was not merely by their attacks on the monarch and by their unceasing diatribes against army and bureaucracy that Social Democratic editors and orators won applause in tavern and workshop or wherever their eager constituents gathered to read the party press. Were a stupid recruit in Jüterbog or Gumbinnen overdrammed by a zealous sergeant until he fell from exhaustion, then one might be certain that the case would be illuminated down to its furthest cranny in the next issue of Vorwärts or by a vitriol-tongued Liebknecht or Ledebour in the Reichstag. Did a Conservative government official in some remote Silesian district snort at Social Democratic voters at a bye-election, the party press and the Reichstag hall would ring with denunciation. Every case of judicial error had a merciless searchlight turned upon it, every instance of official discrimination against those suspected of being Socialists became the theme for attacks in which coarseness and brutality of language often crossed the limits prescribed by the German libel law. Whatever political errors may be charged to the Socialists, the weakness of turning the other cheek to the smiter is something of which the party’s representatives cannot be accused. While one must credit Social Democratic representatives in press and parliament with sincerity of motive in the defense of the politically and socially weak and defenseless, it cannot be overlooked that it is mainly due to them that a spirit of undisciplined coarseness and vituperation has found its way into German public life.

There is no denying that they have had provocation enough. The government from the sovereign down has always made no secret of its determination to fight the Socialists as a foreign enemy in the Fatherland. As believers in “internationalism” and enemies of the existing state, they have been as a matter of course ineligible to any office in the government, whether in the army, navy or in the civil service, although they represent more than one-third of the voting strength of the nation. At the elections all government officials have been expected to exert every legitimate influence against the Social Democratic candidate. Recruits who attended Socialist gatherings or frequented taverns known to be Socialist rendezvous were liable to severe punishment. Especially in Prussia, although the basic ideas of socialism had for years been freely taught in the universities, any teacher in an elementary
school who was suspected of Socialist sympathies exposed himself to loss of promotion or might even be removed from the service. The same fate awaited any postal or customs employee who identified himself in any way with the Socialist cause; and it has often been charged by the Socialists and never disproved that the workmen on public works have been practically forced to enroll their children in clubs where a sort of “hurra-patriotism” was taught and where the youngsters were trained to regard the Social Democrats as the most dangerous enemies of God and native land. Naturally a state of affairs like this leads to deceit, to cringing, tale-bearing and denunciation. Unfortunately also, while the German courts are usually models of fairness and inaccessible to political, social or financial influences, the Social Democrat has not always had an impartial hearing. The Jena students demonstrated against the Socialist convention held in that little Athens on the Saale in 1911, and the Weimar Volkszeitung was fined for calling one of the student leaders a Mistfink, a somewhat intensified equivalent of “mucker.” A laborer in the Kiel district in 1912 gave his daughter the euphonious name of Lassalline. When the registrar refused to record a name so full of danger to the Fatherland, the magistrate’s court finally ordered him to do so, but attached to this confirmation of the parent’s right to denominate his offspring a long oration against socialism.

The Socialist workman replied to this boycott by exercising in his way a terrorism which the government, aided by all the conservative forces in the state, has striven in vain to suppress. He has vented on the non-socialist worker his dissatisfaction with the government, and, as might be expected, often with brutality and violence. That during a political strike, such as the coal strike in the Ruhr district in 1912 (cf. page 167), the Catholic labor unions should suffer bloody attacks from the striking miners is not surprising: even the non-political Hirsch-Duncker unionists have more than one tale to tell of similar mistreatment during labor troubles. But it is not merely the strike breakers in strike times who have suffered. Every non-Socialist brick mason or carpenter must look for a continuous hazing. If he were so unfortunate as to be obliged to work with a Socialist unionist, he might consider himself lucky if he got off with the occasional loss of tools or dinner bucket or an accidental fall into a horse-pond and did not have his hand permanently maimed by the slip of a chisel or his head cracked by the premature topple of a hod of bricks. Against such petty cases of tyranny of course both government and employer have been helpless. In past years the government has eagerly sought from the Reichstag sharper weapons for the suppression of strike violence and the protection of strike breakers; but in spite of the personal influence of the Emperor in their favor, no one of these special measures for the protection of the workers has been able to find a majority in parliament. The fear that they might be used as a weapon for further strengthening the great industrialists has always frightened off enough Clericals to cause their defeat.

It must not be supposed that the feeling against the Socialists has been confined to feudal squires and factory owners. It pervades the entire middle class in Germany, for except the extreme Radicals, all Germans, whether they thrive by land, trade or manufacture, have been taught to regard the Social Democrat as an enemy of the Fatherland. The Rhenish shopkeeper, the Black Forest clockmaker, the Pomeranian peasant farmer, — all have shuddered alike at the growing power and influence of the Social Democracy and regarded almost any means as holy that would tend to defeat its ultimate success. It was only when the excessive demands of agrarian and clerical interests aroused the alarm of those who live by commerce and industry that these classes considered the possibility of a league, and the coworking of Radicals and Social Democrats at the polls in 1912 broke ground in that direction. The Socialist leaders, however, have been well aware that any modification of their extreme radical attitude toward the middle classes would not only endanger their hold
on the working class, with its sharp class feeling, but that a large number of the discontented from all classes would fall away from them. For the growth of socialism’s vote in Germany has been due by no means merely to the rising demands of the industrial workers. It has been distinctly the party of discontent and protest. Every discontented and disappointed man is liable at any time to express his dissatisfaction with society in general by voting the Social Democratic ticket. Has the young medical student failed of an appointment, has the citizen soldier been given a verbal castigation by the officer during his drill with the reserve, has a postal clerk been docked in his pay, has the grocer’s wife had a snub from the factory owner’s, — each sufferer can give vent to his private grievance against society by voting for the Social Democrat and thus making trouble for the powers that be. None of these persons has the slightest sympathy with the ultimate socialist program, and none of them would think of overthrowing the present state of society, except in a moment of ill humor. This habit of “voting to the Left” has attacked large classes of democratically inclined persons of the lower middle class following such a period of reaction as that which ended with the election of the Reichstag of 1912.

It is indeed unfortunate that this is so, and the lovers of Germany have often asked themselves what the end would be, if so strangely constituted a party continued to grow in voting strength. Largely through its own choice the Social Democracy, although representing one-third of the voters in the empire, has been deprived of any considerable share in government and remained in an attitude of sullen hostility to the state. So well have the class organizers of past decades done their work that they have developed among the industrial workers who make up the Social Democratic party a class feeling that is nothing more nor less than an independent class culture. It is not merely a political gulf which the Socialist leaders have fixed between the workman and every other class in Germany. Through constant teaching in young men’s clubs, trade unions and political societies the industrial worker has become to a certain extent a different creature from his middle class neighbor, a member of a nation within the German nation. A striking characteristic of the German the world over is the love of Fatherland. The Socialist workman has claimed to be an international and to feel as one, and in program at least he has professed to be more strongly drawn to his fellow proletarian in France and England than to the shopkeepers and peasant proprietors of his native district. The North German is by tradition strongly monarchical; the Socialist frankly detests monarchy and monarch. While the German, north and south, may not approve of all the methods of the Evangelical and Roman Catholic churches, he is held by mighty roots to a deep religiosity; the Socialist claims to regard religion as a private matter, nevertheless he cannot forget that the church has been the handmaid of reaction and oppression, and the attitude of intellectual leader and proletarian follower is frankly and openly and-religious. Many of the most brilliant Social Democratic leaders with tongue and pen are Jews, it need hardly be said, unorthodox Jews, who have cut loose entirely from the religion of Moses and the prophets. Anyone who is at all familiar with the anti-Semitic feeling among the upper and middle classes in Germany can understand how much the prejudice against the Socialists is deepened by this Jewish alliance. Furthermore, in spite of the casehardening of the modern struggle for existence, the average German has remained a romanticist, full of hero-worship and with a deep enthusiasm for the poetry of the nation’s past; the Social Democrat has been taught to view the past under the hard light of Marx’ theory as a battle-ground of economic forces, where without mercy the strong has preyed upon the weak.

When the war came the attitude of the Social Democracy toward it showed at once that much of the so-called “internationalism” of the German industrial worker is purely academic. All the doctrinarianism of the tavern benches and the nobler enthusiasm of such
demonstrations as that of Treptow could not affect the age-old roots which bind him to the Fatherland. It is improbable that the Socialists, were they to command a majority in Germany’s parliament and so succeed in changing Germany’s constitution as to have a free hand in legislation, would do anything to weaken the nation’s defenses, either by a change in the military system or a destruction of protective duties. It seemed, indeed, as if even old-line leaders, like the late August Bebel, had caught something of the enthusiasm for Germany’s world-empire. After the so-called “Hottentot election” of 1907, when Socialists and Clericals alike suffered severely at the hands of the voters for their opposition to colonial expansion, there began to show itself in the Social Democratic press a tendency toward increasing patriotic expression with regard to the national honor and defenses. Here again South Germany led the way, for here the “revisionists” were stronger. Among the first prominent men to fall in the invasion of France in August 1914 was Dr. Frank of Mannheim, a widely known Social Democratic leader; and indeed the blood of Socialist patriots has reddened every battlefield where German armies have fought. Under these the attitude of the party towards the nation’s inner life cannot fail to undergo a change. In later years indeed the Social Democrats had already accomplished much that was positive. By their constant and searching criticisms they held a searchlight constantly fixed on the weak spots and the sore spots in the courts and the army. In the field of social legislation, such as the extension of compulsory insurance, the fixing of a shorter working day, and the protection of women and children in the industries, they kept high ideals before the country. In their work for universal peace, in their opposition to immoderate military expenditures and to duels and other manifestations of the feudal spirit in the army, they offered a valuable counterbalance to the militarism-run-mad spirit. In their pleas for a judiciary free from influence of every kind, schools free from religious bigotry, for a system of taxation which should fall directly upon the propertied classes, for a strong central control of great industries and for woman’s suffrage, they accomplished much toward the inner upbuilding of the state. These affirmative policies have been pushed by a class of leaders who are very different from those who led the serried thousands of the fourth estate in the nineties or even at the beginning of the present century. The really advanced men in the Social Democratic party are no longer the narrow Marxian enthusiasts or class fanatics who grew up under the anti-socialist laws or when the party was still in the fledgling period of political strategy. They are often men of the highest university training, occasionally with inherited wealth and culture, who know the history of the party and are filled with the optimism of success. They have shown an increasing power to lead the party farther away from a sterile doctrinarianism toward a really practical democracy.

[***]

CHAPTER XVII

THE PRESS AND PUBLIC OPINION

Since the day when the bankrupt Mayence genius invented movable types, Germany has with few interruptions held the first place among printing and publishing nations. Her annual output in books surpasses the combined production of France, England and the United States; and even if we subtract pamphlets, which in German statistics are rated as books, and which bring into the world many things that appear in other countries in magazines, the Fatherland exceeds in its contribution to this “paper age” any two other nations. The explanation is to be found not merely in the high culture of the nation, but also in the methodical spirit, which drives the German to analyze, correlate and formulate, seeking not merely apostles for his patiently won ideas but often clearness for the writer through the very formulation of his ideas. In no land is access to the press so cheap and easy, in no land are the rewards for the author proportionately so large. Unfortunately also in no
land are there so many worthless books brought into the world, from the machine-made doctor dissertation with its pathetic testimony to years of youthful vigor wasted in counting the hairs in Homer’s beard down to the penny manuals on “How to learn French in Three Weeks.” The Germans pay the penalty of a nation which produces each year a mass of creative scholarly research with the by-products of boneless pedantry and speculative dilettanteism.

Besides the book press, the periodical press rolls up each month and each day its vast flood. Every science, art and industry, every branch of commerce, every political fraction has its press; every handicraft, yes, almost every forceful personality in the country has its periodical exponent. The press directory of 1913 mentions 11 periodicals devoted to the continuation school system alone. The Schornsteinfeger, published monthly in Berlin, ministers to the literary needs of chimney sweeps; the Allgemeine deutsche Käseblatt to those of the cheese workers: a specialization in the printed representatives of Germany’s multifarious industries confronts us as hairsplit and bewildering as in the industrial branches themselves. Only indeed in a land where the division of industry and the organization of commerce are carried as far as in Germany could this vast array of trade periodicals live and flourish.

On the other hand the number of popular periodicals dealing with history, political science and geography is small: the Deutsche Rundschau, founded by the late Julius Rodenberg, the Süddeutsche Monatshefte and the Deutsche Revue are the only ones which deserve to be put beside half a dozen or more great British reviews. In the field of artistic and literary criticism there is none which in the variety and brilliance of its contents appeals to so large a public as the Revue des deux Mondes. Nor do the more popular Westermanns or Velhagen und Klasing’s Monatshefte, Nord und Süd or the time-honored Gartenlaube attain to the vivid contemporary interest of a few of the best American illustrated magazines. The out-of-door element, so attractive a part of British and American magazines, has only recently made its appearance in German periodicals and is to be found mainly in publications devoted to Alpine, automobile and aviation clubs or other special sports. If, however, the German press has something less to offer to the leisure hours of the man of general culture than that of the western nations, to the specialist and scholar, whether he be a specialist in Sanscrit, stamp collecting or soap boiling, it brings each year a wealth of material which serves later on as a reservoir for the writers of other nations.

The spirit of the German press is then that of German scholarship. It shows the same enthusiasm for truth, the same conscientiousness in the search for it and the same honesty in proclaiming it as have set their stamp on German scholarship everywhere. The reverse of this in pedantry of manner and boring tediumness of portrayal is not lacking. The daily press, to which this chapter is chiefly devoted, shows these characteristics in an even greater degree. The most popular child of the printing press, the newspaper, had also its birth in Germany, and so far as numbers are concerned, Germany is still above all its home. Exact statistics are lacking, but in 1908 the number of daily papers was estimated by competent authorities at four thousand, of which Dr. Robert Brunhuber,[Footnote: Das deutsche Zeitungswesen.] an expert in this field, counts about four hundred organs of considerable importance. Of these perhaps 35 are papers of great influence of which over one-half appear in Berlin and less than half a dozen outside of Prussia. In the aggregate the German daily press rises then to tremendous figures. The post-office department acts as the agent of the press, receiving subscriptions at all offices and distributing the papers, and reckoning by post-office statistics, German observers set the distribution of papers in the year 1906 at between twelve and twenty million copies per day. This mighty flood, which pours itself daily over all parts of Germany, rippling to the most distant dune villages of the Baltic coast
and the eeriest nests of the Bavarian highlands, flows most densely in the Rhine valley. Here the Cologne, Düsseldorf and Dortmund papers find their way into every hamlet and in the industrial centres into every house. In the Rhine Palatinate the average is one daily newspaper to every fifteen thousand inhabitants in the entire district.

Through this great flood, from the Berlin and Frankfort journals down to the provincial “General Anzeiger” (“Official Gazette”) is a long journey past all sorts of newspaper undertakings. Most of the larger papers maintain correspondence bureaus in the greater German cities, and the largest also in foreign capitals, but as in the case of other lands, by far the greater part of the news comes to them through press associations. The great German press association is Wolff’s Telegraphic Bureau, which differs from international bureaus like Reuter’s and the Agence Havas in that it is mainly national in its scope, and differs from the American press agencies in being directly under government control. Wolff’s Bureau counts among its subscribers practically all the important papers in Germany, its despatches are forwarded over the imperial telegraph system toll free and have a certain precedence over private messages, and it is used, as we shall see, to disseminate governmentally edited news. Besides Wolff’s, there are in Berlin and other larger capitals other news agencies which send out information, — telegraphed, printed, mimeographed, — flooding the newspaper world with official, semi-official, political or colorless news items, which play a great part in the make-up of the provincial press. The pirating of news from the larger journals is carried on by the provincial papers in Germany in a way that is absolutely conscienceless, possibly because, as will be shown below, the reading public seems less eager for news than for editorial comments thereon.

This borrowing of news items is not, however, confined to the provincial press. As we have seen, the larger papers maintain correspondents in foreign capitals; but only in a few cases is this correspondence forwarded by telegraph, since the papers, apparently following the desires of the reading public, prefer to spend their money on literary essays and scientific treatises rather than on telegraph and cable tolls. For their daily news from abroad they depend on Wolff’s Bureau, which has a limited staff abroad, but derives most of its information through the great international agencies like Reuter’s. The cheapest and readiest source of information is the French and British dailies, whose news columns even the largest Berlin papers do not hesitate to use, reproducing with a generous hand news items from the Times, the Daily Chronicle and the Standard forty-eight hours after publication in London.

The effect on Germany’s relations with the outside world of this dependence on British-influenced news agencies has already been noted (cf. page 73 ff.). Even more important for the development of public sentiment at home is the lack of an adequate, independent system of telegraphic correspondence from foreign countries. The greater metropolitan papers which do maintain foreign correspondents have not succeeded in placing in the foreign capitals men who are able to give a true picture of foreign feeling or through personal influence and adroitness to fill the semi-diplomatic mission of their office, with the result that the readers of even such high-class journals as the Kölnische or Frankfurter Zeitung or the Berliner Tageblatt are often uninformed as to the real condition of public affairs and public feeling in France, England and America. The result has been that each succeeding international crisis has found the German reading public living in a fool’s paradise of misinformation with regard to the mighty forces of public sentiment which sway cabinet decisions in London, Paris, Washington and to some extent Rome. Some of the greater German dailies, like the Kölnische, have spent vast sums in sending experts to spy out the highlands of Thibet or the savage stretches of the upper Congo and spread before their readers a wealth of information regarding the economic possibilities of southern Brazil or the valleys of Mesopotamia or the fauna and flora of the strangest islands of the southern
seas. Of everything that has a scientific interest they render account with characteristic German enthusiasm for truth: in political matters their information is usually neither complete nor accurate and their correspondence from neighboring French and Italian cities or even from Alsace or the Prussian East is often but valorous vaporizing of the tap-room sort.

The weakness of the German papers as international newsgatherers is partly to be explained through the personnel of the German newspaper office. This seldom has at its command men of the standing of those who represent the great London papers in foreign capitals, a lack that is directly traceable to the inferior standing of the journalist in Germany as compared with Western lands. In the Fatherland, as elsewhere, the newspaper man does not as a rule freely elect the profession which he practises, but gravitates into it as a result of circumstances. Here, however, the result is worse than elsewhere, not only for the training of the journalist, but for the social status of the profession. In this land of specialization every aspirant for a professional career selects or is supposed to select, or have his parents select for him, his life career before he goes to the university, and he is expected to follow it up with all his force and enthusiasm from that time forth forevermore. Few, very few, select journalism, for while the financial rewards of the successful journalist are not inconsiderable, the social prestige belonging to the profession is still almost as lacking and the professional pride among journalists as undeveloped as half a century ago, when Gustav Freytag wrote his charming comedy Die Journalisten to prove that German editors could be men of honor.

The editorial chairs of Germany contain some brilliant men, who, feeling an inner call to journalism, have deserted the teacher’s chair or even the lawyer’s desk or surgeon’s case. Besides these and others, whose lives have been given to a special training for the periodical press, there are a very great number who have found their way into the newspaper office simply because they have failed as lawyers or as teachers or in some other calling where success means official position. Hard-and-fast conditions of society in Germany admit a fall in the social scale, but seldom a rise. There is no such thing as working for a while in a minor or menial position and then entering one of the learned professions: the educational system forbids it. The dark side of German efficiency is that those who have through temperament or other causes made a failure in the profession for which they have prepared, have thereafter small chance of success in any calling of equal social rank or even in the close in-fighting of business competition. To a good many such journalism offers the only field where they can still hope for a remunerative activity without entire loss of social position.

In addition to the lack of preparation for their profession under which so many German newspaper men suffer, they are not permitted, as in France, to sign their articles. Not a few leading articles and summaries are signed by the chief editor; but as a rule the German newspaper man is hidden behind the same impenetrable veil of anonymity that shrouds his colleagues in England and America. His work, be it ever so faithfully done, brings him no personal advertisement. On the other hand, the lack of liberal institutions condemns the editor to something like political impotence; and except among the Social Democrats, where newspaper editors are frequently elected to legislative office, he rarely gets anything in the way of political reward. The positions in the consular and even the diplomatic service that now and then recompense the American editor for faithful service to the party cause and the titles and distinctions which successful British journalists receive have no counterpart in Germany. With the exception of the two groups with the best developed political sense, the Conservatives and the Social Democrats, the journalist plays but a small part in the active life of the party and is practically never rewarded by the gift of political office. The effect of this upon the ambition of newspaper men can well be imagined. Thus cut off from adequate preparation, shut in behind a paralyzing anonymity, ineligible for political rewards,
the German journalist cannot, save in the case of a few great papers, lay claim to an enviable social or political position. As a rule he does his duty faithfully within the limits allowed him by the laws and by the business considerations of his office.

These considerations play a no more important part in Germany than in more democratic lands, where the cashier’s office is too often permitted to dominate the editorial rooms. Absolute independence of the advertising columns and similar considerations is an ideal rather than a fact in every part of the newspaper world, though here the German publisher may be said to be less exposed to temptation because of the rigid laws which govern business competition and because by education the German is opposed to unfair play in business life. The treatment of the editor as a hireling who must echo the policy of the publisher and guard the latter’s political and financial interests is a sacrifice which the editorial profession makes everywhere to the capitalistic organization of society, and it is no more common in Germany than abroad, although it must be said that anything that in any way diminishes the importance and standing of the press as a tribune of the people must increase the temptation of publisher and editor to sell their influence to the highest bidder.

The dignity of the press is then directly dependent upon the liberty allowed it, and this liberty in turn upon the habit of free institutions. It follows that those statesmen who have shown themselves most hostile to these institutions have in the history of present-day Germany done the most to prostitute the press. Bismarck, according to his press secretary, Moritz Busch, frequently expressed himself with cynical contempt on the subject of the honesty of the German press and its value as a representative of the people. “German papers,” he declared in 1876, “are bound to be amusing reading, for they are meant to be glanced over while drinking a mug of beer and to furnish topics of lively conversation, usually about something which has taken place a long way off in foreign parts.” The Iron Chancellor, however, himself made constant use of the newspapers to influence public opinion both at home and abroad, maintaining at the foreign office, in addition to the official literary bureau, a private bureau under the adroit management first of Busch and later of Professor Aegidi. Through these men he played upon public opinion by means of articles inspired by himself and often prepared under his dictation, which were published not only in the semi-official Norddeutsche Zeitung, the Kölnische Zeitung or the Kreuzzeitung, but in papers issued in remote cities of the provinces, whose connection with the government would not be guessed. Sometimes under the direction of their wily chief his lieutenants would put the Chancellor’s ideas in the form of a letter from a German long resident in Paris or a Prussian close to Vatican circles in Rome, playing upon the various keys and stops of prejudice and sentiment as the national or international situation demanded. By his Press Ordinances of 1863 Bismarck had shown himself quite willing to throttle a free press, later on he assured himself of adequate newspaper support by means of a cleverness and an insincerity a little more than diplomatic. That these means were at times highly immoral, no one who reads Busch’s biography of the Chancellor can deny. From the income of the sequestrated property of the King of Hanover and the Landgrave of Hesse, who had been deposed on the annexation of these countries by Prussia in 1866, the Chancellor drew the so-called “reptile funds,” by which the imperial government maintained an influence over the press which extended into the remotest corners of Germany and made itself felt in London, Paris and Rome.

All of this was justified by Bismarck and his apologists as a measure of war. It is certain that the Iron Chancellor had to face all of his life the bitterest opposition on the part of a few independent newspapers, the most relentless from the Kreuzzeitung, which under its brilliant editor Hammerstein forced the fighting in the most violent manner whenever Bismarck showed the slightest inclination toward liberal ideas. Confronted by bitter enemies
not only in the Liberal and Clerical ranks but among his own class, the conservative
aristocracy, as well, Bismarck did not hesitate to assure himself of press support by means
which were sometimes, as has been pointed out, of doubtful morality. He believed that his
enemies were poisoning the wells of public opinion; he himself disdained no weapons of
deceit and bribery in his newspaper campaigns, furnishing false information to draw the fire
of his opponents, or introducing misleading articles into the trusted organs of the opposition.
The success of this policy for the Chancellor’s aims cannot be denied; its final result was to
weaken for decades the political influence of the German press at home and abroad.

Bismarck’s successors in the home and foreign offices inherited something of his
cyphal contempt for the press without the great Chancellor’s skill in using it for his
purposes. Indeed the attitude of the government officials in Germany toward the
representatives of the fourth estate has been one of arrogance, not unmixed with fear. Often
the feeling seems to be that the press represents an improper curiosity on the part of the
masses about government doings, a curiosity which must be checked if possible, and if that
is not possible, satisfied with such meagre news as the government may find fit for popular
consumption. The result is, that the same feeling is cultivated in the German newspapers that
one finds often among German citizens toward public affairs: they have been told so often
that the governing classes can manage things without their help that they have grown to
believe it, and the press thus frequently accepts without hesitation government leadership
and voluntarily resigns its rights as a tribune of the people. Two instances will illustrate this,
both taken from the exciting days at the end of July, 1914, just before Germany declared war
against Russia. On July 30 the air was full of rumors and the Berlin Lokalanzeiger published
an extra announcing that war had been declared against Russia. This was followed
immediately by a governmental denial and a disavowal and the withdrawal of its issue by
the offending paper. The premature news reached Munich, where it was published in various
extra issues and caused the greatest excitement. At the height of this the newspapers, which
were unable to communicate with Berlin on account of the overloading of the wires, applied
to the Bavarian government to know the truth of the situation. For hours they were kept
waiting, and finally with the greatest reluctance the Bavarian officials gave the information
that they had not been advised of a declaration of war, which as a matter of fact did not take
place till two days later. As showing how dependence on the government has become a
matter of habit in crises, on the same day on which the press representatives were treated so
superciliously by the Bavarian government when making inquiries regarding a matter of the
highest public concern, the Munich Zeitung, a Radical paper, called urgently upon the
imperial officials, in view of the disturbed state of the public mind, to “take charge of public
opinion!”

As a rule the papers have no right to find fault with the government for not
attempting to mould public opinion. Since Bismarck’s day, however, with the growth of
healthfulness in German political life, ministerial efforts to control the public view have
become less insidious, although they are not yet always sincere and devoid of trickery. At
the present time governmental influence finds its way to the public mind through papers
which are directly “official” and papers whose utterances are known as “semi-official” and
also by means of articles in journals where government influences are least suspected. The
directly and openly “official” papers, such as the Reichsanzeiger and the organs of the army
and navy and the various Anzeiger to be found in the Prussian provincial capitals and the
capitals of the other German states, are merely organs of governmental announcement, and
have no more influence on public opinion than departmental announcements in Washington.
Aside from these organs of the imperial and state governments, the various departments of
the federal government contain officials whose duty it is to furnish information to the press,
the most important bureau of that kind being found in the Foreign Office. The organization of these bureaus is as efficient as the German bureaucracy always is, and their work includes not only the furnishing of information to the press, but the preparation of editorial leaders and all sorts of articles intended to work upon public sentiment, which find publication in some of the “semi-official” papers.

As has been noted, the most important agency for disseminating news throughout Germany is Wolff’s Telegraphic Bureau, an institution which may be called a governmentally owned press association. It antedates the foundation of the new German empire, having been organized in 1865 as a joint stock company, with the Prussian government in control of a majority of the stock. Like Reuter’s Bureau, the Agence Havas and other national news agencies, the Wolff Bureau claims an international character. It maintains correspondents in foreign capitals and has in peace times affiliations with other great news agencies. It practically controls the news field in Germany, although its known governmental character causes German readers to discount its despatches to some extent, less because there is any possibility of Wolff’s Bureau falsifying the actual facts furnished from the world outside of Germany than from the feeling that other facts may be suppressed. To the American in Germany the tone of the Wolff messages, when they concern royalty, smacks not a little of unctuous servility. Good or bad, it forms the first means by which the German reader learns his foreign news: that it has not developed further in past years as a real newsgatherer is due less to governmental control than to the traditional lack of interest among Germans in international affairs.

Next to Wolff’s Bureau come the information bureaus of the government offices, referred to above, and that brings up the question of “semi-official” papers. Just which papers deserve this title is hard to say, the German press itself being often in the dark as to how far government influence extends over certain papers. Universally recognized as the government mouthpiece is the Norddeutsche Allgemeine Zeitung of Berlin, which has been in the service of the Prussian and the imperial government since the sixties. Bismarck used it from the early days of his chancellorship, and since that time it has published the government’s views, particularly on foreign affairs, prepared in the government offices and under the direction of the imperial chancellor and occasionally of the emperor himself. The statements of the rather old-fashioned Norddeutsche are recognized as having the highest authority. At the other end of the scale stands the rural daily which champions the government program and especially at election time rages against the Social Democrats with eager zeal in return for the local government advertising given by the all-powerful local administrator, the Landrat. Between the two there extends a whole line of papers, whose articles are regularly or occasionally inspired by the federal or state officials. Certain journals, like the Kölnische Zeitung, the Tägliche Rundschau of Berlin and the Hannoverische Courier, have been regularly used to express government opinion on domestic or foreign affairs, the actual subject-matter or the general ideas being furnished from the Home or Foreign Office. Frequently the reading public is hard put to it to know whether articles in these papers represent the ideas of the government or not, for even the staid Norddeutsche occasionally kicks over the traces and treats the topics of the day in a manner which is quite opposed to all theories of feudal-conservative administration. In proportion, however, as the news matter concerns the person or entourage of the Emperor or one of the rulers of the major states or a foreign crisis the articles in the papers in question are apt to reflect the feeling in government circles, for the value of the proper public treatment of such subjects is well understood by the governing class. The public and semi-public utterances of the Emperor are regularly reported by an official stenographer and carefully edited by the Foreign Office before publication.
“One cannot carry on international politics without a press.” This statement of the late Marschall von Bieberstein, formerly German foreign minister, is undoubtedly confirmed by the practice of every civilized land. But there is considerable difference between the information furnished the national press in London, Paris and Washington and the press articles which find their way into the German “semi-official” papers, a difference peculiar to the German government. In the more democratic countries the press is taken sufficiently into the government’s confidence as to facts to enable it to fulfil its mission as the mouthpiece of the nation. In Germany the imperial and Prussian government by the use of its system of anonymous inspiration has been accustomed to play upon the various organs in which the government’s views are wont to appear so as to control public opinion, fanning or restraining the fires of national enthusiasm as the foreign situation demands. This was illustrated in the careful management of the press in the Morocco crisis of 1911, when the anti-French and anti-British feeling was alternately stimulated and checked; incontestibly also in the days preceding the outbreak of war in 1914, when a series of “hands off!” articles following Austria’s ultimatum to Serbia was well adapted to steel and inspire the national spirit for the approaching crisis.

Occasionally, however, public opinion in Germany gets very much out of hand. This was the case during the Boer War, when the waves of enthusiasm for the South African republics rolled high in spite of all efforts of the governmentally inspired press to pour oil upon them, and in 1906 when through the Kaiser’s interview with the Daily Telegraph correspondent the last phases of the pro-British attitude of the imperial government at the time of the struggle with the Boers were laid bare. On such occasions as this, when German ideals are strongly touched, the press arrays itself with force and remarkable unanimity on the popular side and leads an outbreak of Teutonic fury that echoes in every home and hall of the Fatherland. Such unanimity is, however, rare. Some of the strongest papers are handicapped in their influence on public opinion by the suspicion of government inspiration. All tend to suffer, so far as they are not the mouthpieces of the Foreign Office, from a lack of a feeling of responsibility, passing in their leading articles from an unmotivated exultation over Germany’s present and future situation to an equally unfounded despair.

Much more than in foreign matters has the system of governmental influence been harmful to the German press in matters of domestic policy. While the ministry no longer poisons the wells of public opinion as in Bismarck’s day, it does greatly impair the influence of a great section of the press. During crises like that before the Reichstag election of 1907 or the discussions preceding the passage of the Defense Bill in 1913, the imperial ministry constantly played upon the keys and stops of the press. Here, however, there has grown up in the great National Liberal and Radical papers, not to speak of the vast network of Socialist organs, led by the Berlin Vorwärts, an array of popular tribunes, who guard jealously the interests of the economic groups which they represent and are themselves free from all suspicion of unfair government influence.

Almost all of the great papers of Germany are in fact strict party organs, only a few like the Lokalanzeiger of Berlin professing to be impartial in matters political. Political interests have, as we have seen, combined with economic interests in Germany, so that journals represent not merely a party, but an economic group as well. Thus the Kreuzzeitung, the old organ of the Conservative party, is likewise the most influential representative of agrarian interests, while Radical organs like the Frankfurter Zeitung have their constituency among the financial and commercial classes of the cities and the great National Liberal papers, like the Kölnische Zeitung, the Tägliche Rundschau of Berlin and the Hamburger Nachrichten, represent the industrial interests and those of the upper middle class. It is but natural that those political parties which are most closely identified with economic groups
should be represented by the most aggressive press. Thus the two groups which occupy opposite ends of the political scale, the Conservatives and the Socialists, whose organizations rest on a strong community of economic interest, have an aggressive and well-disciplined press; and as a result it is chiefly among the Conservative and Socialist editors that one finds men of strong personal influence on the counsels of the party. Next to them comes the press of the Centre party, led by the powerful Germany in Berlin, a journal which was founded in 1870 with the first leap into power of the ultramontane party and which has valiantly led the firing line in defense of Roman Catholic interests ever since. Between these extremes stands a long line of papers with liberal and radical leanings. It is remarkable indeed that by far the greater number of journals of national and international standing in Germany are National Liberal in faith or tendency, just as this party, with all of its trimming and irresolution in program, contains a vastly greater proportion of the brains of the empire than its electoral figures would lead one to suppose. Papers like the Kölnische Zeitung, the Münchner Neueste Nachrichten, the Schwäbische Merkur of Stuttgart, the Hannoverische Courier or the Tägliche Rundschau of Berlin, with their Radical contemporaries, the Berliner Tageblatt, the Vossische Zeitung of Berlin and the Frankfurter Zeitung, represent the very best that German journalism has to offer, both as newsgatherers and in the national-patriotic tone of their policies. In Germany as elsewhere the more narrow the political attitude of a paper, the less its importance as a gatherer of news.

Every political, social and economic direction then has its own press, which watches jealously over the interests of its group and presents them with more or less passion and narrowness. From the wild chauvinism of the Berlin Deutsche Tageszeitung or Post to the bitter class appeals of the Socialistic Vorwärts, each strikes its own peculiar note and plays the pipe for its party’s dancing. It seldom happens indeed that a newspaper ties itself completely to the fortunes of a political leader, as in France, nevertheless the party press reflects in striking fashion the individualism and separatism of German politics as well as the pettiness and narrowness which is a part of factional strife. The fulminations of the agrarian aristocrat against the inheritance tax, those of the manufacturer against the income tax or the radical against the tariff on food-stuffs and the appeals of the Social Democrat to class feeling echo and reecho harshly and shrilly according as the acoustic space furnished by the individual sheet is large or small.

The German, whether country squire, townsman or peasant-farmer, demands that the paper which he reads beside the family lamp or the restaurant table shall support first of all Germany’s claims abroad and secondly, the program of his particular party, with loyalty, which is the trait which he most reveres. In no country is a newspaper more clearly tagged with its party name, and in no country does the reader insist more strongly that it shall remain true to its colors. Through thick and thin, right or wrong, in disaster or success, the paper must be the defender, apologist and conservor of the party’s traditions. Every act of the party’s leaders must be championed, every move of the party’s opponents must be attacked or given an unflattering interpretation. Characteristic of this is the attitude of the papers in reporting political debates. “I always took care that the Whig dogs should not get the best of it,” said Dr. Johnson in speaking of his parliamentary reporting, and something like this has become the motto of the German press. Even journals of the highest standing almost always have their party’s representative emerge from a political discussion covered with honor “for his clear and practical demonstration of the facts,” while his opponent invariably “seeks to confuse the matter and takes refuge in excuses and hedging.”

The result of this attitude on public opinion is still further to narrow and to embitter political life. The unfortunate side of this life, already pointed out, is that it splits the nation into factions and creates among these factions the feeling that the government is a hostile
force with which in various crises the best terms possible are to be made. The result is that
the German citizen gets very little help from the press in laying aside the swaddling clothes
of political separatism. He swears by his Frankfurter or Magdeburger or Kölnische and
avoids other papers like the pest. This attitude toward the newspapers is characteristic of the
narrow partisan in every country. An especially unfortunate result in Germany, however, is
the weakening of liberalism through the dissipation of its energies in factional controversies.
Radical and National Liberal papers have found it as impossible to make common cause
against feudal pressure and agrarian demands in the press as in parliament, and the Social
Democratic papers attack the middle-class Berlin Tageblatt as fiercely as they do the feudal
Kreuzzeitung.

Unfortunately then political factionalism and blind subserviency to the party
program harm the independence of the press and damage its influence as an organizer of
public opinion. On the other hand it seems that the sources of public opinion are kept purer
from strictly financial and business contamination in Germany than elsewhere. Such bribery
as there is, is usually backed in some way by government influence, which dominates many
a petty provincial or rural sheet. In the various “districts” and “circles” into which Prussia
is divided some one of the local newspapers enjoys the official advertising and is regarded
as the governmental mouthpiece. This provincial sheet, which assumes the proud title of
“Official Gazette” (Amtsund Kreisblatt), is a private undertaking, of course, but is strongly
under the influence of the local crown official, the Landrat, who has the privilege of
withdrawing at any time the official titles and official advertising. Naturally the paper is
expected to support the government, and particularly the policies of the Conservative party,
with all vigor, and the Landrat sees to it that it goes for the Social Democrats without gloves
and he permits nothing to pass uncensured that might be construed as a reflection on the ruler
or the monarchy. During electoral campaigns the editor of such a paper must do his utmost
to prevent any increase in the Radical or the Socialist vote in his district, if he would avoid
a vigorous bullying from the all-powerful Landrat, who is nearly always a member of the
feudal class.

Aside from such instances of official terrorism, it is not usual to find German
journals listening to financial seduction. Certain papers, it is true, represent particular
business interests, as the Rheinwestfälische Zeitung of Düsseldorf those of the Westphalian
mine operators and iron and steel manufacturers. The big business interests, indeed, have
their own press, which is in great measure independent of party, although supporting of
course Conservative or National Liberal policies. Thus the Krupps and iron and steel
interests are said to own the Berlin Neueste Nachrichten, which represents most adequately
those industries and the financiers behind them, while individuals identified with the
Agrarian League own the Berlin Tageszeitung. It is, however, extremely rare when a
newspaper modifies its understood political policy as a result of financial considerations.
Especially in the case of the Social Democratic press is the influence of the advertising
columns on the papers’ policy negligible.

Of all the influences then which work upon the press, the government through its
various open and subterranean agencies is far and away the strongest. Even in peaceful times
the Berlin ministry may hold a heavy hand on public information through its control of the
only great news agency, Wolff’s Bureau, to which every German paper is in a sense
tributary, from the metropolitan journal with its four editions daily to the “patent outside”
of the East Prussian or Bavarian village. The result is a marked lack of enterprise in seeking
news on the part of the individual journals, greatly in contrast with the papers of western
Europe and America. To begin with, in the very arrangement of the greater number of
German papers the news plays a much less important part than the editorial and essay, for
the telegraphic news is usually relegated to the inside pages, the first page being given over to discursive articles, which in the greater journals may concern the most recent news, but in the smaller papers usually limp twenty-four hours behind it. More often the first columns in the morning or evening editions are devoted to an essay on some political or sociological subject or to a résumé, such as would be found in the Sunday issue of an American paper. Even some of the best German newspapers put the latest news in the last columns of the inside of the last page, the place which seems to foreign readers the least conspicuous in the whole paper. News is indeed furnished with startling frequency by the greater German papers, such journals as the Kölnische Zeitung putting out four editions daily, with a specialization that is characteristic of other sides of German industry, one edition containing general news, another especially market reports, etc. The wealth of material which such a daily offers, including social and political philosophy, fiction, poetry, travel, biography and literary criticism, much of it of considerable scientific and literary value, is confusing to the American, who seeks first of all the news in his daily paper.

There are other confusing sides in the German attitude towards the day’s news when approached with British or American prejudices. One of the most striking is the habit of even the best papers of interlarding news despatches with editorial comment. Provincial sheet and metropolitan daily alike are apt to introduce telegraphic news which is favorable to the cause which they represent with salvos of editorial applause, while unfavorable items are emasculated by constant interlinear comments signed “D.R.” (Der Redakteur, the editor), such as, “We doubt that!” “Well, we shall wait and see!” or even “This is an open falsehood!” or “Such a campaign of lies!” and similar remarks. Or passages of crucial importance in the text may be interrupted by a bracketed row of question marks or points of exclamation. This confusing mixture of editorial opinion with the day’s news is not countenanced by some prominent publishers, like Louis Ullstein, the owner of the Berlin Morgenpost and other publications, who have tried to make head against it. Like most newspaper sins, this is also to be laid at the door of the reader, for it must be said that the German reader likes to have his news served up in a way which shall spice the attractiveness of welcome announcements and soften the bitterness of unwelcome things. The German, it must never be forgotten, embraces a cause with his whole soul, whether it be the cause of the whole Fatherland, or that of his economic class or political party, or even his side in the teapot tempest of local politics. He is a devoted champion and good fighter, but also a hard loser, and his tendency to romanticism often permits him to revel in a paradise of dreams even when the enemy is at the gate. This characteristic of the great body of Germans is not of course a weakness of the politically trained classes nor of those aggressive men who guided Germany’s industry to the front. But it must not be forgotten that the great majority of German citizens are just emerging from a state of political immaturity. They devote themselves with patient conscientiousness and enthusiasm to the daily duties of home and family, handiwork or profession, and leave political leadership to those who make a profession of ruling, quite willing to accept their orders so long as their patriotism seems trustworthy.

If the liking for news flavored with the sauce of editorial comment indicates a weakness in German public opinion, the distaste for a directly sensational treatment of news is a strength. Germany has, to be sure, its political press of a sensational sort. The wild chauvinism of some of the Berlin and provincial journals is not to be outdone in Paris or Petrograd; but in all that does not concern politics, the most sensational of German journals is as mild when compared with certain French or American dailies as the poems of Felicia Hemans with the early effusions of Swinburne. In the whole field of personalities and in the matter of crime especially, the German papers show a decency and reserve all the more
refreshing in view of the flood of impure books which has risen to such a height in Germany. There are, to be sure, yellow journals in Berlin and Munich, and especially certain comic weeklies, the clever *Simplicissimissi* at their head, show a coarseness of tone which has on more than one occasion shut them out from the mails in those countries where puritanism is still a strong tradition; but the German demands that the news columns of his daily paper shall be clean, and the law backs him up in it. For here as elsewhere in German life, the correction of abuses is not left simply to the force of public opinion. Court proceedings must be reported in such a way that they cannot possibly educate to crime; certain classes of cases are entirely shut out of the papers, and it may be said in general that the atmosphere of the German court room does not lend itself to yellow journalism. Offenders against the press laws are invariably punished, often with a severity which seems really out of proportion to the offense.

Especially does the German journalist have to walk carefully to avoid conflict with the rigid libel laws. Even the most innocent remark about the behavior of some public servant or a news item which permits of a construction placing some private individual in an unflattering light may call forth a demand for a public retraction or provoke an expensive libel suit. The German law, indeed, goes very far in protecting the individual in all the rights of personality, especially in the right of avoiding publicity. The retractions published from time to time in German papers are one of the most enlightening chapters in a study of the German press, illustrating as they do how fully the rights of the individual are guarded. The feeling seems to prevail that the doings of no person or group of persons shall be dragged before the public without the consent of those concerned. It goes without saying that the interviewer plays no considerable rôle in the German newspaper world, and that the position of the reporter is much less important than in those countries where an unrestricted license of the press prevails. Indeed the German law goes so far that in many ways the importance of the press as a sanitary agent is taken away. A newspaper is sometimes forced by threats or legal sentence to retract a statement when the retraction is practically a falsehood, for the mere fact that a news item is true does not by any means serve as a defense against a libel suit, if the item may be construed as a reflection on the behavior of any person or group of persons. Thus a case is recorded where an editor was convicted for publishing a statement reflecting on a hospital, although it was shown in the court proceedings that the statement had been made in a public medical gathering. In this case the law guaranteed to the physician the right of criticism, but denied to the editor the right of publicity.

The libel laws are the constant burden of editorial complaint in Germany. Especially the Social Democratic press has had to suffer under their administration at the hands of their political opponents. The German bench is far above any suspicion of bias except that which comes with the belief held in official circles that the Socialists are public enemies, combined with a reverence for those in authority which degenerates at times into servility. This, the Socialist press has contended, was hardly the right source from which it might expect a square deal. In the nineties and the earliest years of the present century heavy sentences, often from three to five years in prison, were pronounced against Social Democratic editors for *lèse majesté*. The modification of the law in 1908 (cf. page 108) did much to soften the tone of the Socialist and Radical press towards royalty in Prussia; but prosecutions for libel still occur when the press of these parties breaks the bounds prescribed by conservative feeling in its criticism of some municipal official or even of a minister of state. Such cases are usually fought bitterly up through the various courts and usually result in a conviction. With the increase of the number and influence of the Socialist press — the party had by 1910 established daily newspapers in more than 68 cities — the watchfulness of prosecuting officers under the inspiration of the higher provincial officials is kept constantly alert. All
of this has not tended to soften the tone of the Socialist editor, who never turns the other cheek to the smiter. This unfortunate state of affairs has done much to lower the tone of political discussion in Germany to a bitterness and brutality, which, especially in electoral campaigns, swells into a crescendo of billingsgate and presents a most unattractive side of the German press. No stronger evidence could be presented that the cure for the shrill outbreaks of political immaturity is to be found in liberty and not in constant paternal correction.

In spite of these false notes, the lack of sensationalism in the treatment of news is one of the most refreshing characteristics of the German press. The fact that in Prussia and in some other German states every issue must show the names of the persons responsible for the news and editorial portions and for the advertising columns is a guarantee; and the innate German love of truth and hatred of sham hangs heavy on the success of those metropolitan sheets which show a dangerous tendency to rival the yellow papers of France and America. That these tendencies are manifest in some of the Berlin papers is not to be denied, and it is to be expected that they will continue to grow in proportion as the Americanization of the imperial capital emancipates the individual spirit from the traditions of the past. But the whole spirit of German public opinion is opposed to this hectic demoralization of the press.

A few years ago, when an enterprising Berlin firm established an illustrated weekly on the model of those British and American papers which have a maximum of the personal in pictures and articles and a minimum of news and literature, the undertaking was received with a shaking of heads everywhere. “This personal advertisement is against the genius of our people,” remarked a prominent Leipsic business man concerning it. “It is an importation from America and is fostering a spirit which Germany has never known.” It must be said in defense of America, however, that the German press admits without hesitation advertisements and a sort of humor which in America would be impossible in any paper using the mails.

The reformation of the libel laws cannot long be delayed in Germany, and the result will almost certainly be an improvement in the tone of political and public discussion. It is, however, very improbable that the tone of the German daily papers will be much brightened thereby. The staring headlines which form such a feature of the foreign press the German newspaper reader knows only in a mild form: he demands that he be given that which is true or at least that which is in accord with his ideas of the truth, and wants no trifling with his news in order to make it sensational. The interesting “write-up” of the American or English reporter cannot therefore find a place in a paper which takes itself and its functions so seriously. The editor may himself destroy the effect of the news by critical interpolations, but these spring in most cases from soul convictions which are those of the reader himself. The latter disdains any attempt to make either news or editorial matter interesting, and this paired with the German lack of feeling for literary form makes the German press dull reading for those who seek in it anything like the sparkle and crisply classical presentation of the Paris journals. The dull and formal narration of the news, fortified usually by editorial comment, political résumés, rhodomontades of doubtful inspiration, accurate but colorless police and market reports, with here and there an outburst of Teutonic rage against foreign competitors or political opponents, — these make up the current parts of the newspapers, and certainly do not appeal to those who read the journals for the froth of life or expect from them models of literary excellence.

Since Schopenhauer’s day, indeed, “newspaper German” has been a term of contempt. “Pig German, — I beg pardon, — newspaper German!” exclaimed the celebrated pessimist more than half a century ago in a memorable essay on “The Butchery of the German Language.” “The linguistic debauch,” he exclaimed in his customary gentle style,
“to which no other nation can show a parallel, seems to proceed in the main from the political newspapers, the lowest form of literature, and go from them into the literary journals and finally into books.” It is certain that newspaper German has done nothing to remove this reproach since Schopenhauer’s day; indeed, the style of German prose, which seems to grow more cumbersome and unwieldy every year, can charge much of its degeneracy to the daily and weekly press. An illustrated journal of the highest standing introduces to its readers a series of pictures “from the by-the-Russians-temporarily-occupied-and-by-the-German-army-under-the-brilliant-leadership-of-General-von-Hindenburg-gloriously-reconquered province of East Prussia,” and similar sins against all of the muses may be found in the best journals. Of recent years a reaction has been observable, led by papers like the Vossische Zeitung of Berlin, “Auntie Voss,” as it is humorously called by its contemporaries, which looks back on a century and three-quarters of literary history since no less a stylist than young Gotthold Ephraim Lessing contributed to its early numbers, or the Frankfurter Zeitung, which commands some very able pens.

Such criticisms of the German newspaper as literature, however, apply only to its news and editorial columns. Besides these transient expressions of the popular spirit which are written day by day and exist only for a day, the German journals, provincial and metropolitan alike, offer each day a mass of material, which is not merely literature in the strict sense of the word, but which for richness and variety of literary and scientific material has no equal anywhere in the world’s press. It is the custom for most papers to maintain a feuilleton, separated from news and editorial matter by a type-bar, which reserves the lower half of the page for matters of more lasting content, non-contemporaneous or quasi-contemporaneous in their interest. This essay was a French invention developed in Germany early in the nineteenth century by the Jewish prose virtuoso Heinrich Heine, and it has cultivated a lightness and gracefulness of style which is strikingly in contrast to the soggy editorial or news paragraph. In light essays on science, literature or art, the whole field of modern culture is laid under tribute with a style which recalls the conversational tone of the drawing room or club. The feuilleton writers of Germany lack the grace which marks the best salon literateurs of the French press; but they count among them some of the most brilliant stylists of the nation and maintain a high standard in the wealth and variety of their scientific material.

To these articles of critical and conversational tone are to be added literary works, such as novels by the best authors of Germany, published serially in the daily papers. Gerhart Hauptmann’s Atlantis first appeared in the daily edition of the Berlin Tageblatt, and other names scarcely less well known on the German Parnassus are to be found in the daily press of the larger cities. Articles of more solid import appear in special supplements, forming a weekly or semi-weekly part of the larger papers. Some of these command the ablest pens in Germany in the field of literature, art and science, and become an indispensable reference material for investigators and critics. Indeed, the literary criticism of such papers as the Berlin Tag and the Vossische Zeitung or the Cologne Volkszeitung is among the best that appears anywhere in Germany. The well-nigh inexhaustible wealth of material offered in this way may be shown by a résumé of the various supplements issued within one week to accompany the morning and afternoon news and editorial matter and market reports of a large Berlin newspaper: a technical supplement of eight pages; a supplement containing essays on legal subjects, four pages; a literary review, two pages; an illustrated supplement, six pages; a comical supplement, six pages; a household supplement, six pages; and a page each for women’s affairs, for art and drama criticism and for tourists. In addition the regular issues contained a letter from China on politico-economic subjects, a sketch of the Hungarian drama, and essays on the teaching of pedagogics in the universities and on the sleeping
sickness in the African colonies, and one page daily devoted to a review of sports, mostly horse racing and aeronautics.

It is evident that while the German newspaper does not as a newsgatherer satisfy western demands, it brings to its readers each day a wealth of material which in other lands would find its way into the “heavier” magazines or into scientific periodicals. It is evident also that while the German who reads his chosen newspaper may be insufficiently informed or biased regarding that which is called in press parlance “live news,” he is schooled in scientific methods of observation and inquiry and in accuracy of reporting regarding those things which can be divorced from the ephemeral passions of the day. He finds in his daily or weekly journal not so much a raconteur of the day’s doings as a pedagogue and staid mentor, who delights to lead him into the devious paths of science or the romantic world of ideas and ideals. The pedagogical instinct and the enthusiasm for knowledge for its own sake, the love of truth and the careful accuracy in method, narrowness of political view and passionate insistence on the personal standpoint: these ingredients of German character are nowhere more clearly exemplified than in the nation’s press.”

The Palestine Mandate

The Council of the League of Nations:

July 24, 1922

Whereas the Principal Allied Powers have agreed, for the purpose of giving effect to the provisions of Article 22 of the Covenant of the League of Nations, to entrust to a Mandatory selected by the said Powers the administration of the territory of Palestine, which formerly belonged to the Turkish Empire, within such boundaries as may be fixed by them; and

Whereas the Principal Allied Powers have also agreed that the Mandatory should be responsible for putting into effect the declaration originally made on November 2nd, 1917, by the Government of His Britannic Majesty, and adopted by the said Powers, in favor of the establishment in Palestine of a national home for the Jewish people, it being clearly understood that nothing should be done which might prejudice the civil and religious rights of existing non-Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country; and

Whereas recognition has thereby been given to the historical connection of the Jewish people with Palestine and to the grounds for reconstituting their national home in that country; and

Whereas the Principal Allied Powers have selected His Britannic Majesty as the Mandatory for Palestine; and

Whereas the mandate in respect of Palestine has been formulated in the following terms and submitted to the Council of the League for approval; and

Whereas His Britannic Majesty has accepted the mandate in respect of Palestine and undertaken to exercise it on behalf of the League of Nations in conformity with the following provisions; and

Whereas by the afore-mentioned Article 22 (paragraph 8), it is provided that the degree of authority, control or administration to be exercised by the Mandatory, not having been previously agreed upon by the Members of the League, shall be explicitly defined by the Council of the League Of Nations; confirming the said Mandate, defines its terms as follows:

ARTICLE 1. The Mandatory shall have full powers of legislation and of administration, save as they may be limited by the terms of this mandate.
ART. 2. The Mandatory shall be responsible for placing the country under such political, administrative and economic conditions as will secure the establishment of the Jewish national home, as laid down in the preamble, and the development of self-governing institutions, and also for safeguarding the civil and religious rights of all the inhabitants of Palestine, irrespective of race and religion.

ART. 3. The Mandatory shall, so far as circumstances permit, encourage local autonomy.

ART. 4. An appropriate Jewish agency shall be recognised as a public body for the purpose of advising and co-operating with the Administration of Palestine in such economic, social and other matters as may affect the establishment of the Jewish national home and the interests of the Jewish population in Palestine, and, subject always to the control of the Administration to assist and take part in the development of the country. The Zionist organization, so long as its organization and constitution are in the opinion of the Mandatory appropriate, shall be recognised as such agency. It shall take steps in consultation with His Britannic Majesty's Government to secure the co-operation of all Jews who are willing to assist in the establishment of the Jewish national home.

ART. 5. The Mandatory shall be responsible for seeing that no Palestine territory shall be ceded or leased to, or in any way placed under the control of the Government of any foreign Power.

ART. 6. The Administration of Palestine, while ensuring that the rights and position of other sections of the population are not prejudiced, shall facilitate Jewish immigration under suitable conditions and shall encourage, in co-operation with the Jewish agency referred to in Article 4, close settlement by Jews on the land, including State lands and waste lands not required for public purposes.

ART. 7. The Administration of Palestine shall be responsible for enacting a nationality law. There shall be included in this law provisions framed so as to facilitate the acquisition of Palestinian citizenship by Jews who take up their permanent residence in Palestine.

ART. 8. The privileges and immunities of foreigners, including the benefits of consular jurisdiction and protection as formerly enjoyed by Capitulation or usage in the Ottoman Empire, shall not be applicable in Palestine. Unless the Powers whose nationals enjoyed the afore-mentioned privileges and immunities on August 1st, 1914, shall have previously renounced the right to their re-establishment, or shall have agreed to their non-application for a specified period, these privileges and immunities shall, at the expiration of the mandate, be immediately reestablished in their entirety or with such modifications as may have been agreed upon between the Powers concerned.

ART. 9. The Mandatory shall be responsible for seeing that the judicial system established in Palestine shall assure to foreigners, as well as to natives, a complete guarantee of their rights. Respect for the personal status of the various peoples and communities and for their religious interests shall be fully guaranteed. In particular, the control and administration of Wakfs shall be exercised in accordance with religious law and the dispositions of the founders.

ART. 10. Pending the making of special extradition agreements relating to Palestine, the extradition treaties in force between the Mandatory and other foreign Powers shall apply to Palestine.

ART. 11. The Administration of Palestine shall take all necessary measures to safeguard the interests of the community in connection with the development of the country, and, subject to any international obligations accepted by the Mandatory, shall have full power to provide for public ownership or control of any of the natural resources of the
country or of the public works, services and utilities established or to be established therein. It shall introduce a land system appropriate to the needs of the country, having regard, among other things, to the desirability of promoting the close settlement and intensive cultivation of the land. The Administration may arrange with the Jewish agency mentioned in Article 4 to construct or operate, upon fair and equitable terms, any public works, services and utilities, and to develop any of the natural resources of the country, in so far as these matters are not directly undertaken by the Administration. Any such arrangements shall provide that no profits distributed by such agency, directly or indirectly, shall exceed a reasonable rate of interest on the capital, and any further profits shall be utilised by it for the benefit of the country in a manner approved by the Administration.

ART. 12. The Mandatory shall be entrusted with the control of the foreign relations of Palestine and the right to issue exequaturs to consuls appointed by foreign Powers. He shall also be entitled to afford diplomatic and consular protection to citizens of Palestine when outside its territorial limits.

ART. 13. All responsibility in connection with the Holy Places and religious buildings or sites in Palestine, including that of preserving existing rights and of securing free access to the Holy Places, religious buildings and sites and the free exercise of worship, while ensuring the requirements of public order and decorum, is assumed by the Mandatory, who shall be responsible solely to the League of Nations in all matters connected herewith, provided that nothing in this article shall prevent the Mandatory from entering into such arrangements as he may deem reasonable with the Administration for the purpose of carrying the provisions of this article into effect; and provided also that nothing in this mandate shall be construed as conferring upon the Mandatory authority to interfere with the fabric or the management of purely Moslem sacred shrines, the immunities of which are guaranteed.

ART. 14. A special commission shall be appointed by the Mandatory to study, define and determine the rights and claims in connection with the Holy Places and the rights and claims relating to the different religious communities in Palestine. The method of nomination, the composition and the functions of this Commission shall be submitted to the Council of the League for its approval, and the Commission shall not be appointed or enter upon its functions without the approval of the Council.

ART. 15. The Mandatory shall see that complete freedom of conscience and the free exercise of all forms of worship, subject only to the maintenance of public order and morals, are ensured to all. No discrimination of any kind shall be made between the inhabitants of Palestine on the ground of race, religion or language. No person shall be excluded from Palestine on the sole ground of his religious belief. The right of each community to maintain its own schools for the education of its own members in its own language, while conforming to such educational requirements of a general nature as the Administration may impose, shall not be denied or impaired.

ART. 16. The Mandatory shall be responsible for exercising such supervision over religious or eleemosynary bodies of all faiths in Palestine as may be required for the maintenance of public order and good government. Subject to such supervision, no measures shall be taken in Palestine to obstruct or interfere with the enterprise of such bodies or to discriminate against any representative or member of them on the ground of his religion or nationality.

ART. 17. The Administration of Palestine may organise on a voluntary basis the forces necessary for the preservation of peace and order, and also for the defence of the country, subject, however, to the supervision of the Mandatory, but shall not use them for purposes other than those above specified save with the consent of the Mandatory. Except for such purposes, no military, naval or air forces shall be raised or maintained by the
Administration of Palestine. Nothing in this article shall preclude the Administration of
Palestine from contributing to the cost of the maintenance of the forces of the Mandatory in
Palestine. The Mandatory shall be entitled at all times to use the roads, railways and ports
of Palestine for the movement of armed forces and the carriage of fuel and supplies.

ART. 18. The Mandatory shall see that there is no discrimination in Palestine against
the nationals of any State Member of the League of Nations (including companies
incorporated under its laws) as compared with those of the Mandatory or of any foreign State
in matters concerning taxation, commerce or navigation, the exercise of industries or
professions, or in the treatment of merchant vessels or civil aircraft. Similarly, there shall be
no discrimination in Palestine against goods originating in or destined for any of the said
States, and there shall be freedom of transit under equitable conditions across the mandated
area. Subject as aforesaid and to the other provisions of this mandate, the Administration of
Palestine may, on the advice of the Mandatory, impose such taxes and customs duties as it
may consider necessary, and take such steps as it may think best to promote the development
of the natural resources of the country and to safeguard the interests of the population. It may
also, on the advice of the Mandatory, conclude a special customs agreement with any State
the territory of which in 1914 was wholly included in Asiatic Turkey or Arabia.

ART. 19. The Mandatory shall adhere on behalf of the Administration of Palestine
to any general international conventions already existing, or which may be concluded
hereafter with the approval of the League of Nations, respecting the slave traffic, the traffic
in arms and ammunition, or the traffic in drugs, or relating to commercial equality, freedom
of transit and navigation, aerial navigation and postal, telegraphic and wireless
communication or literary, artistic or industrial property.

ART. 20. The Mandatory shall co-operate on behalf of the Administration of
Palestine, so far as religious, social and other conditions may permit, in the execution of any
common policy adopted by the League of Nations for preventing and combating disease,
including diseases of plants and animals.

ART. 21. The Mandatory shall secure the enactment within twelve months from this
date, and shall ensure the execution of a Law of Antiquities based on the following rules.
This law shall ensure equality of treatment in the matter of excavations and archaeological
research to the nationals of all States Members of the League of Nations.

(1) “Antiquity” means any construction or any product of human activity earlier than
the year 1700 A.D.

(2) The law for the protection of antiquities shall proceed by encouragement rather
than by threat. Any person who, having discovered an antiquity without being furnished with
the authorization referred to in paragraph 5, reports the same to an official of the competent
Department, shall be rewarded according to the value of the discovery.

(3) No antiquity may be disposed of except to the competent Department, unless this
Department renounces the acquisition of any such antiquity. No antiquity may leave the
country without an export licence from the said Department.

(4) Any person who maliciously or negligently destroys or damages an antiquity
shall be liable to a penalty to be fixed.

(5) No clearing of ground or digging with the object of finding antiquities shall be
permitted, under penalty of fine, except to persons authorised by the competent Department.

(6) Equitable terms shall be fixed for expropriation, temporary or permanent, of
lands which might be of historical or archaeological interest.

(7) Authorization to excavate shall only be granted to persons who show sufficient
guarantees of archaeological experience. The Administration of Palestine shall not, in
granting these authorizations, act in such a way as to exclude scholars of any nation without
good grounds.

(8) The proceeds of excavations may be divided between the excavator and the
competent Department in a proportion fixed by that Department. If division seems
impossible for scientific reasons, the excavator shall receive a fair indemnity in lieu of a part
of the find.

ART. 22. English, Arabic and Hebrew shall be the official languages of Palestine.
Any statement or inscription in Arabic on stamps or money in Palestine shall be repeated in
Hebrew and any statement or inscription in Hebrew shall be repeated in Arabic.

ART. 23. The Administration of Palestine shall recognise the holy days of the
respective communities in Palestine as legal days of rest for the members of such
communities.

ART. 24. The Mandatory shall make to the Council of the League of Nations an
annual report to the satisfaction of the Council as to the measures taken during the year to
carry out the provisions of the mandate. Copies of all laws and regulations promulgated or
issued during the year shall be communicated with the report.

ART. 25. In the territories lying between the Jordan and the eastern boundary of
Palestine as ultimately determined, the Mandatory shall be entitled, with the consent of the
Council of the League of Nations, to postpone or withhold application of such provisions of
this mandate as he may consider inapplicable to the existing local conditions, and to make
such provision for the administration of the territories as he may consider suitable to those
conditions, provided that no action shall be taken which is inconsistent with the provisions
of Articles 15, 16 and 18.

ART. 26. The Mandatory agrees that, if any dispute whatever should arise between
the Mandatory and another member of the League of Nations relating to the interpretation
or the application of the provisions of the mandate, such dispute, if it cannot be settled by
negotiation, shall be submitted to the Permanent Court of International Justice provided for
by Article 14 of the Covenant of the League of Nations.

ART. 27. The consent of the Council of the League of Nations is required for any
modification of the terms of this mandate.

ART. 28. In the event of the termination of the mandate hereby conferred upon the
Mandatory, the Council of the League of Nations shall make such arrangements as may be
deemed necessary for safeguarding in perpetuity, under guarantee of the League, the rights
secured by Articles 13 and 14, and shall use its influence for securing, under the guarantee
of the League, that the Government of Palestine will fully honour the financial obligations
legitimately incurred by the Administration of Palestine during the period of the mandate,
including the rights of public servants to pensions or gratuities.

The present instrument shall be deposed in original in the archives of the League
of Nations and certified copies shall be forwarded by the Secretary-General of the League
of Nations to all members of the League.

Done at London the twenty-fourth day of July, one thousand nine hundred and
twenty-two.

Möglichkeiten und Ursachen, Dr. Georg Lüttke Verlag, Berlin, (1941).

1412. It should be noted that Arnold Sommerfeld stated at the end of 1915, that Einstein was the greatest spirit since Gauss and Newton. See: Letter from A. Sommerfeld to K. Schwarzschild of 28 December 1915, Niedersächsische Staats- und Universitätsbibliothek Göttingen, Cod. Ms. K. Schwarzschild 743. Sommerfeld was one of the first to promote Einstein while demeaning the deceased Poincaré in Sommerfeld’s annotations for Das Relativitätsprinzip, B. G. Teubner, Berlin, Leipzig, (1913)—a book published shortly after Poincaré died, which failed to include any of Poincaré’s works, but obviously helped to promote Sommerfeld.

1936. The literature of the “Anglo-Israel” or “British-Israel” movement is extensive. To name but a few of the hundreds of titles published from the early 1800’s to the present: R. Weaver, Monumenta antiqua: Or, The Stone Monuments of Antiquity Yet Remaining in the British Isles, Particularly as Illustrated by Scripture. Also a Dissertation on Stonehenge: Together with a Compendious Account of the Druids, To Which Are Added Conjectures on the Origin and Design of the Pyramids of Egypt, and of the Round Towers of Ireland, J.B. Nichols & Son, London, (1840). See also: E. Hine, The English Nation Identified with the Lost House of Israel by Twenty-Seven Identifications, J. Heywood, Birmingham, R. Davies, Manchester, (1871). See also: W. Carpenter, The Israelites Found in the Anglo-Saxons: The Ten Tribes Supposed to Have Been Lost, Traced from the Land of Their Captivity to Their Occupation of the Isles of the Sea: With an Exhibition of Those Traits of Character and National Characteristics Assigned to Israel in the Books of the Hebrew Prophets, G.

1944. A. Sammes, Britannia Antiqua Illustrata: Or, the Antiquities of Ancient Britain, Derived from the Phoenicians: Wherein the Original Trade of this Island Is Discovered, the Names of Places, Offices Dignities, as Likewise the Idolatry, Language, and Customs of the
Primitive Inhabitants Are Clearly Demonstrated from That Nation. . . Together with a Chronological History of this Kingdom, from the First Traditional Beginning, until the Year of Our Lord 800. . . Faithfully Collected out of the Best Authors . . . with the Antiquities of the Saxons, as Well as Phoenicians, Greeks, and Romans. The First Volume, Printed by T. Roycroft, for the Author, London, 1676

1949. T. Brightman, Brightmans predictions and prophecyes vvritten 46 yeares since: concerning the three churches of Germanie, England, and Scotland : fore-telling the miserie of Germanie, the fall of the pride of bishops in England by the assistance of the Scottish Kirk: all which should happen, as he foretold, between the yeares of 36 and 41, &c., (1641); and A reuelation of the Reuelation: that is, the Reuelation of St. John opened clearely with a logi call resolution and exposi tion : wherein the sense is cleared, out of the Scripture, the event also of thinges foretold is discussed out of the church-historyes, Amsterdam, (1615); and The revelation of S. Iohn illustrated with an analysis & scholions Where in the sence is opened by the scripture, & the event of things fore-told, shewed by histories, Class [on van Dorpe], Leyden, (1616); and A revelation of the Apocalyps, that is, the Apocalyps of S. John illustrated with an analysis & scolions where the sense is opened by the scripture, & the events of things foretold, shewed by histories. Hereunto is prefixed a generall view: and at the end of the 17. chapter, is inserted a refutation of R. Bellarmine touching Antichrist, in his 3. book of the B. of Rome, Iudocus Hondius & Hendrick Laurens, Amsterdam, (1611); and Apocalypsis apocaypseos: id est Apocalypsis D. Joannis analysi et scholiiis illustrata; ubi ex scriptura sensus rerumque praedictarum ex historiis eventus discutiuntur. Huic Synopsis praefigitur universalis, et refutatio Rob. Bellarmini de antichristo libro tertio de Romano Pontifice ad finem capitis decimi septimi inseritur, Heidelberg, (1612); and Een Grondighe ondeckinghe ofte duydelijcke uytlegginghe, met een logicale ontknoopinghe, over de gantsche openbaringe Johannis des Apostels: waer in de sin uyt de Schriftuere verklaert, ende inghelyichijs de uytkomsten der dinghen die voorseyt waren, met de kerchelijcke historien aenghewesen worden, Jan Evertsz Cloppenburch, boeckvercooper, 'tAmsteldredam, (1621).

1958. J. Collet, A Treatise of the Future Restoration of the Jews and Israelites to Their Land: with Some Account of the Goodness of the Country, and Their Happy Condition There, till They Shall Be Invaded by the Turks : with Their Deliverance from All Their Enemies, When the Messiah Will Establish His Kingdom at Jerusalem, and Bring in the Last Glorious Ages, Printed for J. Highmore, M. Cooper and G. Freer, London, (1747).

1962. U. Shipton, The Second Part of Mother Shiptons Prophecies: With Sixteen Others. . . Not Onely Concerning the Kingdom of England, but Also of the Turks Invading Germany, the Downfall of the Pope, and the Calling of the Jews, Printed for Joshua Coniers in the Long-Walke near Christ-church hospital, London, (1651). See also: R. Head, The Life and Death of the Famous Mother Shipton; Containing, an Account of Her Strange Birth, and the Most Important Passages of Her Life; Also Her Prophecies Now Newly Collected and Explained, and Illustrative of Some of the Most Wonderful Events That Have Happened, or Are to Come to Pass. Taken from a Very Scarce Copy, Published Upwards of Two Hundred Years Since, Dean and Munday, London. See also: R. Head, The Life and Death of Mother Shipton. Being not only a true Account of her Strange BIRTH, and most Important Passages of her LIFE, but also of her Prophecies: Now newly Collected. and Historically Experienced,
from the time of her Birth, in the Reign of KING HENRY the VII, until this present year 1684. Containing the most Important Passages of State during the reign of these Kings and Queens of England following, viz. Henry the VIII. King James. Edward the VI. King Charles the I. Queen Mary. King Charles the II. Queen Elizabeth. Whom God Preserve. Strangely Preserved amongst other writings belonging to an Old Monastery in York-shire, and now published for the Information of Posterity. To which are added some other Prophecies yet unfulfil’d. As also Mr. Folwell’s Predictions concerning the Turk, Pope, and French King, With Reflections thereupon, Printed for Benj. Harris, at the Stationers-Armes and Anchor under the Piazza of the Royal Exchange, London, (1684).

Notes 2599

to Which Is Prefixed a Sermon Preached Before the Society on April 18, 1822 at the Parish Church of St. Paul, Covent Garden, by the Rev. George Stanley Faber, London Society for Promoting Christianity amongst the Jews, London, (1822); and The Conversion of the Jews to the Faith of Christ the True Medium of the Conversion of the Gentile World: a Sermon Preached Before the London Society for Promoting Christianity Amongst the Jews, on Thursday, April 18, 1822, at the Parish Church of St. Paul, Convent Garden, Published for the Baltimore Auxiliary Society for Meliorating the Condition of the Jews, Baltimore, (1823); and Protestantism & Catholicism: the Catholic Question: to the editor of the St. James’s Chronicle, St. James Chronicle, Edinburgh, (1829); and The Difficulties of Romanism, Towar & Hogan, Philadelphia, (1829); and Recapitulated Apostasy, the True Rationalé of the Concealed Apocalyptic Name of the Roman Empire, Printed for J.G. & F. Rivington, London, (1833); and Difficulties of Infidelity, Rivington, London, (1833); and The Primitive Doctrine of Justification Investigated: Relatively to the Several Definitions of the Church of Rome and the Church of England; and with a Special Reference to the Opinions of the Late Mr. Knox, as Published in His Remains, R.B. Seeley and W. Burnside, London, (1839); and Views of Daniel VIII; Extracted from His Dissertations on the Prophecies, Sold by I. Wilcox, Providence, (1844); and Rome and the Bible, Society for Promoting Christian Knowledge, London, (1845); and A Sermon Preached Before the London Society for the Promotion of Christianity Amongst the Jews, Justus Cobb, Printer, Middlebury, (1847); and Facts and Assertions, Or, a Brief and Plain Exhibition of the Incongruity of the Peculiar Doctrines of the Church of Rome: With Those Both of the Sacred Scriptures and of the Early Writers of the Christian Church Catholic, Printed for the Society for Promoting Christian Knowledge, London, (1851); and The Revival of the French Emperorship Anticipated from the Necessity of Prophecy, T. See, H. A. Lorentz, “Deux Mémoires de Henri Poincaré sur la Physique Mathématique”, Acta Mathematica, Volume 38, (1921), pp. 293-308; and compare it to Lorentz’ commentary from 1906, and notes from 1909, H. A. Lorentz, Theory of Electrons, B. G. Teubner, Leipzig, (1909), pp. 223-230, 328-329; in which he calls Albert Einstein’s proxy theory of Poincaré’s corrections of Lorentz’ theory “artificial”, a fallacy of Petitio Principii. Lorentz, who attributed to Einstein, what he knew to belong to Poincaré, may have done so out of resentment for Poincaré, as some have suggested—after all, Poincaré completed gracefully that which Lorentz had long struggled after—and/or Lorentz may have given Einstein credit for Poincaré’s work so that he, Lorentz, could attack its fallacious nature without offending Poincaré.

Poincaré makes clear his attribution of the formulation, which he completed and corrected, stems from Lorentz in “Sur la Dynamique de l’Électron”, Comptes rendus hebdomadaires des séances de L’Académie des sciences, Volume 140, (1905), pp. 1504-1508; reprinted in H. Poincaré, La Mécanique Nouvelle: Conférence, Mémoire et Note sur la Théorie de la Relativité / Introduction de Édouard Guillaume, Gauthier-Villars, Paris, (1924), pp. 77-81 URL:

2141. H. Bergson, Durée et Simultanéité, à Propos de la Théorie d’Einstein, English translation by L. Jacobson, Duration and simultaneity, with Reference to Einstein’s Theory, The Library of Liberal Arts, Bobbs-Merrill, Indianapolis, (1965); which contains a bibliography at pages xlii-xlv.

2173. T. J. J. See, quoted in, “Prof. See Attacks German Scientist, Asserting That His Doctrine Is 122 Years Old”, *The New York Times*, 13 April 1923, Section 1, p. 5.

“In order for the compensation to occur, the phenomena must correspond, not to the true
time $t$, but to some determined local time $t'$ defined in the following way.

I suppose that observers located at different points synchronize their watches with
the aid of light signals; which they attempt to adjust to the time of the transmission of these
signals, but these observers are unaware of their movement of translation and they
consequently believe that the signals travel at the same speed in both directions, they restrict
themselves to crossing the observations, sending a signal from $A$ to $B$, then another from $B$
to $A$. The local time $t'$ is the time determined by watches synchronized in this manner.

If in such a case

$$1 / K_4^{1/2}$$

is the speed of light, and $v$ the translation of the Earth, that I imagine to be parallel to the
positive $x$ axis, one will have:

$$t' = t - vx / V^2$$

“Pour que la compensation se fasse, il faut rapporter les phénomènes, non pas au temps vrai
$t$, mais à un certain temps local $t'$ défini de la façon suivante.

Je suppose que des observateurs placés en différents points, règlent leurs montres
à l'aide de signaux lumineux; qu'ils cherchent à corriger ces signaux du temps de la
transmission, mais qu’ignorant le mouvement de translation dont ils sont animés et croyant
par conséquent que les signaux se transmettent également vite dans les deux sens, ils se
bornent à croiser les observations, en envoyant un signal de A en B, puis un autre de B en A.
Le temps local \( t' \) est le temps marqué par les montres ainsi réglées.

Si alors

\[
\frac{1}{K_\alpha^{1/2}}
\]

est la vitesse de la lumière, et \( v \) la translation de la Terre que je suppose parallèle à l’axe des
\( x \) positifs, on aura:

\[
t' = t - \frac{vx}{V}
\]

remarks regarding the new variable \( t' \): it is what Lorentz calls the *local time*. At a given point
\( t \) and \( t' \) will not defer but by a constant, \( t' \) will, therefore, always represent the time, but the
origin of the times being different for the different points serves as justification for his
designation.” “Disons deux mots sur la nouvelle variable \( t' \): c’est ce que Lorentz appelle *le
temps locale*. En un point donné \( t \) et \( t' \) ne différeront que par une constante, \( t' \) représentera
donc toujours le temps mais l’origine des temps étant différente aux différents points: cela
justifie sa dénomination.” and from 1902, *Science and Hypothesis*, Dover, New York,
(1952), p. 90: “There is no absolute time. When we say that two periods are equal, the
statement has no meaning, and can only acquire a meaning by convention. Not only have we
no direct intuition of the equality of two periods, but we have not even direct intuition of the
simultaneity of two events occurring in two different places. I have explained this in an
article entitled “Mesure du Temps.”

2250. Physikalische Zeitschrift, Volume 9, Number 22, (November 1, 1908), p. 762. While some believe that Voigt was expressing his modesty, it might also be that he was pointedly asserting the primacy of the elastic theory of light.

2252. H. Poincaré’s St. Louis lecture from September of 1904, La Revue des Idées, 80, (November 15, 1905); “L’État Actuel et l’Avenir de la Physique Mathématique”, Bulletin

2260. Lorentz’ letter as quoted and translated by A. Ernst and Jong-Ping Hsu (W. Kern is credited with assisting in the translation), “First Proposal of the Universal Speed of Light by Voigt in 1887”, Chinese Journal of Physics (The Physical Society of the Republic of China), Volume 39, Number 3, (June, 2001), pp. 211-230, at 214. The authors note that the concept of general and local time was Lorentz’ idea, not Voigt’s. In other words, Voigt’s concept was kinematic, and Einstein held no priority over Voigt for the idea of relativistic “time”. The Lorentz to Voigt letter is cited as “Deutsches Museum München, Archives, HS 5549”.

Notes 2641

2313. A. Einstein, Physics Today, 35, 8, (August, 1982), p. 46. Note the reference is to the frame of the moving body, not the frame of a moving medium, and to electrons, not light. As usual, Einstein is nonspecific in his reference. Fizeau performed numerous experiments, some to measure light’s speed on Earth: H. Fizeau, Comptes rendus hebdomadaires des séances de L’Académie des sciences, 29, (1849), p. 90; which could be compared to Bradley’s interpolation of light speed in the reference frame of the vacuum, as Einstein did in 1952, “But the result of Fizeau’s experiment and the phenomenon of aberration also guided me.”—J. Stachel, Ed., The Collected Papers of Albert Einstein, Volume II, Princeton University Press, (1987), p. 230; had he ever considered them.

Though Lorentz averred that the Fizeau result compelled a resting æther, in 1895, it was Jakob Laub, in 1907, who first sought to arrive at the Lorentz Transformation by means of the Fizeau experiment of moving medium with respect to Fresnel’s coefficient of drag, and it was Max von Laue who corrected Laub’s formulation: J. Laub, Annalen der Physik, 23, (1907), pp. 738-744; and, 25, (1908), pp. 175-184. M. v. Laue, Annalen der Physik, 23, (1907), pp.989-990.

With respect to psychologists and their equating of time with space, W. Smith stated in 1902, “Kant speaks of time as a line; and psychologists are learning to regard time as a projection at right angles to the plane of the present. But that this spatiality is essential to the time-concept has not been, in general, recognized.” in “The Metaphysics of Time”, *The Philosophical Review*, Volume 11, Number 4, (July, 1902), pp. 372-391. G. F. Stout stated, in 1902, “Psychologists generally hold the same type of theory for the two cases of space and time cognition, and the indications of individual views given under Extension (q. v.) hold largely also for time.” *Dictionary of Philosophy and Psychology*, Volume 2, Macmillan, New York, London, (1902), p. 705.

2588. Quoted in C. L. Poor, “What Einstein Really Did”, *Scribner’s Magazine*, Volume 88, (July-December 1930), pp. 527-538, at 527. Poor was very much aware of the fact that Einstein would plagiarize known formulas by irrationally asserting known empirical facts as if *a priori* first principles and then pretend to “deduce”—through induction—the hypotheses and equations of his predecessors, to then deduce the same known empirical facts as conclusions from the hypotheses and equations he had taken from others without acknowledgment, in a fallacy of *Petitio Principii*. Charles Lane Poor quoted Anthony Berkeley (a. k. a. A. B. Cox, a. k. a. Francis Iles) in the context of Einstein’s fabricated and vague inductions by fallacy of *Petitio Principii*, artfully posing as deductions. Poor also accused Einstein and his coterie of making too hasty of universal generalizations of specific terrestrial phenomena.

Letter from G. Herglotz to D. Hilbert, date not known, SUB Cod. Ms. Hilbert 147.

In the republication of Felix Klein’s “Zu Hilberts erster Note über die Grundlagen der Physik”, Nachrichten von der Königlichen Gesellschaft der Wissenschaften zu Göttingen. Mathematisch-physikalische Klasse, (1917), pp. 469-482; in F. Klein, Gesammelte mathematische Abhandlungen, Volume I, Chapter 31, Springer, Berlin, (1921), pp. 553-567, at 566; a notation points out that it was Hilbert who deduced the field equations in a scientific synthesis, before Einstein, while Einstein simply asserted them (in a fallacy of Petitio Principii posing as an inductive analysis). Einstein, himself, acknowledged that Hilbert provided the deductive synthesis, which produced the equations, in Einstein’s 1916 paper on Hamilton’s principle.

Letter from M. Born to D. Hilbert of 23 November 1915, Niedersächsische Staats- und Universitätsbibliothek Göttingen, Cod. Ms. D. Hilbert 40 A: Nr. 11; the relevant part of which is reproduced in D. Wuensch,, „zwei wirkliche Kerle“: Neues zur Entdeckung der Gravitationsgleichungen der Allgemeinen Relativitätstheorie durch Albert Einstein und David Hilbert, Termessos, Göttingen, (2005), pp. 73-74.

Einstein to Zangger, A. M. Hentschel translator, The Collected Papers of Albert Einstein, Volume 8, Document 152, Princeton University Press, (1998), p. 151. Hilbert described his theory as being of ideal beauty both in his letter to Einstein and in his lecture of 20 November 1915, as is stated in the second paragraph of both the proofs and the published paper.

A. Einstein to A. Sommerfeld, The Collected Papers of Albert Einstein, Volume 8, Part A, Document 96. It is not within the scope of this paper to thoroughly investigate the role of Grossmann and the tragedy of Einstein’s betrayal of his trust. There is already extensive literature on this subject.

2771. S. Oppenheim, Kritik der Newtonschen Gravitationsgesetzes, A. Haase, (1903) [Separatabdruck aus dem Jahresberichten der Staats-Realschule Karolinenthal für das Schuljahr 1902-03.], pp. 56-60.

Es sei nun auch mir gestattet, auf diese Untersuchung G e r b e r s nochmals zurückzukommen, durch Wiederausdruck einer von mir im Jahre 1903 an ihr geübten Kritik. Sie erschien als eine Programmabhandlung unter dem Titel: „Kritik des Newtonschen Gravitationsgesetzes“ (Programm der K. K. Deutschen Staatsrealschule in Karolinenthal-Prag, 1903) und lautet wörtlich wie folgt:

Die Voraussetzung, von der C. Neumann ausgeht, ist die, daß das Potential der gegenseitigen Anziehung zweier Teilchen \(\left(\frac{m_1}{m_2}\right)\) das für ruhende Punkte durch \(\frac{k^2 m_1 m_2}{r}\) gegeben ist, einiger Zeit bedarf, um von \(m_1\) zu \(m_2\) zu gelangen und daher dort nicht zur Zeit \(t\) sondern später ankommt, ebenso wie das zur Zeit \(t\) in \(m_1\) angenommene und von \(m_2\) ausgesandte Potential von dort etwas früher ausgeht. Beiden Fällen entspricht eine Vergrößerung des Potentials im Verhältnis von \(r: r - \Delta r\), wo \(\Delta r\) von der Zeitdifferenz abhängig ist, die das Potential zu seiner Fortpflanzung benötigt. Das Anziehungspotential ist daher

\[
P = \frac{\frac{k^2 m_1 m_2}{r}}{r - \Delta r} = \frac{k^2 m_1 m_2}{r \left(1 - \frac{\Delta r}{r}\right)}
\]

und stimmt nach gehöriger Entwicklung, durch die es in

\[
P = \frac{k^2 m_1 m_2}{r} \left[1 + \frac{1}{c^2} \left(\frac{dr}{dt}\right)^2\right],
\]

(worin \(c\) die Fortpflanzungsgeschwindigkeit der Gravitation oder der elektrischen Anziehung bedeutet) formal mit dem Weber schen Gesetz überein.

Man kann, wie dies Gerber getan hat, die Rechnung C. Neumanns dadurch verallgemeinern, d. h. den Ausdruck für das Potential noch um eine zweite zu bestimmende Konstante erweitern, daß man

\[
P = \frac{k^2 m_1 m_2}{r} \left(1 - \frac{\Delta r}{r}\right)^{\lambda}
\]

setzt. Man erhält so (die Rechnung ganz im Sinne C. Neumanns durchführend)

\[
P = \frac{k^2 m_1 m_2}{r} \left[1 + \frac{\lambda(\lambda + 1)}{1 \cdot 2 \cdot c^2} \left(\frac{dr}{dt}\right)^2\right]
\]
als ein neues, dem \( \text{W e b e r schen G esetze anal oges} \) Fernkraftgesetz, das zwei Konstanten enthält, die sich den Beobachtungen anpassen können. Die Berechnung der Bewegung der Planeten unter der Annahme, daß an Stelle des \( \text{N e w t o n schen Gesetzes} \) dieses erweiterte tritt, führt zu dem Resultate, daß säkularen Störungen die Länge des Perihels sowie die mittlere Länge unterworfen sind, daß aber bloß die erstere ausschlaggebend ist, indem die letztere das Quadrat der Exzentrizität als Faktor erhält und daher wegen der Kleinheit dieser stets unmerklich bleibt. Die säkulare Störung in der Länge des Perihels ist

\[
\Delta \pi = \frac{\lambda (\lambda + 1)}{1 \cdot 2} \cdot \frac{n^2 a^2}{c^2}
\]

(worin \( n \) die mittlere tägliche Bewegung und \( a \) die Bahnachse des Planeten bedeuten) und muß, soll sie die Anomalie in der Bewegung des Merkur beseitigen, die Gleichung

\[
\frac{\lambda (\lambda + 1)}{1 \cdot 2} \cdot \frac{n^2 a^2}{c^2} = 41,25''
\]

erfüllen. Die aus dem \( \text{W e b e r schen G esetze allein} \) resultierende Perihelstörung unter der Annahme, daß die Fortpflanzungsgeschwindigkeit der Gravitation, \( c \), identisch ist mit der des Lichtes \( (300000 \text{ km/sek}) \) beträgt \( 13,65'' \). Es bleibt daher für \( \lambda \) die Gleichung

\[
\frac{\lambda (\lambda + 1)}{1 \cdot 2} = \frac{41,25}{13,65} = 3
\]

aus der die zwei Werte \( \lambda_1 = 2 \) und \( \lambda_2 = -3 \) folgen. Wie man sieht, läßt sich unter der Annahme, daß das Potential der anziehenden Kraft zweier bewegter Teilchen durch den Ausdruck

\[
P = \frac{\chi^2 m_1 m_2}{r} \left[ 1 + \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 \right]
\]

gegeben ist, indem \( c \) als die Fortpflanzungsgeschwindigkeit der Gravitation identisch angenommen werden kann mit der des Lichtes, der Widerspruch in der Bewegungstheorie des Planeten Merkur vollständig lösen. Auch für die anderen Planeten folgen, wie die nachstehenden Zahlen es zeigen, Differenzen, die noch, etwa den Planeten Venus ausgenommen, innerhalb der möglichen Beobachtungsfehler liegen:

<table>
<thead>
<tr>
<th>Planet</th>
<th>Merkur</th>
<th>( \Delta \pi = 13,65'' ) für ( \lambda = 1 )</th>
<th>( \Delta \pi = 40,95'' ) für ( \lambda = 2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;</td>
<td>Venus</td>
<td>286</td>
<td>858</td>
</tr>
<tr>
<td>&quot;</td>
<td>Erde</td>
<td>127</td>
<td>381</td>
</tr>
<tr>
<td>&quot;</td>
<td>Mars</td>
<td>44</td>
<td>132</td>
</tr>
</tbody>
</table>
„Das Grundgesetz, welches Riemann für das Weber sche substituiert, lautet:

\[ P = \frac{\chi^2 m_1 m_2}{r} \left[ 1 - \frac{1}{c^2} \left( \frac{dx}{dt} \right)^2 + \left( \frac{dy}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right] \]

Auch unter Zugrundelegung dieses ergibt sich für die Bewegung der Planeten um die Sonne nur eine Störung, die merklich werden kann, nämlich in der Länge des Perihels. Dieselbe ist doppelt so groß als die aus dem Weber schen sich ergebende, so daß, wenn man nach einem Vorschlag von Lévy [Footnote: Lévy, Sur l’application des lois électrodynamiques au mouvement des planètes. Compt. rend. Paris 1890.] beide unter Einführung einer erst zu bestimmenden Konstante \( \lambda \) zu einem vereinigt in der Form:

\[ P = P_{\text{Weber}} + \lambda \left( P_{\text{Riemann}} - P_{\text{Weber}} \right), \]

d. h.

\[ P = \frac{\chi^2 m_1 m_2}{r} \left[ 1 - \frac{1}{c^2} \left( 1 - \lambda \right) \left( \frac{dr}{dt} \right)^2 + \lambda \left( \frac{dx}{dt} \right)^2 + \left( \frac{dy}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right] \]

man eine Perihelstörung von der Größe

\[ 13,65'' + \lambda \left( 27,30'' - 13,65'' \right) = 13,65'' \left( 1 + \lambda \right) \]

erhält. Soll sie gleich sein 41,25'', so wird \( \lambda = 2 \) und die Gesetze

\[ P_1 = \frac{\chi^2 m_1 m_2}{r} \left[ 1 + \frac{1}{c^2} \left( \frac{dr}{dt} \right)^2 - \frac{2}{c^2} \left( \frac{dx}{dt} \right)^2 + \left( \frac{dy}{dt} \right)^2 + \left( \frac{dz}{dt} \right)^2 \right], \]

ebenso wie

\[ P_2 = \frac{\chi^2 m_1 m_2}{r} \left[ 1 + \frac{3}{c^2} \left( \frac{dr}{dt} \right)^2 \right] \]

beseitigen, das Newtonsche Gesetz substituierend, mindestens eine der bisher in den Bewegungen der Planeten konstatierten Unregelmäßigkeiten, die im Perihel des Merkur, unter der gewiß einfachen Annahme, daß die Fortpflanzungsgeschwindigkeit der Gravitation der des Lichtes an Größe gleich ist, ohne gar zu große Schwierigkeiten in den Bewegungen der anderen Planeten hervorzurufen. Es muß jedoch hervorgehoben werden, daß dieses
einzige Ergebnis, so zutreffend es sein mag, nicht genügt, um die volle Substitution des Newtonschen Gesetzes durch eines \( P_1 \) oder \( P_2 \) nach allen Richtungen hin zu rechtfertigen. Zunächst bleibt nämlich, wie man sich leicht überzeugen kann, die Schwierigkeit bestehen, die nach von Seele in der Ausdehnung ihrer Gültigkeit auf den unendlichen Raum liegt, andererseits müßte auch noch die Bewegung sehr sonnennaher Kometen untersucht werden, hauptsächlich was periodische Störungen anlangt, um eine endgültige Entscheidung zu treffen.‘’

Man sieht, daß die Aufgabe, die sich P. G e r b e r stelltte, im wesentlichen nur darin bestand, einen physikalisch plausiblen Grund für die Verallgemeinerung des einfachen C. N e u m a n n schen Ansatzes für das retardierte Potential

\[
P = \frac{\chi^2 m_1 m_2}{r \left( 1 - \frac{Ar}{r} \right)}
\]

(siehe p. 18 seiner Programmabhandlung) zu finden. Inwieweit die Begründung, wie er sie durchführt, stichhaltig ist und die Physiker befriedigt, darüber enthalte ich mich jeder Entscheidung.

Nur eine Bemerkung sei mir noch gestattet. Sie zielt dahin, daß die beiden eben erwähnten Ausdrücke \( P_1 \) (nach G e r b e r) und \( P_2 \) (nach L é v y ) die Zahl der von W i e c h e r t in seiner Mitteilung „Perihelbewegung des Merkur und allgemeine Mechanik“, Götting. Nachr. 1916, p. 125, aufgestellten Gesetze, die geeignet sind, das Newtonsche Gesetz soweit zu verallgemeinern, daß dadurch die anomale Perihelbewegung des Merkur erklärt wird, um zwei vergrößern, wenn auch das Prinzip der Erweiterung in beiden Fällen ein anderes ist. Hier das Prinzip der Relativität von Raum und Zeit — bei G e r b e r und L é v y aber das der Retardation des Potentials im Sinne einer Art von Aberration, bei der aber die Glieder erster Ordnung in der Fortpflanzungsgeschwindigkeit der Gravitation wegfallen, weil sie nichts zum effektiven Potential beitragen.
